THE
LONDON ENCYCLOPÆDIA.

VOL. XVIII.

POTASH TO ROME.

J. Haddon, Printer, Castle Street, London.

THE
LONDON ENCYCLOPÆDIA,
OR
UNIVERSAL DICTIONARY
OF
SCIENCE, ART, LITERATURE, AND PRACTICAL MECHANICS,

COMPRISING A
POPULAR VIEW OF THE PRESENT STATE OF KNOWLEDGE.

ILLUSTRATED BY
NUMEROUS ENGRAVINGS, A GENERAL ATLAS,
AND APPROPRIATE DIAGRAMS.

Sic oportet ad librum, presertim miscellanei generis, legendum accedere lectorem, ut solet ad convivium conviva civis. Convivator annittitur omnibus satisfacere; et tamen si quid apponitur, quod hujus aut illius palato non respondeat, et hic et ille urbane dissimulant, et alia fercula probant, ne quid contristent convivatorem. *Erasmus.*

A reader should sit down to a book, especially of the miscellaneous kind, as a well-behaved visitor does to a banquet. The master of the feast exerts himself to satisfy his guests; but if, after all his care and pains, something should appear on the table that does not suit this or that person's taste, they politely pass it over without notice, and commend other dishes, that they may not distress a kind host. *Translation.*

BY THE ORIGINAL EDITOR OF THE ENCYCLOPÆDIA METROPOLITANA,
ASSISTED BY EMINENT PROFESSIONAL AND OTHER GENTLEMEN.

IN TWENTY-TWO VOLUMES.
VOL. XVIII.

 bottom of which spreads about, and gives it the re-
 semblance of a wooden *potlid* in country houses.

Derham.
 A soldier drinks his *pot*, and then offers payment.
Swift.

Leaves eaten raw are termed sallad; if boiled,
 they become *potherbs*: and some of those plants
 which are *pot-herbs* in one family, are sallads in an-
 other. *Watts*.

For great the man, and useful, without doubt,
 Who seasons *pottage*, or expels the gout;
 Whose science keeps life in, and keeps death out.
Harte.

POTAGER, *n. s.* From Pottage. A por-
 ringer.

An Indian dish or *potager*, made of the bark of
 a tree, with the sides and rim sewed together after
 the manner of twiggen-work. *Grew's Museum*.

POTAMOGETON, pond weed, a genus of
 the tetragynia order, and tetrandria class of plants;
 natural order fifteenth, inundata: CAL. none;
 petals four; no style, and four seeds. There
 are twelve species, all of them vegetables floating
 on the surface of stagnant waters, affording
 agreeable shade to fish, and food to cattle.

POTAMON, or POTAMO, a philosopher of Alexandria. He attached himself to none of the schools of philosophy of his time; but kept a middle course between the scepticism of the Pyrrhonians and the presumption of the dogmatists. He was the first projector of the Eclectic sect; for, though their mode of philosophising had been common before, he was the first that attempted to institute a new sect on this principle. 'Diogenes Laertius relates that, not long before he wrote his Lives of the Philosophers, an Eclectic sect, *ελεκτικα τις αιρεσις*, had been introduced by Potamo of Alexandria, who selected tenets from every former sect. Suidas and Porphyry also mention him. The time when Potamo flourished is uncertain. Suidas places him under Augustus: but it is more probable, from the account of Laertius, that he flourished about the close of the second century.'

POTARGO, *n. s.* Ital. *potarge*. A West Indian pickle.

What lord of old would bid his cook prepare
Mangos, *potargo*, champignons, cavarre? *King*.

POTASH, *n. s.* Fr. *potasse*. The vegetable alkali. See below.

Cheshire rock-salt, with a little nitre, allum, and *potash*, is the flux used for the running of the plate-glass. *Woodward*.

POTASH, or POTASSA, in chemistry and the manufactures, more commonly known as the vegetable alkali, is a fixed alkaline salt obtained from the ashes of burnt vegetables of various kinds. The method of making potash is described by Dr. Shaw as follows:—Burn a quantity of billet wood to gray ashes; and, taking several pounds of these ashes, boil them in water, so as to make a very strong lixivium or lie. Let this lie be strained through a coarse linen cloth, to keep out any parts of half-burnt wood that might happen to remain in the ashes; then evaporate this strained lie in an iron pan, over a quick fire, almost to dryness: then, taking out the matter remaining at the bottom, and putting it into an iron crucible, set it in a strong fire till the matter is melted, and then immediately pour it out upon an iron plate, where it soon cools, and appears in the form of a solid lump of potash. In this manner potash is made in the large way of business, for the service of the soap-boiler, glass-maker, fuller, &c.; but, according to the difference of the wood, or combustible matter employed, with the manner of turning it, and conducting the process, different kinds of potash are prepared. There are certain saline plants that yield this potash to great advantage, as particularly the plant kali; there are others that afford it in less plenty, and of an inferior quality, as bean-stalks, &c.; but, in general, all vegetable subjects afford it of one kind or other, and may most of them be made to yield it tolerably perfect after the manner of the process already laid down, even the loppings, roots, and refuse parts of ordinary trees, vine-clippings, &c.

It was announced in the philosophical Journals that, in France, potash had been obtained in great quantities from potato stalks. In order to put this to the test of experiment, Sir John Hay and Dr. M'Culloch made a trial on a large scale, and found that the quantity of potash was

so small that no person could be remunerated by it for the trouble of the process. Messrs. Taylors of Queensferry, by desire of Sir John Hay, made an experiment on the produce of two acres of potato stalks, which yielded two casks of ashes, weighing 2 cwt. 23 lbs., which produced of soluble substance only 36 lbs., containing a great deal of muriate of potash and sulphate of potash. The value of this produce was not more than 2*d.* per lb., or 6*s.* in all; and on twelve acres of their own they had a similar result.

The following is a table of the saline product of 1000 lbs. of ashes of the following vegetables:—

Saline products.	
Stalks of Turkey wheat, or maize,	} 198 lbs.
Stalks of sunflower	
Vine branches	349
Elm	162-6
Box	166
Sallow	78
Oak	102
Aspen	111
Beech	61
Fir	219
Fir	132
Fern cut in August	116
Wormwood	} or 125 according to Wildenheim.
Fumitory	
Heath	
	748
	360
	115 Wildenheim.

On these tables Kirwan makes the following remarks:—1. That in general weeds yield more ashes, and their ashes much more salt, than woods; and that consequently, as to salts of the vegetable alkali kind, as potash, pearl-ash, cashup, &c., neither America, Trieste, nor the northern countries, have any advantage over Ireland. 2. That of all weeds fumitory produces most salt, and next to it wormwood. But, if we attend only to the quantity of salt in a given weight of ashes, the ashes of wormwood contain most. *Trifolium fibrinum* also produces more ashes and salt than fern. Dr. John of Berlin observes that uncombined potash does not occur in living vegetables, it being always combined with an acid, and is only found in them when they are in a state of putridity or decomposition. Plants that feel rough and sharp, particularly *equisetum*, contain much siliceous earth; in the latter full thirteen per cent. Lichens that grow on the summits of fir trees contain an uncommon proportion of oxide of iron, which, Dr. John remarks, may be viewed as illustrative of the formation of iron by the vegetable process. Dr. John recommends the use of decaying and diseased wood to those who wish to obtain potash from it by burning, as he maintains that the quantity of potash is much increased by the putrefactive process. This remark is not new; for we find it mentioned in the second volume of Schreber's *Sammlung verschiedener Schriften*, published in 1763, that putrid wood was recommended for obtaining ashes in preference to fresh wood. Plants, which were allowed to grow in a solution of natron, absorbed by their roots a considerable portion of the alkali; but none of this appeared when the ashes of the plant were examined: in

place of it appeared potash; and hence it is conjectured that vegetables have the power of converting natron into potash.

The process for obtaining pot and pearl-ash is given by Kirwan as follows:—

1. The weeds should be cut just before they seed, then spread, well dried, and gathered clean.

2. They should be burned within doors on a grate, and the ashes laid in a chest as fast as they are produced. If any charcoal be visible, it should be picked out, and thrown back into the fire. If the weeds be moist, much coal will be found. A close smothered fire, which has been recommended by some, is very prejudicial.

3. They should be lixiviated with twelve times their weight of boiling water. A drop of the solution of corrosive sublimate will immediately discover when the water ceases to take up any more alkali. The earthy matter that remains is said to be a good manure for clayey soils.

4. The lie thus formed should be evaporated to dryness in iron pans. Two or three at least of these should be used, and the lie, as fast as it is concreted, passed from the one to the other. Thus, much time is saved, as weak lies evaporate more quickly than the stronger. The salt thus produced is of a dark color, and contains much extractive matter; and, being formed in iron pots, is called potash.

5. This salt should then be carried to a reverberatory furnace, in which the extractive matter is burnt off, and much of the water dissipated: hence it generally loses from ten to fifteen per cent. of its weight. Particular care should be taken to prevent its melting, as the extractive matter would not then be perfectly consumed, and the alkali would form such a union with the earthy parts as could not easily be dissolved. Kirwan adds this caution, because Dr. Lewis and Mr. Dossie have inadvertently directed the contrary. This salt, thus refined, is called pearl-ash, and must be the same as the Dantzic pearl-ash.

To obtain this alkali pure, Berthollet recommends to evaporate a solution of potash, made caustic by boiling with quicklime, till it becomes of a thickish consistence; to add about an equal weight of alcohol, and let the mixture stand some time in a close vessel. Some solid matter, partly crystallised, will collect at the bottom; above this will be a small quantity of a dark-colored fluid; and on the top another lighter. The latter, separated by decantation, is to be evaporated quickly in a silver basin in a sand-heat. Glass, or almost any other metal, would be corroded by the potash. Before the evaporation has been carried far, the solution is to be removed from the fire, and suffered to stand at rest; when it will again separate into two fluids. The lighter, being poured off, is again to be evaporated with a quick heat; and, on standing a day or two in a close vessel, it will deposit transparent crystals of pure potash. If the liquor be evaporated to a pellicle, the potash will concrete without regular crystallisation. In both cases a high-colored liquor is separated, which is to be poured off; and the potash must be kept carefully secluded from air.

Its taste is remarkably acrid, and it is so exceedingly corrosive that, when applied to any

part of the body, it destroys it almost instantaneously. On account of this property it has been called caustic, and is often used by surgeons to open abscesses, and destroy useless or hurtful excrements. When heated it melts. At a red heat it swells, and evaporates slowly in a white acrid smoke. When exposed to the air it soon attracts moisture, and is converted into a liquid; and combines with carbonic acid, for which it has a great affinity. It has a very strong affinity for water. At the common temperature of the air, one part of water dissolves two parts of potassa. The solution is transparent, very dense, and almost of the consistence of oil. In this state it is usually employed by chemists. When four parts of potash in powder, and one of snow are mixed together, the mixture becomes liquid, and absorbs a quantity of caloric. This mixture was employed by Lowitz to produce artificial cold. When the aqueous solution of potash is evaporated to a proper consistency, the potash crystallises. The shape of its crystals is very different, according to the way in which they have been produced. When allowed to form in the cold, they are octahedrons in groups, and contain 0.43 of water: when formed by evaporation on the fire, they assume the figure of very thin transparent blades of extraordinary magnitude, which, by an assemblage of lines crossing each other in prodigious numbers, present an aggregate of cells or cavities, commonly so very close that the vessel may be inverted without losing one drop of the liquid it contains. Potash is not altered by exposure to the light.

A perfectly pure solution of potash will remain transparent on the addition of lime-water, show no effervescence with dilute sulphuric acid, and not give any precipitate on blowing air from the lungs through it by means of a tube.

Pure potash for experimental purposes may most easily be obtained by igniting cream of tartar in a crucible, dissolving the residue in water, filtering, boiling with a quantity of quicklime, and, after subsidence, decanting the clear liquid, and evaporating in a loosely covered silver capsule, till it flows like oil, and then pouring it out on a clean iron plate. A solid white cake of pure hydrate of potash is thus obtained, without the agency of alcohol. It must be immediately broken into fragments, and kept in a well-stoppered phial.

As 100 parts of subcarbonate of potash are equivalent to about seventy of pure concentrated oil of vitriol, if into a measure tube, graduated into 100 equal parts, we introduce the seventy grains of acid, and fill up the remaining space with water, then we have an alkalimeter for estimating the value of commercial pearl-ashes, which, if pure, will require for 100 grains 100 divisions of the liquid to neutralise them. If they contain only sixty per cent. of genuine subcarbonate, then 100 grains will require only sixty divisions, and so on. When the alkalimeter indications are required in pure or absolute potash, such as constitutes the basis of nitre, then we must use 102 grains of pure oil of vitriol, along with the requisite bulk of water to fill up the volume of the graduated tube.

The hydrate of potash, as obtained by the preceding process, is solid, white, and extremely caustic; in minute quantities, changing the purple of violets and cabbage to a green, reddened litmus to purple, and yellow turmeric to a reddish-brown. It rapidly attracts humidity from the air, passing into the oil of tartar per deliquium of the chemists; a name, however, also given to the deliquescent subcarbonate. Charcoal applied to the hydrate of potash at a cherry-red heat gives birth to carburetted hydrogen, and an alkaline subcarbonate; but, at a heat bordering on whiteness, carburetted hydrogen, carbonous oxide, and potassium are formed. Several metals decompose the hydrate of potash, by the aid of heat; particularly potassium, sodium, and iron. The fused hydrate of potash consists of 6 protoxide of potassium + 1.125 water = 7.125, which number represents the compound prime equivalent. It is used in surgery as the potential cautery for forming eschars; and it was formerly employed in medicine diluted with broths as a lithontriptic. In chemistry it is very extensively employed, both in manufactures and as a reagent in analyses. It is the basis of all the common soft soaps.

Dr. Wollaston has recently ascertained the existence of potash in sea-water. He estimates the proportion of this alkali, which he supposes to exist in the state of sulphate, at something less than $\frac{1}{3000}$ th part of the water, at its average density. He has also detected traces of potash in the water of the lake of Ourmia or Arunee, which is unconnected with the ocean. The water of this lake (which is situated on the province of Azerbaijan in Persia) is said to be salter than that of the sea, so that no fish can live in it.

Potash, until Sir Humphry Davy's memorable discovery of its chemical nature, was considered as a simple body, though strong suspicions were entertained of its being of a compound nature. From that philosopher's researches, however, potash appears to consist of a metallic basis, which he called potassium, united with oxygen, in the following proportions:—

Potassium . . .	83
Oxygen . . .	17
	—
	100

POTASSIUM, in chemistry, the name given by Sir H. Davy to the metallic base of potash, discovered by him in 1807. Till this period potash and soda were necessarily regarded as simple from the impossibility of decomposing them by any known methods. Yet they were generally suspected to be compounds, though no chemist was able to detect their elements. By many the alkaliescent principle was supposed to be nitrogen, as the acidifiable was oxygen. Morveau and Desormes published an ingenious set of experiments, in which they endeavoured to prove that potash was a compound of hydrogen and lime. Darracq, however, with that accuracy which has characterised most of his enquiries, soon disproved this theory, and evinced that the results obtained by Desormes and Morveau were owing, in most cases, to the impurity of the

potash with which they had made their experiments; while in others they had drawn wrong inferences from mistaken resemblances.

As soon as voltaic electricity was so far rendered manageable as to be applied with very great power to chemical analyses, Mr. Davy conceived the idea of enlisting this wonderful agency into his service, with a view of endeavouring to obtain a decomposition of the alkalies; and he was the more fully induced to give a full scope and latitude to a series of experiments of this kind from observing that if a neutral substance, or a compound of an acid and an alkali, constituted a part of the voltaic circle, a decomposition of such substance was the result, the acid alone always travelling to the positive side of the chain and the alkali to the negative.

In the first attempts which Sir H. Davy made for the decomposition of the fixed alkalies, he entirely failed, in consequence of his having acted upon their aqueous solutions only. He afterwards used potash in the state of igneous fusion, and acted upon it by an electrical power, which was produced from a galvanic battery of 100 plates of six inches square, highly charged. Here some brilliant phenomena were produced. A most intense light and a column of flame were exhibited, which seemed to be owing to the development of combustible matter; and when the order was changed, so that the alkali was brought in contact with the negative side of the battery, æriform globules, which inflated in the atmosphere, rose through the potash. Being, however, unable to collect the products of decomposition by this means, he had then recourse to pure potash in its usual state, and depended on electricity alone for its fusion, as well as its decomposition.

A small piece of pure potash, moistened a little by the breath, was placed upon an insulated disc of platinum, connected with the negative side of a battery consisting of 100 plates of six inches and 150 of four inches square, in a state of intense activity, and a platinum wire, communicating with the positive side, was brought in contact with the upper surface of the alkali. Under these circumstances, a vivid action soon commenced. The potash began to fuse at both its points of electrification, and small globules, having a high metallic lustre and precisely similar in visible characters to quicksilver, appeared, some of which burnt with explosion and bright flame. These globules, which appeared to be metallic, were the basis of potash.

If iron turnings be heated to whiteness in a curved gun-barrel, and potash be melted and made slowly to come in contact with the turnings, air being excluded, potassium will be formed, and will collect in the cool part of the tube. This method of procuring it was discovered by M. M. Gay Lussac and Thenard in 1808. It may likewise be produced by igniting potash with charcoal, as M. Curaudau showed the same year.

M. Brunner, by acting on calcined tartar in a bottle of wrought iron, has succeeded in obtaining potassium at a comparatively moderate heat. The bottle is spheroidal, about half an inch in thickness, and capable of holding about a pint:

of water; a bent gun-barrel of ten or twelve inches in length screws into the mouth of the bottle. The bottle, well luted over with fire-clay, is set in a strong air furnace, so that the tube may dip down externally beneath the surface of naphtha contained in a cylindrical copper vessel, standing in a tub containing ice and water. The top of the naphtha vessel has a cover fixed on it, pierced with a hole to receive the end of the gun-barrel; and, from the side of the upper part of the vessel, a small tube goes off at right angles to let the air and vapors escape. It is advantageous to mix a little ground charcoal with the tartar previously calcined in a covered vessel, in the same iron bottle for example. Nearly 300 grains of potassium have been procured by this apparatus from twenty-four ounces of crude tartar.—*Bibliothèque Universelle*, xxii. 36.

Potassium is possessed of very extraordinary properties. It is lighter than water, its specific gravity being 0.865 to water 1.0. At common temperatures it is solid, soft, and easily moulded by the fingers. At 150° Fahrenheit it fuses, and in a heat a little below redness it rises in vapor. It is perfectly opaque. When newly cut, its color is splendid white, like that of silver, but it rapidly tarnishes in the air. To preserve it unchanged, we must enclose it in a small phial, with pure naphtha. It conducts electricity like the common metals. When thrown upon water, it acts with great violence, and swims upon the surface, burning with a beautiful light of a red color, mixed with violet. The water becomes a solution of pure potash. When moderately heated in the air, it inflames, burns with a red light, and throws off alkaline fumes. Placed in chlorine, it spontaneously burns with great brilliancy.

On all fluid bodies which contain water, or much oxygen or chlorine, it readily acts; and in its general powers of chemical combination, says its illustrious discoverer, potassium may be compared to the alkali, or universal solvent, imagined by the alchemists.

Potassium combines with oxygen in different proportions. When potassium is gently heated in common air, or in oxygen, the result of its combustion is an orange-colored fusible substance. For every grain of the metal consumed, about one cubic inch and seven-tenths of oxygen are condensed. To make the experiment accurately, the metal should be burned in a tray of platina covered with a coating of fused muriate of potash.

The substance procured by the combustion of potassium at a low temperature, was first observed in October 1807, by Sir Humphry Davy, who supposed it to be the protoxide; but M. M. Gay Lussac and Thenard, in 1810, showed that it was in reality the deutoxide, or peroxide. When it is thrown into the water, oxygen is evolved, and a solution of the protoxide results, constituting common aqueous potash. When it is fused, and brought in contact with combustible bodies, they burn vividly, by the excess of its oxygen. If it be heated in carbonic acid, oxygen is disengaged, and common subcarbonate of potash is formed.

When it is heated very strongly upon platina,

oxygen gas is expelled from it, and there remains a difficultly fusible substance of a gray color, vitreous fracture, soluble in water without effervescence, but with much heat. Aqueous potash is produced. The above ignited solid is protoxide of potassium, which becomes pure potash by combination with the equivalent quantity of water. When we produce potassium with ignited iron-turnings and potash, much hydrogen is disengaged from the water of the hydrate, while the iron becomes oxidised from the residuary oxygen. By heating together pure hydrate of potash and boracic acid, Sir H. Davy obtained from seventeen to eighteen of water from 100 parts of the solid alkali.

By acting on potassium with a very small quantity of water, or by heating potassium with fused potash, the protoxide may also be obtained. The proportion of oxygen in the protoxide is determined by the action of potassium upon water. Eight grains of potassium produce from water about nine cubic inches and a half of hydrogen; and for these the metal must have fixed four cubic inches and three quarters of oxygen. But as 100 cubic inches of oxygen weigh 33.9 gr. 43 will weigh 1.61. Thus, 9.61 gr. of the protoxide will contain eight of metal; and 100 will contain 83.25 metal + 16.75 oxygen. From these data, the prime of potassium comes out 4.969; and that of the protoxide 5.969. Sir H. Davy adopts the number 75 for potassium, corresponding to 50 on the oxygen scale.

When potassium is heated strongly in a small quantity of common air, the oxygen of which is not sufficient for its conversion into potash, a substance is formed of a grayish color, which, when thrown into water, effervesces without taking fire. It is doubtful whether it be a mixture of the protoxide and potassium, or a combination of potassium with a smaller proportion of oxygen than exists in the protoxide. In this case it would be a suboxide, consisting of 2 primes of potassium = 10 + 1 of oxygen = 11.

When thin pieces of potassium are introduced into chlorine, the inflammation is very vivid; and, when potassium is made to act on chloride of sulphur, there is an explosion. The attraction of chlorine for potassium is much stronger than the attraction of oxygen for the metal. Both of the oxides of potassium are immediately decomposed by chlorine, with the formation of a fixed chloride, and the extrication of oxygen.

The combination of potassium and chlorine is the substance which has been improperly called muriate of potash, and which in common cases, is formed by causing liquid muriatic acid to saturate solution of potash, and then evaporating the liquid to dryness and igniting the solid residuum. The hydrogen of the acid here unites to the oxygen of the alkali, forming water, which is exhaled; while the remaining chlorine and potassium combine. It consists of 5 potassium + 4.5 chlorine.

Potassium combines with hydrogen, to form potassureted hydrogen, a spontaneously inflammable gas, which comes over occasionally in the production of potassium by the gun-barrel experiment. M. M. Gay Lussac and Thenard describe

also a solid compound of the same two ingredients, which they call a hydruret of potassium. It is formed by heating the metal a long while in the gas, at a temperature just under ignition. They describe it as a grayish solid, giving out its hydrogen on contact with mercury.

When potassium and sulphur are heated together, they combine with great energy, with disengagement of heat and light even in vacuo. The resulting sulphuret of potassium is of a dark gray color. It acts with great energy on water, producing sulphureted hydrogen, and burns brilliantly when heated in the air, becoming sulphate of potash. It consists of 2 sulphur + 5 potassium, by Sir H. Davy's experiments. Potassium has so strong an attraction for sulphur that it rapidly separates it from hydrogen. If the potassium be heated in the sulphureted gas, it takes fire and burns with great brilliancy; sulphuret of potassium is formed, and pure hydrogen is set free.

Potassium and phosphorus enter into union with the evolution of light; but the mutual action is feeble than in the preceding compound. The phosphuret of potassium, in its common form, is a substance of a dark chocolate color, but when heated with potassium in great excess it becomes of a deep gray color, with considerable lustre. Hence it is probable that phosphorus and potassium are capable of combining in two proportions. The phosphuret of potassium burns with great brilliancy when exposed to air, and when thrown into water produces an explosion, in consequence of the immediate disengagement of phosphureted hydrogen.

Charcoal which has been strongly heated in contact with potassium effervesces in water, rendering it alkaline, though the charcoal may be previously exposed to a temperature at which potassium is volatilised. Hence there is probably a compound of the two formed by a feeble attraction.

Of all known substances, potassium is that which has the strongest attraction for oxygen; and it produces such a condensation of it, that the oxides of potassium are denser than the metal itself. Potassium has been skilfully used by Sir H. Davy and MM. Gay Lussac and The-nard, for detecting the presence of oxygen in bodies. A number of substances, undecomposable by other chemical agents, are readily decomposed by this substance.

When a globule is placed upon ice, not even the solid form of both the substances can prevent their union; for the metalloid instantly burns with a bright flame, and a deep hole is made in the ice, which is found to contain a solution of potash. When a globule is dropped upon moistened turmeric paper, it instantly burns, and moves rapidly upon the paper, as if in search of moisture, leaving behind it a deep reddish brown trace. So strong is the attraction of the basis of potash for oxygen, that it discovers and decomposes the small quantities of water contained in alcohol and ether, even when they are carefully purified.

POTATO, *n. s.* An American word, battata originally. See below. An esculent root.

On choicest melons and sweet grapes they dine,
And with *potatoes* fat their wanton swine. *Waller.*

Leek to the Welch, to Dutchmen butter's dear,
Of Irish swains *potatoe* is the cheer;
Oats for their feasts the Scottish shepherds grind,
Sweet turnips are the food of Blouzalind;
While she loves turnips butter I'll despise,
Nor leeks, nor oatmeal, nor *potatoe* prize. *Gay.*
The families of farmers live in filth and nastiness
upon buttermilk and *potatoes*. *Swift.*

The red and white *potatoes* are the most common
esculent roots now in use, and were originally
brought from Virginia into Europe. *Miller.*

POTATO, in botany. See SOLANUM. Potatoes came originally from North America, where they were not reckoned good for food. They were first introduced into Ireland in 1565, and thence into England by a vessel wrecked on the western coast, at North Meols, in Lancashire, a place and soil still famous for producing this vegetable in great perfection. It was forty years after their introduction, however, before they were much cultivated about London; and then they were considered as rarities, without any conception of the utility that might arise from bringing them into common use. At this time they were distinguished from the Spanish by the name of Virginia potatoes, or battatas, which is the Indian name of the Spanish sort. At a meeting of the Royal Society, March 18th, 1662-3, a letter was read from Mr. Buckland, a Somerset gentleman, recommending the planting of potatoes in all parts of the kingdom to prevent famine. This was referred to a committee; and, in consequence of their report, Mr. Buckland had the thanks of the society; such members as had lands were entreated to plant them, and Mr. Evelyn was desired to mention the proposals at the close of his Sylva. In Sweden, notwithstanding the indefatigable industry of Linnæus, the culture of potatoes was only introduced in 1764, when a royal edict was published to encourage their general cultivation. They were known there, however, at an earlier period; for, in the Memoirs of the Royal Academy of Sciences in Sweden, 1747, M. Charles Skytse proposed to distil brandy from them, in order to save corn, which in that country is very dear. He found that an acre of land set with potatoes will yield a much greater quantity of brandy than when sown with barley. The utility of potatoes is well known, and this utility has brought them into general use, and has extended them over every part of this kingdom. To promote this utility, and to make their cultivation more easy, a variety of experiments and inquiries have been made. See RURAL ECONOMY.

POTATO. The following account of the potato was communicated to the Board of Agriculture by Dr. Wright of Edinburgh.

The potato is a native of America, and was well known to the Indians long before the conquest of Mexico and Peru. Gomara, in his General History of the Indies, and Josephus Acosta, are amongst the earliest Spanish writers who have mentioned the potato by the Indian names of openanck, pape, and papas. Clusius, and after him Gerard, gave figures of the potato plant. Gerard was the first author who gave it the

name of *solanum tuberosum*, which Linnæus and his followers have adopted. In 1584, Sir Walter Raleigh, so celebrated for his worth, his valour, and his misfortunes, discovered that part of America called Norembega, and by him named Virginia; whether the admiral was acquainted with the potato in his first voyage, or whether it was sent to him by Sir Thomas Grenville, or by Mr. Lane, the first governors of Virginia, is uncertain. It is probable he was possessed of this root about the year 1586. He is said to have given it to his gardener in Ireland, as a fine fruit from America, and which he desired him to plant in his kitchen garden in the spring. In August this plant flowered, and in September produced a fruit; but so different to the gardener's expectation, that, in an ill-humour, he carried the potato apple to his master. "Is this," said he, "the fine fruit from America you prized so highly?" Sir Walter either was, or pretended to be, ignorant of the matter; and told the gardener, since that was the case, to dig up the weed and throw it away. The gardener soon returned with a good parcel of potatoes. Gerard, an old English botanist, received seedlings of the potato about the year 1590; and tells us, that it grew as kindly in his garden as in its native soil, Virginia. The plant was cultivated in the gardens of the nobility and gentry early, about the year 1620, as a curious exotic; and towards the year 1684, was planted out in the fields, in small patches, in Lancashire. From thence it was gradually propagated all over the kingdom, as well as in France. In 1683, Sutherland has inserted the *solanum tuberosum* in his *Hortus Medicus Edinburgensis*; and it is probable that many others in Scotland cultivated the potato in their gardens about that time. It was not, however, grown in the open fields in Scotland till the year 1728, when Thomas Prentice, a day labourer, first cultivated potatoes at Kilsyth. The success was such, that every farmer and every cottager followed his example; and for many years past it has become a staple article. Thomas Prentice, by his industry, had saved £200 sterling, which he sunk for double interest. Upon this he subsisted for many years, and died at Edinburgh in 1792, aged eighty-six years. This plant thrives as well in Europe as it does in America. In this island, particularly, it is quite at home; and there is hardly a soil, but, with a little pains, may be made to produce the potato. The potato may be cultivated in every habitable part of the globe; but with variable success. The heat of the West Indies is too great for it. In Jamaica, however, and other mountainous islands, where they have all climates, it has been produced in great perfection. On account of the potato being a species of *solanum*, or night-shade, there were many who were prejudiced against it, alleging it was narcotic. In Burgundy, we find the culture and use of potatoes in food interdicted, as a poisonous and mischievous root. Amongst other effects, it was accused of producing leprosy and dysentery. Potatoes exposed a few days to the sun and weather acquire a green colour, bitter taste, and a narcotic quality. In this state they are not fit for eating; but there is not

the smallest foundation for the other allegations. Prejudice and ignorance have long yielded to experience and truth; and all mankind at this day agree, that there is no food so wholesome, more easily procured, or less expensive, than the potato. It constitutes the chief article of food to immense numbers of people, and may be converted to the support of all domestic animals, whether raw, boiled, or roasted.

POTCH, *v. a.* Fr. *pocher*. To thrust out the eyes as with a thumb. To thrust; push.

ПОТЧ, *v. a.* Fr. *pocher*. To poach; to boil slightly. Commonly written **ПОАЧ**, which see.

POTEMKIN (George Prince), a descendant of a Polish family, who entered into the service of Russia, and distinguished himself so much as to be appointed to the chief command by Catharine II. On the 17th December, 1788, he took the important fortress of Oczakow from the Turks, and obtained several other victories over them. The empress rewarded his services by loading him with riches and honors: and it is said that she intended to have made him sovereign of that part of his native country which she had dismembered, when he died in 1791, aged fifty-two.

POTENTIA, *n. s.* Lat. *potentia*, *potens*.
PO'TENT, *adj.* } Power; efficacy; author-
PO'TENTATE, } rity; potent is powerful;
PO'TENTLY. } forcible; strong; efficacious: potentate, a possessor of sovereign power: potently follows the senses of potent.

Thus did the uncircumcised *potentates*
 Of earth, debase religion in the sight
 Of those they ruled, who looking up beheld
 The fair celestial gift despised, enslaved;
 And mimicking the folly of the great,
 With prompt docility despised her too. *Pollok.*

All obeyed the superior voice
 Of their great *potentate*; for great indeed
 His name, and high was his degree in heaven. *Milton.*

POTENGER (John), an English author, born at Winchester in 1647. He took the degree of B.A. in Corpus Christi College, Oxford; and entering the Temple, was called to the bar. He is chiefly known by his *Life of Agricola*, from Tacitus; and his *Pastoral Reflection on Death*, a poem. He died at Dorchester, in 1733.

POTENT, or **POTENCE**, in heraldry, a term for a kind of cross whose ends all terminate like the head of a crutch. It is otherwise called the Jerusalem cross. See diagram.

POTENTIAL, *adj.* } Fr. *potenciel*; Lat.
POTENTIALITY, *n. s.* } *potentialis*. Existing in
POTENTIALLY. } possibility only: having effect as distinct from an actual property: efficacious: potentiality is possibility: potentially corresponds with potential.

The magnifico is much beloved,
 And hath in his effect a voice *potential*,
 As double as the Duke's. *Shakspeare. Othello*
 The cautery is either actual or *potential*. *Markham.*

The true notion of a soul's eternity is this, that the future moments of its duration can never be all

past and present; but still there will be futurity and potentiality of more for ever. *Bentley.*

This duration of human souls is only potentially infinite. *Id.*

POTENTIAL, in grammar, is an epithet applied to one of the moods of verbs. The potential is the same in form with the subjunctive, and is, according to Ruddiman, implied in that mood; for which reason that grammarian rejects it: but others observe that it differs from the subjunctive in this that it always carries with it the signification of power, will, or duty. It is sometimes called the permissive mood, because it often implies a permission or concession to do a thing.

POTENTIAL CAUTERY, in medicine, denotes the consuming, or reducing to an eschar, any part of the human body by a caustic alkaline or metallic salt, &c., instead of a red-hot iron, which last is called the actual cautery.

POTENTILLA, silver-weed, wild tansy, or cinquefoil, a genus of the pentagynia order, and icosandria class of plants; natural order thirty-fifth, senticosæ: CAL. decemfid: there are five petals: SEEDS roundish, naked, and affixed to a small dry receptacle. The species are six:

1. *P. argentea*, silvery upright potentilla, has upright stalks, branching a foot high; and five-lobed leaves, having the lobes wedge-shaped, cut on the edges, hoary, and white underneath, and the branches terminated by small yellow flowers.

2. *P. fragaroides*, the strawberry-like potentilla, has a somewhat tuberous root, furnished with many long fibres, long trailing shoots, rooting at the joints; pinnated, mostly three-lobed leaves, having oval lobes, with the extreme lobe the largest, and clusters of small white flowers. This species bears a great resemblance to the small sterile strawberry plants.

3. *P. fruticosa*, the shrubby potentilla, commonly called shrub cinquefoil. This rises with a short shrubby stem, dividing into a branchy full head, three or four feet high; closely garnished with pinnated leaves of five oblong, narrow, acute-pointed folioles, pale green above, and whitish underneath; and the branches terminated by clusters of large, spreading, yellow flowers. This is a beautiful deciduous flowering shrub, worthy of a place in every curious collection. It grows wild in Yorkshire, and other northern parts of England, &c., but has been long cultivated in gardens as an ornamental shrub.

These plants flower in June and July; the flowers are composed each of five roundish petals, and about twenty stamina. They are all very hardy, and may be employed in the different compartments of the pleasure ground. Their propagation is very easy. The shrubby potentilla may be propagated abundantly by suckers, layers, and cuttings; all of which will readily grow, and make plants in one year, which, after having two or three years growth in the nursery, will be fit for any of the shrubby compartments. The herbaceous kinds may be propagated by parting the roots in autumn or spring, or by seed in any of those seasons.

POTERIUM, garden burnet, a genus of the polyandria order, and monœcia class of plants; natural order fifty-fourth, miscellanæ: MALL.

CAL. tetraphyllous: cor. quadripartite: there are from thirty to forty stamina. FEMALE CAL. tetraphyllous: cor. quadripartite: there are two pistils: the berry is formed of the indurated tube of the corolla. The species are three:

1. *P. hybridum*, hybrid agrimony-leaved burnet, rises with upright, taper, closely gathered stalks, two feet high; pinnated odoriferous leaves of three or four pairs of sawed lobes, terminated by an odd one; and the stalks terminated by long foot-stalks, dividing into smaller, each supporting a small roundish spike of flowers. This species often proves biennial; but, by cutting down some of the stalks before they flower, it will cause it to multiply at bottom, and become abiding.

2. *P. sanguisorba*, the common garden burnet, has fibry perennial roots, crowned by a large tuft of pinnated leaves, or six or seven pair of sawed lobes, terminated by an odd one; upright angular stalks, dividing, and branching a foot and a half high, terminated by oblong spikes of purplish red flowers. This species grows wild in England, in chalky soils; but has been long cultivated as a choice sallad herb for winter and spring use, it being of a warm nature: the young leaves are the useful parts. It is perennial in root, and retains its radical leaves all the year; but the stalks are annual.

3. *P. spinosum*, shrubby spinous burnet of Crete, has a shrubby stem and branches, rising about a yard high, armed with spines; small pinnated ever-green leaves, of six or seven pairs of lobes, terminated by an odd one, and the branches terminated by small heads of greenish flowers. All these species flower in June and July, succeeded by ripe seeds in autumn. They are naturally perennial; but the two herbaceous ones are abiding in root only; the other in root, stem, and branches: the two former are hardy, and the third requires shelter in winter. The second sort merits culture in every kitchen-garden for winter and spring salads. The third sort must be kept always in pots, to have shelter in winter. They are all easily propagated, the second sort by seed and by parting the roots. The first sort may also be increased by seeds and slips off the root, as for the former sort: and the propagation of the third is by slips or cuttings of the branches in spring and summer, planted in pots, and placed under glasses, giving shade and water; or it might be forwarded more by plunging them in a hot-bed. Burnet is of a heating, drying nature, cordial and alexipharmic.

POT'GUN, *n. s.* A corruption of popgun. A gun which makes a small smart noise.

An author thus who pants for fame,
Begins the world with fear and shame,
When first in print, you see him dread
Each *potgun* levelled at his head.

Swift's Miscellanies.

POTH'ECARY, *n. s.* A corruption of apothecary. Lat. *apothecarius*. One who compounds and sells physic.

Modern 'pothecaries, taught the art
By doctors' bills to play the doctor's part,
Bold in the practice of mistaken rules,
Prescribe, apply, and call their masters fools.

Pope

POTH'ER, n. s. This word is sometimes written podder, sometimes pudder, and is derived by Junius from Fr. *foudre*, thunder, by Skinner from Dut. *peuteren* or *peteren*, to shake or dig; and more probably, by a second thought, from Fr. *poudre*, dust. See **BOTHER**, **Bustle**; tumult; flutter. A low word.

Such a *poth'er*,
As if that whatsoever god, who leads him,
Were crept into his human powers,
And gave him graceful posture.

Shakspeare. Coriolanus.

He suddenly unties the poke,
Which from it sent out such a smoke,
As ready was them all to choke,
So grievous was the *poth'er*.

Drayton.

Some hold the one, and some the other,
But howsoe'er they make a *poth'er*.
He that loves reading and writing, yet finds cer-
tain seasons wherein those things have no relish,
only *pothers* and wearies himself to no purpose.

Hudibras.

Locke.

I always speak well of thee,
Thou always speak'st ill of me;
Yet after all our noise and *poth'er*,
The world believes nor one nor t'other.

Guardian.

'Tis yet in vain to keep a *poth'er*
About one vice, and fall into the other.
What a *poth'er* has been here with Wood and his
brass,

Pope.

Who would modestly make a few half-pennies pass!
Swift.

POTHOS, in botany, a genus of the polyandria order, and gynandria class of plants. The spathe or sheath is a simple spadix covered: CAL. none: petals four, and as many stamina; the berries are dispersum. Species four, American plants.

POTIDÆA, a town of Macedonia, in the peninsula of Pallene. It was founded by a colony of Corinthians, and became tributary to the Athenians, from whom Philip II. of Macedon took it, and gave it to the Olynthians, whom he afterwards extirpated. Cassander repaired and enlarged it, and named it Cassandria.

POTION, n. s. Fr. *potion*; Lat. *potio*. A draught; commonly a physical draught.

For tastes in the taking of a *potion* or pills, the head and neck shake.

Bacon's Natural History.

The earl was by nature of so indifferent a taste, that he would stop in the midst of any physical *potion*, and, after he had licked his lips, would drink off the rest.

Wotton.

Most do taste through fond intemperate thirst;
Soon as the *potion* works, their human countenance,
The' express resemblance of the gods, is changed
Into some brutish form of wolf or bear.

Milton.

POTNÆE, a town of Bœotia, where Bacchus had a temple. The Potnians, having murdered the priest of Bacchus, were ordered by the oracle to sacrifice a young man annually. This horrible sacrifice having continued some years, Bacchus interposed and substituted a goat. Paus. 9. c. 8.

POTOMAC, a river of the United States, which rises in two branches, the north and south, originating in and near the Alleghany mountains, and forming, through its whole course, part of the boundary between Virginia and Maryland. It passes by Shepherdstown, Georgetown, Washington city, Alexandria, Port Tobacco, &c., and

flows into Chesapeake Bay, between Point Lookout and Smith's Point. It is seven miles and a half wide at its mouth, and one mile and a quarter at Alexandria, 200 miles from the Ocean. The termination of the tide water is above 300 miles from the sea, and the river is navigable for ships of the greatest burden through nearly that distance. Above the tide water the river has three considerable falls, those above Georgetown are now passable in boats. Its length above the tide is upwards of 300 miles through an inhabited country. Its junction with the Shenando at Harper's Ferry is regarded as a great curiosity. The river has seven fathoms of water at its mouth, five at St. George's island, four and a half at Lower Matchodie, and three at Swan's Point, and thence to Alexandria.

POTOMAC ACADEMY, in Prince George county, Valencia, near the Potomac; twenty-three miles east of Fredericksburg.

POTOMAC CREEK, a river of Virginia, which runs into the Potomac. Long. 77° 22' W., lat. 38° 24' N.

POTOSI, a government once belonging to Peru, but added by the Spanish government to the viceroyalty of Buenos Ayres, and now a province in the republic of Bolivia. It is bounded on the north by the cordillera of Vilcanota, which separates it from the Peruvian provinces, and by countries inhabited by wandering tribes; on the east by the mountains of Arequipa, the Pacific Ocean, and the Chilian Andes; on the west by the governments of Paraguay and Buenos Ayres; and on the south by that of Buenos Ayres. Great part of it is full of mountains, ravines, and chasms, of a very cold temperature, and almost barren of vegetable productions; in other parts the country is covered with deserts, forests, vast plains, and mountain streams expanding into rivers. The Provincias de la Sierra, which lie near the Andes, are the most populous.

POTOSI, a city of the above province and district of Porco, is situated in a narrow glen on the river of this name, and on the south side of the mountain which contains the Potosi mines. The environs are barren, and the climate cold; the valleys being destitute of wood, the sides of the hills covered only with moss, and their summits with eternal snows. A few vicunas are the only animals now and then seen grazing in this elevated region.

The *silver mine* of Potosi is by far the most productive of the whole of those in this government. The mountain from which the metal is extracted is of a conical form, about six leagues in circumference, and 4182 feet above the neighbouring plains. The discovery of its treasure was owing entirely to the accident we have adverted to in our article **AMERICA, SOUTH**, which see: a Peruvian, named Diego Hualpa, while chasing some chamois among the rocks, in his ascent laid hold of a small shrub, whose roots giving way disclosed to his view an immense vein of silver, which has been since distinguished by the name of La Rica, or the Rich. The Indian concealed the circumstance for a time from all his friends, and only had recourse to this treasure to supply his occasional wants; but the obvious change in his fortune had excited the

suspicious of one of his companions, who, by urgent entreaties, drew from him the secret, and, upon some slight quarrel, he soon after revealed it to his master, a Spaniard. The information was no sooner received than the mine was opened; and it was formally registered 21st of April, 1545. Since that time it has been constantly wrought, and the silver, which has paid the royal duties from this mine, has been valued at 5750,000,000 of livres tournois, equal to £234,693,840 sterling. The mountain is now almost completely excavated, and is perforated with above 300 pits, few of which, however, are more than seventy yards deep. It is opened at the base; and vaults, dug horizontally, penetrate into its bowels, and meet the veins of silver. In these vaults, which are called by the miners sacabouas, and are about six feet high and eight feet broad, the air is cold and unwholesome, and the Indians work there alternately night and day, entirely naked, lest they should embezzle the ore.

On the first discovery of the mine of Potosi, the metal was much purer than at present, being now inferior to many of the other mines. It is the abundance of the ore alone which renders it worth working. According to Acosta, the average contents of silver in the crude ore were, in 1574, from eight to nine marks per quintal; and the minerals which yielded fifty marks per quintal were considered as extremely rich. Since the beginning of the eighteenth century, however, they reckon only from three to four marks per caxon, or from $\frac{10}{100}$ to $\frac{90}{100}$ per quintal. A caxon contains about 50 cwt. From this it appears that the mean riches of the minerals have diminished in the proportion of 170 to one; but, what is surprising, the quantity of silver extracted from the mines of Potosi has only diminished in the proportion of four to one, according to the following calculations, which are from Humboldt.

1. From the opening of the mines of Potosi in 1545 to the year 1556, when the royal duties were first recorded with accuracy, Ulloa, upon the authority of Don Sebastiani Sandoval y Guzman, who published an account of these mines in 1634, entitled *Pretensiones del Potosi*, makes the total produce which paid duty to be 613,000,000 of piastres, making a yearly average of 55,726,000 piastres, or 6,556,000 marks of silver. This immense sum, however, Humboldt, upon unquestionable data, has reduced to 127,500,000 piastres, or 15,000,000 of marks, making an annual produce of nearly 1,363,636½ marks.

2. The royal duties paid on the silver extracted from the mines of Potosi, between the 1st of January 1556, and 31st of December 1578, during which the fifth only was paid, amounted to 9,801,906 piastres, making a total produce of 49,009,530 piastres: or 5,765,827 marks of silver, which, for twenty-three years, makes the average annual produce of 256,688 marks.

3. The duties paid from the 1st of January 1579, to the 19th of July 1736, during which one and a half per cent. de covos was first paid, and then the fifth of the remaining 98½ piastres, amounted to 129,417,273 piastres, making a total produce of nearly 610,458,835 piastres, or

71,818,686½ marks of silver, which, for 157 years and a half, is at an annual average produce of nearly 455,991½ marks.

4. Between the 20th of July 1736 and the 31st of December 1789, during which the one and a half per cent. de covos and the half of the fifth only were paid, the royal duties amounted to 14,542,684 piastres, making a total produce of 128,129,374½ piastres, or 15,074,044 marks of silver, which, for fifty-three years and a half, makes an annual produce of nearly 281,758 marks.

5. From 1789 to 1803 we have no account of the royal duties; but during that period the total produce of Potosi, according to the records of the mint, was 46,000,000 of piastres, or 5,411,764 marks, making a yearly average of 386,554½ marks.

It appears, therefore, that the annual produce of the last period is little more than a fourth of that of the first; but, in giving the average produce for such long periods, the gradual diminution or increase of the quantity of silver extracted from these mines could not be distinctly marked. We may therefore observe that, during the second period, when the royal duties were first correctly registered, the king's fifth varied from 500,000 to 300,000 piastres; and that, during the first fifty years of the third period, the duties varied from 1,000,000 to 1,500,000 piastres; and then gradually diminished until 1735, when they only amounted to 271,621 piastres, 6 reals. From 1737 to 1789, the increase was equally gradual from 183,704 to 335,468 piastres. We may also remark that, in these calculations, we have uniformly valued the piastre at only eight reals de plata, although, until near the close of the sixteenth century, the Spaniards reckoned by piastres of 480 maravedis, or nearly 13½ reals de plata. In estimating, therefore, the total produce of these mines from 1545 to 1803, allowance must be made for this low valuation.

The quantity of silver extracted from the mines of Potosi during the

	Marks.
1st period, was	15,000,000
2nd	5,765,827

Nothing, according to Helms, can equal the ignorance with which the mining is here carried on. The mines, many of them, are filled with

water, which, by the application of proper machinery, might be easily drained off. The methods employed for this purpose are, however, ill contrived and ineffectual. Mr. Helms saw one drain which had been begun in 1779, and had, at an incredible expense, been carried two miles. This drain, even at its mouth, was too high, and it had been made to slope one yard in every 132; so that it could not possibly free many of the pits from the water with which they were overwhelmed. 'Still greater ignorance,' says Mr. Helms, 'was, if possible, displayed by the directors of the smelting houses and refining works at Potosi. By their method of amalgamation, they were scarcely able to gain two-thirds of the silver contained in the paco-ore; and, for every mark of pure silver gained, they destroyed one, and frequently two, marks of quicksilver. Indeed all the operations at the mines of Potosi, the stamping, sifting, washing, quickening, and roasting the ore, are conducted in so slovenly, wasteful, and unscientific a manner, that to compare the excellent method of amalgamation invented by baron Born, and practised in Europe, with the barbarous process used by these Indians and Spaniards, would be an insult to the understanding of my readers. The tools of the Indian miner are very badly contrived and unwieldy. The hammer, which is a square piece of lead of twenty pounds weight, exhausts his strength. The iron, a foot and a half long, is a great deal too incommodious, and in some narrow places cannot be made use of. The thick tallow candles wound round with wool, vitiates the air. In the royal mint at Potosi, where from 550,000 to 600,000 marks of silver, and about 2000 marks of gold, are annually coined, affairs were not better conducted. Every hundred weight of refined copper used for alloy in the gold and silver coin cost the king £35, through the gross ignorance of the overseers of the work, who spent a whole month in roasting and calcining it, and frequently rendered it quite unfit for the purpose.' These various evils the German commissioners, sent over by the king of Spain to inspect the mines, endeavoured to remove. They constructed a new laboratory, according to the most improved model, by which the copper ores used for alloy could be refined in four hours and a half, and for one-twentieth part of the expense incurred by the former process: they also erected machinery for the draining of the mines. New amalgamation works were also erected, and suitable instructions given to the persons employed. 'As soon as the water in the pits,' Helms observes, 'can be got under, the mines of Potosi will be in a more flourishing condition than ever. The total want of timber, however, on the naked ridge of mountains on which Potosi is situated, very much retards the work.'

POTOSI, formerly Mine-au-Burton, a post town and capital of Washington county, Missouri territory; forty-five miles west of St. Genevieve, and sixty S.W. of St. Louis.

POTOSI, SAN LOUIS, an extensive intendency of Mexico or New Spain, under the Spanish government, whose territorial limits it is scarcely possible accurately to ascertain, it being sur-

rounded by deserts, or countries inhabited by wandering and independent tribes of Indians. On the south it is bounded by the intendancies of Vera-Cruz, Mexico, and Guanaxuato; on the east by the gulf of Mexico, and on the west by Zacatecas and Durango. This immense district includes, therefore, a greater surface than Europe or Spain; but though gifted by nature with the most precious productions, and situated under a serene sky, it is quite wild as to cultivation in most parts, and more thinly peopled than Asiatic Russia. Its position on the eastern limits of New Spain, the proximity of the United States, the easy communication with the colonists of Louisiana, and various other circumstances, concur, however, to favor its progress towards civilisation and prosperity.

On the coast, which is 230 leagues in extent, are a number of lagunas, or salt water lakes. The capital is of this name, and contained in Humboldt's time 12,000 inhabitants. It is situated on the eastern side of this table-land west of the sources of the Rio de Panuca.

POTSCHINKI, a town of European Russia, in the government of Nischnei-Novgorod. It has a traffic in cattle, and 4000 inhabitants, and here is kept by government a stud of horses, which supplies a regiment of life-guards. 117 miles S.S.E. of Nischnei-Novgorod.

POTSDAM, a province of Brandenburg, Prussia, comprehending the former districts of the Ucker Mark, the Mark of Priegnitz, and the greatest part of the Middle Mark. It is situated between Pomerania and West Prussia on the north, and the province of Saxony on the south and west: Berlin, with a small district around, forms a distinct government. Towards the north-west this province is bounded by the Elbe and the Havel, and on the north-east by the Oder. Its area is about 8000 square miles, divided into the following thirteen circles:—

Lower Barnim,	West Havelland,
Upper Barnim,	East Priegnitz,
Teltow-Storkow,	West Priegnitz,
Zauch-Belzig,	Ruppın,
Juterbock-Lucken-	Prenzlów,
walde,	Templin,
East Havelland,	New Angermunde.

This tract is one extensive low plain, varied only occasionally by hills of slight elevation. The soil, though for the most part a light sand, sometimes barren and even drifting, contains spots, particularly on the rivers, remarkable for their fertility. The climate is not cold, and, since a number of the lakes have been drained, it is reckoned healthy. The chief mineral here is marsh iron ore, which affords about twenty per cent. of metal. The inhabitants, about 500,000, are in general industrious, and carry on manufactures of woollens, cotton, and linen. The towns are small, the principal, after Potsdam, being Brandenburg, Prenzlów, Spandau, and Ruppın.

POTSDAM, the chief town of the above government, is of a square form and situated on the north bank of the Havel, which here spreads its waters into a succession of small lakes. Potsdam, since the close of the seventeenth century,

has been the frequent residence of the court of Berlin, but is indebted for its chief improvements to Frederic II. The new town was either built or repaired entirely by that prince: the fronts of several of the streets are all of stone, but the rest of the houses are finished in a far inferior style. The streets are not as yet all paved. On the whole, however, Potsdam may vie in beauty with Manheim, or any German town. It is surrounded by a wall and ditch, and has four gates toward the land, and four toward the river; on the banks of which is the Havel, a magnificent structure, begun in 1660, and extended progressively during the subsequent reigns. Its finest ornaments are a colonnade, a cupola, and a marble staircase. In the front is a square for manœuvring troops; and along the river extensive gardens. Connected with it also are a theatre, menagerie, and noble stables. The town-house was built in 1754, on the plan of that of Amsterdam. There are in Potsdam extensive barracks; a great hall for exercising the troops in bad weather; and in the garrison church statues of Mars and Bellona. Here also is the tomb of Frederick II. There are in the town six other churches and a Jewish synagogue. The market-place is ornamented by statues of the kings of Prussia and an obelisk. The lyceum, two public schools of inferior extent, and one belonging to the garrison; the infirmary itself, a poor-house, and an orphan-house on a large scale, for the children of soldiers, are other public establishments worth notice.

The population of Potsdam, exclusive of military, is about 25,000; the former amount in general to the number of 6000 or 8000. In the absence of the court, Potsdam seems deserted. Its numerous manufactures are all on a small scale: but brewing is here, as in other German towns, a business of great extent; and the cultivation of gardens in the neighbourhood supplies no small employment. The palace of Sans Souci, the favorite retreat of 'the great Frederick,' is three-quarters of a mile to the north-west, and stands on the ascent of an eminence. It is only one story in height, with a circular pavilion at each end: in one is the library of Frederick, exactly in the state it was left at his death. Sans Souci has two appended buildings for a collection of paintings, and for other court entertainments. In the garden is a cabinet of statues, gems, and medals. Two miles to the west is a palace begun towards the close of the eighteenth century on a magnificent scale, but not likely to be soon finished. The structure called the marble palace is in the midst of a garden at some distance from Sans Souci. Fifteen miles W.S.W. of Berlin, and sixty-one E.N.E. of Dresden.

POTSDAM, a post town of St. Lawrence county, New York; ninety miles west of Plattsburg, and 150 N.N.W. of Albany. It is a flourishing town. The principal village is situated on the Racket, where there are fine falls, which afford excellent seats for mills and manufactories. A weekly newspaper is published here.

POTT (Percival), F.R.S., was born in London in 1713. He received the rudiments of his education at a private school at Darne in Kent;

and became an apprentice to Mr. Nourse, one of the surgeons of St. Bartholomew's Hospital; of which hospital, in 1744-5, he was elected an assistant; and, in 1749, appointed one of the principal surgeons. In 1746 he married the daughter of Robert Cruttenden, Esq. His first publication is said to have been planned in 1756, during his confinement, in consequence of a compound fracture of the leg: from that time his pen was seldom long unemployed. His practice and his reputation were now rapidly increasing: in 1764 he was elected F.R.S.; and afterwards was complimented with honorary diplomas from the Royal Colleges of Surgeons in Edinburgh and Dublin. In 1787 he resigned the office of surgeon to St. Bartholomew's Hospital, 'after having served it,' as he used to say, 'man and boy, half a century;' and on the 22d of December, 1788, after an illness of eight days, he expired. He published a great number of treatises on various branches in surgery; particularly, On Tumors which soften the Bones; On Ruptures; On the Hydrocele; On Fistula Lachrymalis; On Hernia of the Bladder and Stone; On Fistula in Ano; On Fractures and Dislocations; On Wounds of the Head; On the Cataract, Polypus of the Nose, Cancer of the Scrotum, Ruptures, and Mortification of the Toes. All these have been collected and published in 1 vol. 4to.

POTTER (Christopher), a learned English divine, born in 1591, and educated at Oxford. In 1633 he published his Answer to a late Popish Plot, entitled Charity Mistaken, which he wrote by special order of king Charles I., whose chaplain he then was. In 1634 he was appointed dean of Worcester; and in 1640 vice-chancellor of the university of Oxford; in the execution of which office he met with considerable hindrance from the members of the long parliament. Upon the breaking out of the civil wars, he sent all his plate to the king, declaring 'that he would rather, like Diogenes, drink in the hollow of his hand, than that his majesty should want;' and he afterwards suffered much for the royal cause. He was accordingly nominated dean of Durham in 1646, but was prevented from being installed by his death, which happened about two months after. 'He was a person learned and religious, exemplary in his conversation, courteous in his carriage, of a sweet and obliging nature, and of a comely presence.' He was remarkable for his charity to the poor.

POTTER (John), D. D., archbishop of Canterbury, was the son of a linen-draper at Wakefield, in Yorkshire, where he was born about 1674. He studied at University College, Oxford; and at the age of nineteen published *Variantes Lectiones et Notæ ad Plutarchi Librum de Audiendis Poetis; et ad Basilii magni orationem ad Juvenes, quomodo cum fructu legere possint Græcorum Libros*, 8vo., 1693. In 1697 came out his *Lycophron*, in folio; which is reckoned the best edition of that obscure writer: soon after he published his *Antiquities of Greece*, 2 vols. 8vo. These works established his literary reputation, and engaged him in a correspondence with Grævius and other learned foreigners. In 1706 he was made chaplain to the queen; in

1715 bishop of Oxford; and in 1737 he succeeded archbishop Wake in the see of Canterbury; which high station he supported with much dignity until his death in 1747. He was a learned and exemplary churchman; but strongly tinctured with the pride of office; and disinherited his eldest son for marrying below his rank. His Theological works, containing Sermons, Charges, Discourses on Church Government, and Divinity Lectures, were printed at Oxford, in 3 vols. 8vo., 1753.

POTTER (Robert), a divine of the church of England, was born in Norfolk in 1721, and educated at Emanuel College, Cambridge, where he took his bachelor's degree in 1741. His first preferment was the vicarage of Scarning in Norfolk, where he wrote poems in imitation of Pope, which were published in 1 vol. 8vo., in 1774. In 1777 appeared his translation of *Æschylus*, with notes, 4to.; reprinted in 1779 in 2 vols. 8vo. In 1781 came out the first volume of his translation of Euripides, and the second in the year following. In 1788 he printed his *Sophocles*, and his school-fellow, lord Thurlow, gave him a prebend in the church of Norwich: bishop Bagot presented him, about the same time, to the vicarages of Lowestoft and Kessingland. He died at Lowestoft in 1804. Besides the above, Mr. Potter wrote *Observations on the Poor Laws*; an Answer to Dr. Johnson's *Lives of the Poets*; A Translation of the Oracle concerning Babylon, &c.

POTTERY, the manufacture of earthen-ware, or the art of making earthen vessels. See DELFT, PORCELAIN, &c. The wheel and lathe are the usual instruments in pottery; the first for large works, and the last for small. The potter's wheel consists principally in the nut, which is a beam or axis, whose foot or pivot plays perpendicularly on a free-stone sole or bottom. From the four corners of this beam, which does not exceed two feet in height, arise four iron bars, called the spokes of the wheel, which, forming diagonal lines with the beam, descend, and are fastened at bottom to the edges of a strong wooden circle, four feet in diameter, perfectly like the felloe of a coach wheel, except that it has neither axis nor radii, and is only joined to the beam, which serves it as an axis, by the iron bars. The top of the nut is flat, of a circular figure, and a foot in diameter; and on this is laid the clay which is to be turned and fashioned. The wheel thus disposed is encompassed with four sides of four different pieces of wood fastened on a wooden frame; the hind piece, which is that on which the workman sits, is made a little inclining towards the wheel; on the fore pieces are placed the prepared earth; on the side piece he rests his feet, and these are made inclining to give him more or less room. Having prepared the earth, the potter lays a round piece of it on the circular head of the nut, and, sitting down, turns the wheel with his feet till it moves with the proper velocity; then, wetting his hands with water, he presses his hand or his finger's end into the middle of the lump, and thus forms the cavity of the vessel, continuing to widen it from the middle; thus turning the inside into form with one hand,

while he proportions the outside with the other, the wheel constantly turning all the while, and he wetting his hands from time to time. When the vessel is too thick, he uses a flat piece of iron, somewhat sharp on the edge, to pare off what is redundant; and, when it is finished, it is taken off from the circular head by a wire passed under the vessel. The potter's lathe is also a kind of wheel, but more simple and slight than the former: its three chief members are an iron beam or axis three feet and a half high, and two feet and a half diameter, placed horizontally at the top of the beam, and serving to form the vessel upon: and another larger wooden wheel, all of a piece, three inches thick, and two or three feet broad, fastened to the same beam at the bottom, and parallel to the horizon. The beam or axis turns by a pivot at the bottom in an iron stand. The workman gives the motion of the lathe with his feet, by pushing the great wheel alternately with each foot, still giving it a greater or less degree of motion as his work requires. They work with the lathe with the same instruments, and after the same manner, as with the wheel. The mouldings are formed by holding a piece of wood or iron cut in the form of the moulding to the vessel, while the wheel is turning round; but the feet and handles are made by themselves, and set on with the hand; and, if there be any sculpture in the work, it is usually done in wooden moulds, and stuck on piece by piece on the outside of the vessel. The art of making pottery is intimately connected with chemistry. For Mr. Wedgwood's remarkable improvements in this art see STAFFORDSHIRE.

The process of manufacturing *stoneware* is described by Dr. Watson as follows:—

Tobacco-pipe clay from Dorsetshire is beaten much in water. By this process, the finer parts of the clay remain suspended in the water, while the coarser sand and other impurities fall to the bottom. The thick liquid, consisting of water and the finer parts of the clay, is farther purified by passing it through hair and lawn sieves, of different degrees of fineness. After this, the liquid is mixed (in various proportions for various wares) with another liquor, of as nearly as may be the same density, and consisting of flints calcined, ground, and suspended in water. The mixture is then dried in a kiln; and, being afterwards beaten to a proper temper, it becomes fit for being formed at the wheel into dishes, plates, bowls, &c. When this ware is to be put into the furnace to be baked, the several pieces of it are placed in the cases made of clay, called seggars, which are piled one upon another in the dome of the furnace. A fire is then lighted; and when the ware is brought to a proper temper, which happens in about forty-eight hours, it is glazed by common salt. The salt is thrown into the surface, through holes in the upper part of it, by the heat of which it is instantly converted into a thick vapor; which, circulating through the furnace, enters the seggar through holes made in its side (the top being covered to prevent the salt from falling on the ware), and, attaching itself to the surface of the ware, it forms that vitreous coat upon the surface which

is called its glaze. The yellow or queen's-ware is made of the same materials as the flint-ware; but the proportion in which the materials are mixed is not the same, nor is the ware glazed in the same way. The flint-ware is generally made of four measures of liquid flint, and of eighteen of liquid clay. The yellow ware has a greater proportion of clay in it. In some manufactories they mix twenty, and in others twenty-four, measures of clay, with four of flint. These proportions, if estimated by the weight of the materials, would probably give for the flint-ware about 3 cwt. of clay to 1 cwt. of flint, and for the yellow ware somewhat more clay. The proportion, however, for both sorts of ware depends very much upon the nature of the clay, which is very variable even in the same pit. Hence a previous trial must be made of the quality of the clay, by burning a kiln of the ware. If there be too much flint mixed with the clay, the ware, when exposed to the air after burning, is apt to crack; and, if there be too little, the ware will not receive the proper glaze from the circulation of the salt vapor. This glaze, even when it is most perfect, is in appearance less beautiful than the glaze on the yellow ware.

The yellow glaze is made by mixing together in water, till it becomes as thick as cream, 112 lbs. of white lead, 24 lbs. of ground flint, and 6 lbs. of ground flint-glass. Some manufactories leave out the glass, and mix only 80 lbs. of white lead with 20 lbs. of ground flint; and others, doubtless, observe different rules, of which it is very difficult to obtain an account.

The ware before it is glazed is baked in the fire. By this means it acquires the property of strongly imbibing moisture. It is therefore dipped in the liquid glaze, and suddenly taken out: the glaze is imbibed into its pores, and the ware presently becomes dry. It is then exposed a second time to the fire, by which means the glaze it has imbibed is melted, and a thin glassy coat is formed upon its surface. The color of this coat is more or less yellow, according as a greater or less proportion of lead has been used. The lead is principally instrumental in producing the glaze, as well as in giving it the yellow color; for lead, of all the substances hitherto known, has the greatest power of promoting the vitrification of the substances with which it is mixed. The flint serves to give a consistence to the lead during the time of its vitrification, and to hinder it from becoming too fluid, and running down the sides of the ware, and thereby leaving them unglazed.

The yellowish color which lead gives when vitrified with flints, may be wholly changed by very small additions of other mineral substances. Thus, to give one instance, the beautiful black glaze, which is fixed on one sort of the ware made at Nottingham, is composed of twenty-one parts by weight of white lead, of five of powdered flints, and of three of manganese. The queen's-ware at present is much whiter than formerly.

The coarse stoneware made at Bristol consists of tobacco-pipe clay and sand, and is glazed by the vapor of salt, like Staffordshire flint-ware; but it is far inferior to it in beauty.

POTTLE, *n. s.* From pot. A liquid mea-

sure containing four pints. Sometimes used for a tankard, or pot out of which glasses are filled.

Roderigo hath to-night caroused
Potations *pottle* deep. *Shakspeare.*

The oracle of Apollo
Here speaks out of his *pottle*,
Or the Tripes his tower bottle.

Ben Jonson.

POUCH, *n. s.* Fr. *poche*. Sax. *þoga*. A small bag; a pocket.

In January husband that *poucheth* the grotes,
Will break up his lay, or be sowing of otes.

Tusser.

Tester I'll have in *pouch*, when thou shalt lack.

Shakspeare.

The spot of the vessel, where the disease begins, gives way to the force of the blood pushing outwards, as to form a *pouch* or cyst. *Sharp's Surgery.*

The common heron hath long legs for wading, a long neck to reach prey, and a wide extensive throat to *pouch* it. *Derham.*

From a girdle about his waist, a bag or *pouch* divided into two cells. *Gulliver's Travels.*

POUCH, Fr. *giberne*, a case of black stout leather with a flap over it, which is generally ornamented by a brass crown, &c., for the battalion-men; a fuse for the grenadiers; and a bugle-horn for the light infantry. The pouch hangs from a cross belt, over the left shoulder, and is worn in that manner, by the infantry, for the purpose of carrying their ammunition. The pouches in use among the cavalry are smaller, which the French call *demie giberne*.

POUGHARD (Julian), a learned French critic, was born near Domfront, in Normandy, and educated at Mans, and at Paris, where he rendered assistance to M. Thevenot, in his edition of the Ancient Mathematicians. After this he was engaged some years in arranging the MSS. of the royal library. In 1701 he became an associate of the Academy of Inscriptions, to whose memoirs he contributed some valuable papers on the learning of the Egyptians. He next became editor of the *Journal des Sçavans*; and in 1704 was appointed professor of Greek, but died the year following, aged forty-nine. Besides the above works, he wrote a Universal History from the Creation to the Death of Cleopatra.

POUGHKEEPSIE, a township of the United States, the capital of Dutchess county, New York, situated on the east bank of the Hudson, about a mile east of the river, contains a court-house, jail, bank, academy, five houses of public worship; and had, in 1812, 422 dwelling-houses, and forty-nine stores, shops, &c. Many of the old houses are mostly of stone, but those recently erected are of brick and wood. Poughkeepsie is a flourishing town, in one of the most wealthy and best agricultural counties in the state, and has an extensive trade. Here are three printing-offices, from each of which is issued a weekly newspaper. Seventy-five miles north of New York. Population 4670.

POVERTY, *n. s.* Fr. *pauvreté*; Lat. *pau-pertas*. Indigence; necessity; want of riches.

My men are the poorest,
But *poverty* could never draw them from me.

Shakspeare.

There is in all excellencies in composition a kind of *poverty*, or a casualty of jeopardy. *Bacon.*

Such madness, as for fear of death to die,
Is to be poor for fear of *poverty*. *Denham.*

These by their strict examples taught,
How much more splendid virtue was than gold;
Yet scarce their swelling thirst of fame could hide,
And boasted *poverty* with too much pride. *Prior.*

There is such a state as absolute *poverty*, when a man is destitute not only of the conveniences, but the simple necessities of life, being disabled from acquiring them, and depending entirely on charity. *Rogers.*

POVERTY BAY, a bay on the east coast of New Zealand, in the South Pacific Ocean, called by the natives Taoneroa, or Long Sand, discovered by Cook in the year 1769. This bay, in the form of a horse-shoe, is known by an island lying close under the north-east point. It obtained its name from the inhospitable behaviour of the natives. Long. 181° 36' W., lat. 38° 42' S.

POULT, *n. s.* } Fr. *poulet*; Lat. *pullus*. A
POULTRY, } young chicken.
POUL'TERER. }

If thou dost it half so gravely, so majestically,
hang me up by the heels for a *poulterer's* hare. *Shakspeare.*

Several nasty trades, as butchers, *poulterers*, and fishmongers, are great occasions of plagues. *Harvey.*

What louder cries, when Ilium was in flames,
Than for the cock the widow'd *poultry* made. *Dryden.*

The cock knew the fox to be a common enemy of all *poultry*. *L'Estrange.*

One would have all things little, hence has tried
Turkey *poult*s, fresh from the egg, in batter fried. *King.*

Soldiers robbed a farmer of his *poultry*, and made him wait at table, without giving him a morsel. *Swift.*

POULTRY comprehends all birds brought up in yards, as cocks, hens, capons, ducks, turkeys, &c. Under this class we may, therefore, reckon the common cock, the peacock, the turkey, the pintada or Guinea hen, &c. They all bear a strong similitude to each other, being equally granivorous, fleshy, and delicate to the palate. Many of the wild species of birds, when cooped up or caged, pine away, grow gloomy, and some refuse all sustenance whatever; none except those of the *poultry* kind grow fat, who seem to lose all remembrance of their former liberty, satisfied with indolence and plenty.

POULTICE, *n. s.* Fr. *pulte*; Lat. *pultis*. A cataplasm; a soft or mollifying application.

Poultice relaxeth the pores, and maketh the humour apt to exhale. *Bacon's Natural History.*

Poultices allayed pains, but drew down the humours, making the passages wider, and apter to receive them. *Temple.*

If your little finger be sore, and you think a *poultice* made of our vitals will give it ease, speak, and it shall be done. *Swift.*

POUNCE, *n. s.* & *v. a.* } Italian *ponzone*.
POUNCED, *adj.* } Skinner. Spanish
POUN'CETBOX, *n. s.* } *punzen*; Lat. *punctus*.

The claw or talon of a bird of prey; a powder thrown through a perforated box: to pierce

or perforate; pour or sprinkle through perforations: pouncet-box, a small perforated box.

As haggard hawk, presuming to contend
With hardy fowl, about his able might,
His weary *pounces*, all in vain doth spend
To truss the prey too heavy for his flight. *Spenser*

He was perfumed like a milliner,
And, 'twixt his finger and his thumb, he held
A *pouncetbox*, which ever and anon
He gave his nose. *Shakspeare. Henry IV.*
The new dissembled eagle, now endued
With beak and *pounces*, Hercules pursued. *Dryden.*

POUNCE, gum semdarach, pounded and sifted very fine, to rub on paper in order to preserve it from sinking, and to adapt it better for the reception of ink in writing. Pounce is also charcoal-dust, enclosed in a piece of muslin or open stuff, to be passed over holes pricked in work, in order to mark the lines or designs on paper, silk, &c., placed underneath, which are to be afterwards finished with a pen, needle, or other like instrument.

POUND, *n. s.* & *v. a.* } Sax. *þund*, *þunian*
POUND'AGE, *n. s.* } (whence in some
POUN'DER, *n. s.* } places they use the
word *pun*); Goth. Swed. and Dan. *pund*; Belg. *pond*; Lat. and Ital. *pond*; Lat. *pondo*. A certain weight, certain sum of money (money being first weighed); to beat or grind by a weight or pestle: poundage is, a certain sum deducted from or paid upon a pound of money: a pounder is a heavy large pear; also a person or thing denominated from a certain number of pounds: as, a ten pounder, a gun that carries a bullet of ten pounds weight; or in ludicrous language a man with ten pounds a year; in like manner, a note or bill has been called a twenty pounder or ten pounder, from the sum it bears.

A *pound* doth consist of ounces, drams, scruples. *Wilkins.*

Tonnage and *poundage*, and other duties upon merchandizes, were collected by order of the board. *Clarendon.*

His mouth and nostrils poured a purple flood,
And *pounded* teeth came rushing with his blood. *Dryden.*

Should their axle break, its overthrow
Would crush, and *pound* to dust the crowd below,
Nor friends their friends, nor sires their sons could
know. *Dryden's Juvena.*

Great Hannibal within the balance lay,
And tell how many *pounds* his ashes weigh. *Dryden.*

Alcinous' orchard various apples bears,
Unlike are bergamots and *pounder* pairs. *Id.*

She describes
How under ground the rude Riphean race
Mimick brisk cyder, with the brake's product wild
Sloes *pounded*. *Philips.*

He that said that he had rather have a grain of fortune than a *pound* of wisdom, as to the things of this life, spoke nothing but the voice of wisdom. *South's Sermons.*

Lifted pestles brandished in the air,
Loud strokes with *pounding* spice the fabrick rend,
And aromatick clouds in spires ascend. *Garth.*

Opaque white powder of glass, seen through a microscope, exhibits fragments pelucid and colour-

less, as the whole appeared to the naked eye before it was *pounded*. *Bentley.*

None of these forty or fifty *pounders* may be suffered to marry under the penalty of deprivation. *Swift.*

That exchequer of medals in the cabinets of the great duke of Tuscany is not worth so little as an hundred thousand *pound*. *Peacham of Antiquities.*

He gave, whilst ought he had, and knew no bounds;

The poor man's drachma stood for rich men's *pounds*. *Harte.*

POUND, *n. s. & v. a.* From Sax. *pindan*. A pinfold; an enclosure: to enclose in a pound. Rather than they should *pound* us up. *Shakspeare. Spectator.*

I ordered John to let out the good man's sheep that were *pounded* by night.

I hurry,
Not thinking it is levee-day,
And find his honour in a *pound*,
Hemm'd by a triple circle round.

Swift's Miscellanies.

To **POUR**, *v. a. & v. n.* From the Welsh *burw*. Lat. *ruo*? To let or drive some liquid out of a vessel, or from one place or receptacle to another; to emit; send forth: as a verb neuter, to stream; flow; rush violently.

If they will not believe those signs, take of the water of the river, and *pour* it upon the dry land. *Exodus iv. 9.*

A Samaritan bound up his wounds, *pouring* in oil and wine, and brought him to an inn. *Luke 10.*

London doth *pour* out her citizens;

The mayor and all his brethren in best sort,
With the plebeians swarming.

Shakspeare. Henry.

As thick as hail,

Came post on post; and every one did bear

Thy praises in thy kingdom's great defence,

And *pour'd* them down before him. *Id. Macbeth.*

The devotion of the heart is the tongue of the soul; actuated and heated with love, it *pours* itself forth in supplications and prayers. *Duppa.*

Your fury then boiled upward to a fume;

But, since this message came, you sink and settle,

As if cold water had been *pour'd* upon you. *Dryden.*

If we had groats or sixpences current by law, that wanted one-third of the silver by the standard, who can imagine that our neighbours would not *pour* in quantities of such money upon us, to the great loss of the kingdom? *Locke.*

If the rude throng *pour* on with furious pace,
And hap to break thee from a friend's embrace,
Stop short. *Gay.*

All his fleecy flock

Before him march, and *pour* into the rock,

Not one or male or female stayed behind. *Pope.*

Is it for thee the linnet *pours* his throat?

Loves of his own and raptures swell the note. *Id.*

A ghastly band of giants,
All *pouring* down the mountains, crowd the shore. *Id.*

POUSSE, *n. s.* The old word for pease; corrupted, as may seem, from pulse.—Spenser.

But who shall judge the wager won or lost?
—That shall yonder herd groom and none other,
Which over the *pousse* hitherward doth post. *Spenser.*

POUSSIN (Nicholas), an eminent French painter, born in 1594, at Andel, in Normandy.

He was instructed for a few months by one Ferdinand Elle, a portrait painter, and spent a month with L'Alleman; after which he went to Italy to study the antique and bas relief, but neglected coloring. He was invited back to Paris by Louis XIII. who assigned him a pension with lodgings in the Thuilleries. Piqued by some insults from the faction of Vouet's school, he returned to Rome, where he died in 1665. He had during the whole of his life a perpetual demand for easel-pieces, for which he obtained large prices.

POUSSIN, or **DUGHET** (Gaspar). This painter, whose real name was Dughet, was born in Paris in 1660. He went to Rome to see his sister, who was married to Nicholas Poussin; under whose instruction he became one of the best landscape painters that ever appeared. While he continued at Rome he assumed the name of his brother-in-law and benefactor, by which only he is now known. He died in 1662.

POUT, *n. s.* From pouth. A kind of fish; a cod-fish; also a kind of bird, or heath fowl.

Of wild birds, Cornwall hath quail, wood-dove, heath-cock, and *pout*. *Carew's Survey of Cornwall.*

Pout, *v. n.* Sax. *botan*: Fr. *bouter*. To look sullen; push out the lips.

Like a misbehaved and sullen wench,
Thou *pout'st* upon thy fortune and thy love. *Shakspeare.*

Satyrs was made up betwixt man and goat, with a human head, hooked nose, and *pointing* lips.

I would advise my gentle readers, as they consult the good of their faces, to forbear frowning upon loyalists, and *pointing* at the government. *Addison's Freeholder.*

The nurse remained *pointing*, nor would she touch a bit during the whole dinner. *Arbuthnot and Pope.*

The ends of the wounds must come over one another, with a compress to press the lips equally down, which would otherwise become crude, and *point* out with great lips. *Wiseman.*

POW'DER, *n. s., v. a., v. n.* French *poudre*; Ital. *polvere*; Lat. *pulvis*. Dust; any body committed; particularly powder prepared for the hair, and gunpowder: to powder is to reduce to dust; to sprinkle as with dust: the compounds are explained by the extracts.

The calf which they had made, he burnt in the fire, and ground it to *powder*. *Exodus xxxii. 20.*

If you embowel me to-day, I'll give you leave to *powder* me and eat me to-morrow. *Shakspeare.*

To the Spital go,

And from the *powdering-tub* of infamy

Fetch forth the lazar kite Doll Tearsheet. *Id.*

Salting of oysters, and *powdering* of meat, keepeth them from putrefaction. *Bacon's Nat. History.*

The seditious, being furnished with artillery *powder* and shot, battered Bishopsgate. *Hayward.*

Powder thy radiant hair,
Which if without such ashes thou would'st wear,
Thou who, to all which come to look upon,
Wert meant for Phebus, would'st be Phaeton. *Donne.*

When the' hair is sweet through pride or lust,
The powder doth forget the dust. *Herbert.*
Immoderate feeding upon powdered beef, pickled
meats, anchovy, and debauching with brandy, do in-
flame and acuate the blood.

Harvey on Consumption.
My hair I never powder, but my chief
Invention is to get me powdered beef.

Cleaveland.
In the galaxy, that milky way
Which nightly, as a circling zone, thou seest
Powdered with stars. *Milton's Paradise Lost.*
The flame invades the powder-rooms, and then
Their guns shoot bullets, and their vessels men.

Waller.
When we view those large bodies of oxen, what
can we better conceit them to be, than so many
living and walking powdering-tubs, and that they
have animam salis? *More.*

Whilst two companions were disputing it at
sword's point, down comes a kite powdering upon
them and gobkets up both. *L'Estrange.*

As to the taking of a town, there were few con-
querors could signalise themselves that way, before
the invention of powder and fortifications. *Addison.*

A brown powderly spar, which holds iron, is found
amongst the iron ore. *Woodward on Fossils.*

The powdered footman
Beneath his flapping hat secures his hair. *Gay.*

There stands the toilette,
The patch, the powder-box, pulville, perfumes. *Id.*

Upon the blowing up of a powdermill, the win-
dows of adjacent houses are bent and blown out-
wards, by the elastick force of the air within exerting
itself. *Arbutnot.*

Our humbler province is to tend the fair,
To save the powder from too rude a gale. *Pope.*
You may stick your candle in a bottle or a pow-
der-horn. *Swift.*

POWDER CHESTS, in the marine, wooden trian-
gular chests, filled with gunpowder, nails, and
old iron, to set on fire when a vessel is boarded
by an enemy. These cases are usually from
twelve to eighteen inches in length, and about
eight or ten in breadth, having their outer or up-
per part terminating in an edge. They are nailed
to several places of the quarter-deck and bulk-
head of the waist, having a train of powder which
communicates with the inner apartments of the
ship, so as to be fired at pleasure to annoy the
enemy. They are particularly used in merchant-
ships which are furnished with close-quarters to
oppose the boarders.

POWDERS, FULMINATING, in chemistry, are
compositions which explode upon the applica-
tion either of certain degrees of heat, trituration,
or concussion. Under this title, therefore, are
included several very distinct chemical combi-
nations, the principal of which are those of
azote, with the metals and alkalis. The common
fulminating powder is thus made:—Triturate
in a warm mortar three parts by weight of
nitre, two of carbonate of potass, and one of
flowers of sulphur. A few grains of this laid
upon a knife, and held over the candle, first fuse,
and then explode with a loud report. A drachm
of it put into a shovel, and held over the fire,
makes a noise as loud as a cannon, and indents
the shovel as if it had received a violent blow.
If the mass be removed from the fire as soon as

it is fused, and kept in a dry, well closed phial, it
may at any time be exploded by a spark, and will
burn like gunpowder, but more rapidly and with a
greater report; but this effect will not be pro-
duced by unmelted powder. Whilst the powder
is in fusion, but not sufficiently heated to pro-
duce the blue flame, a particle of ignited char-
coal thrown upon it will immediately occasion
a very loud explosion. The fulminating property
of this powder is acquired by fusion, or when
the potass and sulphur form sulphuret of potass.
It may therefore be prepared by mixing sulphu-
ret of potass with nitre, instead of adding the
sulphur and alkali separate. If a solution of
gold be precipitated by ammonia, the product
will be fulminating gold. This precipitate,
when separated by filtration, and washed, must
be dried without heat, as it is liable to explode
with no great increase of temperature; and it
must not be put into a bottle closed with a glass
stopper, as the friction of this would expose the
operator to the same danger. Less than a grain
of this, held over the flame of a candle, explodes
with a very sharp and loud noise.

Fulminating silver may be made by precipi-
tating a solution of nitrate of silver by lime-wa-
ter, drying the precipitate by exposure to the air
for two or three days, and pouring on it liquid
ammonia. When it is thus converted into a
black powder, the liquid must be poured off, and
the powder left to dry in the air. It detonates
with the gentlest heat, or even with the slightest
friction, so that it must not be removed from the
vessel in which it is made. If a drop of water
fall upon it, the percussion will cause it to ex-
plode. It was discovered by Berthollet.

Brugnatelli made a fulminating silver by pow-
dering a hundred grains of nitre of silver, put-
ting the powder into a beer-glass, and pouring
on it, first an ounce of alcohol, then as much
concentrated nitrous acid. The mixture grows
hot, boils, and an ether is visibly formed, that
changes into gas. By degrees the liquor becomes
milky and opaque, and is filled with small white
clouds. When all the gray powder has taken
this form, and the liquor has acquired a consist-
ency, distilled water must be added immediately
to suspend the ebullition, and prevent the matter
from being redissolved, and becoming a mere
solution of silver. The white precipitate is then
to be collected on a filter, and dried. The force
of this powder greatly exceeds that of fulminat-
ing mercury. It detonates in a tremendous
manner, on being scarcely touched with a glass
tube, the extremity of which has been dipped in
concentrated sulphuric acid. A single grain,
placed on a lighted coal, makes a deafening
report. The same thing happens if it be placed
on a bit of paper on an electric pile, and a spark
drawn from it.

M. Chenevix has invented a fulminating silver
not so dangerous as that just mentioned. It ex-
plodes only by a slight friction in contact with
combustible bodies. It is thus prepared:—Dif-
fuse a quantity of alumina through water, and
let a current of oxygenated muriatic acid gas
pass through it for some time. Then digest some
phosphate of silver on the solution of the oxyge-
nated muriate of alumina, and evaporate

slowly. The product obtained will be a hyper-oxygenated muriate of silver, a single grain of which, in contact with two or three of sulphur, will explode violently with the slightest friction.

Fulminating mercury was discovered by Mr. Howard. A hundred grains are to be dissolved with heat in an ounce and a half by measure of nitric acid. The solution, when cold, is to be poured on two ounce measures of alcohol, and heat applied till an effervescence is excited. As soon as the precipitate is thrown down, it must be collected on a filter, that the acid may not react on it, and washed and dried by a very gentle heat. It detonates with a very little heat or friction.

Of some experiments on the powers of this powder, the inventor gives the following account:—‘Desirous of comparing the strength of the mercurial compound with that of gunpowder,’ says Mr. Howard, ‘I made the following experiment in the presence of my friend Mr. Abernethy:—Finding that the powder could be fired by flint and steel, without a disagreeable noise, a common gunpowder proof, capable of containing eleven grains of fine gunpowder, was filled with it, and fired in the usual way: the report was sharp, but not loud. The person who held the instrument in his hand felt no recoil: but the explosion laid open the upper part of the barrel, nearly from the touch-hole to the muzzle, and struck off the hand of the register, the surface of which was evenly indented to the depth of 0·1 of an inch, as if it had received the impression of a punch.

‘The instrument used in this experiment being familiarly known, it is therefore scarcely necessary to describe it; suffice it to say that it was of brass, mounted with a spring register, the moveable hand of which closed up the muzzle, to receive and graduate the violence of the explosion. The barrel was half an inch in calibre, and nearly half an inch thick, except where a spring of the lock impaired half its thickness.

‘A gun belonging to Mr. Keir, an ingenious artist of Camden Town, was next charged with seventeen grains of the mercurial powder, and a leaden bullet. A block of wood was placed at about eight yards from the muzzle to receive the ball, and the gun was fired by a fuse. No recoil seemed to have taken place, as the barrel was not moved from its position, although it was in no ways confined. The report was feeble: the bullet, Mr. Keir conceived, from the impression made on the wood, had been projected with about half the force it would have been by an ordinary charge, or sixty-eight grains of the best gunpowder. We therefore re-charged the gun with thirty-four grains of the mercurial powder; and, as the great strength of the piece removed any apprehension of danger, Mr. Keir fired it from his shoulder, aiming at the same block of wood. The report was like the first, sharp, but not louder than might have been expected from a charge of gunpowder. Fortunately Mr. Keir was not hurt; but the gun was burst in an extraordinary manner. The breech was what is called a patent one, of the best forged iron, consisting of a chamber 0·4 of an inch thick all round, and 0·4 of an inch in calibre; it was torn open and flawed in many directions, and the gold touch-hole driven out. The barrel into

which the breech was screwed was 0·5 of an inch thick; it was split by a single crack three inches long, but this did not appear to me to be the immediate effect of the explosion. I think the screw of the breech, being suddenly enlarged, acted as a wedge upon the barrel. The balled missed the block of wood, and struck against a wall, which had already been the receptacle of so many bullets that we could not satisfy ourselves about the impression made by this last.

‘As it was pretty plain that no gun could confine a quantity of the mercurial powder sufficient to project a bullet with a greater force than an ordinary charge of gunpowder, I determined to try its comparative strength in another way. I procured two blocks of wood, very nearly of the same size and strength, and bored them with the same instrument to the same depth. The one was charged with half an ounce of the best Dartford gunpowder, and the other with half an ounce of the mercurial powder; both were alike buried in sand, and fired by a train communicating with the powders by a small touch-hole. The block containing the gunpowder was simply split into three pieces; that charged with the mercurial powder was burst in every direction, and the parts immediately contiguous to the powder were absolutely pounded, yet the whole hung together, whereas the block split by the gunpowder had its parts fairly separated. The sand surrounding the gunpowder was undoubtedly most disturbed; in short, the mercurial powder appeared to have a great superiority.

During a lecture in the laboratory of Yale College, about 100 or 150 grains of fulminating mercury lay on a stool, and were covered with a glass receiver of about five or six quarts capacity. A small quantity of the same powder, at the distance of a few feet, was merely flashed by a coal of fire, but without explosion. In a manner not easily understood, the whole powder under the glass receiver instantly exploded with a dreadful report; but, what was particularly remarkable, the glass was merely lifted up a little, and was shattered by its fall, while the stool, made of fir plank, an inch and a half thick, on which the powder lay, had a hole blown quite through it, almost as large as the palm of the hand. The whole effect of the explosion was confined to the stool, every thing around having remained uninjured.

An effect almost equally singular took place lately in the same laboratory, with some fulminating silver upon the point of a knife, which was about to be put upon a plate of copper, connected with one pole of a galvanic battery in active operation. The other pole was not touched by the experimenter, but, probably by the influence conveyed through the floor of the room, the powder exploded the moment the knife touched the plate of copper. The knife blade was broken in two, and one-half of it thrown to a distance among the audience.

Three parts of chlorate of potassa, and one of sulphur, triturated in a metal mortar, cause numerous successive detonations, like the cracks of a whip, the reports of a pistol, or the fire of musketry, according to the rapidity and force of

the pressure employed. A few grains, struck with a hammer on an anvil, explode with a noise like that of a musket, and torrents of purple light appear round it. Thrown into concentrated sulphuric acid, it takes fire and burns with a white flame, but without noise.

Six parts of the chlorate, one of sulphur, and one of charcoal, detonate by the same means, but more strongly, and with a redder flame.

Sugar, gum, or charcoal, mixed with the chlorate, and fixed or volatile oils, alcohol, or ether, made into a paste with it, detonate very strongly by the stroke, but not by trituration. Some of them take fire, but slowly, and by degrees, in the sulphuric acid.

All these mixtures that detonate by the stroke, explode much more loudly if previously wrapped up in double paper.

Fulminations of the most violent kind require the agency of azote or nitrogen; as we see not only in its compounds with the oxides of gold, silver, and platina; but still more remarkably in its chloride and iodide.

A fulminating antimoniac powder has been prepared by M. Serullas in the following manner:—Grind carefully together 100 parts of tartar emetic and three parts of lamp-black, or ordinary charcoal powder. Crucibles capable of holding about three ounces of water, to be only three-fourths filled, are to be ground smooth on their edges, and rubbed inside with powdered charcoal, so as to dust lightly their surface, and prevent the subsequent adherence of the carbonaceous cone which remains after the calcination. The above mixture, being introduced into the crucible, is to be covered with a layer of powdered charcoal; and the joinings of the cover must be luted. After exposure for three hours to a good heat in a reverberatory furnace, the crucible must be removed, and left to cool for six or seven hours. This interval of time is necessary to allow the air, which always penetrates a little way into the crucibles, to burn the exterior coat of the fulminating mass; or otherwise, if it be taken out too recently, there is always an explosion. We must then hastily enclose it, without breaking, into a glass with a wide opening. After some time, it spontaneously breaks down into fragments of different sizes, retaining all its properties for years. When the calcination has been conducted as above, the product is excessively fulminating, so that, without the least compression, it gives rise to a violent detonation on contact with water. 100 parts of antimony, seventy-five of carbureted cream of tartar, and twelve of lamp black, triturated together, form also an excellent mixture. A piece of the size of a pea of this fulminating compound introduced into a mass of gunpowder explodes it when thrown into water. It is to the presence of potassium that the above explosive property is due. Sixty parts of carbureted cream of tartar, 120 of bismuth, and one of nitre, treated as above, yield an alloy very rich in potassium, of which the smallest portion cut with scissars sparkles. When bruised it melts and burns.—*An. de. Chim.* Oct. 1822.

POWDER, JAMES'S. See JAMES'S POWDER.

POWDER MAGAZINE, a bomb-proof arched building, to contain powder in fortified places.

POWEL (David), D. D., a Welsh divine and antiquary, born in Denbighshire, about 1552, and educated at Oxford, where he graduated. He became vicar of Ruabon, in Denbighshire. He published Caradoc's History of Wales, with annotations, in 1584; and several other works. He died at Ruabon in 1590.

POWELL (Sir John), a judge of the common pleas and king's bench, was born at Gloucester, which city he represented in parliament in 1685. In 1687 he was made one of the justices of common pleas, from which he was removed to the king's bench the following year, when he distinguished himself on the trial of the seven bishops, and was in consequence deprived of office; but he was restored to it at the revolution. He was a sound lawyer, and a man of humor. An old woman being tried before him on the charge of witchcraft, among other things it was stated that she could fly. 'Prisoner,' said the judge, 'is it true that you can fly?' 'Yes, my lord.' 'Well, then, you may; for there is no law against flying;' and he directed the jury to acquit her. He died a judge in 1713.

POWER, <i>n. s.</i>	} Fr. <i>pouvoir</i> ; Span. <i>poder</i> . Command; dominion; authority; influence arising from greatness; ability; strength; motive; force: hence motion of the mind; faculty; one invested with power; host; army; divinity: powerless is an obsolete adjective for capable of performing: powerful, forcible; mighty; influential: the adverb and noun-substantive corresponding: powerless, weak; impotent.
POWER'ABLE, <i>adj.</i>	
POWER'FUL,	
POWER'FULLY, <i>adv.</i>	
POWER'FULNESS, <i>n. s.</i>	
POWER'LESS, <i>adj.</i>	

After the tribulation of those days shall the sun be darkened, and the *powers* of the heavens shall be shaken. *Matthew.*

Care, not fear; or fear not for themselves, altered something the countenances of the two lovers: but so as any man might perceive, was rather an assembling of *powers* than a dismayedness of courage. *Sidney.*

He, to work him the more mischief, sent over his brother Edward with a *power* of Scots and Redshanks into Ireland, where they got footing. *Spenser's State of Ireland.*

That which moveth God to work is goodness, and that which ordereth his work is wisdom, and that which perfecteth his work is *power*. *Hooker.*

Gazellus, upon the coming of the bassa, valiantly issued forth with all his *power* and gave him battle. *Knolles.*

If law, authority, and *power* deny not,
It will go hard with poor Antonio. *Shakspeare.*

If ever
You meet in some fresh cheek the *power* of fancy,
Then you shall know the wounds invisible,
That love's keen arrows make. *Id.*
I was in the thought, they were not fairies, and yet the guiltiness of my mind, the sudden surprise of my *powers*, drove the grossness of the foppery into a received belief. *Id.*

Merciful *powers*!
Restrain in me the cursed thoughts, that nature
Gives way to in repose. *Id. Macbeth.*

Who leads his power?
Under whose government come they along?
Shakspeare.

My heart, dear Harry,
Threw many a northward look to see his father
Bring up his powers, but he did long in vain. *Id.*
I give you welcome with a powerless hand,
But with a heart full of unstained love. *Id.*
This man had power with him, to draw him forth
to his death. *Bacon's Essays.*
He died of great years, but of strong health and
powers. *Bacon.*

That you may see how powerful time is in altering
tongues, I will set down the Lord's prayer, as it was
translated in sundry ages. *Camden.*

Cast down thyself, and only strive to raise
The glory of thy Maker's sacred name;
Use all thy powers, that blessed power to praise,
Which gives thee power to be and use the same.
Davies.

So much he stands upon the powerfulness of the
Christian religion, that he makes it beyond all the
rules of moral philosophy, strongly effectual to ex-
pel vice, and plant in men all kind of virtue.
Hakewill on Providence.

What beast, what worm, wherein we may not see
the footsteps of Deity? Wherein we may not read
infiniteness of power and skill? *Bp. Hall.*

By understanding the true difference betwixt the
weight and the power, a man may add such a fitting
supplement to the strength of the power, that it shall
move any conceivable weight, though it should never
so much exceed that force which the power is natu-
rally endowed with. *Wilkins.*

My labour
Honest and lawful, to deserve my food
Of those who have me in their civil power. *Mil on.*

We have sustained one day in doubtful fight,
What heaven's Lord hath powerfullest to send
Against us from about his throne. *Id.*

The sun and other powerfully lucid bodies dazzle
our eyes. *Boyle.*

Before the revelation of the gospel, the wickedness
and impiteny of the heathen world was a much
more excusable thing, because they had but very ob-
scure apprehensions of those things which urge men
most powerfully to forsake their sins. *Tillotson.*

Dejected! no, it never shall be said,
That fate had power upon a Spartan soul;
My mind on its own centre stands unmov'd
And stable as the fabric of the world.
Dryden.

With indignation thus he broke
His awful silence, and the powers bespoke. *Id.*
It is not in the power of the most enlarged under-
standing to invent one new simple idea in the mind,
not taken in by the ways aforementioned. *Locke.*

Observing in ourselves that we can at pleasure
move several parts of our bodies, which were at
rest; the effects also that natural bodies are able to
produce in one another occurring every moment to
our senses, we both these ways get the idea of power.
Id.

By assuming a privilege belonging to riper years,
to which a child must not aspire, you do but add
new force to your example, and recommend the ac-
tion more powerfully. *Id.*

If there's a power above us,
And that there is all nature cries aloud
Through all her works, he must delight in virtne.
Addison.

'Tis surprising to consider with what heats these
two powers have contested their title to the kingdom
of Cyprus, that is in the hands of the Turk.
Id. on Italy.

POWER, in arithmetic and algebra, is that
which results from the successive multiplication of
of any quantity or number into itself, the degree
of the power being always denominated by the
number of equal factors that are employed,
thus:

$$2 = 2^1, \text{ 1st power of } 2.$$

$$2 \times 2 = 2^2, \text{ 2d power of } 2.$$

$$2 \times 2 \times 2 = 2^3, \text{ 3d power of } 2.$$

Hence it appears, that the index which denotes
the degree of any power, is always equal to the
number of factors, from which that power arises
or one more than the number of operations.

POWNALL (Thomas), F.R.S. and F.S.A.
an ingenious writer, was born at Lincoln in 1722,
and became secretary to the commissioners for
trade and plantations in 1745. In 1753 he went
to America, where he prevented the formation of
a congress in the seven years' war. For this he
was made governor of Massachusetts, whence he
removed to New Jersey, and next to South Car-
olina, where he continued till 1761, when he
was recalled, and made director-general of the
office of control with the rank of colonel. He
died at Bath in 1805. His works are: 1. On
the Administration of the Colonies. 2. Descrip-
tion of part of North America, folio. 3. Treatise
on the study of Antiquities, 8vo. 4. Memorials
addressed to the Sovereigns of Europe and the
Atlantic. 5. On the Antiquities of the Provincia
Romana of Gaul, 4to. 6. Descriptions of Roman
Antiquities dug up at Bath, 4to. 7. Intel-
lectual Physics, 4to.

POX, *n. s.* Sax. poccar. See Pock. Prop-
erly pocks, which originally signified small
bags or pustules; pustules; efflorescences. It
is used of many eruptive distempers.

Wilt thou still sparkle in the box,
Canst thou forget thy age and pox?
Dorset.

POX, SMALL. See MEDICINE, INDEX.

POYAIS. A fertile tract of land on the
Mosquito shore, near the Bay of Honduras, in
central America, having a capital of the same
name, and inhabited by a war-like race of In-
dians, who have hitherto maintained their inde-
pendence. Sir Gregor Mac Gregor, an English
officer, who took an active part in the revolution
of Venezuela, in 1816, seized upon Amelia
Island in 1817, attacked Porto Bello in 1819;
but was ultimately obliged to abandon his enter-
prise against the Spaniards. He settled amongst
the Poyais Indians, obtained their entire confi-
dence, was chosen cacique, improved their com-
merce, and established schools. The Poyais
country yields indigo, sugar, coffee, cocoa, to-
bacco, mahogany, dye, stuffs, &c.

POZE, *v. a.* To puzzle. See POSE.
And say you so? then I shall poze you quickly.
Shakspeare.

PRACHIN, one of the sixteen circles of Bo-
hemia, occupies the south-west corner of the
kingdom. Its area is 1820 square miles; and
on the borders of Bavaria it has a number of
lofty mountains, covered with forests: the in-
terior is more level and fertile. The Moldau has
its source here, but the Wottawa is the larger
stream. In the mountains are found precious
stones, and in the sands of the Wottawa some
gold dust and pearls. The Bohemian is the

prevailing language. Population 210,000. The chief town is Piseck.

PRAC'TISE, *v. a. & v. n.*

PRAC'TISANT, *n. s.*

PRAC'TISER,

PRAC'TITIONER.

Fr. *pratique*; Lat. *practica*; Gr. *πρακτικη*. Habit; custom; use; method; dexterity; performance: practicable is performable; feasible; assailable: the adverb and noun-substantive corresponding: practical and practick (the

latter obsolete), relating to action; not merely speculative: the adverb and noun-substantive that follow corresponding: to practise, to do habitually or constantly: as a verb neuter, to form a habit of acting; transact; use; a profession; use bad or deceitful arts: practiser and practitioner, he who practises.

Incline not my heart to *practise* wicked works with men that work iniquity. *Psalm cxxi. 4.*

Will truth return unto them that *practise* in her?

Ecclesi.

He sought to have that by *practice* which he could not by prayer; and, being allowed to visit us, he used the opportunity of a fit time thus to deliver us. *Sidney.*

Thereto his subtle engines he doth bend,

His *practick* wit, and his fair filed tongue,

With thousand other sleights. *Spenser.*

There are some papistical *practitioners* among you.

Whitgift.

This disease is beyond my *practice*; yet I have known those which have walked in their sleep, who have died holily in their beds. *Shakspeare.*

Shall we thus permit

A blasting and a scandalous breath to fall

On him so near us? this needs must be *practice*;

Who knew of your intent and coming hither?

Id.

When he speaks,

The air, a chartered libertine, is still;

And the mute wonder lurketh in men's ears,

To steal his sweet and honied sentences;

So that the act and *practick* part of life

Must be the mistress to this theorick. *Id.*

If thou do'st him any slight disgrace, he will *practise* against thee by poison. *Id. As You Like It.*

Here entered Pucelle and her *practisants*.

Shakspeare.

Sweet *practiser*, thy physick I will try,

That ministers thine own death if I die. *Id.*

Wise states prevent purposes

Before they come to *practice*, and foul *practices*

Before they grow to act. *Denham's Sophy.*

True piety without cessation tost

By theories the *practick* part is lost. *Denham.*

At *practised* distances to cringe, not fight.

Milton.

They shall *practise* how to live secure. *Id.*

Ofthave we wondered

How such a ruling spirit you could restrain,

And *practise* first over yourself to reign. *Waller.*

Religion comprehends the knowledge of its principles, and a suitable life and *practice*; the first, being speculative, may be called knowledge; and the latter, because it is *practicable*, wisdom. *Tillotson.*

I never thought I should try a new experiment, being little inclined to *practise* upon others, and as little that others should *practise* upon me.

Temple's Miscellanies.

I had reasoned myself into an opinion that the

use of physicians, unless in some acute disease, was a venture, and that their greatest *practisers* *practised* least upon themselves. *Temple.*

An heroic poem should be more like a glass of nature, figuring a more *practicable* virtue to us, than was done by the ancients. *Dryden.*

Obsolete words may be laudably revived, when they are more sounding, or more significant than those in *practice*. *Id.*

This falls out for want of examining what is *practicable* and what not, and for want again of measuring our force and capacity with our design.

L'Estrange.

Of such a *practice* when Ulysses told,

Shall we, cries one, permit

This lewd romancer and his bantering wit?

Tate.

There are two functions of the soul, contemplation and *practice*, according to that general division of objects, some of which only entertain our speculations others also employ our actions; so the understanding, with relation to these, is divided into speculative and *practick*. *South.*

He must be first an exercised, thorough-paced *practitioner* of these vices himself. *Id.*

We will, in the principles of the politician, shew how little efficacy they have to advance the *practiser* of them to the things they aspire to. *Id.*

Few *practical* errors in the world are embraced upon the stock of conviction, but inclination. *Id.*

Whilst they contend for speculative truth, they by mutual calumnies, forfeit the *practick*.

Government of the Tongue.

I've *practised* with him,

And found a means to let the victor know,

That Syphax and Sempronius are his friends.

Addison.

The meanest capacity, when he sees a rule *practicably* applied before his eyes, can no longer be at a loss how it is to be performed. *Rogers.*

Tooth-drawers are *practical* philosophers, that go upon a very rational hypothesis, not to cure, but to take away the part affected. *Steele.*

After one or more ulcers formed in the lungs, I never, as I remember, in the course of above forty years' *practice*, saw more than two recover.

Blackmore.

This is a *practicable* degree of christian magnanimity. *Atterbury.*

The author exhorts all gentlemen *practitioners* to exercise themselves in the translatory. *Arbuthnot*

Others by guilty artifice and arts

Of promised kindness *practice* on our hearts;

With expectation blow the passion up,

She fans the fire without one gale of hope.

Granville.

Unreasonable it is to expect, that those who lived before the rise and condemnation of heresies, should come up to every accurate form of expression which long experience afterwards found necessary, to guard the faith, against the subtle *practices*, or provoking insults of its adversaries. *Waterland.*

Some physicians have thought, that if it were *practicable* to keep the humours of the body in an exact balance of each with its opposite, it might be immortal; but this is impossible in the *practice*. *Swift.*

I do not know a more universal and unnecessary mistake among the clergy, but especially the younger *practitioners*. *Id.*

PRACTICE, in military education, or gun-practice. In the spring, as soon as the weather permits, the exercise of the great guns begins, with an intention to show the gentlemen cadets, at the royal military academy at Woolwich, and private men, the manner of laying, loading,

pointing, and firing the guns. Sometimes instruments are used to find the centre line, or two points, one at the breach, the other at the muzzle, which are marked with chalk, and whereby the piece is directed to the target: then a quadrant is put into the mouth to give the gun the required elevation, which at first is guessed at, according to the distance the target is from the piece. When the piece has been fired, it is sponged to clear it from any dust or sparks of fire that might remain in the bore, and loaded; then the centre line is found as before; and if the shot went too high or too low, to the right or to the left, the elevation and trail are altered accordingly. This practice continues morning and evening for about six weeks, more or less, according as there are a greater or less number of recruits. In the mean time others are shown the motions of quick-firing with field-pieces. Mortar-practice is generally acquired thus: a line of 1500 or 2000 yards is measured in an open spot of ground from the place where the mortars stand, and a flag fixed at about 300 or 500 yards: this being done, the ground where the mortars are to be placed is prepared and levelled with sand, so that they may lie at an elevation of forty-five degrees; then they are loaded with a small quantity of powder at first, which is increased afterwards by an ounce every time, till they are loaded with a full charge; the times of the flights of the shells are observed to determine the length of the fuzes. The intention of this practice is when a mortar battery is raised in a siege, to know what quantity of powder is required to throw the shells into the works at a given distance, and to cut the fuzes of a just length, that the shell may burst as soon as it touches the ground.

PRADON (Nicholas), a French dramatic poet, born at Rouen in the seventeenth century. He affected to be the rival of Racine; and, through the support of a party, his tragedy of Phædra and Hippolytus appeared for some time to balance the reputation of Racine's tragedy of the same title. He died at Paris in 1698.

PRÆCOGNITA, *n. s.* Latin *præcognita*. Things previously known in order to understand something else.

Either all knowledge does not depend on certain *præcognita* or general maxims, called principles, or else these are principles. *Locke.*

PRÆMUNIRE, in law, is taken either for a writ so called, or for the offence whereon the writ is granted; the one may be understood by the other. It is named, from the first words of the writ, 'Præmunire facias, A. B.—Cause A. B. to be forewarned—that he appear before us to answer the contempt wherewith he stands charged;' which contempt is particularly recited in the preamble to the writ. It derived its origin from the exorbitant power claimed and exercised in England by the pope; and was originally ranked as an offence immediately against the king; because it consisted in introducing a foreign power into this land, and creating imperium in imperio, by paying that obedience to papal process which constitutionally belonged to the king alone, long before the Reformation in the reign of Henry VIII. The church of

Rome, under pretence of her supremacy and the dignity of St. Peter's chair, took on her to bestow most of the ecclesiastical livings of any worth in England, by mandates, before they were void. These provisions were so common that at last Edward I., in the thirty-fifth year of his reign, made a statute against papal provisions, which, Coke says, is the foundation of all the subsequent statutes of præmunire. In the reign of Edward II. the pope again endeavoured to encroach, but the parliament withstood him; and it was one of the articles charged against that unfortunate prince that he had given allowance to the pope's bulls. But Edward III. to remedy these grievances, in conjunction with his nobility, wrote an expostulatory letter to the pope; but receiving a menacing answer, acquainting him that the emperor and the king of France had lately submitted to the holy see, Edward replied, that if both the emperor and the French king should undertake the pope's cause, he was ready to give battle to them both, in defence of the liberties of the crown. Hereupon more sharp and penal laws were devised against provisors, which enact, that the court of Rome shall present or collate to no bishopric or living in England; and that whoever disturbs any patron in the presentation to a living by virtue of a papal provision, such provisor shall pay fine and ransom to the king, and be imprisoned till he renounces such provision; and the same punishment is inflicted on such as cite the king, or any of his subjects, to answer in the court of Rome. And, when pope Urban V. attempted to revive the vassalage and annual rent to which king John had subjected his kingdom, it was unanimously agreed by all the estates, 40 Edw. III., that king John's donation was null and void, being without the concurrence of parliament, and contrary to his coronation oath; and all the nobility and commons engaged that, if the pope should endeavour to maintain these usurpations, they would resist him with all their power. In the reign of Richard II. it was found necessary to strengthen these laws; and therefore it was enacted by statutes 3 Ric. II. c. 3, and 7 c. 12, that no alien shall be capable of letting his benefice to farm; or of being presented to any ecclesiastical preferment, under the penalty of the statutes of provisors. By stat. 12 Ric. II. c. 15, all liegemen of the king accepting of a living by any foreign provision are put out of the king's protection, and the benefice made void. To which the statute 13 Ric. II. st. 2, c. 2, adds banishment, and forfeiture of lands and goods: and, by c. 3, any person bringing over any citation or excommunication from beyond sea, on account of the execution of the foregoing statutes of provisors, shall be imprisoned, forfeit his goods and lands, and suffer pain of life and member. The next statute, which is referred to by all subsequent statutes, is called the statute of præmunire. It is the statute 16 Ric. II. c. 5, which enacts that whoever procures, at Rome or elsewhere, any translations, processes, excommunications, bulls, instruments, or other things which touch the king, against him, his crown and realm, and all persons aiding and assisting therein, shall be put out of the king's protection, and their lands and

goods forfeited to the king's use, and they shall be attached by their bodies to answer to the king and his council; or process of præmunire facias shall be made out against them, as in other cases of provisors. By stat. 2 Henry IV. c. 3, all persons who accept any provision from the pope, to be exempt from canonical obedience to their proper ordinary, are also subjected to the penalties of præmunire. In the reign of Henry VIII. the penalties of præmunire were extended to more equal abuses; as the kingdom then entirely denounced the authority of the see of Rome. And therefore, by the several statutes of 24 Hen. VIII. c. 12, and 25 Hen. VIII. c. 19 and 21, to appeal to Rome from any of the king's courts, to sue to Rome for any license or dispensation, or to obey any process from thence, are made liable to the pains of præmunire. To restore to the king the nomination of vacant bishoprics, and yet keep up the established forms, it is enacted by stat. 25 Henry VIII. c. 20, that if the dean and chapter refuse to elect the person named by the king, or any archbishop or bishop to confirm or consecrate him, they shall fall within the penalties of the statutes of præmunire. By stat. 5 Eliz. c. 1, to refuse the oath of supremacy will incur the penalties of præmunire; and to defend the pope's jurisdiction in this realm is a præmunire for the first offence, and high treason for the second. By stat. 13 Eliz. c. 2, to import any agni Dei, crosses, beads, or other superstitious things pretended to be hallowed by the bishop of Rome, and tender the same to be used; or to receive the same with such intent, and not discover the offender; or if a justice of the peace, knowing thereof, shall not within fourteen days declare it to a privy counsellor, they all incur a præmunire. But importing or selling mass books, or other popish books, is by stat. 3 Jac. I. c. 5, sec. 25, only liable to a penalty of 40s. Lastly, to contribute to the maintenance of a Jesuit's college, or any popish seminary beyond sea, or any person in the same, or to contribute to the maintenance of any Jesuit or Popish priest in England, is by stat. 27 Eliz. c. 2, made liable to the penalties of præmunire. Thus far the penalties of præmunire kept within the bounds of their original institution, depressing the power of the pope; but they have since been extended to other heinous offences. Thus 1. By the stat. 1 and 2 Ph. & M. c. 8, to molest the possessors of abbey lands granted by parliament to Henry VIII. and Edward VI. is a præmunire. 2. So likewise is the offence of acting as a broker or agent in any usurious contract, where above ten per cent. interest is taken, by stat. 13 Eliz. c. 10. 3. To obtain any stay of proceedings, other than by arrest of judgment or writ of error, in any suit for a monopoly, is likewise a præmunire, by stat. 21 Jac. I. c. 3. 4. To obtain an exclusive patent for the sole making or importation of gun-powder or arms, or to hinder others from importing them, is also a præmunire, by statutes 16 Car. I. c. 21, and 1 Jac. II. c. 8. 5. To assert, maliciously and advisedly, by speaking or writing, that parliament has a legislative authority without the king, is declared a præmunire by stat. 13 Car. II. c. 1. 7. By the habeas corpus act, also, 31 Car. II. c. 2, it is a

præmunire, and incapable of the king's pardon, to send any subject of this realm a prisoner into parts beyond the seas. 8. By stat. 1 W. & M. stat. 1, c. 8, persons of eighteen years of age, refusing to take the oaths of allegiance and supremacy, upon tender by a magistrate, are subject to the penalties of a præmunire; and by stat. 8 and 9 W. III. c. 24, sergeants, counsellors, proctors, attorneys, and all officers of courts, practising without having taken these oaths, and subscribed the declaration against popery, are guilty of a præmunire, whether the oaths be tendered or not. 2. By stat. 6 Ann. c. 7, to assert maliciously and directly, by preaching, teaching, or advised speaking, that the then pretended prince of Wales, or any person other than according to the acts of settlement and union, has any right to the throne of these kingdoms, or that the king and parliament cannot make laws to limit the descent of the crown; such preaching, teaching, or advised speaking, is a præmunire: as writing, printing, or publishing the same doctrines, amounted to high treason. 10. By stat. 6 Ann. c. 23, if the assembly of peers of Scotland, convened to elect their ten representatives in the British parliament, shall presume to treat of any other matter save only the election, they incur the penalties of a præmunire. 11. The stat. 6 Geo. I. c. 18 (enacted after the infamous South Sea project), makes all unwarrantable undertakings by unlawful subscriptions, then commonly known by the name of bubbles, subject to the penalties of præmunire. 12. The stat. 12 Geo. III. c. 11, subjects to the penalties of præmunire all such as knowingly and wilfully solemnise, assist, or are present at, any forbidden marriage of such of the descendants of the body of king George II. as are by that act prohibited to contract matrimony without the consent of the crown. The punishment of præmunire may be gathered from the foregoing statutes, which are thus summed up by Coke: 'That, from the conviction, the defendant shall be out of the king's protection, and his lands and tenements, goods and chattels, forfeited to the king; his body shall remain in prison at the king's pleasure or during life. These forfeitures do not bring this offence within felony; being inflicted by particular statutes, and not by the common law.' But so odious, Sir Edward Coke adds, was this offence of præmunire, that a man that was attainted of it might have been slain by any other man without danger of law; but this was soon held untenable, and explained that it is only lawful to kill him in the heat of battle, or for necessary self-defence. And, to obviate such savage notions, the stat. 5 Eliz. c. 1, expressly provides that it shall not be lawful to kill any person attainted in a præmunire. But still such delinquent, though protected as a part of the public from public wrongs, can bring no action for any private injury, how atrocious soever; being so far out of the protection of the law that it will not guard his civil rights, nor remedy any grievance which he as an individual may suffer. And no man, knowing him to be guilty, can with safety give him comfort, aid, or relief.

PRÆNESTE, in ancient geography, a town of Latium, south-east of Rome, towards the terri-

tory of the Æqui; a place of great strength; famous for the temple and oracle of Fortune, called Sortes Prænestina, which Tiberius wished to destroy, but was deterred by the majestic appearance of the place. From a colony it was afterwards raised to a municipium by Tiberius, on his recovery from a dangerous illness near it. It was a very ancient city, with a territory of large extent. The temple of Fortune was built in the most sumptuous manner by Sylla, and the pavement was Mosaic work. Concerning the Sortes, Cicero himself says that it was a mere contrivance to deceive, either for gain or superstition.

PRÆNOMEN, among the ancient Romans, signified the name prefixed to the family name, answering to our Christian name: such as Caius, Lucius, Marcus, Quintus, &c.

PRÆTEXTA TOGA, among the ancient Romans, a long white gown, with a border of purple round the edges, and worn by the children of patricians till the age of puberty, viz. by the boys till seventeen, when they changed it for the toga virilis: and by the girls till marriage. It was the habit which the magistrates, augurs, and priests, as well as senators, assumed on all solemn occasions, and therefore, being looked upon as sacred, it is supposed to have been chosen for youth at that age to guard them in a peculiar manner against the temptations incident to that period of life.

PRÆTEXTATÆ, a name given to tragedies among the Romans, in which the actors personated people of quality who had the particular privilege of wearing the prætexta.

PRÆTEXTATUS, one clothed in the prætexta, applied in a particular manner to the noble youth by whom it was worn to denote their age and condition, as may be learned from different medals.

PRÆTIUM SEPULCHRI, in old law books, &c., those goods accruing to the church wherein a corpse is buried.

PRÆTOR, a magistrate among the ancient Romans, not unlike our lord chief justices; as being vested with the power of distributing justice among the citizens. At first there was only one prætor; but afterwards, another being created, the first or chief one had the title of prætor urbanus, or the city prætor; the other was called peregrinus, as being judge in all matters relating to foreigners. But, besides these, there were afterwards created many provincial prætors; who were not only judges, but also assisted the consuls in the government of the provinces, and even were invested with the government of provinces themselves.

PRÆTORIA AUGUSTA, a town of Italy, belonging to the Salassii, near the two gates or defiles of the Alps, the Grajæ and Penninæ; a Roman colony, settled by Augustus after the defeat of the Salassii by Terentius Varro, on the spot where he encamped, situated on the river Duria Major. It is now called Aosta.

PRÆTORIAN CAMP, the place designed for the purpose of assembling within the same enclosure all the troops subjected to the power of the prætors. Sejanus, minister of Tiberius, occupying the station of præfect, desired that all

the soldiers of the prætorian cohorts, whose quarters were dispersed about, should be gathered together and lodged in one vast edifice, which he caused to be built, and entitled castrum prætorium or rather castra prætoriana. Antiquarians are not agreed as to the precise situation of this magnificent structure, but it is pretty evident that it stood at the eastern side of Rome, between the Nomentane and Tibertine ways, behind the baths of Dioclesian, and near the walls of the city. This camp or rather barrack was constructed of brick, of reticular workmanship, covered with stucco, and enriched with superb porticoes in columns. Constantine demolished it: but it appears to have been restored by the care of Ligorio. In the centre of the camp was the prætorium or tribunal, at which the præfect distributed justice. This had the exterior form of a temple, but was very plain within, the most conspicuous object being a table covered with a purple cloth embroidered with gold.

The camp was surrounded by an enclosure in some places double, and more or less extensive, within which were erected, on a quadrangular plan, two stories in height, the quarters of the soldiers, between the different divisions of which vast colonnades established an easy communication. The towers placed on the outside gave to the whole the appearance of a fortress, and the great space within ensured health to the troops, while it afforded them the requisite room for going through their various exercises.

PRÆTORIAN GUARDS, in Roman antiquity, were the emperor's guards, who at length were increased to 10,000: they had this denomination, according to some, from their being stationed at a place called Prætorium: their commander was styled præfectus prætorii.

PRÆTORIUM, or PRÆTORIUM, among the Romans, denoted the hall or court wherein the prætor lived, and wherein he administered justice. It likewise denoted the tent of the Roman general, wherein councils of war, &c., were held: also a place in Rome where the prætorian guards were lodged.

PRÆTORIUM, in ancient geography, a town of South Britain, belonging to the Brigantes; now called Patrington, according to Camden, near the mouth of the Humber in Yorkshire.

PRÆTUTIANI, an ancient people of Italy, who inhabited that part of Picenum which was anciently called Interamna, from its lying between two rivers, and is now named Teramo.

PRAGA, a town of Poland, on the Vistula, opposite Warsaw, with which it communicates by a bridge of boats. It has never recovered the catastrophe of 1794, when it was taken by storm, by the Russians under Suwarrow, and a general massacre ensued. The town was on this memorable occasion set on fire in several places, and almost reduced to ashes. The number of lives lost has been calculated at 20,000.

PRAGMATICAL, *adj.* } Fr. *pragmatique*,
PRAGMATIC. } Greek *πραγματα*.
Meddling; impertinently busy.

No sham so gross, but it will pass upon a weak man that is *pragmatical* and inquisitive.

Common estimation puts an ill character upon pragmatick meddling people.

Government of the Tongue.

Lacquoys were never so saucy and pragmatick as they are now-a-days.

Addison's Spectator.

He understands no more of his own affairs than a child; he has got a sort of a pragmatick silly jade of a wife, that pretends to take him out of my hands.

Arbutnot.

Such a backwardness there was among good men to engage with an usurping people, and pragmatick and ambitious orators.

Swift.

PRAGMATIC SANCTION, in the civil law, is defined by Hottoman to be a rescript or answer of the sovereign, delivered by advice of his council, to some college, order, or body of people. A similar answer given to any particular person is called simply rescript. The term pragmatic sanction is chiefly applied to a settlement of Charles VI. emperor of Germany, who in 1722, having no sons, settled his hereditary dominions on his eldest daughter the archduchess Maria Theresa, which was confirmed by the diet of the empire, and guaranteed by Great Britain, France, the States General, and most of the powers in Europe. The word pragmatic is derived from the Greek *πραγμα*, negotium, business.

PRAGUE, an important city of Europe, the capital of Bohemia, is situated on both sides of the Moldau, at about an equal distance from the east and west frontiers of that kingdom; but it occupies a larger space of ground on the right than on the left bank of the river. The streets are well paved, with raised footpaths, and the town contains several squares. It is divided into the Old Town, extending in an oblong form along the right bank of the Moldau; the New Town outside of the old, and consequently farther from the river; and lastly, the Radschin or Hradschin, a detached quarter, built on a high precipitous hill, on the left bank. The whole is surrounded by a moat and earthen mound, the circuit of which is not less than ten miles. The Old Town has in one part a separate quarter for the Jews. The Radschin contains a number of houses belonging to the nobility and gentry, the cathedral, and the archbishop's palace. In a low track, to the north and east of this, is the quarter called Klein-seite, or Little Prague, said to be the oldest part of the town; and on the river side the suburb called Smichow. The Moldau is here of great width, but too shallow to be navigable. Its course is from north to south, and it is crossed by a bridge of sixteen arches, and 1850 feet in length.

Prague contains the ruins of what was the residence of the sovereign of Bohemia before the incorporation with the Austrian dominions. This building stood at the southern extremity of the town, in the citadel, which is still well fortified. At the other end of the town, a building, also called a palace, used for public offices. It is so large as to contain 150 rooms, with a noble hall. The cathedral is a fine Gothic structure, situated on the steep side of the hill of the Radschin, overlooking a great part of the city. It suffered greatly in the thirty years' war. The theatre is large; and the churches, convents,

schools, family mansions, &c., are, though great in number, little distinguished as edifices. The houses are built in general of stone. Prague is the rendezvous of the families of the Austrian nobility and gentry, whose incomes exempt them from the necessity of living in retirement, without enabling them to figure among the grandees of the imperial court. The society is consequently genteel, and balls, theatrical exhibitions, and masquerades, are of frequent occurrence. Of the population, about 85,000, nearly 7000 are Jews, and about 5000 strangers, attracted hither by the pleasures or advantages of the place. The Protestants have here two churches: the great majority being Catholics; and Prague is the see of an archbishop. The favorite saint is John Nepomuck (Nepomucenus), who lived in the fourteenth century, and allowed himself to be cast into the Moldau, rather than reveal to the emperor an important secret.

The university is the oldest in Germany, having been founded in 1348. About forty years after the well known John Huss and Jerome of Prague appeared, and the spirit of free enquiry, aided by an intercourse with England, has never since been wholly extinct. The interference of the Bohemian government with the new sectaries caused a reduction of the number of pupils at the university, and in 1409 that of Leipsic was founded by a body of them removing. The present number of the professors at Prague is about forty; that of students 900. It has classes of theology, law, medicine, philosophy, and classics. The public library contains above 100,000 volumes. Here is also an observatory, a cabinet of natural history, a seminary for training schoolmasters, three gymnasia, an academy for drawing and painting, riding and fencing schools, and a number of private boarding houses. To these may be added the academy of sciences, the societies of economics and of the friends of the arts. There are likewise some good private galleries of paintings. Tycho Brahe was a refugee in this city; the site of his observatory is now occupied by a mansion of a nobleman. Of the charitable institutions, the principal are three hospitals, two orphan-houses, and a lying-in-hospital.

The manufactures in linen, cotton, silk, and hats, are extensive; there are also, on a smaller scale, those of paper, brass-ware, tinkery, plated goods, glass, tobacco (on the government account), mathematical and musical instruments. Here is also some transit trade, and brewing is carried on extensively. Of the mercantile houses, nearly the half are Jewish. The shops are in general ill furnished, and the lower orders in wretched poverty.

Prague has often been exposed to the calamities of war, particularly in the fifteenth century, by the persecution of the Hussites. In 1620 a battle was fought on the White Mountain, about two miles from this city, between the Imperialists and Bohemians, in which the latter were defeated, and compelled to relinquish their sovereign. In 1741 a French corps blockaded in Prague, and in 1757, the Austrians being defeated near this place by the Prussians, Prague underwent a siege and heavy bombardment. The

town would require almost an army to defend it; for, though fortified, it is far too extensive for strength, and is commanded by several adjacent heights. 144 miles N. N. W. of Vienna, and seventy-five S. S. E. of Dresden. Long. (of the observatory) 14° 25' 10" E., lat. 50° 5' 23" N.

PRAISE, *n. s.* & *v. a.* } Belg. *prijis*; Swed.

PRASFUL, *adj.* } Dan. and Teut. *prys*;

PRAS'ER, *n. s.* } of Goth. *prose*. Re-

PRASE'WORTHY, *adj.* } known; fame; commendation; honor; tribute of gratitude: to commend; applaud; celebrate; glorify: praiseful and praiser explain themselves: praiseworthy is commendable; worthy of praise.

One generation shall *praise* thy works to another, and declare thy mighty works. *Palm cxlv. 4.*

The shepherds returned, glorifying and *praising* God for all the things that they had heard and seen. *Luke ii. 20.*

Of whose high *praise*, and *praiseful* bliss,
Goodness the pen, heaven the paper is. *Sidney.*

We men and *praisers* of men should remember, that, if we have such excellencies, it is reason to think them excellent creatures, of whom we are. *Sidney.*

The Tritonian goddess having heard
Her blazed fame, which all the world had filled,
Came down to prove the truth, and due reward
For her *praiseworthy* workmanship to yield. *Spenser.*

Turn to God, who knows I think this true,
And use it oft, when such a heart missays,
To make it good; for such a *praiser* prays. *Donne.*

He ordain'd a lady for his prize,
Generally *praiseful*, fair and young, and skilled in
housewiferies. *Chapman's Iliad.*

Forgive me, if my verse but say you are
A Sidney: but in that extend as far
As loudest *praisers*. *Ben Jonson's Epigrams.*

Since men have left to do *praiseworthy* things,
Most think all praises flatteries; but truth brings
That sound, and that authority with her name,
As to be raised by her is only fame. *Ben Jonson.*

Then is our fortitude worthy of *praise*, when we
can endure to be miserable. *Bp. Hall. Contemplations.*

Will God incense his ire
For such a petty trespass, and not *praise*
Rather your dauntless virtue? *Milton.*

They touched their golden harps, and hymning
praised
God and his works. *Id.*

Lucan, content with *praise*, may lie at ease
In costly grotts and marble palaces;
But to poor Bassus what avails a name,
To starve on compliments and empty fame? *Dryden.*

We *praise* not Hector, though his name we know
Is great in arms; 'tis hard to *praise* a foe. *Id.*

Firmus, who seized upon Egypt, was so far *praise-*
worthy, that he encouraged trade. *Arbuthn t.*

A soul redeemed demands a life of *praise*;
Hence the complexion of his future days;
Hence a demeanour holy and unspecked,
And the world's hatred, as its sure effect. *Cowper.*

PRAM, or PRAME, a kind of lighter used in Holland and the ports of the Baltic Sea, to carry the cargo of a merchant ship along-side in order to lade, or to bring it to shore to be lodged in the store-houses after being discharged out of the vessel.

PRAME, in military affairs, a kind of floating battery, being a flat-bottomed vessel, which draws little water, mounts several guns, and is very useful in covering the disembarkation of troops.

PRANCE, *v. n.* Belg. *pronken*; Dan. *prango*, to set one's self to show; to move pompously or ostentatiously; to spring and bound in high mettle.

The horses' hoofs were broken by means of the *prancings*, the *prancings* of their mighty ones. *Judges v. 22.*

Here's no fantastick mask, nor dance,
But of our kids that frisk and *prance*;
Nor wars are seen,
Unless upon the green
Two harmless lambs are butting one the other. *Wotton.*

I see
The' insulting tyrant *prancing* o'er the field,
Strowed with Rome's citizens, and drenched in
slaughter,

His horses' hoofs wet with Patrician blood. *Addison.*
With mud filled high, the rumbling cart draws
near,
Now rule thy *prancing* steeds, laced charioteer. *Gay.*

We should neither have meat to eat, nor manufac-
ture to clothe us, unless *prance* about in
coats of mail, or eat brass. *Swift.*

Far be the spirit of the chase from them,
To spring the fence, to rein the *prancing* steed. *Thomson.*

PRANK, *v. a.* & *n. s.* Belg. *pronken*. See
PRANCE. To decorate; dress or adjust to ostentation: a frolic.

Some *prank* their ruffs, and others timely dight
Their gay attire. *Spenser.*

These are tribunes of the people,
The tongues o' the common mouth: I despise them;
For they do *prank* them in authority
Against all noble sufferance. *Shakspeare.*

Your high self,
The gracious mark o' the land, you have obscured
With a swain's wearing; and me, poor lowly maid,
Most goddess-like *pranked* up. *Id. Winter's Tale.*

Lay home to him;
Tell him, his *pranks* have been too broad to bear
with. *Shakspeare.*

They caused the table to be covered and meat set
on, which was no sooner set down, than in came the
harpies, and played their accustomed *pranks*. *Raleigh.*

Ye gallants, whom a little yellow earth and the
webs of that curious worm have made gorgeous
without and perhaps proud within, remember that
ere long, as one worm decks you without, so another
worm shall consume you within; and that both the
earth that you *prank* up, and that earth wherewith
you *prank* it, is running back into dust. *Bp. Hall.*

I had not unlocked my lips
In this unhallowed air, but that this juggler
Would think to charm my judgment as mine eyes,
Obtruding false rules, *prankt* in reason's garb. *Milton.*

They put on their clothes, and played all those
pranks you have taken notice of. *Addison's Guardian.*

As in unequal association it always happens, what-
ever unlucky *prank* was played was imputed to Cave. *Johnson.*

PRASIUM, in botany, shrubby hedge-nettle; a genus of the gymnospermia order and didyma

nia class of plants; natural order forty-second, verticillatæ. There are four monospermous berries.

PRASLIN, a high island, one of the Sechelles in the Indian Seas, and next in size to Mahé, from which it is eight leagues distant; it has a good road on the north, sheltered by the little island Curieuse. It has some French families. Long. 55° 47' E., lat. 4° 19' S.

PRATE, *v. n.* & *n. s.* } Dan. *prate*; Belg.
PRATTLE, *v. n.* & *n. s.* } *praten*. To talk care-
PRATTLER, *n. s.* } lessly; chatter; tattle;
be loquacious: prattle is a diminutive of prate, and as a substantive is idle, empty talk: prattler, a trifling talker.

His knowledge or skill is in *prating* too much.
Tusser.

Behold me, which owe
A moiety of the throne, here standing
To *prate* and talk for life and honour, 'fore
Who please to hear. *Shakspeare. Winter's Tale.*

I prattle
Something too wildly, and my father's precepts
I therein do forget. *Id. Tempest.*

The bookish theorick,
Wherein the toged consuls can propose
As masterly as he; mere *prattle*, without practice,
Is all his soldiiership. *Id. Othello.*

Poor *prattler*! how thou talkest. *Shakspeare.*
After flammock and the blacksmith had, by joint
and several *pratings*, found tokens of consent in the
multitude, they offered themselves to lead them.
Bacon's Henry VII.

Prattler, no more, I say;
My thoughts must work, but like a noiseless sphere,
Harmonious peace must rock them all the day;
No room for *prattlers* there. *Herbert.*

Oh listen with attentive sight
To what my *prating* eyes indite! *Cleveland.*
Would her innocent *prate* could overcome me;
Oh! what a conflict do I feel. *Denham's Sophy.*
The insignificant *prattle* and endless garrulity of
the philosophy of the schools. *Glanville.*

What nonsense would the fool thy master *prate*,
When thou, his knave, canst talk at such a rate?
Dryden.
A French woman teaches an English girl to
speak and read French, by only *prattling* to her.
Locke.

There is not so much pleasure to have a child
vrattle agreeably, as to reason well.
Id. On Education.

His tongue, his *prattling* tongue, had changed him
quite
To sooty blackness, from the purest white. *Addison.*
I must *prattle* on, as afore,
And beg your pardon, yet this half hour.
Prior.

Let cred'ulous boys and *prattling* nurses tell,
How, if the festival of Paul be clear,
Plenty from liberal horn shall strow the year.
Gay.

When expectation rages in my blood,
Is this a time, thou *prater*? hence, begone.
Southern.
This is the way of the world; the deaf will *prate*
of discords in musick. *Watts.*

When children first begin to spell,
And stammer out a syllable,
We think them tedious creatures;
But difficulties soon abate,
When birds are to be taught to *prate*,
And women are the teachers. *Cowper.*

PRATINAS, a Greek poet, contemporary with Æschylus, born at Phsuis. He was the first among the Greeks who composed satires, which were represented as farces. Of these thirty-two were acted, and eighteen of his tragedies, one of which only obtained the poetical prize. Some of his verses are extant, quoted by Athenæus.

PRATO, a considerable and well built town of the grand duchy of Tuscany, district of Florence, Italy, is situated in a pleasant district, on the Bisenzio, and surrounded with a wall and ditch. It has several squares, of which the best is the Piazza Mercantile; but the great ornament of the place is its fine white marble cathedral. There are twelve other churches, two poor-houses, a foundling, and four other hospitals; manufactures of silk, woollen, soap, and hats. The vicinity is fertile and contains several stone quarries. Six miles south-east of Pistoja, and nine N. N. W. of Florence.

PRATT (Charles), earl of Camden, was the third son of Sir John Pratt, knight, chief justice of the court of king's bench under George I., and was born in 1713, the year before his father was called to the bench. He received the rudiments of his education at Eton, and afterwards removed to King's College, Cambridge. He took his degree of M. A., attended the Inner Temple, and was in due time admitted a barrister at law. Notwithstanding the great abilities he afterwards displayed, he passed nine years almost unknown and unnoticed, and was thinking of giving up the law and turning to divinity, when he was raised from obscurity by Mr. Henley (afterwards lord chancellor) employing him in a cause he himself was engaged in, on a circuit, and thus affording him the opportunity of displaying his professional knowledge and eloquence. He became now one of the most successful pleaders at the bar, and was chosen to represent the borough of Downton, Wilts, after the general election in 1756; appointed recorder of Bath and attorney-general in 1756; in January, 1762, he was made serjeant at law, appointed chief justice of the common pleas, and knighted. He presided in that court with a dignity and impartiality never exceeded by any of his predecessors; and, when John Wilkes was committed to the Tower on an illegal general warrant, his lordship, with the intrepidity of a British magistrate, granted him an habeas corpus; and, on his being brought before the court of common pleas, discharged him from his confinement. His spirited behaviour on this occasion, and in the consequent judicial proceedings between the printers of the North Briton and the messengers and others, was so acceptable that the city of London presented him with their freedom in a gold box, and put up his picture painted by Reynolds in the Guildhall. The corporations of Dublin, Bath, Exeter, and Norwich, paid him the like compliment. On the 16th of July, 1765, he was created a peer or Great Britain, by the title of lord Camden, baron Camden, in Kent; and July 30th 1766 on the resignation of Robert, earl of Northington, he was appointed lord high chancellor of Great Britain. In this station he gave his most

decided opinion against the legality of general warrants. He conducted himself in this high office so as to obtain the esteem of all parties; but, when the taxation of America was in agitation, he declared himself so strongly against it, that he was obliged to resign. Upon the fall of lord North he was again taken into the administration, and on the 27th of March, 1782, appointed president of the council; an office which he resigned in March 1783. On the 13th of May 1786 he was created viscount Bayham, of Bayham abbey, Kent, and earl Camden. He died on the 18th of April, 1794, at his house in Hill Street, Berkley Square, being at that time president of the privy council, a governor of the charter-house, recorder of the city of Bath, and F. R. S. He married Elizabeth, daughter of Nicholas Jeffries, esq., by whom he had issue John Jeffries Pratt (second earl of Camden), and four daughters.

PRATT (S. J.), a miscellaneous writer, was born at St. Ives, Hunts, in 1749, and was successively an itinerant corrector, bookseller, and author, at first using the name of Courtney Melmoth. His principal works were *The Zion of Genius*; *Sympathy*, a poem; and *Landscapes in verse*; *Liberal Opinions*, 5 vols.; *Emma Corbett*, 3 vols.; *The Pupil of Pleasure*, 2 vols.; and *Family Secrets*, 5 vols. novels: also *Gleanings abroad* and in *England*, 3 vols. 8vo., once very popular vols. of *Travels: The Fair Circassian*, a tragedy, &c. He died at Birmingham in 1814.

PRAVITY, *n. s.* Lat. *pravitās*. Corruption; malignity; vice.

Doubt not but that sin

Will reign among them, as of thee begot;

And therefore was law given them, to evince

Their natural pravity. *Milton's Paradise Lost.*

More people go to the gibbet for want of timely correction, than upon any incurable pravity of nature.

L'Estrange.

I will show how the pravity of the will could influence the understanding to a disbelief of Christianity.

South.

PRAWN, *n. s.* Italian *parnocche*. A small crustaceous fish.

I had prawns, and borrowed a mess of vinegar.

Shakspeare.

PRAWN. See CANCER.

PRAXAGORAS, a native of Athens, who at nineteen years of age composed the History of the Kings of Athens, in two books; and at twenty-two the Life of Constantine the Great, in which, though a Pagan, he speaks very highly of that prince. He also wrote the History of Alexander the Great. He lived under Constantius about A. D. 345.

PRAXIPHANES, a Rhodian, who wrote a learned commentary on the obscure passages of Sophocles. *Diog.*

PRAXITELES, a very celebrated Greek sculptor, who lived A. A. C. 330, in the reign of Alexander the Great. All the ancient writers mention his statues with high commendation, especially a Venus executed by him for the city of Cnidos, which was so admirable a piece, that king Nicomedes offered to release the inhabitants from their tribute as the purchase of it; but they

refused to part with it. The inhabitants of Cos requested him to make a statue of Venus. He gave them a choice of two, one naked, the other clothed; they preferred the latter. He was one of the gallants of Phryne.

PRAY, *v. n.* & *v. a.* } Fr. *prier*; Ital. *pregare*; Lat. *precor*. To

PRAYER, } make petitions to a divine being; entreat; ask; supplicate; implore: prayer is petition to a divine being; mode or practice of supplicating; entreaty: prayer-book, book of devotional forms or prayers.

Therefore bretheren I beseeche you be oure Lord Iesus Crist, and be charite of the hooli goost, that ghe helpe me in youre *preieris* to the Lord, that I be deluyerd fro the unfeithful men that ben in iudee.

Wiclif Romayns 15.

And the develis *prieden* him, and seiden, if thou castist us from hennes sende us in to the drove of swyn.

Id. Matt. 3.

My heart's desire and prayer to God for Israel is, that they might be saved.

Romans x. 1.

Is any sick? let him call for the elders of the church, and let them pray over him.

James v. 14.

I will buy with you, sell with you, but I will not eat with you, drink with you, nor pray with you.

Shakspeare.

You shall find

A conqu'ror that will pray in aid for kindness,

Where he for grace is kneeled to. *Id.*

They did say their prayers, and addressed them Again to sleep.

Id. Macbeth.

Were he as famous and as bold in war,

As he is famed for mildness, peace, and prayer.

Shakspeare.

Get a prayerbook in your hand,

And stand between two churchmen;

For on that ground I'll build a holy descent. *Id.*

Pray my colleague Antonius I may speak with him;

And as you go, call on my brother Quintus, And pray him with the tribunes to come to me.

Ben Jonson.

The solemn worship of God and Christ is neglected in many congregations; and instead thereof, an indigested form and conception of extemporal prayer is used.

White.

He that prays, despairs not; but sad is the condition of him that cannot pray; happy are they that can, and do, and love to do it.

Taylor.

No man can always have the same spiritual pleasure in his prayers; for the greatest saints have sometimes suffered the banishment of the heart, sometimes are fervent, sometimes they feel a barrenness of devotion; for this spirit comes and goes.

Taylor.

Unskilful with what words to pray, let me Interpret for him.

Milton.

Sighs now breathed

Inutterable, which the spirit of prayer

Inspired.

Id.

He fell to his devotions on that behalf, and made those two excellent prayers which were published immediately after his death.

Fell.

Prayer among men is supposed a means to change the person to whom we pray; but prayer to God doth not change him, but fits us to receive the things prayed for.

Stillingfleet.

He praised my courage, prayed for my success;

He was so true a father of his country,

To thank me for defending even his foes. *Dryden.*

He that will have the benefit of this act, must pray a prohibition before a sentence in the ecclesiastical court.

Ayliffe.

Should you *pray* to God for a recovery, how rash would it be to accuse God of not hearing your *prayers*, because you found your disease still to continue.

Wake.

But I *pray*, in this mechanical formation, when the ferment was expanded to the extremities of the arteries, why did it not break the receptacle?

Bentley's Sermons.

Barnard in spirit, sense and truth abounds;
Pray then what wants he? fourscore thousand pounds.

Pope.

I know not the names or number of the family which now reigns, farther than the *prayerbook* informs me.

Swift.

If men would consider *prayer* not only as it is an invocation of God, but also as it is an exercise of holy thoughts, as it is an endeavour to feel and to be affected with the great truths of religion, they would soon see that, though God is so good as not to need much calling upon, yet that man is so weak as to need much assistance, and to be under a constant necessity of that help, and light, and improvement, which arises from *praying* much. *Law.*

Let cottagers and unenlightened swains
Revere the laws they dream that Heaven ordains;
Resort on Sundays to the house of *prayer*,
And ask, and fancy they find, blessings there.

Couper.

PRAYA, a sea-port town, the capital of Terceira, one of the Azores; it stands in a beautiful plain, and has a church, four convents, three hospitals, and about 3000 inhabitants.

PRAYA PORTE, the capital of St. Jago, one of the Cape de Verd Isles, is the residence of the Portuguese governor general; but its trade is limited to the supply of provisions and refreshments to outward bound Guinea and East India ships. A fort commands the harbour.

PRAYER is a solemn address to God, which, when it is of any considerable length, has been said to consist of adoration, confession, supplication, intercession, and thanksgiving. By adoration we express our sense of God's infinite perfections, his power, wisdom, goodness, and mercy; and acknowledge that our constant dependence is upon Him by whom the universe was created, and has been hitherto preserved. By confession is meant our acknowledgment of our manifold transgressions of the divine laws, and our consequent unworthiness of all the good things which we enjoy at present, or expect to be conferred upon us hereafter. In supplication we intreat our omnipotent Creator and merciful Judge not to deal with us after our iniquities, but to pardon our transgressions, and by his grace to enable us to live henceforth righteously, soberly, and godly, in this present world; and by Christians this intreaty is always made in the name and through the mediation of Jesus Christ, because to them it is known that there is none other name under heaven given unto men whereby they may be saved. To these supplications for mercy, we may likewise add our prayers for the necessities of life; because, if we seek first the kingdom of God and his righteousness, we are assured that such things shall be added unto us. Intercession signifies those petitions which we offer up for others, for friends, for enemies, for all men, especially for our lawful governors, whether supreme or subordinate. And thanksgiving is the expression of

our gratitude to God, the giver of every good and perfect gift, for all the benefits enjoyed by us and others, for the means of grace, and for the hope of glory. Such are the component parts of a regular and solemn prayer, adapted either for the church or for the closet. But an ejaculation to God, conceived on any emergency, is likewise a prayer, whether it be uttered by the voice or suffered to remain a mere affection of the mind; because the Being to whom it is addressed discerneth the thoughts of the heart. In this article we have treated of prayer in general, as the private duty of every individual; but there ought to be public as well as private prayer. The prayers of every Christian ought to be offered in the name and through the mediation of Jesus Christ. We conclude our reflections on the general duty, with observing, that nothing so forcibly restrains from ill as the remembrance of a recent address to heaven for protection and assistance. After having petitioned for power to resist temptation, there is so great an incongruity in not continuing the struggle, that we blush at the thought, and persevere, lest we lose all reverence for ourselves. After fervently devoting our souls to God, we start with horror at immediate apostasy; every act of deliberate wickedness is then complicated with hypocrisy and ingratitude; it is a mockery of the Father of Mercies, the forfeiture of that peace in which we closed our address, and a renunciation of the hope which that address inspired. But if prayer and immorality be thus incompatible, surely the former should not be neglected by those who contend that moral virtue is the summit of human perfection.

Dr. Paley has so well met the question, 'What virtue is there in prayer which should make it consistent with wisdom to grant a favor to the supplicant, which would not be consistent to grant without it?' that we shall transcribe his observations.

1. A favor granted to prayer may be more apt, on that very account, to produce good effects upon the person obliged. It may hold in the divine bounty, what experience has raised into a proverb in the collation of human benefits, that which is obtained without asking is oftentimes received without gratitude.

2. It may be consistent with the wisdom of the Deity to withhold his favors till they be asked for, as an expedient to encourage devotion in his rational creation, in order thereby to keep up and circulate a knowledge and sense of their dependency upon him.

3. Prayer has a natural tendency to amend the petitioner himself, and thus to bring him within the rules which the wisdom of the Deity has prescribed to the dispensation of his favors. If these, or any other assignable suppositions, serve to remove the apparent repugnancy between the success of prayer and the character of the Deity, it is enough; for the question with the petitioner is not from which, out of many motives, God may grant his petition, or in what particular manner he is moved by the supplications of his creatures; but whether it be consistent with his nature to be moved at all, and whether there be any conceivable motives which

may dispose the divine will to grant the petition what he wants, in consequence of his praying for it.—*Moral Philosophy*, vol. 2.

PREACH, *v. n., v. a. & n. s.* } Fr. *prescher* ;
 PREACHER, *n. s.* } Latin *predico*.
 PREACHMENT. } To deliver a

public discourse upon sacred subjects; to proclaim; publish; inculcate: used by Hooker for a discourse: a preacher is one who discourses publicly on religion: preachment, a religious discourse mentioned in contempt.

Prophets *preach* of thee at Jerusalem. *Nehemiah*.

The Lord gave the word; just was the company of the *preachers*. *Psalms* lxxviii, 11.

From that time Jesus began to *preach*. *Matthew*.

The Jews of Thessalonica had knowledge that the word of God was *preached* of Paul. *Acts*.

This oversight occasioned the French spitefully to term religion in that sort exercised, a mere *preach*. *Hooker*.

There is not any thing publicly notified, but we may properly say it is *preached*. *Id.*

Was't you, that revell'd in our parliament,
 And made a *preachment* of your high descent?

Shakespeare.

You may hear the sound of a *preacher's* voice, when you cannot distinguish what he saith. *Bacon*.

Divinity will not pass the yard and loom, the forge or anvil, nor *preaching* be taken in as an easier supplementary trade, by those that disliked the pains of their own. *Decay of Piety*.

Here lies a truly honest man,
 One of those few that in this town
 Honour all *preachers*; hear their own.

Crashaw.

He decreed to commissionate messengers to *preach* this covenant to all mankind. *Hammond*.

It is evident in the apostles' *preaching* at Jerusalem and elsewhere, that at the first proposal of the truth of Christ to them, and the doctrine of repentance, whole multitudes received the faith, and came in. *Hammond*.

Surely that *preaching* which comes from the soul, most works on the soul. *Fuller*.

He oft to them *preached*
 Conversion and repentance. *Milton*.

The shape of our cathedral is not proper for our *preaching* auditories, but rather the figure of an amphitheatre with galleries. *Graunt*.

Can they *preach* up equality of birth,
 And tell us how we all began from earth?

Dryden.

All this is but a *preachment* upon the text. *L'Estrange*.

No *preacher* is listened to but Time, which gives us the same train of thought that elder people have tried in vain to put into our heads before. *Swift*.

Live while you live the sacred *preacher* cries,
 And give to God each moment as it flies. *Doddridge*.

PREADAMITES, a denomination given to inhabitants of the earth, conceived by some to have lived before Adam. Isaac de la Pereyra, in 1655, published a book to evince the reality of preadamites, by which he gained many proselytes; but the answer of Demarets, professor of theology at Groningen, published in 1656, put a stop to its progress; though Pereyra made a reply. His system was this: the Jews he calls

Adamites, and supposes them to have issued from Adam; and gives the title Preadamites to the Gentiles, whom he supposes to have been a long time before Adam. But, this being expressly contrary to the Mosaic account, Pereyra had recourse to the fabulous antiquities of the Egyptians and Chaldeans, and to some idle rabbins, who imagined there had been another world before that described by Moses. He was apprehended by the inquisition in Flanders; but he appealed from their sentence to Rome; whither he went in the time of Alexander VII., and where he printed a retraction. See PRE-EXISTENCE.

PREAMBLE, *n. s.* } Fr. *preamble*; Lat.
 PREAMBULOUS, *adj.* } *preambulo*. Introduction; preface; something previous: preambulous is preparatory.

Truth as in this we do not violate, so neither is the same gainsayed or crossed, no not in those very *preambles* placed before certain readings, wherein the steps of the Latin service book have been somewhat too nearly followed. *Hooker*.

Doors shut, visits forbidden, and divers contestations with the queen, all *preambles* of ruin, though now and then he did wring out some petty contentments. *Wotton*.

This *preamble* to that history was not improper for this relation. *Clarendon*.

With *preambles* sweet
 Of charming sympathy they introduce
 Their sacred song, and waken raptures high. *Milton*.

He not only undermineth the base of religion, but destroyeth the principal *preambulous* unto all belief, and puts upon us the remotest error from truth. *Browne*.

I will not detain you with a long *preamble*. *Dryden*.

PREAPPREHENSION, *n. s.* Pre and apprehend. An opinion formed before examination.

A conceit not to be made out by ordinary eyes, but such as regarding the clouds, behold them in shapes conformable to *preapprehensions*. *Browne*.

PREASE, *n. s.* Press; crowd. See PRESS. Obsolete.

A ship into the sacred seas,
 New-built, now launch we; and from out our *prease*
 Chuse two and fifty youths. *Chapman*.

PREBEND, *n. s.* } Fr. *prebende*; low Lat.
 PREBENDARY, *n. s.* } *præbenda*. A stipend granted in cathedral churches; the stipendiary.

To lords, to principals, to *prebendaries*. *Hubbard*.

Deans and canons, or *prebends* of cathedral churches, in their first institution, were of great use, to be of counsel with the bishop. *Bacon*.

His excellency gave the doctor a *prebend* in St. Patrick's cathedral. *Swift's Miscellanies*.

A PREBEND is the maintenance a prebendary receives out of the estate of a cathedral or collegiate church. Prebends are distinguished into simple and dignitary; a simple prebend has no more than the revenue for its support; but a prebend with dignity has always a jurisdiction annexed to it.

PREBENDARY. The difference between a prebendary and a canon is, that the former receives his prebend in consideration of his offi-

ciating in the church, but the latter merely by his being received into the cathedral or college.

PRECARIOUS, *adj.* } Fr. *precaire*; Lat. *precarius*. Depen-
PRECARIOUSLY, *adv.* } dent; uncertain, be-
PRECARIOUSNESS, *n. s.* } cause depending on the will of another; held by courtesy. Dr. Johnson remarks, 'No word is more unskillfully used than this with its derivatives. It is used for uncertain in all its senses; but it only means uncertain, as dependent on others;' the adverb and noun substantive follow the senses of the adjective.

What subjects will *precarious* kings regard?

A beggar speaks too softly to be heard. *Dryden*.

Those who live under an arbitrary tyrannical power, have no other law but the will of their prince, and consequently no privileges but what are *precarious*. *Addison*.

If one society cannot meet or convene together, without the leave or licence of the other society; nor treat or enact any thing relative to their own society without the leave and authority of the other; then is that society in a manner dissolved, and subsists *precariously* upon the mere will and pleasure of the other. *Lesley*.

He who rejoices in the strength and beauty of youth, should consider by how *precarious* a tenure he holds these advantages, that a thousand accidents may before the next dawn lay all these glories in the dust. *Rogers's Sermons*.

Most consumptive people die of the discharge they spit up, which, with the *precariousness* of the symptoms of an oppressed diaphragm, from a mere lodgment of extravasated matter, render the operation but little advisable. *Sharp's Surgery*.

Our scene *precariously* subsists too long

On French translation and Italian song:

Dare to have sense yourselves; assert the stage,
 Be justly warmed with your own native rage. *Pope*.

Heaven, earth, and hell, and worlds unknown,
 Depend *precarious* on thy throne. *Watts*.

PRECAUTION, *n. s. & v. a.* Fr. *precaution*, from Lat. *præcautus*. Preservative caution; preventive measures; to warn beforehand.

By the disgraces, diseases and beggary of hopeful young men brought to ruin, he may be *precautioned*. *Locke*.

Unless our ministers have strong assurances of his falling in with the grand alliance, or not opposing it, they cannot be too circumspect and speedy in taking their *precautions* against any contrary resolution. *Addison on the War*.

PRECEDANT, *adj.* Mistaken by the author, as Dr. Johnson says, for *præcidaneous*; Lat. *præcidaneus*, cut or slain before. Previous, antecedent.

That priority of particles of simple matter, influx of the heavens and preparation of matter might be antecedent and *precedaneous*, not only in order, but in time, to their ordinary productions. *Hale*.

PRECEDE, *v. a.* } Fr. *preceder*; Lat. *præcedo*. To go before in order of
PRECEDENCE, *n. s.* }
PRECEDENCY, }
PRECEDENT, *adj. & n. s.* } time, place, or rank:
PRECEDENT, *n. s.* } precedence and precedence is, superiority; adjustment of place; and, in an obsolete sense, something going before or past; precedent is, former; going before; and, as a noun substantive, any thing of the same kind done before; a rule or example.

Examples for cases can but direct as *precedents* only. *Hooker*.

I do not like, but yet it does allay
 The good *precedence*.

Shakspeare. Antony and Cleopatra.

Our own *precedent* passions do instruct us
 What levity's in youth. *Id. Timon.*

No power in Venice

Can alter a decree established:

'Twill be recorded for a *precedent*;

And many an error, by the same example,

Will rush into the state.

Id. Merchant of Venice.

When you work by the imagination of another, it is necessary that he, by whom you work, have a *precedent* opinion of you, that you can do strange things. *Bacon*.

Among the laws touching *precedence* in Justinian, divers are that have not yet been so received every where by custom. *Selden*.

The royal olive accompanied him with all his court, and always gave him the *precedency*. *Howel*.

How are we happy, still in fear of harm?

But harm *precedes* not sin. *Milton*.

None sure will claim in hell

Precedence; none, whose portion is small

Of present pain, that with ambitious mind

Will covet more. *Id. Paradise Lost.*

The constable and marshal had cognizance touching the rights of place and *precedence*. *Hale*.

The world, or any part thereof, could not be *precedent* to the creation of man. *Id.*

God, in the administration of his justice, is not tied to *precedents*, and we cannot argue, that the providences of God towards other nations, shall be conformable to his dealings with the people of Israel. *Tillotson*.

Arius and Pelagius durst provoke

To what the centuries *preceding* spoke. *Dryden*.

That person hardly will be found,

With gracious form and equal virtue crowned;

Yet if another could *precedence* claim,

My fixt desires could find no fairer aim. *Id.*

Being distracted with different desires, the next inquiry will be, which of them has the *precedency*, in determining the will to the next action? *Locke*.

Truths, absolutely necessary to salvation, are so clearly revealed that we cannot err in them, unless we be notoriously wanting to ourselves; herein the fault of the judgment is reduced into a *precedent* default in the will. *South*.

Such *precedents* are numberless; we draw

Our rights from custom; custom is a law. *Granville*.

The ruin of a state is generally *preceded* by an universal degeneracy of manners and contempt of religion. *Swift*.

The contempt with which the whole army heard of the manner of your retreat assures me that, as your conduct was not justified by *precedent*, it will never be thought an example for imitation. *Junius*.

PRECEDENCE, **PRECEDENCY**, a place of honor to which a person is entitled. This is either of courtesy or of right. The former is that which is due to age, estate, &c., which is regulated by custom and civility; the latter is settled by authority, and, when broken in upon, gives an action at law. A table of *precedency* is given in our article **HERALDRY**.

PRECENTOR, *n. s.* Fr. *precenteur*; Latin *precentor*. He that leads a choir.

Follow this *precentor* of ours, in blessing and magnifying that God of all grace, and never yield-

ing to those enemies, which he died to give us power to resist and overcome. *Hammond.*

PRECEPT, *n. s.* } Fr. *precepte*; Lat. *præ-*
PRECEPTIAL, *adj.* } *ceptum*. A rule authori-
PRECEPTIVE, } tatively given; a mandate;
PRECEPTOR, *n. s.* } direction: preceptual and
preceptive mean, consisting of or giving pre-
cepts: preceptor is a teacher; tutor.

The custom of lessons furnishes the very simplest and rudest sort with infallible axioms and *precepts* of sacred truth, delivered even in the very letter of the law of God. *Hooker.*

Men

Can counsel, and give comfort to that grief
Which they themselves not feel; but tasting it,
Their counsel turns to passion, which before
Would give *preceptual* medicine to rage;
Fetter strong madness in a silken thread,
Charm ach with air, and agony with words.

Shakspeare.

As the *preceptive* part enjoys the most exact virtue so is it most advantageously enforced by the promissory, which, in respect of the rewards, and the manner of proposing them, is adapted to the same end. *Decay of Piety.*

A good schoolmaster minces his *precepts* for chil-

dren to swallow, hanging clogs on the nimbleness of his own soul, that his scholars may go along with him. *Fuller.*

'Tis sufficient, that painting be acknowledged for an art; for it follows, that no arts are without their *precepts*. *Dryden.*

Passionate chiding carries rough language with it, and the names that parents and *preceptors* give children, they will not be ashamed to bestow on others. *Locke.*

The lesson given us here is *preceptive* to us not to do any thing but upon due consideration. *L'Estrange.*

The ritual, the *preceptive*, the prophetic, and all other parts of sacred writ, were most sedulously, most religiously guarded by them. *Government of the Tongue.*

A *precept* or commandment consists in, and has respect to, some moral point of doctrine, viz. such as concerns our manners, and our inward and outward good behaviour. *Ayliffe.*

It was to thee, great Stagyrte, unknown,
And thy *preceptor* of divine renown. *Blackmore.*

It is by imitation, far more than by *precept*, that we learn every thing; and, what we learn thus, we acquire not only more effectually, but more pleasantly. *Burke on the Sublime.*

PRECESSION OF THE EQUINOXES.

PRECESSION OF THE EQUINOXES. One of the most obvious and at the same time most important of the celestial motions is the diurnal revolution of the starry heavens. The whole appears to turn round an imaginary axis, which passes through two opposite points of the heavens, called the poles. One of these is in our sight, being very near the star, and in the tail of the little bear. The great circle which is equidistant from both poles divides the heavens into the north and south hemispheres, which are equal. It is called the equator, and it cuts the horizon in the east and west points, and every star in it is twelve sidereal hours above, and as many below the horizon, in each revolution.

The motion of the sun determines the length of day and night, and the vicissitudes of the seasons. By a long series of observations the shepherds of Asia were able to mark out the sun's path in the heavens; he being always in the opposite point to that which comes to the meridian at midnight, with equal but opposite declination. Thus they could tell the stars among which the sun then was, although they could not see them. They discovered that his path was a great circle of the heavens, afterwards called the ecliptic; which cuts the equator in two opposite points, dividing it, and being divided by it, into two equal parts: that when the sun was in either of these points of intersection, his circle of diurnal revolution coincided with the equator, and therefore the days and nights were equal. Hence the equator came to be called the equinoctial line, and the points in which it cuts the ecliptic were called the equinoctial points, and the sun was then said to be in the equinoxes. One of these was called the vernal and the other the autumnal equinox.

It was a most important problem in practical astronomy to determine the exact moment of the sun's occupying these stations; for it was natural to compute the course of the year from that moment. Accordingly, this has been the leading problem in the astronomy of all nations. It is susceptible of considerable precision, without any apparatus of instruments. It is only necessary to observe the sun's declination on the noon of two or three days before and after the equinoctial day. On two consecutive days of this number, his declination must have changed from north to south or from south to north. If his declination on one day was observed to be 21' N., and on the next 5' S., it follows, that his declination was nothing, or that he was in the equinoctial point about twenty-three minutes after seven in the morning of the second day. Knowing the precise moments, and knowing the rate of the sun's motion in the ecliptic, it is easy to ascertain the precise point of the ecliptic in which the equator intersected it.

By a series of such observations made at Alexandria, between the years 161 and 127 before Christ, *Hipparchus*, the father of our astronomy, found that the point of the autumnal equinox was about 6° E. of the star called *Spica virginis*. Eager to determine every thing by multiplied observations, he ransacked all the Chaldean, Egyptian, and other records, to which his travels could procure him access, for observations of the same kind; but only found some observations of *Aristillus* and *Timocharis* made about 150 years before. From these it appeared evident that the point of the autumnal equinox was then about 8° E. of the same star. He discusses these observations with great sagacity and rigor; and, on their authority, asserts that the

equinoctial points are not fixed in the heavens, but move to the west about 1° in seventy-five years or less.

This motion is called the *precession of the equinoxes*, because by it the time and place of the sun's equinoctial station precedes the usual calculations: it is fully confirmed by all subsequent observations. In 1750 the autumnal equinox was observed to be $20^\circ 21'$ W. of spica virginis. Supposing the motion to have been uniform during this period of ages, it follows, that the annual precession is about $50\frac{1}{2}''$; that is, if the celestial equator cuts the ecliptic in a particular point on any day of this year, it will on the same day of the following year cut it in a point $50\frac{1}{2}''$ to the west of it, and the sun will come to the equinox $20' 23''$ before he has completed his round of the heavens. Thus the equinoctial or tropical year, or true year of seasons, is so much shorter than the revolution of the sun or the sidereal year. This discovery has immortalised the name of Hipparchus. It must be acknowledged, indeed, to be one of the most singular that has been made, that the revolution of the whole heavens should not be stable, but its axis continually changing. For since the equator changes its position, and the equator is only an imaginary circle, equidistant from the two poles or extremities of the axis; these poles and this axis must equally change their positions. The equinoctial points make a complete revolution in about 25745 years, the equator being all the while inclined to the ecliptic in nearly the same angle. Therefore the poles of this diurnal revolution must describe a circle round the poles of the ecliptic, at the distance of about $23^\circ 30'$ in 25745 years; and, in the time of Timochares, the north pole of the heavens must have been 30° east of where it now is.

The precession of the equinoxes, however, was known to the astronomers of India, many ages before the time of Hipparchus. The Chaldeans had also a pretty accurate knowledge of the year of seasons. From their saros, we deduce their measure of this year to be 365d. 5h. 49m. and 11s., exceeding the truth only by 26s., and much more exact than the year of Hipparchus. They had also a sidereal year of 365d. 6h. 11m. The Egyptians also had a knowledge of something equivalent to this: for they had discovered that the dog star was no longer the faithful fore-warner of the overflowing of the Nile. This knowledge is also involved in the precepts of the Chinese astronomy, of much older date than the time of Hipparchus. But all these facts do not deprive Hipparchus of the honor of the discovery, or fix on him the charge of plagiarism. This motion was clearly unknown to the astronomers of the Alexandrian school, and it was pointed out to them by Hipparchus in the way in which he ascertained every other position in astronomy, namely, as the mathematical result of actual observations, and not as a thing deducible from any opinions on other subjects related to it.

As a thing for which no physical reason could be assigned, the precession of the equinoxes was long disputed. But the establishment of the Copernican system reduced it to a very clear affair; the motion, which was thought to affect

all the heavenly bodies, is now seen to be only an effect of the earth's motion. The earth turns round its own axis while it revolves round the sun, in the same manner as we may cause a child's top to spin on the brim of a mill-stone, while the stone is turning slowly round its axis. If the top spin steadily its axis will always point to the zenith of the heavens; but we frequently see that, while it spins briskly round its axis, the axis itself has a slow conical motion round the vertical line, so that, if produced, it would slowly describe a circle in the heavens round the zenith point. The flat surface of the top may represent the terrestrial equator, gradually turning itself round on all sides. If this top were formed like a ball, with an equatorial circle on it, it would represent the whole motion; the only difference being, that the spinning motion and this wavering motion are in the same direction; whereas the diurnal rotation and the motion of the equinoctial points are in contrary directions. Even this dissimilarity may be removed, by making the top turn on a cap, like the card of a mariner's compass. It is now fully established that, while the earth revolves round the sun from west to east in the plane of the ecliptic, in the course of a year it turns round its own axis from west to east in 23h. 56' 4", which axis is inclined to this plane in an angle of nearly $23^\circ 28'$; and that this axis turns round a line perpendicular to the ecliptic in 25,745 years from east to west, keeping nearly the same inclination to the ecliptic.—By these means its pole in the sphere of the starry heavens describes a circle round the pole of the ecliptic at the distance of $23^\circ 28'$ nearly. The consequence of this must be, that the terrestrial equator, when produced to the sphere of the starry heavens, will cut the ecliptic in two opposite points, through which the sun must pass when he makes the day and night equal: and that these points must shift to the west at the rate of $5\frac{1}{2}''$ annually, which is the precession of the equinoxes. Accordingly, this has been the received doctrine among astronomers for nearly three centuries, and it was thought perfectly conformable to appearances.

Dr. Bradley hoped to discover the parallax of the earth's orbit by observations of the actual position of the pole of the celestial revolution. If the earth's axis keeps parallel to itself, its extremity must describe, in the sphere of the starry heavens, a figure equal and parallel to its orbit round the sun; and, if the stars be so near that this figure is a visible object, the pole of diurnal revolution will be in different distinguishable points of the figure. Consequently, if the axis describe this cone already mentioned, the pole will not describe a circle round the pole of the ecliptic, but will have a looped motion along this circumference, similar to the absolute motion of one of Jupiter's satellites, describing an epicycle whose centre describes the circle round the pole of the ecliptic.

This sagacious astronomer observed such an epicyclical motion, and thought that he had now overcome the only difficulty in the Copernican system; but, on considering his observations, he found this epicycle quite inconsistent with the consequences of the annual parallax, and it puz-

zled him exceedingly. One day, while sailing on the Thames, he observed that, every time the boat tacked, the direction of the wind, estimated by the direction of the vane, seemed to change. This suggested to him the case of his observed epicycle, and he found it an optical illusion, occasioned by a combination of the motion of light with the motion of his telescope while observing the polar stars. Thus he established an incontrovertible argument for the Copernican system, and immortalised his name by his discovery of the aberration of the stars. The doctor now engaged in a series of observations for ascertaining all the phenomena of this discovery. In the course of these, which were continued for twenty-eight years, he discovered another epicyclical motion of the pole of the heavens. He found that the pole described an epicycle whose diameter was about 18", having for its centre that point of the circle round the pole of the ecliptic in which the pole would have been found independent of this new motion: and that the period of this epicyclical motion was eighteen years and seven months. It struck him that this was precisely the period of the revolution of the nodes of the moon's orbit. Of these results he gave a brief account to lord Macclesfield, then president of the Royal Society. Mr. Machin, to whom he also communicated the observations, gave him in return a very neat mathematical hypothesis, by which the motion might be calculated.

Let E (fig. 1.) be the pole of the ecliptic, and

fig. 1.

S P Q a circle distant from it $23^{\circ} 28'$, representing the circle described by the pole of the equator during one revolution of the equinoctial points. Let P be the place of this last mentioned pole at some given time. Round P describe a circle, A B C D, whose diameter A C is 18". The real situation of the pole will be in the circumference

of this circle; and its place, in this circumference, depends on the place of the moon's ascending node. Draw EPF and GPL perpendicular to it; let GL be the colure of the equinoxes, and EF the colure of the solstices. Dr. Bradley's observations showed that the pole was in A when the node was in L, the vernal equinox. If the node recede to H, the winter solstice, the node is in B. When the node is in the autumnal equinox, at G, the pole is at C; and when the pole is in F, the summer solstice, the pole is in D. In all intermediate situations of the moon's ascending node the pole is in a point of the circumference A B C D, three signs or 9° more advanced. By comparing together a great number of observations, Dr. Bradley found that the mathematical theory, and the calculation depending on it, would correspond much better with the observations, if an ellipse were substituted for the circle A B C D, making the longer axis A C 18", and the shorter, B D, 16". D'Alembert determined, by the physical theory of gravitation, the axes to be 18" and 13", 4. These observations, and this mathematical theory, must be considered as so many astronomical facts, and the methods of computing the places of all celestial phenomena must be drawn from them, agreeably to the universal practice of determining every point of the heavens by its longitude, latitude, right ascension, and declination.

This equation of the pole's motion makes a change in the obliquity of the ecliptic. The inclination of the equator to the ecliptic is measured by the arch of a great circle intercepted between their poles. If the pole be in O, instead of P, it is plain that the obliquity is measured by EO instead of EP. If EP be considered as the mean obliquity of the ecliptic, it is augmented by $9'$ when the moon's ascending node is in the vernal equinox, and consequently the pole in A. It is, on the contrary, diminished $9'$ when the node is in the autumnal equinox, and the pole in C; and it is equal to the mean when the node is in the colure of the solstices. This change of the inclination of the earth's axis to the plane of the ecliptic was called the nutation of the axis by Sir Isaac Newton; who showed that a change of nearly a second must obtain in a year by the action of the sun on the prominent parts of the terrestrial spheroid. But he did not attend to the change which would be made in this motion by the variation which obtains in the disturbing force of the moon, in consequence of the different obliquity of her action on the equator, arising from the motion of her own oblique orbit. It is this change which now goes by the name of nutation, and we owe its discovery entirely to Dr. Bradley. The general change of the position of the earth's axis has been termed deviation by modern astronomers.

It is easy to ascertain the quantity of this change of obliquity. When the pole is in O, the arch ADCO is equal to the node's longitude from the vernal equinox, and that PM is its cosine; and (on account of the smallness of AP in comparison of EP) PM may be taken for the change of the obliquity of the ecliptic. This is therefore $= 9' \times \cos. \text{long. node}$, and is additive to the mean obliquity, while O is in the semicircle B A D, that is, while the longitude of

the node is from nine signs to three signs ; but subtractive while the longitude of the node changes from three to nine signs. But the nutation changes also the longitudes and right ascensions of the stars and planets by changing the equinoctial points, and thus occasioning an equation in the precession of the equinoctial points. The great circle or meridian which passes through the poles of the ecliptic and equator is always the solstitial colure, and the equinoctial colure is at right angles to it: therefore when the pole is in P or in O, EP or EO is the solstitial colure. Let S be any fixed star or planet, and let SE be a meridian or circle of longitude; draw the circles PS, OS, and the circles M'EM'', mEm', perpendicular to PE, OE. If the pole were in its mean place P, the equinoctial points would be in the ecliptic meridian M'EM'', or that meridian would pass through the intersections of the equator and ecliptic, and the angle M'ES would measure the longitude of the star S. But, when the pole is in O, the ecliptic meridian mEm' will pass through the equinoctial points. The equinoctial points must therefore be to the west of their mean place, and the equation of the precession must be additive to that precession; and the longitude of the star S will now be measured by the angle mES, which, in the case here represented, is greater than its mean longitude. The difference, or the equation of longitude, arising from the nutation of the earth's axis, is the angle OEP, or $\frac{OM}{OE} OM$ is

the sine of the angle CPO, which, by what has been already observed, is equal to the longitude of the node: Theorem OM is equal to $9'' \times \text{longitude node}$, and $\frac{OM}{OE}$ is equal to $\frac{9'' \times \text{sin. long. node}}{\text{sin. obliq. eclip.}}$. This equation is additive

to the mean longitude of the star when O is in the semicircle CBA, or while the ascending node is passing backwards from the vernal to the autumnal equinox; but it is subtractive from it while O is in the semicircle ADC, or while the node is passing backwards from the autumnal to the vernal equinox; or, to express it more briefly, the equation is subtractive from the mean longitude of the star while the ascending node is in the first six signs, and additive to it while the node is in the last six signs.

This equation of longitude is the same for all the stars; for their longitude is reckoned on the ecliptic, and therefore is affected only by the variation of the point from which the longitude is computed. The right ascension, being computed on the equator, suffers a double change. It is computed from, or begins at, a different point of the equator, and it terminates at a different point; because, the equator having changed its position, the circles of declination also change theirs. When the pole is at P the right ascension of S from the solstitial colure is measured by the angle SPE, contained between that colure and the star's circle of declination. But, when the pole is at O, the right ascension is measured by the angle SOE, and the difference of SPE and SOE is the equation of right as-

ension. The angle SOE consists of two parts, GOE and GOS; GOE remains the same wherever the star S is placed, but GOS varies with the place of the star.—We must first find the variation by which GPE becomes GOE, which variation is common to all the stars. The triangles GPE, GOE, have a constant side GE, and a constant angle G; the variation PO of the side GP is extremely small, and therefore the variation of the angles may be computed by Mr. Cotes's Fluxionary Theorems. See Simpson's Fluxions, sect. 253, &c. As the tangent of the side EP, opposite to the constant angle G, is to the sine of the angle GPE, opposite to the constant side EG, so is PO the variation of the side GP, adjacent to the constant angle, to the variation x of the angle GPO, opposite to the constant side EG. This gives $x = \frac{9'' \times \text{sin. long. node}}{\text{tang. obl. eclip.}}$.

This is subtractive from the mean right ascension for the first six signs of the node's longitude, and additive for the last six signs. This equation is common to all the stars.

We may discover the variation of the other part SOG of the angle, which depends on the different position of the hour circles PS and OS, which causes them to cut the equation in different points, where the arches of right ascension terminate, as follows:—The triangles SPG, SOG, have a constant side SG, and a constant angle G. Therefore, by the same Cotesian theorem, $\tan. SP : \text{sin. SPG} = PO : y$, and y, or the second part of the nutation in right ascension, = $\frac{9'' \times \text{sin. diff. R. A. of star and node}}{\text{cotan. declin. star}}$.

The nutation also affects the declination of the stars: For SP, the mean codeclination, is changed into SO.—Suppose a circle described round S, with the distance SO cutting SP in f; then it is evident that the equation of declin. is $Pf = PO \times \cos. OPf = 9'' \times \text{sign R. A. of star} - \text{long. of node}$.

These are the calculations constantly used in our astronomical researches, founded on Maclain's Theory. When still greater accuracy is required, the elliptical theory must be substituted, by taking (as is expressed by the dotted lines) O in that point of the ellipse described on the transverse axis AC, where it is cut by OM, drawn according to Machin's theory. All the change made here is the diminution of OM in the ratio of 18 to 13.4, and a corresponding diminution of the angle CPO. The detail of it may be seen in De la Lande's Astronomy, art. 2874. The calculations being in every case tedious, and liable to mistakes, on account of the changes of the signs of the different equations, the zealous promoters of astronomy have calculated and published tables of these equations.

We may now consider the precession of the equinoctial points, with its equations, arising from the nutation of the earth's axis, as a physical phenomenon, and endeavour to account for it upon those mechanical principles which have so happily explained all the other phenomena of the celestial motions. Sir Isaac Newton quickly found it to be a consequence, and the most beautiful proof, of the universal gravitation of matter. There is no part of his immortal work

where his sagacity and fertility of resource shine more conspicuously than in this investigation. His investigation, however, was only a shrewd guess, founded on assumptions, of which it would be extremely difficult to demonstrate either the truth or falsity, and which required the genius of a Newton to select in such a complication of abstruse circumstances. The subject has occupied the attention of the first mathematicians of Europe since his time; and is still considered as the most curious and difficult of mechanical problems. The most elaborate and accurate dissertations on the precession of the equinoxes are those of Sylvabella and Walmesly, in the Philosophical Transactions, published about 1754; that of Thomas Simpson, in his Miscellaneous Tracts; that of Frisius, in the Mem. of the Berlin Academy, and afterwards in his Cosmographia; that of Euler in the Memoirs of Berlin; that of D'Alembert in a separate dissertation; and that of de la Grange on the Libration of the Moon, which obtained the prize in the Academy of Paris in 1769. The dissertation of Frisius is thought the most perspicuous of them all, being conducted in the method of geometrical analysis; whereas most of the others proceed in the fluxionary and symbolic method, which does not give the same perspicuous conviction of the truth of the results.

We shall here give a short sketch of Newton's investigation. Let S (fig. 2) be the sun, E the

Fig. 2.

earth, and M the moon, moving in the orbit N M C D n, which cuts the plane of the ecliptic, in the line of the nodes N n, and has one-half raised above it, as represented in the figure, the other half being hid below the ecliptic. Suppose this orbit folded down; it will coincide with the ecliptic in the circle N m c d n. Let E X represent the axis of this orbit, perpendicular to its plane, and therefore inclined to the ecliptic. Since the moon gravitates to the sun in the direction M S, which is all above the ecliptic, it is plain that this gravitation has a tendency to draw the moon towards the ecliptic. Suppose this force to be such that it would draw the moon down from M to i in the time that she would have moved from M to t, in the tangent to her orbit. By the combination of these motions the moon will desert her orbit, and describe the line M r, which makes the diagonal of the

parallelogram; and, if no farther action of the sun be supposed, she will describe another orbit M δ n', lying between the orbit M C D n and the ecliptic, and she will come to the ecliptic, and pass through it in a point n' nearer to M than n is, which was the former place of her descending node. By this change of orbit, the line E X will no longer be perpendicular to it; but there will be another line E x which will now be perpendicular to the new orbit. Also the moon, moving from M to r, does not move as if she had come from the ascending node N, but from a point N lying beyond it; and the line of the orbit in this new position is N' n'. Also the angle M N' m is less than the angle M N m. Thus the nodes shift their places in a direction opposite to that of her motion, or move to the west; the axis of the orbit changes its position, and the orbit itself changes its inclination to the ecliptic. These momentary changes are different in different parts of the orbit, according to the position of the line of the nodes. Sometimes the inclination of the orbit is increased, and sometimes the nodes move to the east. But, in general, the inclination increases from the time that the nodes are in the line of syzygie, till they get into quadrature, after which it diminishes till the nodes are again in syzygie. The nodes advance only while they are in the octants after the quadrature, and while the moon passes from the quadrature to the node, and they recede in all other situations. Therefore the recess exceeds the advance in every revolution of the moon round the earth, and, on the whole, they recede.

What has been said of one moon would be true of each of a continued ring of moons surrounding the earth, and they would thus compose a flexible ring, which would never be flat, but waved, according to the difference (both in kind and degree), of the disturbing forces acting on its different parts. But suppose these moons to cohere, and to form a rigid and flat ring, nothing would remain in this ring but the excess of the contrary tendencies of its different parts. Its axis would be perpendicular to its plane, and its position in any moment will be the mean position of all the axes of the orbits of each part of the flexible ring. Suppose this ring to contract in dimensions, the disturbing forces will diminish in the same proportion, and in this proportion will all their effects diminish. Suppose its motion of revolution to accelerate, or the time of a revolution to diminish; the linear effects of the disturbing forces being as the square of the times of their action, and their angular effects as the times, those errors must diminish also on this account; and we can compute what those errors will be for any diameter of the ring, and for any period of its revolution. We can tell, therefore, what would be the motion of the nodes, the change of inclination, and deviation of the axis, of a ring which would touch the surface of the earth, and revolve in twenty-four hours; nay, we can tell what these motions would be, should this ring adhere to the earth. They must be much less than if the ring were detached. For the disturbing forces of the ring must drag along with it the whole globe of the earth. The quantity of motion which the disturbing forces would have produced in the ring

alone, will now, says Newton, be produced in the whole mass; and therefore the velocity must be as much less as the quantity of matter is greater: but still all this can be computed.

That there is such a ring on the earth is certain; for the earth is not a sphere, but an elliptical spheroid. Sir Isaac Newton, therefore, made a computation of the effects of the disturbing force, and has exhibited a most beautiful example of mathematical investigation. He first asserts that the earth must be an elliptical spheroid, whose polar axis is to its equatorial diameter as 229 to 230. Then he demonstrates that if the sine of the inclination of the equator be called π , and if t be the number of days (sidereal) in a year, the annual motion of a detached ring will

be $360^\circ \times \frac{3\sqrt{1-\pi^2}}{4t}$. He then shows that

the effect of the disturbing force on this ring is to its effect on the matter of the same ring, distributed in the form of an elliptical stratum (but still detached) as 5 to 2; therefore the motion

of the nodes will be $360^\circ \times \frac{3\sqrt{1-\pi^2}}{10t}$, or $16'$

$16'' 24'''$ annually. He then proceeds to show that the quantity of motion in the sphere is to that in the equatorial ring revolving in the same time, as the matter in the sphere to the matter in the ring, and as three times the square of a quadrantal arch to two squares of a diameter, jointly: then he shows that the quantity of matter in the terrestrial sphere is to that in the protuberant matter of the spheroid as 52900 to 461 (supposing all homogeneous). From these premises it follows that the motion of $16' 16'' 24'''$ must be diminished in the ratio of 10717 to 100, which reduces it to $9'' 07'''$ annually. And this, he says, is the precession of the equinoxes, occasioned by the action of the sun; and the rest of the $50\frac{1}{2}''$, which is the observed precession, is owing to the action of the moon nearly five times greater than that of the sun. This appeared a great difficulty; for the phenomena of the tides show that it cannot much exceed twice the sun's force.

The ingenuity of this process is justly celebrated by Daniel Bernouilli, who (in his Dissertation on the Tides, which shared the prize of the French Academy with M'Laurin and Euler) says that Newton saw through a veil what others could hardly discover with a microscope in the light of the meridian sun. His determination of the form and dimensions of the earth, which is the foundation of the whole process, is not offered as any thing better than a probable guess, in re difficilem; and it has been since demonstrated with geometrical rigor by M'Laurin. His next

principle, that the motion of the nodes of the rigid ring is equal to the mean motion of the nodes of the moon, has been most critically discussed by the first mathematicians, as a thing which could neither be proved nor refuted. Frisius has at last shown it to be a mistake, and that the motion of the nodes of the ring is double the mean motion of the nodes of a single moon; and that Newton's own principles should have produced a precession of eighteen seconds and a quarter annually; which removes the difficulty formerly mentioned.

Sir Isaac Newton's third assumption, that the quantity of motion of the ring must be shared with the included sphere, was acquiesced in by all his commentators, till D'Alembert and Euler, in 1749, showed that it was not the quantity of motion round an axis of rotation which remained the same, but the quantity of momentum or rotatory effort. The quantity of motion is the product of every particle by its velocity; that is, by its distance from the axis; while its momentum, or power of producing rotation, is as the square of that distance, and is to be had by taking the sum of each particle multiplied by the square of its distance from the axis. Since the earth differs so little from a perfect sphere, this makes no sensible difference in the result. It will increase Newton's precession about three-fourths of a second.

The source of Newton's mistake in the solution of this intricate problem was first detected by Mr. Landen, in the first volume of his Memoirs. That superior mathematician discovered that when a rigid annulus revolves with two motions, one in its own plane, and the other round one of its diameters, half the motive force acting upon the ring is counteracted by the centrifugal force arising from the compound motion, and half only is efficacious or accelerating the plane of the annulus round its diameter. Mr. Landen did not expressly demonstrate this; but it has been done very completely by Dr. Brinkley, in the seventh volume of the Memoirs of the Irish Academy. We cannot here pursue this subject; but beg to refer the reader to Dr. Milner's paper in the Philosophical Transactions; to Dr. Abram Robertson's paper in the Philosophical Transactions for 1807; to the Dissertation of Frisius already specified; and to the popular view of this problem by M. Laplace in his Exposition, book iv. ch. 13.

To find the precession in right ascension and declination.—Put d = the declination of a star, and a = its right ascension; then their annual variations of precessions will be nearly as follow, viz. $20'' \cdot 084 \times \cos. a$ = the annual precession in declination, and $46'' \cdot 0619 + 20'' \cdot 084 \times \sin. a \times \text{tang. } d$ = that of right ascension.

PRECLÆ, *precious*, early, the twenty-first order in Linnæus's fragments of a natural method; consisting of primrose, an early flowering plant, and a few genera which agree with it in habit and structure. See BOTANY.

PRECINCT, *n. s.* Lat. *præcinctus*. Outward limit; boundary.

The main body of the sea being one, yet within divers *precincts*, hath divers names; so the catholic church is in like sort divided into a number of distinct societies. *Hooker.*

This is the manner of God's dealing with those that have lived within the *precincts* of the church; they shall be condemned for the very want of true faith and repentance. *Perkins.*

Through all restraint broke loose, he wings his way
Nor far off heaven, in the precincts of light,
Directly towards the new created world. *Milton.*
To find our hearthstone turned into a tomb,
And round its once warm precincts palely lying
The ashes of our hopes, is a deep grief,
Beyond a single gentleman's belief. *Byron.*

PRECIOUS, adj. } Fr. *precieux* ; Latin
PRECIOUSLY, adv. } *pretiosus*. Valuable ;
PRECIOUSNESS, n. s. } of great worth ; costly ;
often used in irony: the adverb and noun-substantive follow the senses of the adjective.

A woman that hadde a boxe of alabastre of precious oymement cam to him and schedde out on the heed of lim restyng. *Wiclif. Matt. 26.*

The lips of knowledge are a precious jewel.

Many things which are most precious, are neglected only because the value of them lieth hid. *Hooker.*

I never saw
Such precious deeds in one that promised nought
But beggary and poor luck. *Shakspeare. Cymbeline.*
Its preciousness equalled the price of pearls. *Wilkins.*

Let none admire
That riches grow in hell ; that soil may best
Deserve the precious bane. *Milton.*
The index - or forefinger was too naked whereto to commit their preciousities, and hath the tuition of the thumb scarce upon the second joint. *Brownne.*

Barbarians seem to exceed them in the curiosity of their application of these preciousities. *More.*

Fortune, conscious of your destiny,
Ev'n then took care to lay you softly by ;
And wrapp'd your fate among her precious things,
Kept fresh to be unfolded with your king's.

More of the same kind, concerning these precious saints amongst the Turks, may be seen in Pietro della Valle. *Locke.*

These virtues are the hidden beauties of a soul which make it lovely and precious in his sight, from whom no secrets are concealed. *Addison's Spectator.*

PRECIPICE, n. s. Fr. *precipice* ; Lat. *præcipitium*. A headlong or perpendicular steep.

I ere long that precipice must tread,
Whence none return that leads unto the dead. *Sandys.*

You take a precipice for no leap of danger,
And woo your own destruction. *Shakspeare.*

Where the water dasheth more against the bottom, there it moveth more swiftly and more in precipice ; for in the breaking of the waves there is ever a precipice. *Bacon.*

No stupendous precipice denies
Access, no horror turns away our eyes. *Denham.*

Swift down the precipice of time it goes,
And sinks in minutes, which in ages rose. *Dryden.*

Drink as much as you can get ; because a good coachman never drives so well as when he is drunk ; and then shew your skill, by driving to an inch by a precipice. *Swift.*

PRECIPITANCE, or
PRECIPITANCY, n. s. } Latin
PRECIPITANT, adj. } *precipitans*.
PRECIPITANTLY, adv. } Haste ;
PRECIPITATE, v. a., v. n., adj. & n. s. } rash
PRECIPITATELY, adv. } haste ;
PRECIPITATION, n. s. } hurry :
PRECIPITOUS. } precipi-

tant is, falling or rushing headlong ; hasty ; hurried: the adverb corresponding: precipitate, to urge or throw headlong ; urge on with violence ; hasten ; hurry blindly ; throw to the bottom by a chemical process: as a verb neuter, to fall headlong ; fall to the bottom: precipitate as an adjective is synonymous with precipitant: as a noun substantive, it is a medical term for the red oxide of mercury: precipitately and precipitation correspond with the adjective: precipitous is, steep ; headlong ; hasty ; rash.

Hadst thou been aught but goss'mer feathers ;
So many fathom down precipitating,
Thou'dst shiver like an egg. *Shakspeare. King Lear.*

Let them pile ten hills on the Tarpeian rock,
That the precipitation might down-stretch
Below the beam of sight, yet will I still
Be this to them. *Id. Coriolanus.*

Barcephas saith, it was necessary this paradise should be set at such a height, because the four rivers, had they not fallen so precipitate, could not have had sufficient force to thrust themselves under the great ocean. *Raleigh.*

She had a king to her son-in-law, yet was, upon dark and unknown reasons, precipitated and banished the world into a nunnery. *Bacon.*

As for having them obnoxious to ruin, if they be of fearful natures, it may do well ; but, if they be daring, it may precipitate their designs, and prove dangerous. *Id.*

By strong water every metal will precipitate. *Id.*
Separation is wrought by precipitation or sublimation ; that is, a calling of the parts up or down, which is a kind of attraction. *Id.*

The commotions in Ireland were so sudden and so violent, that it was hard to discern the rise, or apply a remedy to that precipitant rebellion. *King Charles.*

Monarchy, together with me, could not but be dashed in pieces by such a precipitous fall as they intended. *Id.*

Short intermittent and swift recurrent pains do precipitate patients into consumptions. *Harvey.*

They were wont, upon a superstition, to precipitate a man from some high cliff into the sea, tying about him with strings many great fowls. *Wilkins.*

Dear Frythraë, let not such blind fury
Precipitate your thoughts, nor set them working,
Till time shall lend them better means
Than lost complaints. *Denham's Sophy.*

The archbishop, too precipitate in pressing the reception of that which he thought a reformation, paid dearly for it. *Clarendon.*

Thither they haste with glad precipitance. *Milton.*

Without longer pause,
Downright into the world's first region throws
His flight precipitant. *Id. Paradise Lost.*

As the chymist, by catching at it too soon, lost the philosophical elixir, so precipitancy of our understanding is an occasion of error. *Glanville.*

Though the attempts of some have been precipitous, and their enquiries so audacious as to have lost themselves in attempts above humanity, yet have the enquiries of most defected by the way. *Brownne's Vulgar Errors.*

The goddess guides her son, and turns him from
the light,
Herself involved in clouds, precipitates her flight. *Dryden.*

Thus framed for ill, he loosed our triple hold,
Advice unsafe, precipitous, and bold. *Id.*
How precious the time is, how precipitous the oc-

casian, how many things to be done in their just season, after once a ground is in order. *Evelyn.*

The birds heedless while they strain
Their tuneful throats, the towing heavy lead
O'ertakes their speed; they leave their little lives
Above the clouds, precipitant to earth. *Philips.*

Gold endures a vehement fire long without any change, and, after it has been divided by corrosive liquors into invisible parts, yet may presently be precipitated, so as to appear again in its own form.

Greew's Cosmologia.

When the full stores their ancient bounds disdain,
Precipitate the furious torrent flows;
In vain would speed avoid, or strength oppose.

That could never happen from any other cause than the hurry, precipitation, and rapid motion of the water, returning at the end of the deluge towards the sea. *Woodward.*

Mr. Gay died of a mortification of the bowels; it was the most precipitate case I ever knew, having cut him off in three days. *Arbuthnot.*

As the escar separated, I rubbed the super-
excrecence with the vitriol stone, or sprinkled it
with precipitate. *Wiseman.*

Should he return, that troop so blithe and bold,
Precipitant in fear, would wing their flight,
And curse their cumbrous pride's unwieldy weight.

Pope.

Not so bold Arnall; with a weight of skull
Furious he sinks, precipitately dull.

Id. Dunciad.

Hurried on by the precipitancy of youth, I took
this opportunity to send a letter to the secretary.

Swift.

A rashness and precipitance of judgment, and hasti-
ness to believe something on one side or the other,
plunges us into many errors. *Watts's Logick.*

We are complicated machines; and though we
have one main spring, that gives motion to the whole,
we have an infinity of little wheels, which, in their
turns, retard, precipitate, and sometimes stop, the
motion. *Chesterfield.*

PRECIPITATION, in chemistry, the process of
decomposition by which any body separates
from others in a solution and falls to the bottom:
thus, if to an acid and an oxide a third body as
an alkali be added, then the alkali having a
greater affinity to the acid than the metallic
oxide has, combines with it, and the oxide in
consequence precipitates, or appears in a sepa-
rate state at the bottom. The substance thus
sinking is called the precipitate, and that, by the
addition of which this effect is produced is called
the precipitant. Sir Humphry Davy found that
whenever one metal precipitates another from its
acid solution, the body that falls down is usually
free both from acid and oxygen; and that the
whole of the oxygen and the acid, is transferred
from one metal to the other.

PRECISE, *adj.* } Fr. *precis*; Lat. *præ-*
PRECISELY, *adv.* } *cisus*. Exact; strict;
PRECISENESS, *n. s.* } nice; having definite li-
PRECISIAN, } mits; formal: precisely
PRECISION, } and preciseness corre-
PRECISIVE, *adj.* } spond with this, and pre-
cision is synonymous with the latter: a precisian
is one who limits or restrains with exactness or
rigor: precise, exactly limited.

In his track my wary feet have stept,
His undeclined ways precisely kept. *Sandys.*
Means more durable to preserve the laws of God

from oblivion and corruption grew in use, not with-
out precise direction from God himself. *Hooker.*

Doth it follow that all things in the church, from
the greatest to the least, are unholy, which the Lord
hath not himself precisely instituted? *Id.*

You'll not bear a letter for me; you stand upon
your honour; why, thou unconformable baseness, it is
as much as I can do to keep the term of mine honour
precise. *Shakespeare.*

He knows,

He cannot so precisely weed this land

As his misdoubts present occasion,

His foes are so enrouted with his friends. *Id.*

Though love use reason for his precisian, he admits
him not for his counsellor. *Id.*

The state hath given you licence to stay on land
six weeks, and let it not trouble you if your occa-
sions ask farther time; for the law in this point is not
precise. *Bacon.*

I will distinguish the cases; though give me leave,
in the handling of them, not to sever them with too
much preciseness. *Id.*

These men, for all the world, like our precisians
be,

Who for some cross or saint they in the window see
Will pluck down all the church. *Drayton.*

Where more of these orders than one shall be set
in several stories, there must be an exquisite care to
place the columns precisely one over another.

Wotton's Architecture.

In human actions there are no degrees and precise
natural limits described, but a latitude is indulged.

Taylor.

Let us descend from this top

Of speculation; for the hour precise

Exacts our parting. *Milton's Paradise Lost.*

The time, to find the age of the moon, cannot shew
precisely an exact account of the moon, because of
the inequality of the motions of the sun and of the
moon. *Holder.*

He that thinks of being in general, thinks never
of any particular species of being; unless he can
think of it with and without precision at the same
time. *Locke.*

The raillery of the wits in king Charles the Se-
cond's reign, upon every thing which they called
precise, was carried to so great an extravagance that
it almost put all Christianity out of countenance.

Addison.

Measuring the diameter of the fifth dark circle,
I found it the fifth part of an inch precise.

Newton's Opticks.

The reasonings must be precise, though the prac-
tice may admit of great latitude. *Arbutnot.*

I was unable to treat this part more in detail,
without sacrificing perspicuity to ornament, without
wandering from the precision or breaking the chain
of reasoning. *Pope.*

The precise difference between a compound and
collective idea is this, that a compound idea unites
things of a different kind, but a collective, things of
the same kind. *Watts.*

A profane person calls a man of piety a precisian.

Id.

Precise abstraction is when we consider those
things apart which cannot really exist apart; as
when we consider mode, without considering its sub-
stance or subject. *Id.*

What is the world? a term which men have got
To signify not one in ten knows what.
A term which with no more precision passes,
To point out herds of men than heads of asses!
In common use no more it means, we find,
Than many fools in same opinions joined.

Churchill.

PRECLUDE', v. a. Lat. *præcludo*. To shut out or hinder by anticipation.

This much will obviate and *preclude* the objections of our adversaries, that we do not determine the final cause of the systematical parts of the world, merely as they have respect to the exigencies or conveniences of life. *Bentley.*

If you once allow them such an acceptance of chance, you have *precluded* yourself from any more reasoning against them. *Id.*

I fear there will be no way left to tell you, that I entirely esteem you; none but that which no bills can *preclude*, and no king can prevent. *Pope.*

PRECO'CIOUS, adj. } Fr. *precocis*; Latin
PRECO'CI'Y. } *præcociis*. Ripe before the time: too early ripeness.

I may say of the younglings of our time, that *precocity* of understanding supplieth age and stature. *Bp. Hall.*

Some impute the cause of his fall to a *precocity* of spirit and valour in him; and that therefore some infectious southern air did blast him. *Howel.*

Many *precocious* trees, and such as have their spring in the winter, may be found in most parts. *Browne.*

And every body but his mother deemed Him almost man; but she flew in a rage And bit her lips (for else she might have screamed) If any said so, for to be *precocious* Was in her eyes a thing the most atrocious. *Byron.*

PRECONCEIT', n. s. *Præ* and conceit. An opinion previously formed.

A thing in reason impossible, which notwithstanding through their misfashioned *preconceit* appeared unto them no less certain than if nature had written it in the very foreheads of all the creatures. *Hooker.*

In a dead plain the way seemeth the longer because the eye hath *preconceited* it shorter than the truth; and the frustration of that maketh it seem so. *Bacon.*

Custom with most men prevails more than truth; according to the notions and *preconceptions* which it hath formed in our minds, we shape the discourse of reason itself. *Hakewill.*

Fondness of *preconceived* opinions is not like to render your reports suspect, nor for want of care, defective. *Glanville.*

The reason why men are so weak in governing is, because most things fall out accidentally, and come not into any compliance with their *preconceived* ends, but they are forced to comply subsequently. *South.*

PRECONTRACT, n. s. *Præ* and contract. As a verb, accented on the last syllable. A contract previous to another.

He is your husband on a *precontract*;
To bring you thus together, 'tis no sin. *Shakspeare.*

Some are such as a man cannot make his wife, though he himself be unmarried, because they are already *precontracted* to some other; or else are in too near a degree of affinity or consanguinity. *Ayliffe.*

PRE'CURSE, n. s. Lat. *præcurro*. Fore-running.

The like *precurse* of fierce events,
As harbingers preceding still the fates,
And prologue to the omen coming on
Have heaven and earth together demonstrated. *Shakspeare.*

Job's lightnings, the *precursors*
Of dreadful thunder claps, more momentary
Were not. *Id. Tempest.*
This contagion might have been presaged upon consideration of its *precursors*, viz. a rude winter, and a close, sulphurous and fiery air. *Harvey.*

Thomas Burnet played the *precursor* to the coming of Homer in his Homerides. *Pope.*

PREDACEOUS, adj. } Lat. *præda*. Liv-
PRED'AL, } } ing by prey; plun-
PRED'ATORY. } } dering.

The king called his parliament, where he exaggerated the malice and the cruel *predatory* war made by Scotland. *Bacon.*

As these are endowed with poison, because they are *predaceous*: so these need it not, because their food is near at hand, and may be obtained without contest. *Derham.*

Sarmatæ, laid by *predal* rapine low,
Mourned the hard yoke, and sought relief in vain. *Boysse.*

PREDECEASED, adj. *Præ* and deceased. Dead before.

Will you mock at an ancient tradition, begun upon an honourable respect, and worn as a memorable trophy of *predeceased* valour? *Shakspeare.*

PREDECESSOR, n. s. Fr. *predecesseur*; Lat. *præ* and *cededo*. One that was in any state or place before another; an ancestor.

In these pastoral pastimes a great many days were spent to follow their flying *predecessors*. *Sidney.*

There is cause why we should be slow and unwilling to change, without very urgent necessity, the ancient ordinances, rites, and approved customs of our venerable *predecessors*. *Hooker.*

If I seem partial to my *predecessor* in the laurel, the friends of antiquity are not few. *Dryden.*

The present pope, who is well acquainted with the secret history, and the weakness of his *predecessor*, seems resolved to bring the project to its perfection. *Addison.*

The more beautiful Chloe sat to thee,
Good Howard, emulous of Apelles' art;
But happy thou from Cupid's arrow free,
And flames that pierced thy *predecessor's* heart. *Prior.*

PREDESTINATE, v. a. & v. n. } Fr. *pre-*
PREDESTINA'RIAN, n. s. } } *destiner*;
PREDESTINA'TION, } } Latin *præ*
PREDESTINATOR, } } and *desti-*
PREDESTINE, v. a. } } *no*. To ap-

point beforehand: in ludicrous language, to hold predestination: *predestinarian*, one who holds that doctrine; see below. *Predestinator* is used out of all analogy by Cowley as synonymous with *predestinarian*: to *predestine* is to decree beforehand.

Whom he did foreknow, he also did *predestinate* to be conformed to the image of his son. *Romans.*

Having *predestinated* us unto the adoption of children by Jesus Christ to himself. *Ephesians* i. 5.

Some gentleman or other shall 'scape a *predestinate* scratch face. *Shakspeare.*

Predestination we can differance no otherwise from providence and prescience, than this, that prescience only foreseeth, providence foreseeth and carth for, and hath respect to all creatures, and *predestination* is only of men; and yet not of all to men belonging, but of their salvation properly in the common use of divines; or perdition, as some have used it.

Raleigh's History of the World

Why does the *predestinarian* so adventurously climb into heaven, to ransack the celestial archives, read God's hidden decrees, when with less labour he may secure an authentick transcript within himself?

Decay of Piety.

Me, mine example let the Stoicks use,
Their sad and cruel doctrine to maintain;
Let all *predestinators* me produce,
Who struggle with eternal fate in vain. *Cowley.*

Nor can they justly accuse
Their maker, or their making, or their fate;
As if *predestination* overruled
Their will, disposed by absolute decree,
Or high fore-knowledge.

Milton's Paradise Lost.

His ruff crest he rears,
And pricks up his *predestinating* ears.

Dryden.

Ye careful angels, whom eternal fate
Ordains on earth and human acts to wait,
Who turn with secret power this restless ball,
And bid *predestinal* empires rise and fall. *Prior.*

PREDESTINATION is, according to the Calvinistic writers, the decree of God, whereby he hath from all eternity unchangeably appointed whatsoever comes to pass; and hath more especially fore-ordained certain individuals of the human race to everlasting happiness, and hath passed by the rest, or fore-ordained them to everlasting misery. The former of these are called the elect, and the latter the reprobate. This doctrine is the subject of one of the most perplexing controversies that have occurred among mankind. But it is not peculiar to the Christian faith. It has always been in some degree a popular opinion, and has been believed by many speculative men. The ancient Stoicks, Zeno and Chrysippus, whom the Jewish Essenes seem to have followed, asserted the existence of a Deity that, acting wisely, but necessarily, contrived the general system of the world; from which, by a series of causes, whatever is now done in it unavoidably results. This series or concatenation of causes, they held to be necessary in every part; and that God himself is so much the servant of necessity, and of his own decrees, that he could not have made the smallest object in the world otherwise than it now is, much less is he able to alter any thing. Seneca gives a similar account of the doctrine of fate. See NECESSITY. The Stoical fate differs, however, from the Christian predestination in several points. They regard the divine nature and will as a necessary part of a chain of causes; whereas all Christians consider the Deity as the Lord and Ruler of the universe, omnipotent and free, appointing all things according to his pleasure. Being doubtful of the immortality of the soul, the Stoicks could have no idea of the doctrine of election and reprobation; nor did they ever doubt their own freedom of will, or power of doing good as well as evil, as the Christian predestinarians have done. Mahomet introduced into his Koran the doctrine of an absolute predestination in the strongest terms. In the Christian Church the controversy concerning predestination first made its appearance about the beginning of the fifth century, in consequence of the heretical opinions advanced by Pelagius and Cælestius. See PELAGIANS. These were zealously

opposed by the celebrated St. Augustine, bishop of Hippo, who first asserted the leading tenets of the Predestinarians. The dispute was carried on with great zeal. Zosimus, bishop of Rome, decided at first in favor of Pelagius, but afterwards altered his opinion. The council of Ephesus approved of St. Augustine's doctrine, and condemned that of his opponents. These opinions soon after assumed various modifications. A party called predestinarians carried Augustine's doctrine farther than he had done, and said that God had decreed the sins as well as punishment of the wicked. Another party moderated Pelagius's doctrine, and were called SEMI-PELAGIANS. (See that article.) But the doctrine of St. Augustine, who wrote several treatises on the subject, became general. He was the oracle of the school-men. They only disputed about the true sense of his writings.

The whole of the earliest reformers maintained these opinions of Augustine. Under Luther they only assumed a more regular and systematic form than they had before exhibited. But, as the Lutherans afterwards abandoned them, they are now known by the name of Calvinistic doctrines, from John Calvin of Geneva. The opponents of the doctrine of predestination among the Protestants usually receive the appellation of Arminians or Remonstrants. They derive the first of these appellations from James Arminius, professor of theology at Leyden, and the second from the Arminians who remonstrated against the synod of Dort. (See ARMINIUS.) A counter remonstrance was presented, containing the opinions of the Calvinists, which was approved of by the synod. The substance of it was afterwards adopted in nearly the same expressions into the Confession of Faith, compiled by the assembly of divines at Westminster in 1643; which every clergyman of the church of Scotland subscribes previous to his admission. It runs thus:—'God from all eternity did, by the most wise and holy counsel of his own will, freely and unchangeably ordain whatsoever comes to pass: yet so, as thereby neither is God the author of sin, nor is violence offered to the will of the creatures, nor is the liberty or contingency of second causes taken away, but rather established. Although God knows whatsoever may or can come to pass upon all supposed conditions; yet hath he not decreed any thing because he foresaw it as future, or that which would come to pass upon such conditions. By the decree of God, for the manifestation of his glory, some men and angels are predestinated unto everlasting life, and others are fore-ordained to everlasting death. These angels and men, thus predestinated and fore-ordained, are particularly and unchangeably designed; and their number is so certain and definite that it cannot be either increased or diminished. Those of mankind that are predestinated unto life, God, before the foundation of the world was laid, according to his eternal and immutable purpose, and the secret council and good pleasure of his will, hath chosen, in Christ, unto everlasting glory, out of his mere free grace and love, without any foresight of faith, good works, or perseverance in either of them, or any other thing in the

creature, as conditions or causes moving him thereunto; and all to the praise of his glorious grace. As God hath appointed the elect unto glory, so hath he, by the eternal and most free purpose of his will, fore-ordained all the means thereunto. Wherefore, they who are elected, being fallen in Adam, are redeemed by Christ, are effectually called unto faith in Christ, by his Spirit working in due season; are justified, adopted, sanctified, and kept, by his power through faith unto salvation. Neither are any other redeemed by Christ, effectually called, justified, adopted, sanctified, and saved, but the elect only. The rest of mankind God was pleased, according to the unsearchable counsel of his own will, whereby he extended or withholdeth mercy as he pleaseth, for the glory of his sovereign power over his creatures, to pass by, and to ordain them to dishonor and wrath for their sin, to the praise of his glorious justice.

There are two kinds of modern Calvinists or Predestinarians, viz. the Supralapsarians, who maintain that God did originally and expressly decree the fall of Adam, as a foundation for the display of his justice and mercy; while those who maintain that God only permitted the fall of Adam are called Sublapsarians; their system of decrees concerning election and reprobation being, as it were, subsequent to that event. But, as Dr. Priestley justly remarks, if we admit the divine prescience, there is not, in fact, any difference between the two schemes; and, accordingly, that distinction is now seldom mentioned. Nor was the church of Rome less agitated by the contest about predestination than the first Protestants were. The council of Trent was much perplexed how to settle the matter without giving offence to the Dominicans, who were much attached to the doctrine of Augustine, and possessed great influence in the council. After much dispute, the great object came to be, how to contrive such a decree as might give offence to nobody, and decide nothing. Upon the whole, however, they seem to have favored the Semi-pelagian scheme. Among other things, it was determined that good works are of themselves meritorious to eternal life; but it is added, by way of softening, that it is through the goodness of God that he makes his own gifts to be merits in us. Catarin revived at that council an opinion of some of the schoolmen, that God chose a small number of persons, such as the blessed virgin, the apostles, &c., whom he was determined to save without any foresight of their good works; and that he also wills that all the rest should be saved, providing for them all necessary means, but they are at liberty to use them or not. This is called in England the Baxterian scheme. The Jesuits at first followed the opinion of Augustine; but afterwards forsook it. Molina, one of their order, was the author of what is called the middle scheme, or the doctrine of a grace sufficient for all men, but subject to the freedom of the human will. Jansenius, a doctor of Louvain, opposed the Jesuits with great vigor, and supported the doctrine of Augustine. (See JANSENISTS.) But the Jesuits had sufficient interest at Rome to procure the

opinions of Jansenius to be condemned. These disputes have never been fully settled, and still divide even the Roman Catholic church. Some of the ablest supporters of Predestination have appeared among the Jansenists, and particularly among the gentlemen of Port-Royal. With regard to Great Britain, the earliest English reformers were in general Sublapsarians, although some of them were Supralapsarians. But the rigid Predestinarians have been gradually declining in number in that church, although they still subscribe the thirty-nine articles. The celebrated Scottish Reformer, John Knox, having been educated at Geneva, established in his own country the doctrine of predestination in its strictest form: and it has probably been adhered to more strictly in Scotland than in any part of Europe. Of late years, however, the dispute concerning predestination has assumed a form considerably different from that which it formerly possessed. Instead of being considered as a point to be determined almost entirely by the Sacred Scriptures, it has, in the hands of a number of able writers, in a great measure resolved itself into a question of natural religion, under the head of the philosophical liberty or necessity of the will. (See METAPHYSICS and NECESSITY.) Readers who wish for farther information on this subject may consult the writings of lord Kames, Jonathan Edwards, and Dr. Priestley, one of the most celebrated Necessitarians of his age. To give even a sketch of the arguments on both sides would far exceed our bounds. Milton, an eminent philosopher and divine, as well as the first of poets, when he wished to exhibit the fallen angels themselves as perplexed by questions above their comprehension, set them to dispute about predestination:—

They reasoned high, of knowledge, will, and fate,
Fixed fate, free-will, fore-knowledge absolute;
And found no end, in wand'ring mazes lost.

PREDETERMINE, *v. a.* *Præ* and *determine*. To doom or confine by previous decree.

We see in brutes certain sensible instincts antecedent to their imaginative faculty, whereby they are *predetermined* to the convenience of the sensible life.

Hale.

This *predetermination* of God's own will is so far from being the determining of ours, that it is distinctly the contrary; for supposing God to predetermine that I shall act freely; 'tis certain from thence, that my will is free in respect of God, and not *predetermined*.

Hammond's Fundamentals.

The truth of the catholic doctrine of all ages, in points of *predetermination* and irresistibility, stands in opposition to the Calvinists.

Hammond.

PREDIAL, *adj.* *Lat. prædium*. Consisting of farms.

By the civil law, their *predial* estates are liable to fiscal payments and taxes, as not being appropriated for the service of divine worship, but for profane uses.

Ayliffe.

PREDICABLE, *n. s. & adj.* } *Lat. prædicabile*. A logical term, denoting one of the five things which can be affirmed: such as may be affirmed: predicament is a class or arrangement of beings

PREDICAMENT,

PREDICATE, *v. a., v. n. & n. s.* }

PREDICATION, *n. s.* }

or things: hence class case or condition of any kind: predicant, one who affirms: to predicate, to affirm any thing of another: to comprise an affirmation; affirm in any way; or that which is affirmed or denied of the subject: predication, affirmation.

The offender's life lies in the mercy
Of the duke only, 'gainst all other voice;
In which *predicament* I say thou stand'st.

Shakespeare.

I shew the line and the *predicament*,
Wherein you range under this subtle king. *Id.*
God then is light in himself; so in relation to us:
and this *predication* of light serves to confirm our
conformity to God in his behalf. *Bp. Hall.*

If there were nothing but bodies to be ranked by
them in the *predicament* of place, then that descrip-
tion would be allowed by them as sufficient.

Digby on Bodies.

It were a presumption to think that any thing in
any created nature can bear any perfect resemblance
of the incomprehensive perfection of the divine na-
ture, very being itself not *predicating* univocally
touching him and any created being. *Hale.*

All propositions, wherein a part of the complex
idea, which any term stands for, is *predicated* of that
term, are only verbal; v. g. to say that gold is a
metal. *Locke.*

Let us reason from them as well as we can; they
are only about identical *predications* and influence.

Id.

These they call the five *predicables*; because every
thing that is affirmed concerning any being, must be
the genus, species, difference, some property, or acci-
dent. *Watts.*

The *predicate* is that which is affirmed or denied of
the subject. *Id. Logic.*

PREDICT, *v. a.* } *Fr. predire*; *Lat. præ-*
PREDICTIO, *n. s.* } *dictus.* To foretell; to
PREDICTOR. } foreshow: prediction is
declaration or revelation of something future;
prophecy: predictor is a foreteller.

These *predictions*

Are to the world in general, as to Cæsar.

Shakespeare.

The *predictions* of cold and long winters, hot and
dry summers, are good to be known. *Bacon.*

How soon hath thy *prediction*, seer blest!

Measured this transient world the race of time.

Till time stand fixed. *Milton's Paradise Lost.*

In Christ they all meet with an invincible evi-
dence, as if they were not *predictions*, but after-rela-
tions; and the penmen of them not prophets but
evangelists. *South.*

He is always inveighing against such unequal dis-
tributions; nor does he ever cease to *predict* public
ruins, till his private are repaired.

Government of the Tongue.

He, who prophesied the best,
Approves the judgment to the rest;
He'd rather choose that I should die,
Than his *prediction* prove a lie.

Swift's Miscellanies.

Whether he has not been the cause of this poor
man's death, as well as the *predictor*, may be dis-
puted. *Swift.*

PREDIGESTION, *n. s.* *Præ* and digestion.
Digestion too soon performed.

Predigestion, or hasty digestion, fills the body
full of crudities and seeds of diseases.

Bacon's Essays.

PREDISPOSE, *v. a.* *Præ* and dispose. To
adapt previously to any certain purpose.

Tunes and airs have in themselves some affinity
with the affections; so as it is no marvel if they
alter the spirits, considering that tunes have a *pre-*
disposition to the motion of the spirits. *Bacon.*

Vegetable productions require heat of the sun, to
predispose, and excite the earth and the seeds.

Burnet.

Unless nature be *predisposed* to friendship by its
own propensity, no arts of obligation shall be able
to abate the secret hatred of some persons towards
others. *South.*

External accidents are often the occasional cause
of the king's evil; but they suppose a *pre-disposition*
of the body. *Wiseman.*

PREDOMINATE, *v. n.* } *Fr. predominer*;
PREDOMINANCE, *n. s.* } *Lat. præ and do-*
PREDOMINANT, *adj.* } *minor.* To pre-
vail; be ascendant; be supreme: predominance
is prevalence; superiority; ascendancy: predomi-
nant, prevalent; ascendant.

Miserable were the condition of that church, the
weighty affairs whereof should be ordered by those
deliberations, wherein such an humour as this were
predominant. *Hooker.*

We make guilty of our disasters, the sun, the
moon, and the stars, as we if we were knaves, thieves,
and treacherous by spherical *predominance*.

Shakespeare.

Foul subordination is *predominant*,

And equity exiled your highness' land. *Id.*

Those helps were overweighed by things that
made against him, and were *predominant* in the
king's mind. *Bacon.*

So much did love t' her executed lord
Preponderate in this fair lady's heart.

Daniel.

In human bodies there is an incessant warfare
amongst the humours for *predominancy*. *Hewel.*

Whether the sun, *predominant* in heaven,
Rise on the earth; or earth rise on the sun.

Milton.

An inflammation consists only of a sanguineous
affluxion, or else is denominable from other humours,
according to the *predominancy* of melancholy, phlegm,
or choler. *Broune.*

The true cause of the Pharisees' disbelief of
Christ's doctrine was, the *predominance* of their covetousness and ambition over their will. *South.*

The gods formed women's souls out of these prin-
ciples which compose several kinds of animals; and
their good or bad disposition arises, according as
such and such principles *predominate* in their consti-
tutions. *Addison.*

The several rays in white light do retain their co-
loric qualities, by which those of any sort, when-
ever they become more copious than the rest, do, by
their excess and *predominance*, cause their proper co-
lour to appear. *Newton.*

The rays, reflected least obliquely, may *predomi-*
nate over the rest, so much as to cause a heap of such
particles to appear very intensely of their colour.

Id. Opticks.

I could shew you several pieces, where the beauties
of this kind are so *predominant*, that you could never
be able to read or understand them. *Swift.*

Where judgment is at a loss to determine the
choice of a lady who has several lovers, fancy may
the more allowably *predominate*. *Clarissa.*

If ever he fell into a fit of the gout, or if any other
cause withdrew him from public cares, principles di-
rectly contrary were sure to *predominate*.

Burke. Character of Lord Chatham.

It is the prevalence or *predominance* of any parti-
cular passion which gives the turn or tincture to a

man's temper, by which he is distinguished, and for which he is loved or esteemed, or shunned and despised by others. *Mason.*

PREEMINENCE, n. s. } Fr. *preeminence* ;
PREEMINENT, adj. } Lat. *præ* and *eminence*. It has been written, to avoid the junction of *ee*, *prehemine*. Excellence; superiority of merit or station: pre-eminent is excellent; superior.

His lance brought him captives to the triumph of Artesia's beauty, such as, though Artesia be amongst the fairest, yet in that company were to have the *preeminence*. *Sidney.*

That which standeth on record hath *preeminence* above that which passeth from hand to hand, and hath no pens but the tongues, no book but the ears of men. *Hooker.*

I do invest you jointly with my power, *Preeminence*, and all the large effects

That troop with majesty. *Shakspeare. King Lear.*

The English desired no *preeminence*, but offered equality both in liberty and privilege, and in capacity of offices and employments. *Hayward.*

It is a greater *preeminence* to have life, than to be without it; to have life and sense, than to have life only; to have life, sense, and reason, than to have only life and sense. *Wilkins.*

Tell how came I here? by some great maker In goodness and in power *preeminent*. *Milton.*

Beyond the equator, the southern point of the needle is sovereign, and the north submits his *preeminence*. *Browne.*

I plead for the *preeminence* of epick poetry. *Dryden.*

We claim a proper interest above others, in the *preeminent* rights of the household of faith. *Sprat.*

Am I distinguished from you but by toils,

Superior toils, and heavier weight of cares?

Painful *preeminence* ! *Addison's Cato.*

PREEMPTION, n. s. Lat. *præemptio*. The right of purchasing before another.

Certain persons, in the reigns of king Edward VI. and queen Mary, sought to make use of this *preemption*, but, crossed in the prosecution, or defeated in their expectation, gave it over. *Carew.*

PREENGAGE', v. a. } *Præ* and *engage*.

PREENGAGEMENT, n. s. } To engage by precedent ties or contracts: the noun substantive corresponding.

Men are apt to think that those obediences they pay to God shall, like a *preengagement*, disannul all after-contracts made by guilt. *Decay of Piety.*

The opinions, suited to their respective tempers, will make way to their assent, in spite of accidental *preengagements*. *Glauville.*

My *preengagements* to other themes were not unknown to those for whom I was to write. *Boyle.*

To Cipseus by his friends his suit he moved,

But he was *preengaged* by former ties. *Dryden.*

As far as opportunity and former *preengagements* will give leave. *Collier of Friendship.*

The world has the unhappy advantage of *preengaging* our passions at a time when we have not reflection enough to look beyond the instrument to the hand whose direction it obeys. *Rogers's Sermons.*

PREEXIST, v. a. } Lat. *præ* and *existo*.

PREEXISTENCE, n. s. } To exist beforehand:
PREEXISTENT, adj. } the noun-substantive and adjective corresponding.

If thy *preexisting* soul,

Was formed at first with myriads more

It did through all the mighty poets roll. *Dryden.*

Wisdom declares her antiquity and *preexistence* to all the works of this earth. *Burnet.*

Artificial things could not be from eternity, because they suppose man, by whose art they were made *preexistent* to them; the workman must be before the work. *H.*

As Simonides has exposed the vicious part of woman from the doctrine of *preexistence*; some of the ancient philosophers have satirised the vicious part of the human species, from a notion of the soul's *postexistence*. *Addison.*

If this *preexistent* eternity is not compatible with a successive duration, then some being, though infinitely above our finite comprehensions, must have had an identical, invariable continuance from all eternity, which being is no other than God. *Bentley.*

Blind to former, as to future fate,

What mortal knows his *preexistent* state?

Pope.

PRE-EXISTENCE is a priority of being, or the being of one thing before another. Thus a cause is in nature pre-existent to its effect. The Peripatetics, though they maintained the eternity of the world, were likewise dogmatical in their opinion that the universe was formed, actuated, and governed, by a sovereign intelligence. Mr. Hume's speculations also, on this abstruse and arduous subject, had a greater tendency to dissipate its gloom than that philosopher himself could imagine. The pre-existence of the human soul to its corporeal vehicle had been from time immemorial a prevailing opinion among the Asiatic sages, and from them was perhaps transferred by Pythagoras to the philosophy of the Greeks; but his metempsychosis is too trivial either to be seriously proposed or refuted. Nevertheless, from the sentiments of Socrates concerning the immortality of the soul, delivered in his last interview with his friends, it is obvious that the tenet of pre-existence was a doctrine of the Platonic school. But their hypothesis was totally unsupported by fact, except the solitary pretence of Pythagoras, that his soul had formerly animated the body of Euphorbus; a fable evidently invented to support his doctrine of transmigration. After the Christian religion had been considerably diffused, and warmly combated by its philosophical antagonists, the same doctrine was resumed and taught at Alexandria, by Platonic proselytes, not only as a topic constituent of their master's philosophy, but as an answer to those formidable objections which had been deduced from the doctrine of original sin, and from the vices which stain, and the calamities which disturb human life. For the human beings introduced by them to the theatre of probation had already attained the capacity of moral agents; as their crime therefore was voluntary their punishment might be just.

The word has also been used with regard to the divinity of our Saviour. The Arians, who allowed the subordinate divinity of our Saviour, believed him pre-existent to all time, and before all worlds; but the Socinians, who esteemed his nature, as well as his person, merely human, insisted that before his incarnation he was only pre-existent in the divine idea, not in nature or person.

PREFACE, *n. s., v. n. &* } French *preface* ;
PREFACER, } Latin *præfatio*.
PREFATORY, *adj.* } Something intro-
 ductory to the main design; introduction; to
 say or introduce something proemial; a prefacer
 is the author of a preface: prefatory, introduc-
 tory; preparative.

This superficial tale
 Is but a *preface* to her worthy praise.

Shakspeare.

Sir Thomas More betrayed his depth of judgment
 in state affairs in his *Utopia*, than which, in the opi-
 nion of Budæus, in a *preface* before it, our age hath
 not seen a thing more deep.

Peacham.

I love to wear clothes that are flush,

Not *prefacing* old rags with plush.

Heaven's high behest no *preface* needs.

Wheresoe'er he gave an admonition, he *prefaced*
 it always with such demonstrations of tenderness.

Fell.

If there be not a tolerable line in all these six,
 the *prefacer* gave me no occasion to write better.

Dryden.

If this proposition, whosoever will be saved, be
 restrained only to those to whom it was intended,
 the Christians, then the anathema reaches not the
 heathens, who had never heard of Christ: after all,
 I am far from blaming even that *prefatory* addition
 to the creed.

Id.

Before I enter upon the particular parts of her
 character, it is necessary to *preface* that she is the
 only child of a decrepid father.

Spectator.

It is lamentable to behold with what lazy scorn
 many of the yawning readers in our age, now-a-days,
 travel over forty or fifty pages of *preface* and dedica-
 tion (the usual modern stint) as if it were so much
 Latin.

Swift.

Thou art rash,

And must be *prefaced* into government.

Southern.

PREFECT, *n. s.* } Lat. *præfectus*. Govern-
PREFECTURE. } nor; commander: *prefec-*
 ture is his office or sphere of government.

He is much

The better soldier, having been a tribune,

Prefect, lieutenant, prætor in the war.

Ben Jonson.

It was the custom in the Roman empire for the
prefects and viceroys of distant provinces to transmit
 a relation of every thing remarkable in their admin-
 istration.

Addison.

The **PREFECT**, in ancient Rome, was one of
 the chief magistrates who governed in the ab-
 sence of the kings, consuls, and emperors. This
 power was greatest under the emperors. His
 chief care was the government of the city, taking
 cognizance of all crimes committed therein, and
 within 100 miles. He judged capitally and
 finally, and even presided in the senate. He
 had the superintendance of the provisions, build-
 ing, and navigation.

The **PREFECT OF THE PRÆTORIUM** was the
 leader of the pretorian bands destined for the em-
 peror's guards, consisting, according to Dion, of
 100,000 men. This officer, according to Suetonius,
 was instituted by Augustus, and usually taken
 from among the knights. By the favor of the
 emperors his power grew very considerable; to
 reduce which, Constantine divided the *prefec-
 ture* of the prætorium into four *prefectures*, and
 each of these again he subdivided into civil and

military departments, the title being reserved to
 him who was invested with the civil authority,
 and that of *cesares belli* given him who com-
 manded the cohorts.

PREFER, *v. a.*

PREFERABLE, *adj.*

PREFERABLENESS, *n. s.*

PREFERABLY, *adv.*

PREFERENCE, *n. s.*

PREFERMENT.

before, and *to*, before the object postponed; to
 advance; exalt; raise; exhibit; offer or propose
 solemnly: preferable is eligible before some
 other thing or person; the adverb and noun
 substantive corresponding: preference is, the act
 of preferring; electing; esteeming or raising one
 thing before another: preferment, advancement;
 promotion; place of honor or advantage; par-
 ticularly a church living.

If I do not remember thee, let my tongue cleave
 to the roof of my mouth; if I *prefer* not Jerusalem
above my chief joy.

Psalms.

He that cometh after me is *preferred before* me,
 for he was before me.

John i. 15.

In honour *preferring* one another.

Romans.

I, when my soul began to faint,

My vows and prayers to thee *preferred*:

The Lord my passionate complaint,

Even from his holy temple, heard.

Sandys.

It may worthily seem unto you a most shamefu-
 thing, to have *preferred* an infamous peace *before* a
 most just war.

Knolles.

I'll move the king

To any shape of thy *preferment*, such

As thou'lt desire.

Shakspeare. Cymbeline.

They flatly disavouch

To yield him more obedience or support,

And as t' a perjured duke of Lancaster,

Their cartel of defiance they *prefer*.

Daniel.

The greater good is to be *preferred before* the less,
 and the lesser evil to be endured rather than the
 greater.

Wilkins.

By the recommendation of the earl of Dunbar, he
 was *preferred* to the bishoprick of Coventry and
 Litchfield.

Clarendon.

O spirit, that dost *prefer*

Before all temples the' upright heart.

Milton.

I shall give an account of some of those appropri-
 ate and discriminating notices wherein the human
 body differs, and hath *preference above* the most per-
 fect brutal nature.

Hale.

All which declare a natural *preferment* of the one
 unto the motion before the other.

Browne.

Leave the critics on either side to contend about
 the *preference* due to this or that sort of poetry.

Dryden.

All *preferments* should be placed upon fit men.

L'Estrange.

The stronger ties we have to an unalterable pur-
 suit of happiness, which is greatest good, the more
 are we free from any necessary compliance with our
 desire, set upon any particular, and then appearing
preferable good, till we have duly examined it.

Locke.

We find in ourselves a power to begin or forbear
 several actions of our minds and motions of our bod-
 ies, barely by a thought or *preference* of the mind,
 ordering the doing, or not doing such a particular
 action.

Id.

It gives as much due to good works as is con-
 sistent with the grace of the gospel; it gives as much
preference to divine grace as is consistent with the
 precepts of the gospel.

Sprat.

The mercenary and inconstant crew of the hunters
after preferment, whose designs are always seen
through. *Davenant.*

Almost every man in our nation is a politician,
and hath a scheme of his own, which he thinks pre-
ferable to that of any other. *Addison.*

The several musical instruments in the hands of
the Apollons, Muses, and Fauns, might give light to
the dispute for preference between the ancient and
modern musick. *Id.*

Every person within the church or commonwealth
may prefer an accusation, that the delinquent may
suffer condign punishment. *Ayliffe.*

Take care,
Lest thou prefer so rash a prayer,
Nor vainly hope the queen of love
Will e'er thy fav'rite's charms improve.

Prior.

Prefer a bill against all kings and parliaments
since the conquest; and, if that won't do, challenge
the crown and the two houses. *Collier.*

Even in such a state as this, the pleasures of virtue
would be superior to those of vice, and justly pre-
ferable. *Atterbury.*

How came he to chuse a comick preferably to the
tragick poets; or how comes he to chuse Plautus
preferably to Terence? *Dennis.*

The Romanists were used to value the latter
equally with the former, or even to give them the
preference. *Waterland.*

A secret pleasure touched Athena's soul,
To see the preference due to sacred age
Regarded. *Pope's Odyssey.*
He spake, and to her hand preferred the bowl.

Pope.

Princes must, by a vigorous exercise of that law,
make it every man's interest and honour to cultivate
religion and virtue, by rendering vice a disgrace,
and the certain ruin to preferment or pretensions.

We know your prudence, Sir William, and I should
be sorry to stop your preferment. *Swift.*

Junius.

PREFIGURATE, or } Lat. *præ* and *figuro*.
PREFIGURE, v. a. } To show by antece-
PREFIGURATION, n. s. } dent representation:
antecedent representation.

What the Old Testament hath, the very same the
New containeth; but that which lieth there, as under
a shadow, is here brought forth into the open sun;
things there prefigured are here performed. *Hooker.*

Such piety, so chaste use of God's day,
That what we turn to feast, she turned to pray,
And did prefigure here in devout taste,
The rest of her high sabbath, which shall last.

Donne.

If shame superadded to loss, and both met together,
as the sinner's portion here, perfectly prefiguring the
two saddest ingredients in hell, deprivation of the
blissful vision, and confusion of face, cannot prove
efficacious to the mortifying of vice, the church doth
give over the patient. *Hammond.*

The variety of prophecies and prefigurations had
their punctual accomplishment in the author of this
institution. *Norris.*

The same providence that hath wrought the one
will work the other; the former being pledges, as
well as prefigurations, of the latter. *Buruet.*

PREFINE', v. a. Fr. *prefinir*; Lat. *præfinio*.
To limit beforehand.

He, in his immoderate desires, prefin'd unto him-
self three years, which the great monarchs of Rome
could not perform in so many hundreds. *Knolles.*

PREFIX', v. a. & n. s. Lat. *præfigo*. To ap-
point before hand; settle; put before another
thing; a thing so fixed: a particle put before a
word to vary its signification.

A time prefix, and think of me at last. *Sandys*

At the prefixed hour of her awaking,

Came I to take her from her kindred's vault.

Shakspeare.

Whose sins
Full weight must be transferred upon my head;

Yet neither thus disheartened or dismayed,

The time prefixed I waited.

Milton.

Because I would prefix some certain boundary be-
tween them; the old statutes end with king Edward
II., the new or later statutes begin with king Edward
III. *Hale's Law of England.*

It is a prefix of augmentation to many words in
that language. *Browne's Vulgar Errors.*

Booth's forward valour only served to show,

He durst that duty pay we all did owe:

The attempt was fair; but heaven's prefixed hour

Not come.

Dryden.

These boundaries of species are as men, and not as
nature makes them, if there are in nature any such
prefixed bounds. *Locke.*

In the Hebrew language the noun has its prefixa
and affixa, the former to signify some few relations,
and the latter to denote the pronouns possessive and
relative. *Clarke.*

PREFORM', v. a. *Præ* and *form*. To form
beforehand. Not in use.

If you consider the true cause
Why all these things change from their ordinance,

Their natures and preformed faculties,

To monstrous quality; why you shall find

That heaven made them instruments of fear

Unto some monstrous state.

Shakspeare. Julius Cæsar.

PREGNANT, adj. } Fr. *pregnant*; Lat.
PREGNANTLY, adv. } *prægnans*. Teeming;
breeding; fertile; full of meaning; evident;
free: the adverb corresponding.

Pregnancy is made a tapster, and hath his quick
wit wasted in giving reckonings. *Shakspeare.*

This granted, as it is a most pregnant and unforced
position, who stands so eminent in the degree of this
fortune as Cassio, a knave very voluble.

Id. Othello.

Were 't not that we stand up against them all,
'Twere pregnant, they should square between them-
selves. *Shakspeare.*

A most poor man made tame to fortune's blows,
Who by the art of known and feeling sorrows,
Am pregnant to good pity. *Id. King Lear.*

A thousand moral paintings I can shew,
That shall demonstrate these quick blows of fortune
More pregnantly than words. *Id. Timon.*

He was sent to school, where his pregnancy was
advantaged by more than paternal care and industry.
Fell.

These knew not the just motives and pregnant
grounds with which I thought myself furnished.

King Charles.

Thou
Dove-like starest brooding on the vast abyss,
And madest it pregnant. *Milton.*

His town, as fame reports, was built of old
By Danae, pregnant with almighty god.

Dryden.

The breast is encompassed with ribs, and the belly
left free for respiration; and, in females, for that ex-
traordinary extension in the time of their pregnancy.

Ray on the Creation

The dignity of this office among the Jews is so *pregnantly* set forth in holy writ, that it is unquestionable; kings and priests are mentioned together.

South.

Through either ocean, foolish man!
That *pregnant* word sent forth again,
Might to a world extend each atom there,
For every drop call forth a sea, a heaven for every star.

Prior.

An egregius and *pregnant* instance how far virtue surpasses ingenuity. *Woodward's Natural History.*

O detestable passive obedience! did I ever imagine I should become thy votary in so *pregnant* an instance?

Arbutnot.

This writer, out of the *pregnancy* of his invention, hath found out an old way of insinuating the grossest reflections under the appearance of admonitions.

Swift's Miscellanies.

PREGNANCY. See MIDWIFERY.

PREHNITE, or PRISMATIC PREHNITE, a mineral of which there are two sub-species, the foliated and the fibrous.

1. Foliated. Color apple-green. Massive, in distinct concretions, and sometimes crystallised. Primitive form an oblique four-sided prism of 103° and 77° . Secondary forms, an oblique four-sided table, an irregular eight-sided table, an irregular six-sided table, and a broad rectangular four-sided prism. Shining. Fracture fine grained uneven. Translucent. Hardness from felspar to quartz. Easily frangible. Specific gravity 2.8 to 3.0. It melts with intumescence into a pale-green or yellow glass. It does not gelatinize with acids. Its constituents, according to the analysis of Klaproth, are, silica 43.83, alumina 30.33, lime 18.33, oxide of iron 5.66, water 1.83. It occurs in France, in the Alps of Savoy, and in the Tyrol. It is said to become electric by heating. Beautiful varieties are found in the interior of Southern Africa.

2. Fibrous prehnite. Color light-green. Massive, in distinct concretions, and crystallised in acicular four-sided prisms. Glistening, pearly. Translucent. Easily frangible. Specific gravity 2.89. It melts into a vesicular enamel. It becomes electric by heating. Its constituents, according to Laugier, are, silica 42.5, alumina 28.5, lime 20.44, natron and potash 0.75, oxide of iron 3, water 2. It occurs in veins and cavities in trap-rocks near Beith in Ayrshire, Bishoptown in Renfrewshire, at Hartfield near Paisley, and near Frisky Hall, Old Kilpatrick; in the trap-rocks round Edinburgh, &c.

PREJUDGE, *v. a.* Fr. *prejuger*; Lat. *præ* and *judico*. To determine beforehand; generally to condemn beforehand.

If he stood upon his own title of the house of Lancaster, he knew it was condemned in parliament, and *prejudged* in the common opinion of the realm, and that it tended to the disinheritance of the line of York.

Bacon's Henry VII.

The child was strong and able, though born in the eighth month, which the physicians do *prejudge*.

Bacon.

The cause is not to be defended, or patronized by names, but arguments, much less to be *prejudged*, or blasted by them.

Hammond.

Some action ought to be entered, lest a greater cause should be injured and *prejudged* thereby.

Ayliffe.

The committee of council hath *prejudged* the whole case, by calling the united sense of both houses of parliament an universal clamour.

Swift.

PREJUDICATE, *v. a. & adj.* } Also of Lat.
PREJUDICATION, *n. s.* } *præ* and *judico*.
To determine beforehand to disadvantage: prejudiced: the art of prejudging.

Are you, in favour of his person, bent
Thus to *prejudicate* the innocent?

Sandys

Our dearest friend

Prejudicates the business, and would seem

To have us make denial.

Shakespeare.

Their works will be embraced by most that understand them, and their reasons enforce belief from *prejudicate* readers.

Browne.

This rule, of casting away all our former *prejudicate* opinions, is not proposed to any of us to be practised at once as subjects or Christians, but merely as philosophers.

Watts.

PREJUDICE, *n. s. & v. a.* } Fr. *prejudico*;
PREJUDICIAL, *adj.* } Lat. *prejudicium*.

Prepossession; judgment formed without examination; used for prepossession either in favor of any thing or against it; and sometimes (but not properly) with *to* before that which the prejudice is against; mischief; hurt; detriment: to prejudice is to fill with unexamined notions or opinions; to obstruct; injure; hurt: prejudicial, obstructed; or possessed by opposite opinions; contrary; opposite; hurtful.

The strength of that law is such, that no particular nation can lawfully *prejudge* the same by any their several laws and ordinances, more than a man, by his private resolutions, the law of the whole commonwealth wherein he liveth.

Hooker.

What one syllable is there, in all this, *prejudicial* any way to that we hold?

Id.

Neither must his example, done without the book, *prejudge* that which is well appointed in the book.

Whitgift.

I have not spoke one the least word,
That might be *prejudice* of her present state,
Or touch of her good person.

Shakespeare. Henry VIII.

Factions carried too high and too violently, is a sign of weakness in princes, and much to the *prejudice* of their authority and business.

Bacon.

'Tis a sad irreverence, without due consideration, to look upon the actions of princes with a *prejudicial* eye.

Holyday.

The king himself frequently considered more the person who spoke, as he was in his *prejudice*, than the council itself that was given.

Clarendon.

His going away the next morning with all his troops was most *prejudicial* and most ruinous to the king's affairs.

Id.

My comfort is, that their manifest *prejudice* to my cause will render their judgment of less authority.

Dryden.

How plain this abuse is, and what *prejudice* it does to the understanding of the sacred scriptures.

Locke.

A prince of this character will instruct us by his example, to fix the unsteadiness of our politicks; or by his conduct hinder it from doing us any *prejudice*.

Addison.

One of the young ladies reads while the others are at work; so that the learning of the family is not at all *prejudicial* to its manufactures.

Id.

Half pillars wanted their expected height,

And roofs imperfect *prejudiced* the sight.

Prior.

A state of great prosperity, as it exposes us to va-

rious temptations, so it is often *prejudicial* to us, in that it swells the mind with undue thoughts.

Atterbury.

Suffer not any beloved study to *prejudice* your mind, so far as to despise all other learning.

Watts.

To this is added a vinous bitter, warmer in the composition of its ingredients than the watery infusion; and, as gentian and lemon-peel make a bitter of so grateful a flavour, the only care required in this composition was to chuse such an addition as might not *prejudice* it.

London Dispensatory.

By these a man's judgment is easily perverted, and a wrong bias hung upon his mind; these are the inlets of *prejudice*; and the unguarded avenues of the mind.

Mason.

The truth is, if the truth may suit your ear,
And *prejudice* have left a passage clear,
Pride has attained its most luxuriant growth,
And poisoned every virtue in them both.

Cowper.

PRELATE, *n. s.* } Fr. *prelat*; Lat. *prælat*;
PRELATICAL. } *tus*. An ecclesiastic of the highest order: relating to prelacy.

Divers of the reverend *prelacy*, and other most judicious men, have especially bestowed their pains about the matter of jurisdiction.

Hooker's Dedication.

It beseemed not the person of so grave a *prelate*, to be either utterly without counsel, as the rest were, or in a common perplexity to shew himself alone secure.

Hooker.

Hear him but reason in divinity,
And, all-admiring, with an inward wish
You would desire the king were made a *prelate*.

Shakspeare.

The archbishop of Vienna, a reverend *prelate*, said one day to king Lewis XI. of France: Sir, your mortal enemy is dead, what time duke Charles of Burgundy was slain.

Bacon.

The presbyter, puff'd up with spiritual pride,
Shall on the necks of the lewd nobles ride,
His brethren damn, the civil power defy,
And parcel out republic *prelacy*.

Dryden.

Yet Munster's *prelate* ever be accurst,

In whom we seek the German faith in vain. *Id.*

Prelacies may be termed the greater benefices; as that of the pontificate, a patriarchship, an archbishoprick and bishoprick.

Ayliffe's Parergon.

How many are there, that call themselves protestants, who put *prelacy* and popery together as terms convertible!

Swift.

The king then wrote a letter to the bishop, in which he complained of the violation of his rights, and the contempt of his authority, charged the *prelate* with countenancing the late act of disobedience, and required an answer in two days.

Johnson.

PRELATION, *n. s.* Lat. *prælatus*. Preference: setting of one above the other.

In case the father left only daughters, they equally succeeded as in co-partnership, without any *prelacion* or preference of the eldest daughter to a double portion.

Hale.

PRELECTION, *n. s.* Lat. *prælectio*. Reading; lecture; discourse.

He that is desirous to prosecute these asystata, or infinitude, let him resort to the *prelections* of Faber.

Hale.

PRELIBATION, *n. s.* Lat. *prælibo*. Taste beforehand; effusion previous to tasting.

The firm belief of this, in an innocent soul, is a high *prelibation* of those eternal joys.

More.

PRELIMINARY, *adj. & n. s.* Fr. *preliminaire*; Lat. *prælimine*. Previous; introductory; proemial: something introductory; previous condition or stipulation.

My master needed not the assistance of that *preliminary* poet to prove his claim; his own majestic mien discovers him to be the king.

Dryden.

The third consists of the ceremonies of the oath on both sides, and the *preliminaries* to the combat.

Notes on Iliad.

PRELUDE, *n. s. & v. a.* } French *prelude*;
PRELUDIOUS, *adj.* } Latin *præludium*.

PRELUDIUM, *n. s.*

A short piece of music played before a full concert; any thing introductory; to serve as an introduction: *preludious* is previous; introductory: *preludium*, a *prelude*.

That's but a *preludious* bliss,

Two souls pickering in a kiss. *Cleveland.*

To his infant arms oppose

His father's rebels and his brother's foes;

Those were the *preludes* of his fate,

That formed his manhood, to subdue

The hydra of the many-headed hissing crew.

Dryden.

Either songster holding out their throats,
And folding up their wings, rencw'd their notes,
As if all day, *preluding* to the fight,
They only had rehears'd, to sing by night. *Id.*

This Menelaus knows, exposed to share

With me the rough *preludium* of the war, *Id.*

The last Georgick was a good *prelude* to *Æneis*, and very well shewed what the poet would do in the description of what was really great.

Addison.

One concession to a man is but a *prelude* to another.

Clarissa.

My weak essay

But sounds a *prelude*, and points out their prey.

Young.

PRELUSIVE, *adj.* From *prelude*. Previous; introductory; proemial.

The clouds

Softly shaking on the dimpled pond

Prelusive drops, let all their moisture flow.

Thomson.

PREMATU'RE, *adj.* Fr. *prematurre*; Lat. *præmaturus*. Precocious; ripe too soon; formed before the time; too early.

'Tis hard to imagine, what possible consideration should persuade him to repent, till he deposited that *prematurre* persuasion of his being in Christ.

Hammond's Fundamentals.

PREMEDITATE, *v. a. & v. n.* } Fr. *præ-*

PREMEDITATION, *n. s.* } *mediter*;

Lat. *præmeditor*. To contrive; form or conceive beforehand; to think beforehand; premeditation, forethought; act of meditating beforehand.

Of themselves they were rude, and knew not so much as how to *premeditate*; the spirit gave them speech and eloquent utterance.

Hooker.

Where I have come, great clerks have purposed
To greet me with *premeditated* welcomes.

Shakspeare.

Are all th' unlooked-for issue of their bodies

To take their rooms ere I can place myself?

A cold *premeditation* for my purpose!

Id.

Hope is a pleasant *premeditation* of enjoyment, as when a dog expects, till his master has done picking of the bone.

More.

He, amidst the disadvantage of extempore against *premeditation*, dispelled with ease and perfect clear-

ness all the sophisms that had been brought against him. *Fell.*

With words *premeditated* thus he said. *Dryden.*
Verse is not the effect of sudden thought; but this hinders not that sudden thought may be represented in verse, since those thoughts must be higher than nature can raise without *premeditation*.

Id. on Dramatic Poetry.

PREMERIT, *v. a.* Lat. *premeritor.* To deserve before.

They did not forgive Sir John Hotham, who had so much *premerited* of them. *King Charles.*

PREMICES, *n. s.* Fr. *premiccs*; Lat. *primitia.* First fruits.

A charger, yearly filled with fruits, was offered to the gods at their festivals, as the *premiccs* or first gatherings. *Dryden.*

PREMIER, *adj. & n. s.* Fr. *premier.* First; chief: a chief minister of state.

The Spaniard challengeth the *premier* place, in regard of his dominions. *Camden's Remains.*

Thus families, like realms, with equal fate,
Are sunk by *premier* ministers of state. *Swift.*

PREMISE', *v. a.* } Lat. *præmissus.* To explain
PREM'ISES, *n. s.* } plain previously; lay
PREM'ISS. } down premises: which are propositions antecedently supposed or proved: premiss is the singular, and rarely used; premises or premisses, in law, properly signifies the land, &c., mentioned in the beginning of a deed; hence it came to mean in law language, *novæ* and lands.

They infer upon the *premisses*, that as great difference as commodiously may be, there should be in all outward ceremonies between the people of God, and them which are not his people. *Hooker.*

O let the vile world end,
And the *premisses* flames of the last day
Knit earth and heaven together. *Shakspeare.*
This is so regular an inference, that, whilst the *premisses* stand firm, it is impossible to shake the conclusion. *Decay of Piety.*

The apostle's discourse here is an answer upon a ground taken; he *premisseth*, and then infers.

Burnet.

I *premise* these particulars, that the reader may know I enter upon it as a very ungrateful task.

Addison.

She studied well the point, and found
Her foes' conclusions were not sound,
From *premisses* erroneous brought,
And therefore the deductions nought.

Swift's Miscellanies.

They know the major or minor, which is implied, when you pronounce the other *premiss* and the conclusion. *Watts.*

PREMIUM, *n. s.* Lat. *præmium.* Something given to invite a loan or a bargain.

No body cares to make loans upon a new project; whereas men never fail to bring in their money upon a land tax, when the *premium* or interest allowed them is suited to the hazard they run.

Addison's Freeholder.

People were tempted to lend, by great *premiums* and large interest; and it concerned them to preserve that government, which they had trusted with their money. *Swift's Miscellanies.*

PREMNA, in botany, a genus of the angiospermia order, and didynamia class of plants: CAL. bilobed: cor. quadrifid: berry quadrilocular:

SEEDS solitary. Species three, fine East India trees.

PREMONISH, *v. a.* Lat. *præmoneo.* To warn or admonish beforehand.

What friendly *premonitions* have been spent
On your forbearance, and their vain event.

Chapman.

After these *premonishments*, I will come to the compartion itself. *Wotton's Architecture.*

How great the force of such an erroneous persuasion is, we may collect from our Saviour's *premonition* to his disciples, when he tells them that those who killed them should think they did God service.

Decay of Piety.

It is no small mercy of God, that he gives us warning of our end. We shall make an ill use of so gracious a *premonition*, if we make not a meet preparation for our passage. *Bp. Hall.*

PREMONSTRANTS, or PREMONSTRATENSES, a religious order of regular canons, instituted in 1120, by St. Norbert; and thence also called Norbertines. The first monastery of this order was built by Norbert in the Isle of France, which he called Premonstre, Præmonstratum; and hence the order derived its name; though, as to the occasion of that name, the writers of that order are divided. At first the religious of this order were so very poor that they had only a single ass, which served to carry the wood they cut down every morning, and sent to Laon in order to purchase bread. But they soon received so many donations, and built so many monasteries, that in thirty years after the foundation of the order they had above 100 abbeys in France and Germany; and, in process of time, the order so increased that it had monasteries in all parts of Christendom, amounting to 1000 abbeys, 300 provostships, a vast number of priories, and 500 nunneries. The rule they followed was that of St. Augustine, with some slight alterations, and an addition of certain severe laws, whose authority did not long survive their founder. The order was approved by Honorius II. in 1126, and afterwards by several succeeding popes. At first the abstinence from flesh was rigidly observed. In 1245 Innocent IV. complained to a general chapter of its being neglected. In 1288 their general, William, procured leave of pope Nicholas IV. for those of the order to eat flesh on journeys. In 1460 Pius II. granted them a general permission to eat meat, excepting from Septuagesima to Easter. The dress of the religious of this order is white, with a scapulary before the cassock. Out of doors they wear a white cloak and white hat; within, a little ca-mail; and at church a surplice, &c. In the first monasteries built by Norbert there was one for men and another for women, only separated by a wall. In 1137, by a decree of a general chapter, this practice was prohibited, and the nuns removed out of those already built to a greater distance from those of the monks. The Præmonstratenses, or monks of Premontré, vulgarly called white canons, came first into England A. D. 1146. Their first monastery, called New House, was erected in Lincolnshire by Peter de Saulia, and dedicated to St. Martial. In the reign of Edward I. this order had twenty-seven monasteries in England.

PREMONTVAL (Peter Le Guay de), an eminent French writer, born at Charenton in 1716. He became a member of the academy of Berlin. He wrote several works, of which the most noted is his *Antidote to the Corruption of the French Language*, written in German. He died at Berlin in 1767, aged fifty-one.

PREMUNIRE, *n. s.* Lat. *premunire*. A writ in common law, whereby a penalty is incurable, as infringing some statute. See below.

Premunire is now grown a good word in our English laws, by tract of time; and yet at first it was merely mistaken for premonire.

Bramhall against Hobbes.

Wolsey incurred a *premunire*, forfeited his honour, estate, and life, which he ended in great calamity.

South.

PREMUNIRE. See **PREMUNIRE**.

PRENANTHES, in botany, wild lettuce, a genus of the polygamia æqualis order, and syngenesia class of plants; natural order forty-ninth, composite: receptacle naked: CAL. calyculated: pappus simple, and almost sessile: the florets are placed in a single series. Species thirty-three; one, *P. mutalis*, common to our own groves.

PRENOMINATE, *v. a.* Latin *prænominato*. To forename.

He you would sound,

Having ever seen, in the *prænominated* crimes,

The youth, you breathe of, guilty. *Shakspeare.*

The watery productions should have the *prænominatio*; and they of the land rather derive their names, than nominate those of the sea. *Browne.*

PRENOTION, *n. s.* Fr. *prenotion*; Lat. *præ* and *nosco*. Foreknowledge; prescience.

The hedgehog's presension of winds is so exact, that it stoppeth the north or southern hole of its nest, according unto *prenotion* of these winds ensuing.

Browne.

PRENTICE, *n. s.* } Contracted from AP-

PRENTICESHIP. } **PRENTICE**. One bound to a master, in order to instruction in a trade: state or servitude of an apprentice.

My accuser is my *prentice*, and, when I did correct him for his fault, he did vow upon his knees he would be even with me.

Shakspeare.

He served a *prenticeship*, who sets up shop,

Ward tried on puppies, and the poor, his drop.

Pope.

PRENZLOW, the chief town of the district of Brandenburg, called the Ucker Mark, Prussia. It is situated in a plain on the lake and river Ucker, and is divided into the Old and New Town; both of which are tolerably built. Here are four Lutheran, two Calvinist, and one Catholic church; a pleasant square, a beautiful public walk, several schools and hospitals, and 8000 inhabitants. The town has also several breweries, and a considerable trade in corn. The woollen manufactures, and still more those of tobacco, occupy a large portion of the inhabitants, many of whom are descended from French Protestant refugees. It was near this place, on 24th October 1806, that the remains of the Prussian army, about 20,000, defeated at Jena on the 14th, were obliged to surrender to the French. Seventy-three miles N. N. W. of Frankfort on the Oder, and fifty-six N. N. E. of Berlin.

PREOC'UPATE, *v. a.* } Fr. *preoccuper*;

PREOCUPATION, *n. s.* } Lat. *præoccupo*. To

PREOCUPY, *v. a.* } anticipate; prepos-

sess; fill with prejudice: preoccupation corresponds with these senses: to preoccupy is the more modern synonyme of preoccupate.

Honour aspieth to death; grief flieth to it; and fear *preoccupieth* it.

Bacon.

That the model be plain without colours, lest the eye *preoccupate* the judgment.

Wotton.

As if, by way of *preoccupation*, he should have said; well, here you see your commission, this is your duty, these are your discouragements; never seek for evasions from worldly afflictions; this is your reward, if you perform it; this is your doom, if you decline it.

South.

I think it more respectful to the reader to leave something to reflections, than *preoccupy* his judgment.

Arbutnot.

PREOMINATE, *v. a.* Lat. *præ* and *ominor*. To prognosticate; to show by omens any future event.

Because many ravens were seen when Alexander entered Babylon, they were thought to *preominate* his death.

Browne.

PREOPIN'ION, *n. s.* Lat. *præ* and *opinio*. Opinion antecedently formed; prepossession.

Diet holds no solid rule of selection; some, in indistinct voracity, eating almost any; others, out of a timorous *preopinio*, refraining from very many things.

Browne.

PREORDAIN', *v. a.* } Lat. *præ* and *ordain*.

PREOR'DINANCE, *n. s.* } To ordain beforehand: antecedent decree.

These lowly courtesies

Might stir the blood of ordinary men,

And turn *preordinance* and first decree

Into the law of children.

Shakspeare. Julius Cæsar.

Sin is the contrariety to the will of God, and if all things be *preordained* by God, and so demonstrated to be willed by him, it remains there is no such thing as sin.

Hammond.

Few souls *preordained* by fate,

The race of gods, have reached that envied state.

Roscommon.

PREPARE', *v. a., v. n. & n. s.* } Fr. *preparer*;

PREPARATION, *n. s.* } It. *preparare*;

PREPAR'ATIVE, *adj. & n. s.* } Lat. *preparo*;

PREPAR'ATIVELY, *adv.* } To fit, qualify,

PREPAR'ATORY, *adj.* } or make ready

PREPAR'REDLY, *adv.* } for any pur-

PREPAR'EDNESS, *n. s.* } pose; make

PREPAR'ER. } ready before-

hand; form; adjust; compound: as a verb neuter, to take previous or preparatory measures; make every thing ready: Shakspeare uses *prepare* for *preparation*; which signifies the act of preparing or previously fitting or ordering things; previous measures; introduction; composition; and, in an obsolete sense, accomplishments; qualification: *preparative* is, having the power or quality of preparing: and, as a noun substantive, that which has this power; that which is done as introductory to something else; the adverb corresponding with the adjective: *preparatory* is, introductory; antecedent; necessary; previous: *preparedly* is, advisedly; orderly; by proper precedent measures: the noun substantive corresponding: *preparer*, he or that which fits or prepares.

There he maketh the hungry to dwell; that they may *prepare* a city for habitation. *Psalm ciii. 36.*

When he prepared the heavens I was there, when he set a compass upon the face of the depth.

Prov. viii. 27.

The long suffering of God waited in the days of Noah, while the ark was preparing.

1 Peter.

They tell us the profit of reading is singular, in that it serveth for a preparative unto sermons.

Hooker.

I make bold to press, with so little preparation, upon you.
—You're welcome.

Shakespeare. Merry Wives of Windsor.

Sir John, you are a gentleman of excellent breeding, authentick in your place and person, generally allowed for your many warlike, courtlike, and learned preparations.

Shakespeare.

Patient Octavia, plough thy visage up
With her prepared nails.

Id. Antony and Cleopatra.

Go in, sirrah, bid them prepare for dinner.

Shakespeare.

In our behalf

Go levy men, and make prepare for war.

Id.

She preparedly may frame herself

T' the way she's forced to.

Id. Antony and Cleopatra.

My book of advancement of learning may be some preparation or key for the better opening of the instruction.

Bacon.

The bishop of Ely, the fittest preparer of her mind to receive such a doleful accident, came to visit her.

Wotton.

Efficacy is a power of speech, which represents to our minds the lively ideas of things so truly, as if we saw them with our eyes; as Dido preparing to kill herself.

Peacham.

The miseries, which have ensued, may be yet, through thy mercy, preparatives to us of future blessings.

King Charles.

Resolvedness in sin can, with no reason, be imagined a preparative to remission.

Decay of Piety.

Prepare men's hearts by giving them the grace of humility, repentance, and probity of heart.

Hammond.

He took the golden compasses, prepared

In God's eternal store, to circumscribe

This universe.

Milton.

It is preparatively necessary to many useful things in this life, as to make a man a good physician.

Hale.

Preparatory, limited, and formal interrogatories in writing preclude this way of occasional interrogatories.

Id.

I wish the chymists had been more sparing, who magnify their preparations, inveigle the curiosity of many, and delude the security of most.

Browne's Vulgar Errors.

Though he judged the time of sickness an improper season for the great work of repentance; yet he esteemed it a most useful preparative, the voice of God himself exhorting to it.

Fell.

The practice of all these is proper to our condition in this world, and preparatory to our happiness in the next.

Tillotson.

What avails it to make all the necessary preparatives for our voyage, if we do not actually begin the journey?

Dryden.

Confound the peace established, and prepare
Their souls to hatred, and their hands to war.

Id.

Codded grains are an improver of land, and preparer of it for other crops.

Mortimer's Husbandry.

I will shew what preparations there were in nature for this dissolution, and after what manner it came to pass.

Burnet.

Rains were but preparatory, the violence of the

deluge depended upon the disruption of the great abyss.

Id.

Such a temper is a contradiction to repentance, as being founded in the destruction of those qualities which are the only dispositions and preparatives to it.

South.

Some preachers, being prepared only upon two or three points of doctrine, run the same round.

Addison.

The beams of light had been in vain displayed,
Had not the eye been fit for vision made;

In vain the author had the eye prepared

With so much skill, had not the light appeared.

Blackmore.

In the preparations of cookery, the most volatile parts of vegetables are destroyed.

Arbuthnot.

Nothing hath proved more fatal to that due preparation for another life, than our unhappy mistake of the nature and end of this.

Wake.

PREPARATION OF DISSONANCES, in music. See MUSIC.

PREPARATIONS, in anatomy, the parts of animal bodies prepared and preserved for anatomical uses. Though several parts prepared dry are useful, yet others must be so managed as to be always flexible, and nearer a natural state. According to Dr. Monro, the best liquor for this purpose is a well rectified colorless spirit of wine, to which is added a small quantity of nitric or sulphuric acids. When these are properly mixed, they neither change the color nor the consistence of their parts, except where there are serous or mucous liquors contained in them. The brain, even of a young child, in this mixture grows so firm as to admit of gentle handling, as do also the vitreous and crystalline humors of the eye. The liquor of the sebaceous glands is coagulated by this spirituous mixture; and it heightens the red color of the injection of the blood-vessels, so that, after the part has been in it a little time, several vessels appear which were before invisible. The glasses which contain the preparations should be of the finest sort, and pretty thick; for through such the parts may be seen very distinctly, and of a true color, and the object will be so magnified as to show vessels in the glass which out of it were not to be seen. As the glass when filled with the liquor has a certain focus, it is necessary to keep the preparation at a proper distance from the sides of it, which is easily done by little sticks suitably placed, or by suspending it by a thread in a proper situation. Mr. Sheldon describes a simple method of stopping the mouths of the preparation glasses, by which means the stopper is rendered nearly as durable as the glass itself. To execute it, let the anatomist take care to have the upper surface of his bottles made plane, by desiring the workmen at the glass-house to flatten them in the making. This they will easily do in forming the round ones, but the flat bottles are attended with considerable difficulty. The right way to make them, would be to blow them in moulds of various sizes; the workmen should likewise form the bottoms of the bottles perfectly flat, that they may stand upright and steady. Bottles of this form being provided for the larger preparations, we grind the upper surface of them on a plain plate of lead, about a quarter of an inch thick, and two feet in diam-

ter; first with fine emery and water, then with powdered rotten stone, or putty first wet with water and at last dry; so that the surface may be reduced to an exact horizontal plane, and of as fine a polish as plate glass. The manœuvre requires but little dexterity; and the anatomist should be provided with a considerable number of these glasses thus prepared. To the top of each bottle a piece of plate glass, cut by a diamond, is to be adapted so as completely to cover, but not project over, the edge of the bottle. When these two smooth surfaces are put upon each other, with a drop of solution of gum between, the attraction of cohesion is so considerable that it requires great force to separate them. A piece of wet ox bladder, freed from fat, and soaked in water till it becomes mucilaginous, is then to be placed over the top, the air pressed out from between it and the glass; after which it must be tied with a pack-thread dipped in the solution of gum arabic. The bladder, being cut off neatly under the last turn of the thread, is then to be dried, the string taken cautiously off, and the top and neck painted with a composition of lamp-black mixed with japanner's gold size: this soon dries, and leaves a fine smooth glossy surface, from which the dirt can at any time be as readily wiped off as from a mirror. By this method large bottles are as easily and effectually secured as small ones; and it is found to answer as well as the hermetical sealing of glasses, which in large vessels is altogether impracticable. With respect to the stopper bottles, which are very convenient for holding small preparations, Mr. S. advises the stoppers to be perfectly well ground; that they pass rather lower down than the neck of the bottle, for the convenience of drilling two holes obliquely through the inferior edge of the substance of the stopper, opposite to each other, for the convenience of fixing threads to hold the subject; for, if the threads pass between the neck and stopper, a space will be left; or, if the stopper be well ground, the neck of the bottle will be broken in endeavouring to press it down. On the other hand, if any space be left, the thread, by its capillary attraction, will act from capillary attraction, raise the spirits from the bottle, and cause evaporation, which will likewise take place from the chink between the stopper and neck. Mr. W. Cooke has found that all preparations of animal bodies may be preserved by a solution of common salt. He finds that if used a little below saturation, it will preserve animal substances for an indefinite period, at all the temperatures of our atmosphere.—Transactions of the Society of Arts, vol. xxxvii. p. 43.

PREPARIS, the most northern of the Andaman Islands, in the eastern entrance of the Bay of Bengal, about a degree south of the Pegue shore, is four miles long, by one and a half broad. It rises gradually towards the middle, and is covered entirely with wood. In clear weather it may be seen at the distance of twenty-five miles, but can only be approached on the east side, on account of rocks; on that side, within half a mile of the shore, there is seven fathoms water. It is only inhabited by birds, squirrels, and monkeys. Long. 93° 40' E., lat. 14° 50' N.

PREPON'DER, *v. a.* Lat. *prepondero*.
 PREPON'DERANCE, or
 PREPON'DERANCY, *n. s.* } To outweigh; over-
 PREPON'DERATE, } power by weight or
 PREPON'DERATION. } influence: the noun
 substantive corre-
 sponding.

Though pillars by channelling be seemingly ingrossed to our sight, yet they are truly weakened; and therefore ought not to be the more slender, but the more corpulent unless appearances *preponder* truths. *Wotton's Architecture.*

A solid verity in one month, is worthy to *preponderate* light falsehood in a thousand. *Bp. Hall.*

That is no just balance, wherein the heaviest side will not *preponderate*. *Wilkins.*

An inconsiderable weight, by distance from the centre of the balance, will *preponderate* greater magnitudes. *Glanville.*

As to addition of ponderosity in dead bodies, comparing them unto blocks, this occasional *preponderancy* is rather an appearance than reality. *Browne's Vulgar Errors.*

He that would make the lighter scale *preponderate*, will not so soon do it, by adding new weight to the emptier, as if he took out of the heavier, what he adds to the lighter. *Locke.*

The mind should examine all the grounds of probability, and, upon a due balancing the whole, reject or receive proportionably to the *preponderancy* of the greater grounds of probability. *Id.*

Little light boats were the ships which people used, to the sides whereof this fish remora fastening, might make it swag, as the least *preponderance* on either side will do, and so retard its course. *Grew.*

The triviallest thing, when a passion is cast into the scale with it, *preponderates* substantial blessings. *Government of the Tongue.*

Unless the very mathematical centre of gravity of every system be fixed in the very mathematical centre of the attractive power of all the rest, they cannot be evenly attracted on all sides, but must *preponderate* some way or other. *Bentley.*

In matters, which require present practice, we must content ourselves with a mere *preponderation* of probable reasons. *Watts.*

PREPOSITION, *n. s.* Fr. *preposition*; Lat. *praepositio*. In grammar, a particle governing a case.

A *preposition* signifies some relation, which the thing signified by the word following it, has to something going before in the discourse; as, Cæsar came to Rome. *Clarke's Latin Grammar.*

PREPOSSESS', *v. a.* *Præ* and possess. To possess with an opinion unexamined; to prejudice.

God hath taken care to anticipate and prevent every man to give piety the *prepossession*, before other competitors should be able to pretend to him; and so to engage him in holiness first, and then in bliss. *Hammond's Fundamentals.*

Had the poor vulgar rout only, who were held under the prejudices and *prepossessions* of education, been abused into such idolatrous superstitions, it might have been pitied, but not so much wondered at. *South.*

With thought, from *prepossession* free, reflect
 On solar rays, as they the sight respect. *Blackmore.*
 She was *prepossessed* with the scandal of salivating
Wiseman.

PREPOSTEROUS, *adj.* } Latin *praeposte-*
 PREPOSTEROUSLY, *adv.* } rus. Strictly,
 PREPOSTEROUNESS, *n. s.* } having that first

which ought to be last : hence, absurdly wrong ; perverted ; the adverb and noun-substantive corresponding.

Preposterous ass ! that never read so far
To know the cause why musick was ordained.
Shakspeare.

Those things do best please me,
That befall *preposterously*.

Id. Midsummer Night's Dream.

Put a case of a land of Amazons, where the whole government, public and private, is in the hands of women : is not such a *preposterous* government against the first order of nature, for women to rule over men, and in itself void ? *Bacon.*

Death from a father's hand, from whom I first
Received a being ! 'tis a *preposterous* gift,
An act at which inverted nature starts,
And blushes to behold herself so cruel. *Denham.*

The Roman missionaries gave their liberal contribution, affording their *preposterous* charity to make them proselytes, who had no mind to be confessors or martyrs. *Fell.*

The method I take may be censured as *preposterous*, because I thus treat last of the antediluvian earth, which was first in order of nature.

Woodward's Natural History.

Upon this supposition, one animal would have its lungs where another hath its liver, and all the other members *preposterously* placed ; there could not be a like configuration of parts in any two individuals.

Bentley's Sermons.

The shapeless pair,
As they designed to mock me, at my side
Take step for step ; and, as I near approach
The cottage, walk along the plastered wall,
Preposterous sight ! the legs without the man.
Cowper.

PREPOTENCY, *n. s.* Lat. *præpotentia*.
Predominance ; superior power.

If there were a determinate *prepotency* in the right, and such as ariseth from a constant root in nature, we might expect the same in other animals. *Browne.*

PREPUCE, *n. s.* Fr. *prepuce* ; Lat. *præputium*. That which covers the glans ; foreskin.
The *prepuce* was much inflamed and swelled.
Wiseman.

PREPUCE. See ANATOMY.

PRERAU, a circle comprising the north-east portion of Moravia, bordering on Austrian Silesia. Its area is 1210 square miles. The smaller part lying on the rivers March and Hanna, is fertile ; the rest is mountainous and containing only here and there fruitful spots. The pastures are good, and the number of sheep considerable. The chief rivers are the March, Hanna, Becswa, and Oder, which has here the commencement of its course. Population 215,000. The chief town of the same name is situated thirteen miles south-east of Almutz and contains 2300 inhabitants.

PREREQUIRE, *v. a.* } Præ and require.

PREREQUISITE, *adj.* } To demand previously : præ and requisite. Something previously necessary.

Some primary literal signification is *prerequired* to that other of figurative. *Hammond.*

Before the existence of compounded body, there must be a pre-existence of active principles, necessarily *prerequisite* to the mixing these particles of bodies. *Hale.*

The conformation of parts is necessary, not only

unto the *prerequisite* and previous conditions of birth, but also unto the parturition. *Browne.*

PREROGATIVE, *n. s.* } Fr. *prerogatif* ;

PREROGATED, *adj.* } low Lat. *prærogativa*. An exclusive or peculiar privilege ; having exclusive privilege.

My daughters and the fair Parthenia might far better put in their claim for that *prerogative*. *Sidney.*

The great caliph hath an old *prerogative* in the choice and confirmation of the kings of Assyria. *Knolles.*

How could communities,
The primogeniture, and due of birth,
Prerogative of age, sceptres, and crowns,
But by degree, stand in authentick place ?
Shakspeare.

'Tis the plague of great ones,
Prerogative are they less than the base ;
'Tis destiny unshunnable. *Id.*

Had any of these second causes despoiled God of his *prerogative*, or had God himself constrained the mind and will of man to impious acts by any celestial enforcements ? *Ruleigh.*

They are the best laws, by which the king hath the justest *prerogative*, and the people the best liberty. *Bacon.*

They obtained another royal *prerogative* and power, to make war and place at their pleasure. *Davies.*

The house of commons, to these their *prerogatives* over the lords, sent an order to the lieutenant of the Tower, that he should cause him to be executed that very day. *Clarendon.*

For freedom still maintained alive,
Freedom an English subject's sole *prerogative*,
Accept our pious praise. *Dryden.*

It seems to be the *prerogative* of human understanding, when it has distinguished any ideas, so as to perceive them to be different, to consider in what circumstances they are capable to be compared. *Locke.*

I will not consider only the *prerogatives* of man above other animals, but the endowments which nature hath conferred on his body in common with them. *Ray on the Creation.*

PREROGATIVE COURT, an English court established for the trial of all testamentary causes, where the deceased has left bona notabilia within two different dioceses. In which case the probate of wills belongs to the archbishop of the province, by way of special prerogative. And all causes relating to the wills, administrations, or legacies of such persons, are originally cognizable herein, before a judge appointed by the archbishop, called the judge of the prerogative-court ; from whom an appeal lies, by stat. 25 Hen. VIII. c. 19, to the king in chancery, instead of the pope as formerly.

PREROGATIVE, ROYAL, that special pre-eminence which the king hath over and above all other persons, and out of the ordinary course of the common law, in right of his regal dignity. It signifies in its etymology (from præ and rogo) something that is required or demanded before, or in preference to all others. And therefore Finch lays it down as a maxim, that the prerogative is that law in case of the king, which is law in no case of the subject. Prerogatives are either direct or incidental. The direct are such positive substantial parts of the royal character and authority, as are rooted in, and spring from,

the king's political person, considered merely by itself, without reference to any other extrinsic circumstances; as, the right of sending ambassadors, of creating peers, and of making war or peace. But such prerogatives as are incidental bear always a relation to something else, distinct from the king's person; and are, indeed, only exceptions, in favor of the crown, to those general rules that are established for the rest of the community: such as, that no costs shall be recovered against the king; and that the king can never be a joint tenant; and that his debt shall be preferred before a debt to any of his subjects.

1. The law ascribes to the king the attribute of sovereignty, or pre-eminency. See SOVEREIGNTY. 2. 'The law also,' says Sir William Blackstone, 'ascribes to the king, in his political capacity, absolute perfection; 'The king can do no wrong.' Which ancient and fundamental maxim is not to be understood as if every thing transacted by the government was of course just and lawful; but means only that whatever is exceptional in the conduct of public affairs is not to be imputed to the king, nor is he answerable for it personally to his people: for this doctrine would totally destroy that constitutional independence of the crown which is necessary for the balance of power in our free and active, and therefore compounded, constitution. And therefore, if the crown should be induced to grant any franchise or privilege to a subject contrary to reason, or in any wise prejudicial to the commonwealth or a private person, the law will not suppose the king to have meant either an unwise or an injurious action, but declares that the king was deceived in his grant; and thereupon such grant is rendered void, merely upon the foundation of fraud and deception, either by or upon those agents whom the crown has thought proper to employ.' The law determines that in the king can be no negligence or laches; and therefore no delay will bar his right. *Nulum tempus occurrit regi* is the standing maxim upon all occasions: for the law intends that the king is always busied for the public good, and therefore has not leisure to assert his right within the times limited to subjects. In the king also can be no stain or corruption of blood; for if the heir to the crown were attainted of treason or felony, and afterwards the crown should descend to him, this would purge the attainer *ipso facto*. This happened in the case of Henry VII. who, as earl of Richmond, stood attainted, but his assumption of the crown cleared the attainers. Neither can the king, in judgment of law, as king, ever be a minor or under age; and therefore his royal grants and assents to acts of parliament are good, though he has not in his natural capacity attained the legal age of twenty-one. By a statute, indeed, 28 Hen. VIII. c. 17, power was given to future kings to rescind all acts of parliament that should be made while they were under the age of twenty-four: but this was repealed by the stat. 1 Edw. VI. c. 11, so far as related to that prince, and both statutes are declared to be determined by 24 Geo. II. c. 24. It has also been usually thought prudent, when the heir apparent has been very young, to appoint a protector, guardian, or regent, for a

limited time: but the very necessity of such extraordinary provision is sufficient to demonstrate the truth of that maxim of common law, that in the king is no minority; and therefore he has no legal guardian. 3. A third attribute of the king's majesty is his perpetuity. The law ascribes to him, in his political capacity, an absolute immortality. The king never dies; Henry, Edward, or George, may die; but the king survives them all. For, immediately upon the decease of the reigning prince in his natural capacity, his kingship or imperial dignity, by act of law, without any interregnum or interval, is vested at once in his heir; who is, *eo-instanti*, king to all intents and purposes. The royal prerogative invests the king with a number of authorities and powers; in the exertion whereof consists the executive part of government. This is wisely placed in a single hand by the British constitution, for the sake of unanimity, strength, and despatch. Were it placed in many hands, it would be subject to many wills: which, if disunited and drawing different ways, create weakness in a government; and to unite these and reduce them to one is a work of more time and delay than the exigencies of state will afford. The king of England is therefore not only the chief, but properly the sole magistrate of the nation; all others acting by commission from, and in due subordination to him. In the exertion of lawful prerogative the king is held to be absolute; that is so far absolute that there is no legal authority that can either delay or resist him. He may reject what bills, may make what treaties, may coin what money, may create what peers, may pardon what offences he pleases: unless where the constitution has expressly, or by evident consequence, laid down some exception or boundary; declaring, that thus far the prerogative shall go and no farther. For otherwise the power of the crown would indeed be but a name and a shadow, insufficient for the ends of government, if, where its jurisdiction is clearly established and allowed, any man or body of men were permitted to disobey it, in the ordinary course of law: we do not now speak of those extraordinary recourses to the first principles which are necessary when the contracts of society are in danger of dissolution, and the law proves too weak a defence against the violence of fraud or oppression. And yet the want of attending to this obvious distinction has occasioned these doctrines of absolute power in the prince and of national resistance by the people, to be much misunderstood and perverted by the advocates for slavery on the one hand, and the demagogues of faction on the other. In the exertion, therefore, of these prerogatives which the law has given him, the king is irresistible and absolute, according to the forms of the constitution. And yet, if the consequence of that exertion be manifestly to the grievance or dishonor of the kingdom, the parliament will call his advisers to a just and severe account. For prerogative consisting (as Mr. Locke has well defined it) in the discretionary power of acting for the public good where the positive laws are silent, if that discretionary power be abused to the public detriment, such prerogative is exerted in an unconstitutional

manner. The king's ministers in all such cases are amenable to parliament. Thus the king may make a treaty with a foreign state, which shall irrevocably bind the nation; and yet, when such treaties have been judged pernicious, impeachments have pursued those ministers by whose agency or advice they were concluded.

With regard to all foreign concerns, the king is the delegate or representative of his people. What is done by the royal authority, with regard to foreign powers, is the act of the whole nation: what is done without the king's concurrence is the act only of private men. And, by the statute 2 Hen. V. c. 6, any subject committing acts of hostility upon any nation in league with the king, was declared to be guilty of high-treason: and, though that act was repealed by the stat. 20 Hen. VI. c. 11, so far as relates to the making this offence high-treason, yet it still remains a very great offence against the law of nations, and punishable by our laws, either capitally or otherwise, according to the circumstances of the case. 1. The king, therefore, considered as the representative of his people, has the sole power of sending ambassadors to foreign states, and receiving ambassadors at home. 2. It is also the king's prerogative to make treaties, leagues, and alliances, with foreign states and princes; though in this, as in all other cases, ministers are amenable to parliamentary impeachment for advising the king to conclude any such treaties that are found to be derogatory from the honor and interest of the nation. 3. The king has also the sole prerogative of making war and peace. And therefore, to make a war completely legal and constitutional, it must be publicly proclaimed by the king's authority. In pursuance of which principle, it is with us declared by the statute 4 Hen. V. c. 7, that, if any subjects of the realm are oppressed in the time of truce by any foreigners, the king will grant letters of marque in due form to all that feel themselves aggrieved. 5. Upon exactly the same reason stands the prerogative of granting safe conducts; without which, by the law of nations, no member of one society has a right to intrude into another. Great tenderness is shown by our laws, not only to foreigners in distress (see *WRECK*), but with regard also to the admission of strangers who come spontaneously: for so long as their nation continues at peace with ours, and they themselves behave peaceably, they are under the king's protection, though liable to be sent home whenever the king sees occasion. But no subject of a nation at war with us can, by the law of nations, come into the realm, or can travel himself upon the high seas, or send his goods and merchandise from one place to another, without danger of being seized by our subjects, unless he has letters of safe conduct; which, by divers ancient statutes, must be granted under the king's great seal, and enrolled in chancery, or else they are of no effect; the king being supposed the best judge of such emergencies as may deserve exception from the general law of arms. But passports under the king's sign-manual, or licenses from his ambassadors abroad, are now more usually obtained, and are allowed to be of equal validity. These are the principal prerogatives

of the king respecting this nation's intercourse with foreign nations.

In domestic affairs the king is considered in a great variety of characters; and thence there arises a number of other prerogatives. 1. He is a constituent part of the supreme legislative power; and, as such, has the prerogative of rejecting such provisions in parliament as he judges improper to be passed. 2. The king has the sole power of raising and regulating fleets and armies. The sole prerogative, also, of erecting, manning, and governing of castles and forts, belongs to the king in his capacity of general of the kingdom; and all lands were formerly subject to a tax, for building castles wherever the king thought proper: in consequence of which their number was increased most enormously. The greater part of them being demolished in the wars with the barons, succeeding kings were cautious of suffering them to be rebuilt: and Sir Edward Coke lays it down, that no subject can build a castle, or house of strength embattled, or other fortress defensible, without the license of the king; for the danger which might ensue, if every man at his pleasure might do it.

The king has also the prerogative of appointing ports and havens, for persons and merchandise to pass into and out of the realm, as he in his wisdom sees proper. By the feudal law, all navigable rivers and havens were computed among the regalia, and were subject to the sovereignty of the state. And in England it has always been held that the king is lord of the whole shore, and particularly is the guardian of the ports and havens, which are the inlets and gates of the realm: and therefore, so early as the reign of John, we find ships seized by the king's officers for putting in at a place that was not a legal port. These legal ports were undoubtedly at first assigned by the crown; since to each of them a court of portmote is incident, the jurisdiction of which must flow from the royal authority: the great ports of the sea are also referred to as well-known and established, by stat. 4 Hen. IV. c. 20, which prohibits the landing elsewhere, under pain of confiscation; and the stat. 1 Eliz. c. 11, recites, that the franchise of lading and discharging had been frequently granted by the crown. But, though the king had a power of granting the franchise of havens and ports, yet he had not the power of resumption, or of narrowing and confining their limits when once established; but any person had a right to load or discharge his merchandise in any part of the haven; whereby the revenue of the custom was much impaired and diminished, by fraudulent landings in obscure and private corners. This occasioned the statutes of 1 Eliz. c. 11, and 13 and 14 Car. II. c. 11, sec. 14, which enable the crown, by commission, to ascertain the limits of all ports, and to assign proper wharfs and quays in each port, for the exclusive landing and loading of merchandise. 3. Another capacity in which the king is considered in domestic affairs is as the fountain of justice, and general conservator of the peace of the kingdom. 4. The king is likewise the fountain of honor, office, and privilege; and this in a different sense from that wherein he is styled the fountain of justice; for here he is

really the parent of them. The king is, lastly, considered by the laws of England as the head and supreme governor of the national church. This prerogative was fixed by stat. 26 Hen. VIII. c. 1 and 1 Eliz. c. 1. In virtue of this authority, the king convenes, prorogues, restrains, regulates, and dissolves, all ecclesiastical synods or convocations. From this prerogative, also, of being the head of the church, arises the king's right of nomination to vacant bishoprics, and other ecclesiastical preferments. As head of the church the king is likewise the dernier resort in all ecclesiastical causes; an appeal lying ultimately to him in chancery from the sentence of every ecclesiastical judge: which right was restored to the crown by stat. 25 Hen. VIII. c. 9.

PRESAGE, *n. s.* & *v. a.* } Fr. *presage*;
PRESAGEMENT. } Latin *presagium*.

Prognostic; presension of futurity; to forebode; foretell: presagement is synonymous with presage noun-substantive.

Henry's late *presaging* prophecy
Did glad my heart with hope.

Shakspeare. Henry VI.

If I may trust the flattering ruth of sleep,
My dreams *presage* some joyful news at hand.

Shakspeare.

I have spent much inquiry, whether he had any
ominous *presagement* before his end. *Wotton.*

This contagion might have been *presaged* upon
consideration of its precursors.

Harvey on Consumption.

That cloud, that hangs upon thy brow, *presages*
A greater storm than all the Turkish power
Can throw upon us. *Denham's Sophy.*

What power of mind

Foreseeing, or *presaging* from the depth
Of knowledge past or present, could have feared
How such united force of gods, how such
As stood like these, could ever know repulse.

Milton.

The falling of salt is an authentick *presagement* of
ill luck, from whence notwithstanding nothing can
be naturally feared. *Browne.*

When others fell, this standing did *presage*
The crown should triumph over popular rage.

Waller.

Wished freedom I *presage* you soon will find,
If heaven be just, and if to virtue kind. *Dryden.*

That by certain signs we may *presage*
Of heats and rains, and wind's impetuous rage,
The sovereign of the heavens has set on high
The moon to mark the changes of the sky. *Id.*

Dreams have generally been considered by authors
only as revelations of what has already happened, or
as *presages* of what is to happen. *Addison.*

PRESBURG, or POSONYI-VarMEGYE, an important palatinate of Hungary, lying in an angle formed by the March and Danube. Its area is 1740 square miles. The Carpathians traverse the whole length of this district; but in general the elevations are not great, and they are commonly covered with vineyards. Of the wine produced, that called the Szent George Ausbruck is inferior only to Tokay. Corn and fruit are produced in the south-east part, particularly in the district called the isle of Schutt. The chief towns are Presburg and Tyrnau; the latter the seat of the court of appeal for the circle to the north of the Danube. Population of the palatinate 200,000, a mixture of Hungarians, Germans, Bohemians, Croats, and Jews.

PRESBURG, or POSONY, a large town of Hungary, on the north bank of the Danube, declared, by a royal decree of 1536, the capital of Hungary. The kings are still crowned here, but the viceroy and the higher officers of government reside at Buda; and the diets and supreme courts of justice meet at Pesh. Presburg contains at present little that is interesting. Its castle, which lately served as a barrack, was burned down in the early part of the present century; and its walls form only a ruinous square pile, with a tower at each corner. This town stands on a hill of moderate elevation, overlooking a vast plain; and the horizon is open in all directions except in the north-west, where, for nearly a third of its circumference, it is intercepted by the distant mountains. The Danube, here nearly half a mile wide, is crossed by a flying bridge. The fortifications have been demolished; and no distinction is now made between the town and suburbs. The suburbs bear marks of improvement: there are here two squares, adorned with statues. The principal church of Presburg is an old Gothic edifice, said to have been built in 1090; the other public buildings are the palace of the palatine, the barracks, corn-market, and town-house. Presburg has an academy, a school for the children of nobility, two or three monasteries, a Catholic and a Lutheran gymnasium. The manufactures, though on a small scale, comprise woollens, silk, oil, tobacco, and snuff. The trade in corn and linen is considerable. It was here that a treaty was concluded between France and Austria, after the campaign of 1805. Thirty-eight miles east by south of Vienna, and 107 W.N.W. of Pesth.

PRESBYTER, *n. s.*

PRESBYTERIAL, *adj.*

PRESBYTERIAN, *adj.* & *n. s.*

PRESBYTERY, *n. s.*

Lat. *presbyter*;
Gr. *πρεβυτερος*.
A priest; an elder:
both the adjectives mean consisting of elders or presbyters; or according to the presbyterian form of church government: presbyterian, as a noun substantive, one who holds with that form: presbytery, a body of elders or priests. See below.

They cannot delegate the episcopal power, properly so called, to *presbyters*, without giving them episcopal consecration. *Lesley.*

Presbyters absent through infirmity from their churches, might be said to preach by those deputies who in their stead did but read homilies. *Hooker.*

Those which stood for the *presbytery*, thought their cause had more sympathy with the discipline of Scotland than the hierarchy of England. *Bacon.*

Chiefly was urged the abolition of episcopal, and the establishing of *presbyterian* government.

King Charles.

Flea-bitten synod, an assembly brewed
Of clerks and elders ana, like the rude
Chaos of *presbytery*, where laymen guide
With the tame woolpack clergy by their side.

Cleveland.

Who should exclude him from an interest, and so unhappily a more unavoidable sway in *presbyterial* determinations? *Holyday.*

And *presbyters* have their jackpuddings too.

Hudibras.

One of the more rigid *presbyterians*.

Swift.

PRESBYTER, or elder, is a word borrowed from the Greek translation of the Old Testament,

where it commonly signifies ruler or governor ; it being a note of office and dignity, not of age : and in this sense bishops are sometimes called presbyters in the New Testament. The grand dispute between the followers of the Geneva and Roman discipline is about the sameness or difference of presbyters and bishops in the time of the apostles.

PRESBYTERIANS, PROTESTANT, so called from their maintaining that the government of the church appointed in the New Testament was by presbyteries, that is, by associations of ministers and ruling elders, possessed all of equal powers, without any superiority among them either in office or in order.

The Presbyterians believe that the authority of their ministers to preach the gospel, to administer the sacraments of baptism and the Lord's supper, and to feed the flock of Christ, is derived from the Holy Ghost by the imposition of the hands of the presbytery. They affirm that there is no order in the church as established by Christ and his apostles superior to that of the presbyters ; that all ministers, being ambassadors of Christ, are equal by their commission ; that presbyter and bishop, though different words, are of the same import ; and that prelacy was gradually established upon the primitive practice of making the moderator or speaker of the presbytery a permanent officer. See BISHOP.

In the Scottish church, every regulation of public worship, every act of discipline, and every ecclesiastical censure, which in other churches flows from the authority of a diocesan bishop, or from a convocation of the clergy, is the joint work of a certain number of clergymen and laymen acting together with equal authority, and deciding every question by a plurality of voices. The laymen, who thus form an essential part of the ecclesiastical courts of Scotland, are called ruling elders. Every parish has two or three of these lay-elders, who are grave and serious persons chosen from among the heads of families, of known orthodoxy, and steady adherence to the worship, discipline, and government of the church. Being solemnly engaged to use their utmost endeavours for the suppression of vice, and the cherishing of piety and virtue, and to exercise discipline faithfully and diligently, the minister, in the presence of the congregation, sets them apart to their office by solemn prayer ; and concludes the ceremony, which is sometimes called ordination, with exhorting both elders and people to their respective duties. The kirk-session, which is the lowest ecclesiastical judicatory, consists of the minister and those elders of the congregation. The minister is *ex officio* moderator, but has no negative voice over the decision of the session ; nor indeed has he a right to vote at all, unless when the voices of the elders are equal and opposite. He may indeed enter his protest against their sentence, if he think it improper, and appeal to the judgment of the presbytery ; but this privilege belongs equally to every elder, as well as to every person who may believe himself aggrieved by the proceedings of the session. The deacons, whose proper office it is to take care of the poor, may be present in every session, and offer their counsel on

all questions that come before it ; but, except in what relates to the distribution of alms, they have no decisive vote with the minister and elders.

The next judicatory is the presbytery, properly so called, which consists of all the pastors within a certain district, and one ruling elder from each parish, commissioned by his brethren to represent, in conjunction with the minister, the session of that parish. The presbytery treats of such matters as concern the particular churches within its limits ; as the examination, admission, ordination, and censuring of ministers ; the licensing of probationers, rebuking of gross or contumacious sinners, the directing of the sentence of excommunication, the deciding upon references and appeals from kirk-sessions, resolving cases of conscience, explaining difficulties in doctrine or discipline, and censuring, according to the word of God, any heresy or erroneous doctrine which hath been either publicly or privately maintained within the bounds of its jurisdiction. In presbyteries, the only prerogatives which the pastors have over the ruling elders, are, the power of ordination by imposition of hands, and the privilege of having the moderator chosen from their body. From the judgment of the presbytery there lies an appeal to the provincial synod, which ordinarily meets twice in the year, and exercises over the presbyteries within the province a jurisdiction similar to that which is vested in each presbytery over the several kirk-sessions within its bounds. These synods are composed of the members of the several presbyteries within the respective provinces which give names to the synods. The highest authority in the church of Scotland is the general assembly, which consists of a certain number of ministers and ruling elders, delegated from each presbytery, and of commissioners from the universities and royal boroughs. A presbytery in which there are fewer than twelve parishes sends to the general assembly two ministers and one ruling elder : if it contains between twelve and eighteen ministers, it sends three of these, and one ruling elder : if it contains between eighteen and twenty-four ministers, it sends four ministers and two ruling elders ; and of twenty-four ministers, when it contains so many, it sends five with two ruling elders. Every royal borough sends one ruling elder, whose election must be attested by the kirk-sessions of their respective boroughs. Every university sends one commissioner from its own body. The commissioners are chosen annually, six weeks before the meeting of the assembly ; and the ruling elders are often men of the first eminence in the kingdom for rank and talents. In this assembly, which meets once a year, the king presides by his commissioner, who is always a nobleman ; but he has no voice in their deliberations, unless he be a member of assembly, which is sometimes the case. Appeals are brought from all the other ecclesiastical courts in Scotland to the general assembly ; and, in questions purely religious, no appeal lies from its determinations. In the subordination of these assemblies, provincial, presbyterial, provincial, and national, the less unto the greater, consists the external order of the church of Scotland.

PRESCIENT, *adj.* } Lat. *presciens*. Fore-
PRESCIENCE, *n. s.* } knowing; prophetic:
PRESCIOUS, *adj.* } precious is of the same
 signification: prescience is foreknowledge; know-
 ledge of the future.

They tax our policy, and call it cowardice,
 Forestall our prescience, and esteem no act
 But that of hand.

Shakspeare. Troilus and Cressida.

Prescience, or foreknowledge, considered in order and nature, if we may speak of God after the manner of men, goeth before providence; for God foreknew all things before he had created them, or before they had being to be cared for; and *prescience* is no other than an infallible foreknowledge. *Raleigh.*

Henry, upon the deliberation concerning the marriage of his eldest daughter into Scotland, had shewed himself sensible and almost *prescient* of this event. *Bacon.*

God's *prescience*, from all eternity, being but the seeing every thing that ever exists as it is, contingents as contingents, necessary as necessary, can neither work any change in the object, by thus seeing it, nor itself be deceived in what it sees. *Hammond.*

If certain *prescience* of uncertain events imply a contradiction, it seems it may be struck out of the omniscience of God, and leave no blemish behind. *More.*

Freedom was first bestowed on human race,
 And *prescience* only held the second place.

Dryden.

Thrice happy thou, dear partner of my bed,
 Whose holy soul the stroke of fortune fled;
Prescious of ills, and leaving me behind,
 To drink the dregs of life. *Id. Æneis.*

Of things of the most accidental and mutable nature God's *prescience* is certain. *South.*

Who taught the nations of the field and wood,
Prescient, the tides or tempests to withstand?

Pope.

PRESCIENCE, in theology, prevision, or foreknowledge; that knowledge which God has of things to come. The doctrine of predestination is founded on the prescience of God, and on the supposition of all futurity being present to him. The apostle Peter, in his celebrated sermon at Jerusalem, asserts both doctrines, of prescience and accountability, in one sentence, Acts ii. 23. 'Him, being delivered by the determinate counsel and foreknowledge of God, ye have taken, and by wicked hands have crucified and slain.'

PRESCIND, *v. a.* } Lat. *prescindo*. To
PRESCINDENT, *adj.* } cut off; to abstract: abstracting.

A bare act of obliquity does not only *prescind* from, but positively deny such a special dependence. *Norris.*

We may, for one single act, abstract from a reward, which nobody who knows the *prescindent* faculties of the soul can deny. *Cheyne.*

PRESCOT, a market town of Lancashire, with a market on Tuesday for corn, provisions, and cattle. It has considerable manufactures of sail-cloth, watches, &c. The church is a handsome building, having a steeple fifty-two yards high, allowed to be the most complete in the county. There is also a dissenters meeting-house, a free-school, and several alms-houses. At St. Helen's, near this town, is an extensive plate glass manufactory, in which 300 persons are employed; and near it is another for smelting and refining copper ore. Near this town lies

Knowlesly, the seat of the earl of Derby. **Prescot** lies eight miles east of Liverpool, and 198 N. N. W. of London.

PRESCRIBE, *v. a. & v. n.* } Lat. *prescribo*
PRESCRIPT, *adj. & n. s.* } To set down au-
PRESCRIPTION, *n. s.* } thoritatively; or-
 der; direct; influence: prescript is directed; laid down formally: prescript, noun substantive, and prescription, direction; model; medical recipe, long used custom.

Both the strength of some negative arguments prove this kind of negative argument strong, by force whereof all things are denied which scripture affirmeth not, or all things which scripture *prescribeth* not condemned? *Hooker.*

Those very laws so added, they themselves do not judge unlawful; as they plainly confess both in matter of *prescript* attire, and of rites appertaining to burial. *Id.*

You tell a pedigree
 Of threescore and two years, a silly time
 To make *prescription* for a kingdom's worth.

Shakspeare.

My father left me some *prescriptions*
 Of rare and proved effects; such as his reading
 And manifest experience had collected
 For general sovereignty. *Id.*

Use such as have prevailed before in things you have employed them; for that breeds confidence, and they will strive to maintain their *prescription*.

Bacon's Essays.

To the blanc moon her office they *prescribed*.

Milton.

By his *prescript*, a sanctuary is framed
 Of cedar, overlaid with gold. *Id.*

A reserve of puerility we have not shaken off from school, where, being seasoned with minor sentences, and never are worn out but with our memories. *Brownie.*

Nor did he ever with so much regret submit unto any *prescript*. *Fell.*

Approving of my obstinacy against all common *prescriptions*, he asked me whether I had never heard of the Indian way of curing the gout by moxa.

Temple.

There's joy, when to wild will you laws *prescribe*,
 When you bid fortune carry back her bribe.

Dryden.

The extremest ways they first ordain,
Prescribing such intolerable pain,
 As none but Cæsar could sustain. *Id.*

Our poet bade us hope this grace to find,
 To whom by long *prescription* you are kind. *Id.*

The assuming an authority of dictating to others, and a forwardness to *prescribe* to their opinions, is a constant concomitant of this bias of our judgments. *Locke.*

It will be found a work of no small difficulty to dispossess a vice from that heart where long possession begins to plead *prescription*. *South.*

The Luqueque plead *prescription* for hunting in one of the duke's forests that lies upon their frontiers.

Addison.

That obligation upon the lands did not *prescribe* or come into disuse, but by fifty consecutive years of exemption. *Arbuthnot.*

Modern 'pothecaries taught the art
 By doctors' bills to play the doctor's part,
 Bold in the practice of mistaken rules,
Prescribe, apply, and call their masters fools.

Pope.

Should any man argue that a physician understands his own art best; and therefore, although he

should *prescribe* poison to all his patients, he cannot be justly punished, but is answerable only to God? *Swift.*

So long a *prescription* supposes an acquiescence in the other claimants; and that acquiescence supposes also some reason, perhaps now unknown, for which the claim was forborne. *Johnson.*

Yet half mankind maintain a churlish strife
With Him, the Donor of eternal life,
Because the deed, by which his love confirms
The largess he bestows, *prescribes* the terms. *Cowper.*

PRESCRIPTION, in English law, is a title acquired by use and time, and allowed by law; as when a man claims any thing, because he, his ancestors, or they whose estate he hath, have had or used it all the time whereof no memory is to the contrary: or it is where for continuance of time, *ultra memoriam hominis*, a particular person hath a particular right against another. There is a difference between prescription, custom, and usage. Prescription hath respect to a certain person, who by intentment may have continuance for ever; but custom is local, and always applied to a certain place; as time out of mind there has been such a custom in such a place, &c. And prescription belongeth to one or a few only; but custom is common to all. Usage differs from both, for it may be either to persons or places: as to inhabitants of a town to have a way, &c. A custom and prescription are in the right; usage is in the possession; and a prescription, that is good for the matter and substance, may be bad by the manner of setting it forth: but where that which is claimed as a custom, in or for many, will be good, that regularly will be so when claimed by prescription for one. Prescription is to be time out of mind; though it is not the length of time that begets the right of prescription, nothing being done by time, although every thing is done in time; but it is a presumption in law that a thing cannot continue so long quiet, if it was against right or injurious to another.

PRESEANCE, *n. s.* Fr. *preseance*. Priority of place in sitting. Not used.

The guests, though rude in their other fashions, may, for their discreet judgment in precedence and *preseance*, read a lesson to our civillest generation. *Carew's Survey of Cornwall.*

PRESENTION, *n. s.* Lat. *presensio*. Perception beforehand.

The hedgehog's *presension* of winds is exact. *Browne.*

PRESENT , <i>adj., v. a., & n. s.</i>	} Fr. <i>present</i> ; Latin <i>presens</i> . In company; face to face; at hand; ready; quick in emergencies; attention; now existent or now specified; not past or future: 'at present' is used for now, or, at the present time: to present, is to place in presence, particu-

PRESENTMENT , <i>n. s.</i>	
PRESENTNESS .	

larly of a superior; introduce; exhibit; offer, give, or put into the hands ceremoniously; distinguish with gifts; lay formally before a court, or high authority: a present, something offered; something given; something given ceremoniously; a letter or mandate, per *presentes*: presence is, state of being present or together; approach face to face, or into view, particularly of a superior; a number assembled before a superior; room in which a superior shows himself; the superior so shown; port; air; mien; readiness; aptitude: the two compounds that follow are obvious in their meaning: presentaneous is, quick; immediate: presentable, what may be presented: presentation, the act of presenting; exhibition; particularly the act of giving any one an ecclesiastical benefice: presentative, presentable in an ecclesiastical sense: presentee, one presented to a benefice: presenter, one who presents: presential, supposing actual or real presence: the noun-substantive corresponding: presentiate, to make present: presentific (obsolete), making present: presently, soon after; and (obsolete) at this time; now: presentment, the act of presenting or thing presented; representation in law: presentment is a denunciation of the jurors, or some other officer, as justice, constable, searcher, surveyor, of an offence enquirable in the court to which it is presented.—Cowell. Presentness is quickness at emergencies; readiness of mind, arising from fortitude.

The shepherd Dorus answered with such a trembling voice and abashed countenance, and oftentimes so far from the matter, that it was some sport to the young ladies, thinking it want of education, which made him so discountenanced with unwonted *presence*. *Sidney.*

The towns and forts you *presently* have are still left unto you to be kept either with or without garri- sons, so as you alter not the laws of the country. *Id.*

By them they pass, all gazing on them round,
And to the *presence* mount, whose glorious view
Their frail amazed senses did confound. *Spenser.*

Tell on, quoth she, the woeful tragedy,
The which these reliques sad *present* unto. *Id.*

Prayers are sometimes a *presentation* of mere desires, as a mean of procuring desired effects at the hand of God. *Hooker.*

To speak of it as requireth, would require very long discourse; all I will *presently* say is this. *Id.*
He sent part of the rich spoil with the admiral's ensign, as a *present* unto Solymán. *Knolles.*

To-night we hold a solemn supper,
And I'll request your *presence*. *Shakespeare.*
I know not by what power I am made bold,
In such a *presence* here, to plead my thoughts. *Id.*

An't please your grace, the two great cardinals
Wait in the *presence*. *Id. Henry VIII.*

Plain Clarence!
I will send thy soul to heaven,
If heav'n will take the *present* at our hands. *Shakespeare.*

Be it known to all men by these *presents*. *Id.*
He knows not what he says; and vain is it,
That we *present* us to him. *Id. King Lear.*

When comes your book forth?
—Upon the heels of my *presentment*. *Shakespeare.*

Covetous ambition, thinking all too little which *presently* it hath, supposeth itself to stand in need of all which it hath not. *Raleigh.*

Virtue is best in a body that is comely, and that hath rather dignity of *presence* than beauty of aspect. *Bacon.*

If a man write little, he had need have a great memory; if he confer little, he had need have a *present* wit; and if he read little, he had need have much cunning. *Id.*

He was appointed admiral, and *presented* battle to the French navy, which they refused. *Hayward.*

Be *present* to her now, as then
And let not proud and factious men
Against your wills oppose their mights.

Ben Jonson.

The Lady Anne of Bretagne, passing through the *presence* in the court of France, and espying Chartier, a famous poet, leaning upon his elbow fast asleep, openly kissing him, said, We must honour with our kiss the mouth from whence so many sweet verses have proceeded. *Peacham.*

Mrs. Gulston, possessed of the improper parsonage of Bardwell, did procure from the king leave to annex the same to the vicarage, and to make it *presentative*, and give them both to St. John's College in Oxon. *Spelman.*

Men that very *presence* fear,
Which once they knew authority did bear.

Daniel.

Some plagues partake of such malignity, that, like a *presentaneous* poison, they enecate in two hours. *Harvey.*

Be not often *present* at feasts, not at all in dissolute company; pleasing objects steal away the heart. *Taylor.*

Now every leaf, and every moving breath
Presents a foe, and every foe a death. *Denham.*

A *present* good may reasonably be parted with, upon a probable expectation of a future good, which is more excellent. *Wilkins.*

Goring had a much better understanding, a much keener courage, and *presentness* of mind in danger. *Clarendon.*

Thou with eternal Wisdom didst converse,
Wisdom thy sister, and with her did'st play
In *presence* of the 'Almighty Father, pleas'd
With thy celestial song. *Milton.*

To her the sov'reign *presence* thus replied. *Id.*

Thou future things canst represent
As *present*. *Id.*

When he saw descend
The Son of God to judge them, terrified
He fled; not hoping to escape, but shun
The *present*; fearing, guilty, what his wrath
Might suddenly inflict. *Id.*

Say, heav'nly muse, shall not thy sacred vein
Afford a *present* to the infant God? *Id.*

On to the sacred hill

They led him high applauded, and *present*
Before the seat supreme. *Id. Paradise Lost.*

Thou therefore now advise,
Or hear what to my mind first thoughts *present*.
Milton.

Thus I hurl

My dazzling spells into the spongy air,
Of power to cheat the eye with bleat illusion,
And give it false *presentments*, lest the place
And my quaint habits breed astonishment. *Id.*
But neither of these are any impediment, because the regent thereof is of an infinite immensity more than commensurate to the extent of the world, and such as is most intimately *present* with all the beings of the world. *Hale.*

He made effectual provision for recovery of advowsons and *presentations* to churches. *Id.*

Perhaps I have not so well consulted the reputation of my intellectuals, in bringing their imperfections into such discerning *presences*. *Glanville's Scepsis.*

Errors, not to be recalled, do find
Their best redress from *presence* of the mind;
Courage our greatest failings does supply.

Waller.

They that are to love inclined,
Swayed by chance, not choice or art,
To the first that's fair or kind,
Make a *present* of their heart. *Id.*

The whole evolution of times and ages, from everlasting to everlasting, is collectedly and *presentifickly* represented to God at once, as if all things and actions were, at this very instant, really *present* an I existent before him. *More.*

Since clinging cares and trains of inbred fears,
Not awed by arms, but in the *presence* bold,
Without respect to purple or to gold. *Dryden.*

Nor could I hope in any place but there,
To find a god so *present* to my prayer. *Id.*
Somewhat is sure designed by fraud or force;
Trust not their *presence*, nor admit the horse. *Id.*

He now *presents*, as ancient ladies do,
That courted long, at length are forced to woo. *Id.*
Octavia *presented* the poet, for his admirable elegy on her son Marcellus. *Id.*

Should I present thee with rare figured plate,
O how thy rising heart would throb and beat. *Id.*
These *presentations* of fighting on the stage are necessary to produce the effects of an heroic play. *Id.*

A good bodily strength is a felicity of nature, but nothing comparable to a large understanding and ready *presence* of mind. *L'Estrange.*

'Tis a high point of philosophy and virtue for a man to be so *present* to himself as to be always provided against all accidents. *Id.*

Men that set their hearts only upon the *present*, without looking forward into the end of things, are struck at. *Id.*

The thing was acceptable, but not the *presenter*. *Id.*

If these nerves, which are the conduits to convey them from without to their audience in the brain, the mind's *presence-room*, are so disordered as not to perform their functions, they have no postern to be admitted by. *Locke.*

How great his *presence*, how erect his look,
How ev'ry grace, how all his virtuous mother
Shines in his face, and charms me from his eyes!
Smith.

The fancy may be so strong as to *presentiate*, upon one theatre, all that ever it took notice of in times past. *Greuv.*

By union, I do not understand that which is local or *presential*, because I consider God as omnipresent. *Norris.*

Thou spendest thy time in waiting upon such a great one, and thy estate in *presenting* him; and, after all, hast no other reward, but sometimes to be smiled upon, and always to be smiled at. *South.*

This eternal, indivisible act of his existence makes all futures actually *present* to him; and it is the *presentiality* of the object which founds the unerring certainty of his knowledge. *Id. Sermons.*

Tell him that no history can match his policies, and *presently* the sot shall measure himself by himself. *South.*

Who, since their own short understandings reach
No further than the *present*, think e'en the wise
Speak what they think, and tell tales of themselves.

Reeve

Kneller, with silence and surprise,
We see Britannia's monarch rise,
And aw'd by thy delusive hand,
As in the *presence-chamber* stand. Addison.

The state is at *present* very sensible of the decay
in their trade. Id.

Our laws make the ordinary a disturber, if he
does not give institution upon the fitness of a person
presented to him, or at least to give notice to the
patron of the disability of his *presentee*. Ayliffe.

Incumbents of churches *presentable* cannot, by
their sole act, grant their incumbencies to others;
but may make leases of the profits thereof. Id.

The moments past, if thou art wise, retrieve
With pleasant mem'ry of the bliss they gave;
The *present* hours in *present* mirth employ,
And bribe the future with the hopes of joy. Prior.

Folks in mudwall tenement,
Affording peppercorn for rent,
Present a turkey or a hen,
To those might better spare them ten. Id.

A graceful *presence* bespeaks acceptance, gives a
force to language, and helps to convince by look and
posture. Collier.

The *present* age hath not been less inquisitive
than the former ages were.

Woodward's *Natural History*.

What, shall the curate controul me? have not I
the *presentation*? Gay.

That he put these bishops in the places of the de-
ceased by his own authority is notoriously false;
for the duke of Saxony always *presented*.

Atterbury.

So ladies in romance assist their knight,
Present the spear, and arm him for the fight.

Pope.

The grand juries were practised with, to *present*
the said pamphlet with all aggravating epithets, and
their *presentments* published for several weeks in all
the newspapers. Swift.

The ample mind keeps the several objects all
within sight, and *present* to the soul. Watts.

Lectorides's memory is ever ready to offer to his
mind something out of other men's writings or con-
versations, and is *presenting* him with the thoughts of
other persons perpetually. Id.

We have always the same natures, and are every
where the servants of the same God, as every place
is equally full of his *presence*, and every thing is
equally his gift. Law.

This much I believe may be said, that the much
greater part of them are not brought up so well, or
accustomed to so much religion, as in the *present* in-
stance. Id.

The *present* moment like a wife we shun,
And ne'er enjoy, because it is our own. Young.

The ideas of pain, and above all of death, are so
very affecting, that whilst we remain in the *presence*
of whatever is supposed to have the power of inflict-
ing either, it is impossible to be perfectly free from
terror. Burke.

PRESENTATION, in ecclesiastic law. See AD-
VOWNS, and PATRONAGE.

PRESENTATION OF OUR LADY, the title of two
orders of nuns. The first was established in
France, about 1627, by Nicholas Sanguin, bishop
of Senlis; it was approved by Urban VIII.
This order never made any great progress. The
second was established in 1664, when Frederick
Borromeo, being apostolical visitor, in the Valte-
line, was intreated by some devout maids at
Morbegno to allow them to live in community in
a retired place; which he granted, and erected

them into a congregation, under the title of con-
gregation of our Lady. They lived under the rule
of St. Augustine.

PRESENTATION OF THE VIRGIN, a feast of the
Romish church, celebrated on the 21st of No-
vember, in memory of the Holy Virgin's being
presented by her parents in the temple, to be
there educated. Emanuel Comnenus, who
began to reign in 1143, makes mention of this
feast in his constitution. Some imagine it to
have been established among the Greeks in the
eleventh century; and think they see evident
proofs of it in some homilies of George of Ni-
comedia, who lived in the time of Photius. Its
institution in the west is ascribed to Gregory XI.
in 1372. Some think it was instituted in me-
mory of the ceremony practised among the
Jews for their new-born females; corresponding
to the circumcision on the eighth day for males.

PRESENTMENT, in law. A presentment, pro-
perly speaking, is the notice taken by a grand
jury of any offence from their own knowledge or
observation, without any bill of indictment laid
before them at the suit of the king; as the pre-
sentment of a nuisance, a libel, and the like;
upon which the officer of the court must after-
wards frame an indictment, before the party
presented can be put to answer it. An inquisi-
tion of office is the act of a jury, summoned by
the proper officer to enquire of matters relating
to the crown, upon evidence laid before them.
Some of these are in themselves convictions,
and cannot afterwards be traversed or denied;
and therefore the inquest, or jury, ought to hear
all that can be alleged on both sides. Of this
nature are all inquisitions of *felo de se*; of flight
in persons accused of felony; of *deodands*, and
the like; and presentments of petty offences in the
sheriff's tourn or court-leet, whereupon the presid-
ing officer may set a fine. Other inquisitions may
be afterwards traversed and examined; as par-
ticularly the coroner's inquisition of the death of
a man, when it finds any one guilty of homicide;
for in such cases the offender so presented must
be arraigned upon this inquisition, and may dis-
pute the truth of it; which brings it to a kind of
indictment, the most usual and effectual means
of prosecution.

PRESERVE', *v. a. & n. s.* } Fr. *preserver*;
PRESERVATION, *n. s.* } low Lat. *præser-*
PRESERVATIVE, *adj. & n. s.* } *vo.* To keep;
PRESERVER. } save; defend;

protect from decay: as a noun substantive, some-
thing so protected, as 'preserved fruit': preser-
vation is, the art or care of preserving: preser-
vative, preventive; having the power of preserv-
ing; that which has this power: preserver, a defen-
der or protector; one who keeps from ruin or
mischief; he who makes artificial preserves.

God sent me to *preserve* you a posterity, and save
your lives. Genesis xlv. 7.

The Lord shall deliver me from every evil work,
and *preserve* me unto his heavenly kingdom.

2 Timothy.

Of all wild beasts *preserve* me from a tyrant;
And of all tame, a flatterer.

Sir P. Sidney.

If we think that the church needeth not those an-
cient *preservatives*, which ages before us were glad to
use, we deceive ourselves. Hooker.

Nature does require
Her times of *preservation*, which, perforce,
I give my tendance to.

Shakspeare. Henry VIII.

Sit, my *preserver*, by thy patient's side.

Shakspeare.

It hath been anciently in use to wear tablets of arsenick, as *preservatives* against the plague; for that, being poisons themselves, they draw the venom from the spirits.

Bacon.

Every senseless thing, by nature's light,
Doth *preservation* seek, destruction shun.

Davies.

Bodies kept clean, which use *preservatives*, are likely to escape infection.

Harvey.

He did too frequently gratify their unjustifiable designs, a guilt all men, who are obnoxious, are liable to, and can hardly *preserve* themselves from.

Clarendon.

We can *preserve* unhurt our minds. *Milton.*

Were there truth herein, it were the best *preservative* for princes, and persons exalted unto such fears.

Browne.

All this is easily discerned in those fruits which are brought in *preserves* unto us.

Id.

Our allwise Maker has put into man the uneasiness of hunger, thirst, and other natural desires, to determine their wills for the *preservation* of themselves, and the continuation of their species.

Locke.

To be indifferent which of two opinions is true is the right temper of the mind, that *preserves* it from being imposed on, till it has done its best to find the truth.

Id.

To be always thinking, perhaps, is the privilege of the infinite Author and *preserver* of things, who never slumbers nor sleeps; but is not competent to any finite being.

Id.

The fruit with the husk, when tender and young, makes a good *preserve*.

Mortimer.

Andrew Doria has a statue erected to him, with the glorious title of deliverer of the commonwealth; and one of his family another, that calls him its *preserver*.

Addison.

The most effectual *preservative* of our virtue is to avoid the conversation of wicked men.

Rogers.

Every petty prince in Germany must be intreated to *preserve* the queen of Great Britain upon her throne.

Swift.

Molly is an Egyptian plant, and was really made use of as a *preservative* against enchantment.

Broome.

PRESERVER. M'INTOSH'S PATENT WATER-PROOF LIFE PRESERVER. This is a simple but ingenious adaptation of air-bags, made of waterproof cloth or canvas, to the support of the body in water. It consists of two strips of waterproof cloth, each about four inches broad and a yard long, or just what will easily surround the body, fastened together at the edges in the form of a narrow bag without any opening, save a small aperture at the side, into which a cock is inserted for the admission of air. To render it perfectly air tight, the cloth is waterproofed while the bag is making, and it is completely fastened by folding the stripes over each other at their junction. The air is simply introduced by blowing with the mouth through the cock, which is to be turned as soon as a sufficient quantity has been admitted, and it may then be applied round the body for use. The proper place to fasten it is immediately under the arms and across the breast, for which purpose it is

furnished with a piece of strong tape, the two ends of which are sewed to the edge of the bag where it is joined, about two or three inches on each side of the middle, where the cock is firmly fastened and made perfectly air-tight; this piece of tape is just sufficiently wide to admit the head easily between it and the bag, and, when put on, it causes the latter to hang down from the neck a little below the breast, and to pass immediately under the arms round to the back, where it is fastened, by two other pieces of tape sewed to the two ends of the bag; these pieces may be made long enough to allow them to be brought round and fastened in front to prevent accidents in the event of their loosing behind. A small piece of tape about two inches long is likewise fastened across the bag at the middle, to allow the other tying pieces to pass through and to prevent them from slipping below the bag, and occasioning the slightest apprehension of danger, in the management of the apparatus. The air may be introduced into the bag either before or after it is placed round the body and fastened; if it hold more air than what is necessary to support the individual using it in water, he will be the best judge of the proper quantity by inflating it before he puts it on; but if it just hold the exact quantity, or very little more, it is quite immaterial whether it be inflated before or not; though we are of opinion it is always better to follow the former plan. There is not the smallest fear of bursting the bag in any case, because, as soon as it is full, any individual will find that he can blow no longer, and will be obliged to desist.

With an apparatus of this kind, which may be had at a very trifling expense, a man may throw himself into the sea with perfect safety, and he may float 100 or 1000 miles with his head and shoulders above water, without the least inconvenience, save what he would suffer from hunger or cold. He will not find it necessary to make the smallest exertion to keep himself in a proper position; for owing to the manner in which the apparatus is placed, and to the equal distribution of the air all round his body, he will preserve nearly an erect posture as long as he pleases; by making the smallest exertion, however, he may take any other position he may find most agreeable: he may lie at his ease on his back, or on one side, or lean forward just as he has a mind; do what he may he cannot sink, unless he chooses to open the cock, and then he must go to the bottom unless he can swim.

PRESIDE', *v. n.* } *Fr. presider*; *Lat. præ-*
PRESIDENCY, *n. s.* } *sideo*. To have authority
PRESIDENT, } over; be set over: presi-
PRESIDENTSHIP. } dency is superintending:
president is, one placed in chief authority; a governor; prefect; tutelary power: presidentship, an office or station.

When things came to trial of practice, their pastors' learning would be at all times of force to over-persuade simple men, who, knowing the time of their own *presidentship* to be but short, would always stand in fear of their ministers' perpetual authority.

Hooker.

How might those captive Israelites, under the oversight and government of Assyrian *presidents*, be able to leave the places they were to inhabit?

Brerewood on Languages.

As the *president* of my kingdom, will I
Appear there for a man.

Shakspeare. Antony and Cleopatra.
This last complaint the indulgent ears did pierce
Of just Apollo, *president* of verse. *Waller.*
Some o'er the publick magazines *preside*,
And some are sent new forage to provide. *Dryden.*

What account can be given of the growth of plants
from mechanical principles, moved without the *pre-*
sidency and guidance of some superior agent?
Ray on the Creation.

The tutor sits in the chair as *president* or moder-
ator, to see that the rules of disputation be ob-
served. *Watts.*

O'er the plans
Of thriving peace, thy thoughtful sires *preside*.
Thomson.

PRESS, *v. a. v. n. & Fr. presser; Lat. pressor.*
PRESSER, [*n. s.*] *presso.* To squeeze;
PRESSGANG, compress; constrain;
PRESS'INGLY, *adv.* crush; drive with violence;
PRESS'ION, *n. s.* compell; urge;
PRESS'ITANT, *adj.* make earnest; force
PRESSMAN, *n. s.* into naval or military
PRESSMONEY, service: as a verb neuter,
PRESSURE, to act with or under
PREST, *adj. & n. s.* prest compulsive
violence; go forward with violence or energy;
crowd; come or go importunately or vehemently;
urge with vehemence; influence strongly;
invade: a press is, an instrument used for squeezing,
crushing, or compressing; particularly the machine
for printing books; a crowd; tumult;
violent tendency; commission for impressing
men in a military sense: a presser and pressman,
one who works a press; also one who forces
away another: pressgang, a crew of men aiding
a military press-officer: pression and pressure
mean, the act of pressing, or force with which
any thing is pressed; impression; stamp; op-
pression; distress: pressitant, gravitating; heavy:
pressmoney, money given to bind to military
service: prest is, ready; not dilatory; 'this is
said to have been the original sense of the word
prest men; men, not forced into the service, as
now we understand it, but men, for a certain
sum received, præst, or ready to march at com-
mand.' Johnson: also, neat; tight: as a noun
substantive, a loan.

The grapes I *pressed* into Pharaoh's cup. *Genesis.*

He *pressed* upon them greatly; and they turned in.

Id.

The posts that rode upon mules and camels, went
out, being hastened and *pressed* on by the king's
commands. *Esther.*

The *press* is full, the fats overflow. *Joel iii. 13.*
For he had healed many, insomuch that they
pressed upon him for to touch him. *Mark iii. 10.*

Good measure *pressed* down, shaken together, and
running over, shall men give into your bosom.

Luke vi. 38.

I *press* toward the mark for the prize.

Philippians.

More wealth any where, to be breefe,
More people, more handsome and *prest*
Where find ye? *Tusser's Husbandry.*

She held a great gold chain ylinked well,

Whose upper end to highest heaven was knit,

And lower part did reach to lowest hell,

And all that *prest* did round about her swell,

To catchen hold of that long chain. *Spenser.*

The experience of his goodness in her own defi-
verance, might cause her merciful disposition to take
so much the more delight in saving others, whom the
like necessity should *press*. *Hooker.*

Gritus desired nothing more than to have con-
firmed the opinion of his authority in the minds of
the vulgar people, by the *prest* and ready attendance
of the Vayoud. *Knolles's History of the Turks.*

The Turks gave a great shout, and *pressed* in on
all sides, to have entered the breach. *Knolles.*

Once or twice she heaved the name of father
Pantingly forth, as if it *prest* her heart. *Shakspeare.*

Come with words as medical as true,
Honest as either, to purge him of that humour
That *presses* him from sleep. *Id.*

For every man that Bolingbroke hath *pressed*
To lift sharp steel against our golden crown,
Heaven for his Richard hath in store
A glorious angel. *Id. Richard II.*

From London by the king I was *prest* forth.

Shakspeare.

I make bold to *press*

With so little preparation. *Id.*

These letters are of the second edition; he will
print them out of doubt, for he cares not what he
puts into the *press*, when he would put us two in.

Id.

Who is it in the *press* that calls on me?

Id. Julius Cæsar.

Creep into the kiln hole.—Neither *press*, coffer,
chest, trunk; but he hath an abstract for the remem-
brance of such places. *Shakspeare.*

If I be not ashamed of my soldiers, I am a
sowed garnet; I have misused the king's *press*.

Id.

From my memory

I'll wipe away all trivial fond records,

All saws of books, all forms, all *pressures* past,

That youth and observation copied there. *Id.*

Concerning the musters and *presses* for sufficient
mariners to serve in his majesty's ships, either the
care is very little, or the bribery very great. *Raleigh.*

Let them be *pressed*, and ready to give succours
to their confederates, as it ever was with the
Romans; for, if the confederate had leagues defen-
sive, the Romans would ever be the foremost.

Bacon.

The less blood he drew, the more he took of trea-
sure; and, as some construed it, he was the more
sparing in the one, that he might be the more *press-*
ing in the other. *Id.*

A wise father ingeniously confessed, that those,
which persuaded *pressure* of consciences, were com-
monly interested therein. *Id.*

He required of the city a *prest* of six thousand
marks; but he could obtain but two thousand
pounds. *Id.*

Each mind is *prest*, and open every ear,
To hear new tidings, though they no way join us.

Fairfax.

Mine own and my people's *pressures* are grievous,
and peace would be very pleasing. *King Charles.*

Only one path to all; by which the *pressmen* came.

Chapman.

The one contracts his words, speaking *pressingly*
and short; the other delights in long-breathed ac-
cents. *Hovel.*

The endeavour to raise new men for the recruit of
the army by *pressing*, found opposition in many places.
Clarendon.

He *pressed* her matron lips

With kisses pure. *Milton.*

His obligation to read not only classick authors,
but the more recent abortions of the *press*, wherein he
proved frequently concerned. *Fell.*

His inodesty might be secured from *pressure* by the concealing of him to be author. *Id.*

The genuine price of lands in England would be twenty years' purchase, were it not for accidental *pressure* under which it labours. *Child on Trade.*

Neither the celestial matter of the vortices, nor the air, nor water, are *pressant* in their proper places. *More.*

Chymists I might *press* with arguments, drawn from some of the eminentest writers of their sect. *Boyle.*

If there be fair proofs on the one side, and none at all on the other, and if the most *pressing* difficulties be on that side on which there are no proofs, this is sufficient to render one opinion very credible, and the other incredible. *Tillotson.*

I was *press'd* by his majesty's commands, to assist at the treaty. *Temple's Miscellanies.*

Their morning milk the peasants *press* at night, Their evening milk before the rising light. *Dryden.*

He gapes; and straight

With hunger *prest*, devours the pleasing bait. *Id.*

He *pressed* a letter upon me, within this hour, to deliver to you. *Id. Spanish Fryar.*

She took her son, and *press'd*
The illustrious infant to her fragrant breast. *Dryden.*

The peaceful peasant to the wars is *prest*,

The fields lie fallow in inglorious rest. *Id.*

The insulting victor *presses* on the more

And treads the steps the vanquished trod before. *Id.*

Thronging crowds *press* on you as you pass,

And with their eager joy may triumph slow. *Id.*

A new express all Agra does affright,

Darah and Aurengzebe are joined in fight;

The *press* of people thickens to the court,

The impatient crowd devouring the report. *Id.*

A great many uneasinesses always soliciting the will, it is natural that the greatest and most *pressing* should determine it to the next action. *Locke.*

After *pressing* out of the coleseed for oil, in Lincolnshire, they burn the cakes to heat their ovens. *Mortimer.*

His easy heart received the guilty flame,
And from that time he *prest* her with his passion. *Smith.*

Why has there been now and then a kind of a *press* issued out for ministers, so that as it were the vagabonds and loiterers were taken in? *Davenant.*

Be sure to *press* upon him every motire. *Addison.*

She is always drawn in a posture of walking, it being as natural for Hope to *press* forward to her proper objects as for Fear to fly from them. *Id.*

If light consisted only in *pression*, propagated without actual motion, it would not be able to agitate and heat the bodies which refract and reflect it; if it consisted in motion propagated to all distances in an instant, it would require an infinite force every moment, in every shining particle, to generate that motion: and if it consisted in *pression* or motion, propagated either in an instant or in time, it would bend into the shadow. *Newton's Opticks.*

Let us not therefore faint, or be weary in our journey, much less turn back or sit down in despair; but *press* cheerfully forward to the high mark of our calling. *Rogers.*

Here, Peascod, take my pouch, 'tis all I own,
'Tis my *pressmoney*.—Can this silver fail? *Gay.*

Excellent was the advice of Eliphaz to Job, in the midst of his great troubles and *pressures*: acquaint thyself now with God, and be at peace. *Atterbury.*

They kept their cloaths, when they were not worn, constantly in a *press* to give them a lustre. *Arbutnot.*

The blood flows through the vessels by the excess of the force of the heart above the incumbent *pressure*, which in fat people is excessive. *Id.*

I put pledgets of lint *pressed* out on the excoration. *Wiseman.*

I am the more bold to *press* it upon you, because these accomplishments sit more handsomely on persons of quality than any other. *Felton.*

On superior powers
Were we to *press*, inferior might on ours. *Pope.*

Leucothoe shook,

And *pressed* Palemon closer in her arms. *Id.*

Through the *press* enraged Thalestris flies.

And scatters death around from both her eyes. *Id.*

Those who negotiated took care to make demands impossible to be complied with; and therefore might securely *press* every article, as if they were in earnest. *Swift.*

You were *pressed* for the sea-service, and got off with much a-do. *Id.*

Of the stuffs I give the profits to dyers and *pressers*. *Id.*

While Mist and Wilkins rise in weekly might,

Make *presses* groan, lead senators to fight. *Young.*

An Englishman fears contempt more than death; he often flies to death as a refuge from his *pressure*, and dies when he fancies the world has ceased to esteem him. *Goldsmith.*

This treatise he completed but did not publish; for that poverty which in our day drives authors as hastily in such numbers to the *press*, in the time of Ascham, I believe, debarred them from it. *Johnson.*

If, by the liberty of the *press*, we understand merely the liberty of discussing the propriety of public measures and political opinions, let us have so much of it as you please; but if it means the liberty of affronting, calumniating, and defaming one another, I, for my part, own myself willing to part with my share of it whenever our legislators shall please to alter the law. *Franklin.*

PRESS, in the mechanic arts, is a machine made of iron or wood, serving to squeeze or compress any body very close. The ordinary presses consist of six members, or pieces; viz. two fat smooth planks, between which the things to be pressed are laid; two screws, or worms, fastened to the lower plank, and passing through two holes in the upper; and two nuts, in form of an S, serving to drive the upper plank, which is moveable, against the lower, which is stable, and without motion. Presses for expressing liquors are of various kinds; some in most respects the same with the common presses, excepting that the under plank is perforated with a great number of holes, to let the juice expressed run through into the tub, or receiver, underneath.

PRESS, CUTTING, or BOOK-BINDER'S CUTTING-PRESS, is a machine used equally by book-binders, stationers, and pasteboard makers; consisting of two large pieces of wood, in form of cheeks, connected by two strong wooden screws, which, being turned by an iron bar, draw together, or set asunder, the cheeks, as much as is necessary for the putting in the books or paper to be cut. The cheeks are placed lengthwise on a wooden stand, in the form of a chest, into which the cuttings fall. The cheeks are two pieces of wood, of the same length with the

screws, serving to direct the cheeks, and prevent their opening unequally. Upon the cheeks the plough moves, to which the cutting knife is fastened by a screw. The plough consists of several parts; a wooden screw or worm, catching within the nuts of the two feet that sustain it on the cheeks, brings the knife to the book or paper, which is fastened in the press between two boards. This screw, which is pretty long, has two directories, which resemble those of the screws of the press. To make the plough slide square and even on the cheeks, so that the knife may make an equal paring, that foot of the plough where the knife is not fixed slides in a kind of groove, fastened along one of the cheeks. Lastly, the knife is a piece of steel, six or seven inches long, flat, thin, and sharp, terminating at one end in a point, like that of a sword, and at the other in a square form, which serves to fasten it to the plough. See **BOOK-BINDING**. As the long knives used by us in the cutting of books or papers are apt to jump in the cutting thick books, the Dutch are said to use circular knives, with an edge all round; which not only cut more steadily, but last longer without grinding.

PRESSING, in the manufactures, is applied to cloth, stuff, &c., to render it smooth and glossy. There are two methods of pressing, viz. cold and hot. Cold-pressing is thus performed:—After the stuff has been scoured, fulled, and shorn, it is folded square in equal plaits, and a skin of vellum or pasteboard put between each plait. Over the whole is laid a square wooden plank, and so put into the press, which is screwed down tight by means of a lever. After it has lain a sufficient time in the press they take it out, removing the pasteboards, and lay it up to keep. Some only lay the stuff on a firm table, after plaiting and pasteboarding, cover the whole with a wooden plank, and load it with a proper weight. Hot-pressing is performed thus:—When the stuff has received the above preparations it is sprinkled a little with water, sometimes gum-water: then plaited equally, and between each two plaits are put leaves of pasteboard, and between every sixth and seventh plait, as well as over the whole, an iron or brass plate well heated in a kind of furnace. This done, it is laid upon the press, and forcibly screwed down. Under this press are laid five, six, &c., pieces at the same time, all furnished with their pasteboards and iron plates. When the plates are well cooled the stuffs are taken out, and stitched a little together to keep them in the plaits. This manner of pressing was only invented to cover the defects of the stuffs; and, accordingly, it has been frequently prohibited.

PRESTEIGN, a market town of Radnorshire, 149 miles W. N. W. of London, in the direct road to Aberystwith. It is a neat well-built town, with clean and regular streets, and is the residence of many genteel families. It is seated on a gravelly soil on the banks of the Lug, at the head of a very fertile vale: the mountains on the west and north-west forming a kind of amphitheatre round it. The name in Welsh is *Slan-Andras*, from the church, which is dedicated to St Andrew. The town is divided into four wards, which have each separate jurisdictions, Vol. XVIII.

officers, levies, &c. It is a borough by prescription, and is governed by a bailiff, annually elected and sworn in by a steward appointed by the crown. The living is a rectory and vicarage united, worth from £500 to £600 a year: the parish lying in two counties. It has an excellent free school, well endowed. The county hall, gaol, bridewell, and correction-house, are kept in it. It has a market on Saturday, and two fairs. Presteign is thirty miles W. N. W. of Worcester.

PRESTER, a meteor consisting of an exhalation thrown from the clouds downwards with such violence that it is set on fire by the collision. The word is Greek, *πρηστηρ*, the name of a kind of serpent; called also *dipsas*, to which this meteor is supposed to bear a resemblance. The prester differs from the thunderbolt in the manner of its inflammation, and in its burning and breaking every thing it touches with greater violence.

PRESTER JOHN, an appellation formerly given to an emperor of the Tartars, who was overcome by Jenghiz Khan A. D. 1201.

PRESTIMONY, in canon law, is derived a *præstatione quotidiana*; and is, by some, defined to be a kind of benefice, served by a single priest. Others say it is the incumbency of a chapel without any title or collation; such as are most of those in castles, where prayers or masses are said, and which are mere endowed oratories. Whence the term is also applied, in the Romish church, to certain perpetual offices bestowed on canons, religious, or others, for the saying of masses, by way of augmentation of their livings. Du Moulin calls it a profane benefice, which however, has a perpetual title, and an ecclesiastical office, with certain revenues attached to it; which the incumbent is allowed to sell, and which may be possessed without tonture; such as the lay church-wardens of Notre Dame. He adds that, in propriety, the canonries of chapels are benefices of this nature.

PRESTO, *n. s.* Ital. *presto*; Lat. *presto*. Quick; at once. A word used by those that show legerdemain.

Presto! begone! 'tis here again;

There's every piece as big as ten. *Swift.*

PRESTON (Thomas), LL. D., a dramatic writer and actor who flourished in the beginning of queen Elizabeth's reign. He was first admitted M. A. and fellow of King's College, Cambridge, and afterwards created LL. D. and elected master of Trinity Hall. In 1564, when the queen was entertained at Cambridge, Preston acted so well in the tragedy of Dido, a Latin piece written by John Ritwise, another fellow of the same college, that queen Elizabeth settled a pension of twenty pounds a year on him; a circumstance which Shakspeare is supposed to allude to, in his *Midsummer Night's dream*, Act 4th. He likewise attended and exhibited at Oxford, on the 6th of September 1566, with other eight Cantabrigians, when the queen visited that university. He also wrote a dramatic piece, in the ancient metre, entitled *Cambyses King of Persia*.

PRESTON, a borough and market town of England, in Lancashire, seated on the Ribble, over which there is a handsome stoue bridge. The

town is well built, and lighted with gas; having a handsome and convenient town hall. The church is spacious and handsome: there are two Roman Catholic chapels, and meeting-houses for all classes of dissenters. The new prison, built according to the plan of John Howard, is a large and commodious building. Here is also a dispensary, a free grammar school, and several public charity schools. It is governed by a mayor, recorder, aldermen, four subaldermen, seventeen common-council-men, and a town clerk. It returns two members to parliament, the right of election being in the inhabitants at large, being the only place in England where the members are returned by universal suffrage. The returning officers are the mayor and two bailiffs. The river here is navigable for small vessels only; and by canal navigation it has communication with most of the principal rivers in England. The cotton manufactories are carried on here extensively. Here is held a court of Chancery, and other offices of justice for the county palatine of Lancaster. It is noted for the defeat of the Scotch royalists under the duke of Hamilton in the reign of Charles I., as well as for that of the rebels in 1715, when they were all made prisoners, and sent up to London. It has a good market-place, large open streets, and markets on Wednesday and Friday. From Preston a Roman road, still distinctly visible in places, conducts to Ribchester, once a military station of that people. Its original designation has been a matter of much contention among antiquaries. Camden supposes it to have been the Coccium of Antoninus, and the Rigodunum of Ptolemy. Horsley was of the same opinion as to Coccium, but inclined to fix Rigodunum at Warrington. Mr. Whitaker, the historian of Manchester, contended that it was Rerigionium of Richard of Cirencester; but Dr. Whitaker, who last investigated the subject, appears to have clearly identified it with Coccium; and assigns its original establishment to Agricola. From the boldness and extent of its ramparts, and also from the number of altars, inscribed stones, earthen vessels, plates of copper, coins, and other relics found here, Ribchester is presumed to have been a station of more than ordinary magnitude and importance. That the Ribble was anciently navigable as high as this place is proved by the fact of many anchors having been dug up in the vicinity, as well as the hull of a ship larger than any that could now be floated above Preston. Preston lies twenty-one miles south of Lancaster, and 216 N. N. W. of London.

PRESTON, a town of Scotland, in Haddingtonshire, in the parish of Preston-Pans, seven miles west of Haddington; formerly noted for its fair, held on the second Thursday of October, called St. Jerome's fair, at which the travelling chapmen made their annual election.

PRESTON-PANS, a parish of Scotland, in East Lothian, so named from the above town and the salt-pans near it, on the east coast of the frith of Forth. The soil is loam, partly on clay and partly on a sandy bottom; and produces good crops of all the usual grain. There are ten salt-pans, of which six are wrought. The average quantity of salt made annually is 10,750 bushels

and four gallons. The total quantity delivered in five years, from 1787 to 1792, was 417,354 bushels five gallons.

PRESTON-PANS, a town in the above parish, built after the erection of the salt-pans, and named from them. It is a quarter of a mile north of Preston. It is a burgh of barony, and a port of the custom-house, eight miles east of Edinburgh, and nine and three-quarters north-west of Haddington. It received its charter of erection in 1617, by which Preston is included in its privileges. It is noted for its extensive manufactures particularly of salt, stone, and earthen-ware, and brick and tile. A manufacture of oil of vitriol, aqua-fortis, and spirit of salt is also carried on to a great extent; and the same company manufactures great quantities of Glauber's salts. On the east of the enclosures of Preston-Pans, on the 21st of September 1745, the forces under prince Charles Stuart obtained a victory over the royal forces under Sir John Cope. See GREAT BRITAIN.

PRESUME', *v. n.*
 PRESUM'ABLY, *adv.*
 PRESUM'ER, *n. s.*
 PRESUMPTION,
 PRESUMPTIVE, *adj.*
 PRESUMPTUOUS,
 PRESUMPTUOUSLY, *adv.*
 PRESUMPTUOUSNESS, *n. s.*

Fr. *presumer*;
 Lat. *presumo*. To suppose; assume; believe or affirm without proof; intrude; attempt vainly, or arrogantly; taking on, upon and of before the object (the last improperly) presumably is without examination: presumer and presumption follow these senses: presumptive is, taken by supposition; confident; arrogant; also in law applied to the person who, if the ancestor should die immediately, would be his heir, but whose right of inheritance may be defeated by some nearer heir being born: presumptuous is arrogant; confident; irreverent toward sacred things: the adverb and noun substantive corresponding.

Keep back thy servant from *presumptuous* sins.

Psalms.

In this we fail to perform the thing, which God seeth meet, convenient, and good; in that we presume to see what is meet and convenient, better than God himself.

Hooker.

The sins whereinto he falleth are not *presumptuous*; but are ordinarily of weakness and infirmity.

Perkins.

I *presume*,

That as my hand has opened bounty to you,
 My heart dropped love; my power rained honour,
 more

On you, than any. *Shakspeare. Henry VIII.*

Let my *presumption* not provoke thy wrath;

For I am sorry, that with reverence

I did not entertain thee as thou art. *Shakspeare.*

Presumptuous priest, this place commands my patience.

Id.

There was a matter we were no less desirous to know, than fearful to ask, lest we might *presume* too far.

Bacon.

The boldness of advocates prevails with judges; whereas they should imitate God, who represseth the *presumptuous*, and giveth grace to the modest.

Id. Essays.

Heavy with some high minds is an overweight of obligation; otherwise great deservers do grow intolerable *presumers*.

Wotton.

Thou hast shewed us how unsafe it is to offend thee, upon *presumption* afterwards to please thee.

King Charles.

A tower whose top might reach to heaven, was a shameful arrogance, an impious *presumption*.

Bp. Hall.

It warns a warier carriage in the thing,
Lest blind *presumption* work their ruining.

Daniel.

I entreat your prayers, that God will keep me from all premature persuasion of my being in Christ, and not suffer me to go on *presumptuously* or desperately in any course.

Hammond.

A *presumption* upon this aid was the principal motive for the undertaking.

Clarendon.

O much deceived, much failing, hapless Eve!

Of thy *presumed* return! event perverse! *Milton.*

I to the heav'nly vision thus *presumed*.

Id.

God, to remove his ways from human sense,
Placed heaven from earth so far, that earthly sight,
If it *presume*, might err in things too high,

And no advantage gain.

Id. Paradise Lost.

Their minds somewhat raised

By false *presumptuous* hope.

Milton.

Authors *presumably* writing by common places, wherein, for many years, promiscuously amassing all that make for their subject, break forth at last into useless rhapsodies.

Browne.

Although in the relation of Moses there be very few persons mentioned, yet are there many more to be *presumed*.

Id.

There being two opinions repugnant to each other, it may not be *presumptive* or sceptical to doubt of both.

Id.

It being not the part of a *presumptuous*, but of a truly humble man to do what he is bidden, and to please those whom he is bound in duty to obey.

Kettlewell.

I had the *presumption* to dedicate to you a very unfinished piece.

Dryden.

The powers incensed

Punished his *presumptuous* pride,

That for his daring enterprise she died.

Id.

Presuming of his force, with sparkling eyes,

Already he devours the promised prize.

Id.

We commonly take shape and colour for so *presumptive* ideas of several species, that, in a good picture, we readily say this is a lion, and that a rose.

Locke.

He that would not deceive himself, ought to build his hypothesis on matter of fact, and not *presume* on matter of fact, because of his hypothesis.

Id.

Experience supplants the use of conjecture in the point; we do not only *presume* it may be so, but actually find it is so.

Government of the Tongue.

Do you, who study nature's works, decide,

Whilst I the dark mysterious cause admire;

Nor into what the gods conceal, *presumptuously* enquire.

Addison's Remarks on Italy.

Though men in general believed a future state, yet they had but confused *presumptions* of the nature and condition of it.

Rogers.

Luther *presumes* upon the gift of continency.

Atterbury.

Canst thou love

Presumptuous Crete, that boasts the tomb of Jove?

Pope.

Those at home held their immoderate engrossments of power by no other tenure than their own *presumption* upon the necessity of affairs.

Swift.

Mark these, she says; these, summoned from afar,
Begin their march to meet thee at the bar;

There find a judge, inexorably just,

And perish there, as all *presumption* must.

Cowper.

The same estate may be frequently devested by the subsequent birth of nearer *presumptive* heirs, before it fixes upon an heir apparent. As if an estate is given to an only child, who dies; it may descend to an aunt, who may be stripped of it by an after-born uncle; on whom a subsequent sister may enter, and who will again be deprived of the estate by the birth of a brother, the heir apparent.

Judge Christian.

PRESUPPOSE, *v. a.* Fr. *presupposer*, *præ* and *suppose*. To suppose as previous; imply as antecedent.

In as much as righteous life *presupposeth* life, in as much as to live virtuously it is impossible except we live; the first impediment, which we endeavour to remove, is penury and want of things without which we cannot live.

Hooker.

All kinds of knowledge have their certain bounds; each of them *presupposeth* many necessary things learned in other sciences, and known beforehand.

Id.

All things necessary to be known that we may be saved, but known with *presupposal* of knowledge concerning certain principles, whereof it receiveth us already persuaded.

Id.

PRESURMISE, *n. s.* *Præ* and *surmise*. *Surmise* previously formed.

It was your *presurmise*,

That, in the dole of blows, your son might drop.

Shakspeare.

PRETEND *v. a. & v. n.*

PRETENCE, *n. s.*

PRETENDER,

PRETEND'INGLY,

PRETENS'ION, *n. s.*

Fr. *pretendre*;

Latin, *pretendere*;

Used by Dryden

literally for to hold

out; to simulate;

claim, taking to before the object: as a verb neuter, to put in a claim, true or false; presume an ability to a thing; profess *presumptuously*: a pretender is one who claims, and more commonly one who cannot prove or sustain a right: *pretendingly* is *presumptuously*; arrogantly: *pretension*, claim, false or true; fictitious appearance.

With flying speed and seeming great *pretence*

Came running in a messenger.

Spenser.

In the great hand of God I stand, and thence

Against the undivulged *pretence* I fight

Of treas'rous malice.

Shakspeare. Macbeth.

This was but an invention and *pretension* given out by the Spaniards.

Bacon.

'Tis their interest to guard themselves from those riotous effects of *pretended* zeal, nor is it less their duty.

Decay of Piety.

But if to unjust things thou dost *pretend*,

Ere they begin let thy *pretensions* end.

Denham.

So strong his appetite was to those executions he had been accustomed to in Ireland, without any kind of commission or *pretence* of authority.

Clarendon.

Spirits on our just *pretences* armed

Fell with us.

Milton.

This let him know,

Lest wilfully transgressing he *pretend*

Id.

Surprised.

Warn all creatures from thee
Henceforth; lest that too heavenly form, *pretended*

Id.

To hellish falsehood, snare them.

There is no security which men can yield comparable to that of an oath; the obligation whereof no man wilfully can infringe, without renouncing the fear of God, and any *pretence* to his favour.

Burton.

Of the ground of redness in this sea are we not fully satisfied? For there is another red sea whose name we *pretend* not to make out from these principles.

Broune.

He so much abhorred artifice and cunning, that he had prejudice to all concealments and *pretensions*.

Fell.

This *pretence* against religion will not only be baffled, but we shall gain a new argument to persuade men over.

Tillotson.

Lucaeus, to lash his horses, bends

Prone to the wheels, and his left foot *pretends*.

Dryden.

Let not Trojans, with a feigned *pretence*

Of proffered peace, delude the Latian prince. *Id.*

The prize was disputed only till you were seen; now all *pretenders* have withdrawn their claims. *Id.*

Men indulged those opinions and practices that favour their *pretensions*.

L'Estrange.

Primogeniture cannot have any *pretence* to a right of solely inheriting property or power.

Locke.

Despise not these few ensuing pages; for never was any thing of this *pretence* more ingeniously imparted.

Evelyn.

Whatever victories the several *pretenders* to the empire obtained over one another, they are recorded on coins without the least reflection.

Addison.

I have a particular reason to look a little *pretendingly* at present.

Collier on Pride.

I should have dressed the whole with greater care; but I had little time, which I am sure you know to be more than *pretence*.

Wake.

Are they not rich? what more can they *pretend*?

Pope.

To just contempt ye vain *pretenders* fall,

The people's fable and the scorn of all. *Id.*

In those countries that *pretend* to freedom, princes are subject to those laws which their people have chosen.

Swift.

The numerous *pretenders* to places would never have been kept in order, if expectation had been cut off.

Id.

Pretenders to philosophy or good sense grow fond of this sort of learning.

Watts.

PRETERITION, *n. s.* } Fr. *preterition*;

PRETERITNESS. } Lat. *preteritus*. The

act of going past: the state of being past.

Had not he been a wise disciple, that should have envied the great favour done to Judas, and have stomached his own *preterition*? So foolish are they, who, measuring God's affection by temporal benefits, are ready to applaud prospering wickedness; and to grudge outward blessings to them which are incapable of any better.

Bp. Hall.

We cannot conceive a *preteritness* still backwards, in infinitum, that never was present, as we can an endless futurity that never will be present; so that though one is potentially infinite, yet nevertheless the other is positively finite; and this reasoning doth not at all affect the eternal existence of the adorable divinity, in whose invariable nature there is no past nor future.

Bentley's Sermons.

PRETERITION, or PRETERMISSION, in rhetoric, a figure whereby, in pretending to pass over a thing untouched, we make a summary mention thereof. I will not say he is valiant, he is learned, he is just, &c.

PRETERLAPSED, *adj.* Lat. *preterlapsus*. Past and gone.

We look with a superstitious reverence upon the accounts of *preterlapsed* ages.

Glanville's Scepis.

Never was there so much of either, in any *preterlapsed* age, as in this.

Walker.

PRETERLEGAL, *adj.* *Preter* and legal. Not agreeable to law.

I expected some evil customs *preterlegal*, and abuses personal, had been to be removed. *King Charles.*

PRETERMIT, *v. a.* Lat. *pretermitto*. To pass by.

The fees, that are termly given to these deputies, for recompense of their pains, I do purposely *pretermit*; because they are not certain.

Bacon.

PRETERNATURAL, *adj.* } *Preter* and

PRETERNATURALLY, *adv.* } natural. Differ-

PRETERNATURALNESS, *n. s.* } ent from what is natural; irregular: the adverb and noun substantive correspond.

Simple air, *preteraturally* attenuated by heat, will make itself room, and break and blow up all that which resisteth it.

Bacon.

That form which the earth is under at present is *preternatural*, like a statue made and broken again.

Burnet.

We will enquire into the cause of this vile and *preternatural* temper of mind, that should make a man please himself with that which can no ways reach those faculties which nature has made the proper seat of pleasure.

South's Sermons.

Anger and the thirst of revenge are a kind of fever; fighting and law-suits bleeding; at least an evacuation. The latter occasions a dissipation of money; the former of those fiery spirits which cause a *preternatural* fermentation.

Shenstone.

PRETERPERFECT, *adj.* Lat. *preteritum perfectum*. A grammatical term applied to the tense which denotes time absolutely past.

The same natural aversion to loquacity has of late made a considerable alteration in our language, by closing in one syllable the termination of our *preterperfect* tense, as drown'd, walk'd, for drowned, walked.

Addison's Spectator.

PRETEXT, *n. s.* Fr. *pretexte*; Lat. *pretextus*. Pretence; false appearance, or allegation.

My *pretext* to strike at him admits

A good construction. *Shakespeare. Coriolanus.*

He made *pretext*, that I should only go And helpe convey his freight; but thought not so.

Chapman.

I shall not say with how much or how little *pretext* of reason they managed those disputes.

Decay of Piety.

Under this *pretext*, the means he sought

To ruin such whose might did much exceed

His power to wrong. *Daniel's Civil War.*

As chymists gold from brass by fire would draw,

Pretexts are into treason forged by law. *Denham.*

They suck the blood of those they depend upon, under a *pretext* of service and kindness.

L'Estrange.

PRETEXTA TOGA. See PRETEXTA.

PRETI (Chevalier Matthias), a celebrated Italian painter, born at Calabria in 1613. His picture of the triumph of Osiris, the Egyptian conqueror, obtained the prize from the Academy of St. Luke at Rome. He died in 1699.

PRETOR, *n. s.* } Fr. *preteur*; Lat. *praetor*.

PRETORIAN, *adj.* } The Roman judge; some times taken for a mayor: judicial.

Good Cinna, take this paper;

And look you lay it in the *pretor's* chair.

Shakespeare.

The chancery had the *pretorian* power for equity; the star-chamber had the censorian power for offences.

Bacon.

Porphyrus, whom you Egypt's pretor made,
Is come from Alexandria to your aid. *Dryden.*
An advocate, pleading the cause of his client before one of the pretors, could only produce a single witness, in a point where the law required two.

Spectator.

PRETOR. See PRÆTOR.

PRETSCHINSTANSKOE KREPOST, a fortress in the government of Orenbourg, European Russia, on the Sacmara, and the principal of the line of forts on that river. The town is inhabited by Tartars. The preparation of birch tar is here a considerable employment.

PRETTY, *adj. & adv.* } Sax. *præte*; Belg.
PRETTILY, *adv.* } *frait*; i. e. Goth. *frida*.
PRETTINESS, *n. s.* } *pryda*. Neat; pleasing; elegant; beautiful or elegant without grandeur: used as a diminutive, contemptuously, and for a small, but not extremely small, number: as an adverb, in some degree: prettily is neatly; elegantly: prettiness follows the senses of the adjective and adverb.

How prettily the young swain seems to wash
The hand was fair before.

Shakspeare. Winter's Tale.

Of these the idle Greeks have many pretty tales.

Raleigh.

Cut off the stalks of cucumbers, immediately after their bearing, close by the earth, and then cast a pretty quantity of earth upon the plant, and they will bear next year before the ordinary time.

Bacon.

One saith prettily; in the quenching of the flame of a pestilent ague, nature is like people that come to quench the fire of a house; so busy, as one letteth another.

Id.

A knight of Wales, with shipping and some pretty company, did go to discover those parts.

Abbot.

There is goodliness in the bodies of animals, as in the ox, greyhound, and stag; or majesty and stateliness, as in the lion, horse, eagle, and cock; grave awfulness, as in mastiffs; or elegance and prettiness, as in lesser dogs and most sort of birds; all which are several modes of beauty.

More.

Of this mixture we put a parcel into a crucible, and suffered it for a pretty while to continue red hot.

Boyle.

Those drops of prettiness, scatteringly sprinkled amongst the creatures, were designed to defecate and exact our conceptions, not to inveigle or detain our passions.

Id.

A pretty task; and so I told the fool,
Who needs must undertake to please by rule.

Dryden

A weazle, a pretty way off, stood leering at him.

L'Estrange.

Children, kept out of ill company, take a pride to behave themselves prettily, after the fashion of others.

Locke.

The world began to be pretty well stocked with people, and human industry drained those uninhabitable places.

Burnet.

The pretty gentleman is the most complaisant creature in the world, and is always of my mind.

Spectator.

He'll make a pretty figure in a triumph,
And serve to trip before the victor's chariot.

Addison.

I shall not enquire how far this lofty method may advance the reputation of learning; but I am pretty sure 'tis no great addition to theirs who use it.

Collier.

These colours were faint and dilute, unless the light was trajected obliquely; for by that means they became pretty vivid.

Newton.

This writer every where insinuates, and, in one place, pretty plainly professes himself a sincere Christian.

Atterbury.

The copper halfpence are coined by the publick, and every piece worth pretty near the value of the copper.

Swift.

They found themselves involved in a train of mistakes, by taking up some pretty hypothesis in philosophy.

Watts.

The first attempts of this kind were pretty modest.

Baker.

PREVAIL', *v. n.* } Fr. *prevaloir*; Lat.

PREVAIL'ING, *adj.* } *prevallere*. To have

PREVAIL'MENT, *n. s.* } power or effect; over-

PREVALENCE, or } come; gain superi-

PREVALENCY, *n. s.* } ority; persuade; in-

PREVALENT, *adj.* } duce; gain influence:

PREVALENTLY, *adv.* } prevailing is, dominant; efficacious; having most influence: prevailment, prevalence, and prevalency, predominance; influence; power; superiority; efficacy: prevalent and prevalently correspond.

With minds obdurate nothing *prevailleth*; as well they that preach, as they that read unto such, shall still have cause to complain with the prophets of old, Who will give credit unto our teaching?

Hooker.

They that were your enemies, are his,
And have prevailed as much on him as you.

Shakspeare.

Messengers

Of strong prevailment in unhardened youth. *Id.*
Brennus told the Roman ambassadors that prevalent arms were as good as any title, and that valiant men might account to be their own as much as they could get.

Raleigh.

Nor is it hard for thee to preserve me amidst the unjust hatred and jealousy of too many, which thou hast suffered to prevail upon me. *King Charles.*

The millennium prevailed long against the truth upon the strength of authority. *Decay of Piety.*

I do not pretend that these arguments are demonstrations of which the nature of this thing is not capable: but they are such strong probabilities, as ought to prevail with all those who are not able to produce greater probabilities to the contrary.

Wilkins.

He was prevailed with to restrain the earl of Bristol upon his first arrival.

Clarendon.

The duke better knew what kind of arguments were of prevalence with him.

Id.

Animals, whose forelegs supply the use of arms, hold, if not an equality in both, a prevalency oft-times in the other.

Browne.

The serpent with me
Persuasively has so prevailed, that I
Have also tasted.

Milton.

On the foughten field,

Michael and his angels prevalent encamping. *Id.*
This custom makes the short-sighted bigots, and the warier scepticks, as far as it prevails. *Locke.*

They are more in danger to go out of the way, who are marching under the conduct of a guide, than he that is an hundred to one will mislead them, than he that has not yet taken a step, and is likelier to be prevailed on to enquire after the right way. *Id.*

Probabilities, which cross men's appetites and prevailing passions, run the same fate: let never so much probability hang on one side of a covetous man's reasoning, and money on the other, it is easy to foresee which will outweigh.

Id.

Upon assurances of revolt, the queen was *prevailed* with to send her forces upon that expedition.

South.

The conduct of a peculiar providence made the instruments of that great design *prevulent* and victorious, and all those mountains of opposition to become plains.

Id.

Save the friendless infants from oppression;
Saints shall assist thee with *prevailing* prayers,
And warring angels combat on thy side.

Rowe.

The gods pray
He would resume the conduct of the day,
Nor let the world be lost in endless night;
Prevailed upon at last, again he took
The harnessed steeds, that still with horror shook.

Addison.

Why, fair one, would you not rely
On reason's force with beauty's joined?

Could I their *prevaleuce* deny,
I must at once be deaf and blind.

Prior.

The evening star so falls in the main,
To rise at morn more *prevaleutly* bright.

Id.

This was the most received and *prevaleut* opinion,
when I first brought my collection up to London.

Woodward.

Least of all does this precept imply, that we should comply with any thing that the *prevaleuce* of corrupt fashion has made reputable.

Rogers.

While Marlbro's cannon thus *prevails* by land,
Britain's sea chiefs by Anna's high command,
Resistless o'er the Tuscan billows rise.

Blackmore.

Thus song could *prevail*
O'er death and o'er hell,

A conquest how hard and how glorious!
This kingdom could never *prevail* against the united power of England.

Swift.

Prevail upon some judicious friend to be your constant hearer, and allow him the utmost freedom.

Id.

PREVARICATE, *v. n.* } Fr. *prevariquer*;
PREVARICATION, *n. s.* } Lat. *prevarico*. To cavil; quibble; shuffle: quibbling; shuffling; cavil.

Laws are either disannulled or quite *prevaricated* through change and alteration of times, yet they are good in themselves.

Spenser.

Whoever helped him to this citation, I desire he will never trust him more; for I would think better of himself, than that he would wilfully *prevaricate*.

Stillingfleet.

He *prevaricates* with his own understanding, and cannot seriously consider the strength, and discern the evidence of argumentations against his desires.

South.

Several Romans, taken prisoners by Hannibal, were released upon obliging themselves by an oath to return again to his camp; among these was one, who, thinking to elude the oath, went the same day back to the camp, on pretence of having forgot something; but, this *prevarication* was so shocking to the Roman senate, that they ordered him to be delivered up to Hannibal.

Addison.

PREVARICATION, in the civil law, is where the informer colludes with the defendants, and so makes only a sham prosecution.

PREVENE', *v. a.*

PREVENIENT, *adj.*

PREVENT', *v. a. & v. n.*

PREVENTER, *n. s.*

PREVENTION, *n. s.*

PREVENTIVE, *adj. & n. s.*

PREVENTIVELY, *adv.*

} Lat. *prævenio*. To go before; hinder, be before; anticipate; preoccupy: the two active verbs are both of this signification

prevent is, preceding; going before, hindering: prevent as a verb neuter is used by Bacon for to come after the time: preventer is either one who goes before or one who hinders: prevention, the act of preceding or hindering; anticipation; preoccupation; obstruction: preventive, hindering ill or good, taking of before the object: the adverb corresponds in sense.

Prevent him with the blessings of goodness.

Psalms.

Mine eyes *prevent* the night-watches, that I might be occupied in thy words.

Id. cxix. 4.

Let thy grace, O Lord, always *prevent* and follow us.

Common Prayer.

Are we to forsake any true opinion, or to shun any requisite action, only because we have in the practice thereof been *prevented* by idolaters?

Hooker.

I do find it cowardly and vile,

For fear of what might fall, so to *prevent*

The time of life. *Shakspeare. Julius Cæsar.*

Atchievements, plots, orders, *preventions*,

Success or loss. *Shakspeare.*

The same officer told us he came to conduct us, and that he had *prevented* the hour, because we might have the whole day before us for our business.

Bacon.

Strawberries watered with water, wherein hath been steeped sheep's dung, will *prevent* and come early.

Id. Natural History.

The archduke was the assailant and the *pre-venter*, and had the fruit of his diligence and celerity.

Bacon.

The greater the distance, the greater the *prevention*; as in thunder, where the lightning precedeth the crack a good space.

Id.

Wars *preventive* upon just fears are true defenses, as well as upon actual invasions.

Id.

Thou hast *prevented* us with overtures of love, even when we were thine enemies.

King Charles.

Nothing engendered doth *prevent* his meat:

Flies have their tables spread ere they appear;

Some creatures have in winter what to eat;

Others do sleep.

Herbert's Temple of Sacred Poems.

God's *preventions*, cultivating our nature, and fitting us with capacities of his high donations.

Hammond.

From the mercy seat above

Preventive grace, descending, had removed

The stony from their hearts, and made new flesh

Regenerate grow instead. *Milton's Paradise Lost.*

This your sincerest care could not *prevent*,

Foretold so lately what would come to pass.

Milton.

Half way he met

His daring foe, at this *prevention* more

Incensed.

Id.

Physick is curative or *preventive* of diseases; *preventive* is that which, by purging noxious humours *preventeth* sickness.

Browne.

In reading what I have written, let them bring no particular gusto, or any *prevention* of mind, and that whatsoever judgment they make, it may be purely their own.

Dryden.

If thy indulgent care

Had not *prevented*, among unbodied shades

I now had wandered.

Philips.

Prevention of sin is one of the greatest mercies God can vouchsafe.

South.

Too great confidence in success is the likeliest to *prevent* it; because it hinders us from making the best use of the advantages which we enjoy.

Atterbury

Procuring a due degree of sweat and perspiration, is the best *preventive* of the gout. *Arbutnot.*

Soon thou shalt find, if thou but arm their hands,
Their ready guilt *preventing* thy commands;
Could'st thou some great proportioned mischief
frame,
They'd prove the father from whose loins they came.

Pope.

PREVESA, a sea-port of Albania, situated at the entrance of the gulf of Arta. It has to the north a fine plain, containing a number of olive plantations, studded with well-built houses. To the west the ground rises, and renders the shore difficult of access. The inhabitants, chiefly Greeks, enjoy certain privileges, in consequence of stipulations between Great Britain and the Porte. Prevesa is built out of the ruins of the ancient Nicopolis, situated at a small distance to the north. It has a small harbour called Vathi, and carries on a good traffic in wood, oil, and fruit. Long one of the colonial possessions of Venice, this place was ceded to the Turks at the peace of Passarowitz in 1718, and remained in their hands until 1798, when it was occupied by the French. The following year it was taken by Ali Pacha, and a part of the inhabitants cruelly massacred. Population about 8000. Forty-five miles south by west of Joannina.

PREVIOUS, *adj.* } *Lat. prævius.* Antece-
PREVIOUSLY, *adv.* } *dent; going before; prior:*
antecedently.

By this *previous* intimation we may gather some hopes, that the matter is not desperate. *Burnet.*

Darting their stings, they *previously* declare
Designed revenge, and fierce intent of war.

Prior.

It cannot be reconciled with perfect sincerity, as *previously* supposing some neglect of better information. *Fiddes.*

Sound from the mountain, *previous* to the storm,
Rolls o'er the muttering earth. *Thomson.*

PREVOT D'EXILES (Anthony Francis), a learned French writer, born at Hesdin in Artois, in 1697. While he was in the convent of St. Germain he wrote the greatest part of the *Memoires d'un Homme de Qualité*. In 1745 he composed his *Histoire Generale des Voyages*. Besides writing many other original pieces, he translated Richardson's *Clarissa Harlowe*, and Sir Charles Grandison, into French. In 1763 being attacked with an apoplectic fit in the forest of Chantilly, and being supposed dead, the curate of the parish ordered a surgeon to open his body, when the unfortunate victim of this rash operation cried out; but the wound was mortal. He only opened his eyes to behold his executioners, and to close them for ever.

PREY, *n. s. & v. a.* *Fr. proie;* *Lat. præda.* Something to be devoured or seized; food or wealth gotten by violence; plunder: to prey is, to feed or live by violence; rob; waste.

Hog in sloth, fox in stealth; lion in *prey.*
Shakspeare.

They pray continually unto their saint the commonwealth, or rather not pray to her, but *prey* on her: for they ride up and down on her, and make her their boots. *Id.*

Jove venom first infused in serpents fell,
Taught wolves to *prey*, and stormy seas to swell.

May.

A garrison supported itself, by the *prey* it took from the neighbourhood of Aylesbury. *Clarendon.*
The whole included race his purposed *prey.*
Milton.

Snè sees herself the monster's *prey,*
And feels her heart and entrails torn away.

Dryden.

There are men of *prey*, as well as beasts and birds of *prey*, that live upon, and delight in blood.

L'Estrange.

Language is too faint to show
His rage of love; it *preys* upon his life;
He pines, he sickens, he despairs, he dies.

Addison.

Pindar, that eagle, mounts the skies,
While virtue leads the noble way;
Too like a vulture Boileau flies,
Where sordid interest shews the *prey.* *Prior*

Their impious folly dared to *prey*
On herds devoted to the god of day. *Pope.*

Who stung by glory, rave, and bound away;
The world their field, and human-kind their *prey.*
Young.

Poor England! thou art a devoted deer,
Beset with every ill but that of fear.
Thee nations hunt; all mark thee for a *prey*;
They swarm around thee, and thou stand'st at bay.
Cowper.

PRIAM, the last king of Troy, the son of Laomedon. He was carried into Greece after the taking of that city by Hercules; but was afterwards ransomed, on which he obtained the name of Priam, Πρίαμος, Greek, signifying ransomed; his former name being Podarces. At his return he rebuilt Ilium, and extended the bounds of the kingdom of Troy, which became very flourishing under his reign. He married Hecuba, the daughter of Cisseus, king of Thrace, by whom he had nineteen children; and among the rest Paris, who carried off Helen, and occasioned the ruin of Troy, which is supposed to have been sacked by the Greeks about 1184 B. C., when Priam was killed by Pyrrhus the son of Achilles at the foot of an altar where he had taken refuge, after a reign of fifty-two years.

PRIAPISM, *n. s.* *Fr. priapisme;* *Lat. priapismus.* A preternatural tension.

Lust causeth a flagrancy in the eyes and *priapism.*
Bacon.

The person every night has a *priapism* in his sleep.
Floyer.

PRIAPUS. [Gr. Πρίαπος, item membrum virile; propter magnitudinem ejus cognominatus est Priapus.] In mythological painting and sculpture. The representations of this deity, held among the ancients to preside over gardens as well as over the genital parts of the sexes, are very numerous upon antique monuments, and are often found in situations which seem very inappropriate; whence it appears that the Greeks more particularly were apt to introduce and familiarise themselves with it. It is probable that they regarded the Priapus merely as an emblem of fecundity, and attached not to it (at least deemed it unnecessary to attach to it) any indecent or lascivious meaning. See PHAL-LUS. The original worshippers of this god, however (the people of Lampsacus), have been much belied if, in the festivals they held in his honor, they did not indulge in a good deal of licentiousness and impurity.

The representations of this nature which have a religious object are extremely numerous, and, as well as the worship of Priapus, have been treated of at a considerable length, and depicted in the rare work of Mr. Knight, entitled an Account of the Remains of the Worship of Priapus, to which is added a Discourse thereon, as connected with the Mystic Theology of the Ancients, London, 1786, 4to.

PRICE, *n. s.* & *v. a.* Fr. *prix*; Lat. *pretium*. Equivalent paid for any thing; value; rate of sale; reward: to pay for or estimate.

I will buy it of thee at a *price*; neither will I offer burnt offerings unto the Lord my God, of that which cost me nothing. 2 Samuel xxiv. 24.

Some shall pay the *price* of others guilt; And he the man that made sans foy to fall, Shall with his own blood *price* that he hath spilt.

Spenser.

We stand in some jealousy, lest by thus over-valuing their sermons; they make the *price* and estimation of scripture, otherwise notified, to fall.

Hooker.

From that which hath its *price* in composition, if you take away any thing, or any part do fail, all is disgrace.

Bacon.

If fortune has a niggard bent to thee, Devote thyself to thrift, not luxury; And wisely make that kind of food thy choice, To which necessity confines thy *price*.

Dryden.

Supposing the quantity of wheat, in respect to its vent, be the same, that makes the change in the *price* of wheat.

Locke.

Sometimes virtue starves, while vice is fed; What then? is the reward of virtue bread? That, vice may merit; 'tis the *price* of toil; The knave deserves it, when he tills the soil.

Pope.

PRICE (John), an English writer of great learning, who flourished in the seventeenth century. He resided several years at Paris, where he published some works, but returned to England in 1646. After travelling through various places, he settled at Florence, where he became a Roman Catholic, and the grand duke of Tuscany made him keeper of his medals, and professor of Greek. He published several works, in which he displayed great erudition; and died at Rome in 1676, or, as Dr. Watkins has it, in 1686.

PRICE (Rev. Richard), D. D., LL. D., and F. R. S. of London, was born at Tynton in Glamorganshire, February 22d, 1723. His father was a dissenting minister at Bridgend in that county, and died in 1739. His mother dying in 1740, he came to London and attended Mr. Eames's academy, under the patronage of his uncle, the Rev. S. Price, who was a colleague of Dr. Watts for forty years. In 1744 he went to reside with Mr. Streatfield of Stoke Newington as his domestic chaplain, while he also regularly assisted Dr. Chandler at the Old Jewry. Having lived with Mr. Streatfield nearly thirteen years, on his death he in 1757 married Miss S. Blundell of Leicestershire. He then settled at Hackney, but, being soon after chosen minister at Newington Green, he lived there until the death of his wife in 1786, when he returned to Hackney. He was next chosen afternoon preacher at the meeting house in Jewry Street, but this he resigned on being elected pastor of the gravel-pit meeting at Hackney. In Febru-

ary, 1791, he was attacked with a nervous fever, and the stone, and died the 19th of April, 1791. He left his property to a sister and two nephews. His universal acquaintance with the sciences, and his usual application of them to the best purposes, are well known. Dr. Kippis, in his address at his funeral, observes, that 'In consequence of his profound knowledge in mathematical calculations, he was qualified at a particular crisis for being of singular utility to his fellow citizens. A number of schemes for insurance for lives, and the benefit of survivorship, promising mighty advantages, were rising up in London. These ruinous schemes would have been carried to great excess had not Dr. Price stepped forward and dispelled the delusion.' With him Mr. Pitt's scheme of the sinking fund originated. When the earl of Shelburne was prime minister, he sought the assistance of Dr. Price in forming a scheme for paying off the national debt, and moved an introductory resolution on that subject in the house of lords; but upon his being driven from office the scheme was abandoned. It was, however, communicated to the public by Dr. Price in a treatise, entitled The State of the Public Debts and Finances, at signing the preliminary Articles of Peace in January 1783; with a Plan for raising Money by Public Loans, and for redeeming the Public Debts. After this, when Mr. Pitt determined to introduce a bill into parliament for liquidating the national debt, he applied to Dr. Price for his advice, and received from him three separate plans; one of which, said by the Dr. to be the least efficient in its operation, was adopted by the minister, though without the slightest acknowledgment of his obligations. See SINKING FUND. In 1763 or 1764 he was chosen F. R. S. and contributed largely to the transactions of that learned body; in 1769 he received from Aberdeen a diploma creating him D. D.; and in 1783 the degree of LL. D. was conferred upon him by the college of Yale in Connecticut. His works are, A Review of the Principal Question and Difficulties in Morals, 8vo., 1758; Dissertations on Providence, &c., 8vo., 1767; Observations on Reversionary Payments, &c., 8vo., 1771; Appeal on the National Debt, &c., 8vo., 1773; Observations on the Nature of Civil Liberty, 1776; on Materialism and Necessity, in a Correspondence between Dr. Price and Dr. Priestley, 1779; on Annuities, Assurances, Population, &c., 8vo., 1779; on the Population of England, 1780; on the Public Debts, Finances, Loans, &c., 8vo., 1783; on Reversionary Payments, 2 vols., 1783; on the Importance of the American Revolution, 1784; besides Sermons, and a variety of papers in the Philosophical Transactions, on astronomical and other philosophical subjects.

PRICK, *v. a.*, *v. n.* & } Sax. *prican*; Belg.
PRICK'ER, *n. s.* [*n. s.*] } *priken*; Dan. *prikke*;
PRICK'ET, } Swed. *pricka*. To
PRICK'LE, } puncture; pierce;
PRICK'LINESS, } spur; goad; form with
PRICK'LOUSE, } a point; fix by or hang
PRICK'LONG, } on a point; nominate
PRICK'LY, *adj.* } by a mark or puncture;
PRICK'PUNCH, *n. s.* } } ture; note down with

a style; mark a tune; to pain; pierce with anguish or remorse; make acid: as a verb neuter, come on the spur; dress or adorn for show: a prick is a sharp pointed instrument of any kind; the puncture, spot, or mark, made with such an instrument; a point; fixed place or point of time or attainment; print of a hare's foot; a painful or remorseful thought: pricker, synonymous with prick, an instrument; also (not in use) a light horseman: a pricket is a buck of the second year: prickle, a small sharp or thorny point: pricklouse, a foolish word of contempt for a tailor: pricksong, a song set to music: prickly, full of sharp points (prickliness corresponding): prickpunch is explained in the extract.

There shall be no more a *pricking* brier unto the house of Israel, nor any grieving thorn.

Ezekiel xxviii. 24.

When they heard this, they were *pricked* in their hearts, and said, Men and brethren, what shall we do?

Acts ii. 37.

It is hard for thee to kick against the *pricks*.

Id. ix. 5.

The cooks slice it into little gobbets, *prick* it on a pang of iron, and hang it in a furnace.

Sandys.

They had not ridden far, when they might see One *pricking* towards them with hasty heat.

Spenser.

Now grins this goodly frame of temperance

Fairly to rise, and her adorned head

To *prick* of highest praise forth to advance. *Id.*

Leave her to heaven,

And to those thorns that in her bosom lodge,

To *prick* and sting her. *Shakspeare. Hamlet.*

These many then shall die, their names are *prickt*.

Shakspeare.

Well, 'tis no matter, honour *pricks* me on;

But how if honour *pricks* me off, when

I come on.

Id. *Henry IV.*

The country gives me proof

Of bedlam beggars, who, with roaring voices,

Strike in their numbed and mortified bare arms

Pins, wooden *pricks*, nails, sprigs of rosemary.

Shakspeare.

My conscience first received a tenderness,

Scruple, and *prick*, on certain speeches uttered

By the bishop of Bayon. *Id.* *Henry VIII.*

Phaeton hath tumbled from his car,

And made an evening at the noon-tide *prick*.

Shakspeare.

I've called the deer, the princess killed a *pricket*.

Id.

He fights as you sing *pricksongs*, keeps time, distance, and proportion.

Id. *Romeo and Juliet.*

The poets make Fame a monster; they say, look how many feathers she hath, so many eyes she hath underneath, so many tongues, so many voices, she *pricks* up so many ears.

Bacon.

Some who are *pricked* for sheriffs, and are fit, set out of the bill.

Id.

The *prickles* of trees are a kind of excrecence; the plants that have *prickles* are black and white, those have it in the bough; the plants that have *prickles* in the leaf are holly and juniper; nettles also have a small venomous *prickle*.

Id.

Artichocks will be less *prickly* and more tender, if the seeds have their tops grated off upon a stone.

Id.

If the Engliſh would not in peace govern them by the law, nor could in war root them out by the sword, must they not be *pricks* in their eyes, and thorns in their sides?

Davies.

They had horsemen, *prickers* as they are termed, fitter to make excursions and to chase, than to sustain any strong charge.

Hayward.

For long shooting, their shaft was a cloth yard, their *pricks* twenty-four score; for strength, they would pierce any ordinary armour.

Carew.

If God would have had men live like wild beasts, he would have armed them with horns, tusks, talons, or *pricks*.

Bramhall.

Before each van

Prick forth the airy knights.

Milton.

They their late attacks decline,

And turn as eager as *pricked* wine.

Hudibras.

No asps were discovered in the place of her death, only two small insensible *pricks* were found in her arm.

Browne.

His rough crest he rears,

And *pricks* up his predestinating ears. *Dryden.*

In this king Arthur's reign,

A lusty knight was *pricking* o'er the plain. *Id.*

I no more

Shall see you browsing, on the mountain's brow,

The *prickly* shrubs. *Id.*

The man who laughed but once to see an ass

Mumbling to make the cross-grained thistles pass,

Might laugh again, to see a jury chaw

The *prickles* of unpalatable law. *Id.*

A fox catching hold of a bramble to break his fall, the *prickles* ran into his feet.

L'Estrange.

A taylor and his wife quarrelling, the woman in contempt called her husband *pricklouse*.

Id.

Pricker is vulgarly called an awl; yet, for joiners' use, it hath most commonly a square blade.

Moxon's Mechanical Exercises.

Prickpunch is a piece of tempered steel, with a round point at one end, to *prick* a round mark in cold iron.

Moxon.

A greyhound hath *pricked* ears, but those of a hound hang down; for that the former hunts with his ears, the latter only with his nose.

Grew.

I caused the edges of two knives to be ground truly straight, and *pricking* their points into a board, so that their edges might look towards one another, and, meeting near their points, contain a rectilinear angle, I fastened their handles together with pitch, to make this angle invariable.

Newton.

The tuneful noise the sprightly courser hears,

Paws the green turf, and *pricks* his trembling ears.

Gay.

If she *pricked* her finger, Jack laid the pin in the way.

Arbuthnot's John Bull.

Keep close to ears, and those let asses *prick*;

'Tis nothing, nothing; if they bite and kick. *Pope.*

His high courage *pricked* him forth to wed. *Id.*

How did the humble swain detest

His *prickly* beard, and hairy breast!

Swift's Miscellanies.

The buck is called the first year a fawn, the second year a *pricket*.

Manwood.

The flower's divine, where'er it grows;

Neglect the *prickles*, and assume the rose. *Watts.*

PRIDE, *n. s. & v. a.* Sax. *pyr* or *pyrð*; Swed. *pryd*; Goth. *pried*. Inordinate self-esteem; ostentation; splendor; exultation; insolence; elevation; dignity of manner: to make proud; rate one's-self high.

Whose lofty trees, yclad with summer's *pride*,
Did spread so broad, that heaven's light did hide.

Spenser.

Pride hath no other glass

To shew itself, but *pride*; for supple knees

Feed arrogance, and are the proud man's fees.

Shakspeare.

That which

Hath wrought this hellish mischief unawares ;
That hardly we escaped the *pride* of France. *Id.*
God hath a special indignation at *pride* above all
sins. *Bp. Hall.*

Vain aims, inordinate desires,
Blown up with high conceits engend'ring *pride*.
Milton.

Smallest lineaments exact,
In all the liveries decked of summer's *pride*. *Id.*
In this array the war of either side,
Through Athens passed with military *pride*.
Dryden.

The honest *pride* of conscious virtue. *Smith.*
He could have made the most deformed beggar as
rich as those who most *pride* themselves in their
wealth. *Government of the Tongue.*

Be his this sword,
Whose ivory sheath, inwrought with curious *pride*,
Adds graceful terror to the wearer's side. *Pope.*
This little impudent hardwareman turns into ri-
dicule the direful apprehensions of the whole king-
dom, *priding* himself as the cause of them.
Swift's Miscellanies.

Though various foes against the truth combine,
Pride above all opposes her design ;
Pride of a growth superior to the rest,
The subtlest serpent with the loftiest crest,
Swells at the thought, and, kindling into rage,
Would hiss the cherub Mercy from the stage.
Cowper.

Earthly things

Are out the transient pageants of an hour ;
And earthly *pride* is like the passing flower,
That springs to fall, and blossoms but to die.
Kirke White.

PRIDEAUX (Humphry), D. D., a learned
divine, born at Padstow in Cornwall in 1648.
Three years he studied at Westminster under
Dr. Busby; and then was removed to Christ
Church, Oxford. Here he published, in 1676,
his *Marmor Oxoniensis ex Aurundelianis, Sel-
denianis, alisque conflata, cum perpetuo Com-
mentario*. This introduced him to the lord
chancellor Finch, afterwards earl of Nottingham,
who, in 1679, presented him to the rectory of
St. Clements, near Oxford, and in 1681 bestowed
on him a prebend of Norwich. Some years
after he was engaged in a controversy with the
Papists, at Norwich, concerning the validity of
the orders of the church of England, which
produced his book upon that subject. In 1688
he was installed in the archdeaconry of Suffolk ;
to which he was collated by Dr. Lloyd, then
bishop of Norwich. In 1691, upon the death of
Dr. Edward Pococke, the Hebrew professorship
at Oxford, being vacant, was offered to Dr.
Prideaux, but he declined it. In 1697 he pub-
lished his *Life of Mahomet*, and in 1702 was
installed dean of Norwich. In 1710 he under-
went the operation of lithotomy, which inter-
rupted his studies for more than a year. Some
time after his return to London he proceeded
with his connexion of the History of the Old
and New Testament. He died in 1724.

PRIDEAUX (John), D. D., a learned English
prelate, born at Stowford in Devonshire in 1578.
His father had a numerous family, and John
applied for the office of parish-clerk at Ugborow
and lost it : yet, by the generosity of a friend, he
was sent to the university of Oxford ; where he
succeeded Dr. Holland as master of Exeter

College, in which he took his degrees. He was
also regius professor of divinity, and vice-chan-
cellor. In 1641 he was made bishop of Wor-
cester, but was plundered soon after, during the
troubles that followed, for having excommuni-
cated those who had taken up arms against the king.
He died in 1650. His principal works are, 1. Ora-
tiones inaugurales. 2. Lectiones decem de totidem
Religionis Capitibus. 3. Fasciculus Controversiarum.
4. Theologia Scholastica Syntagma Mnemonicum.
5. Sermons, 4to. 6. A Synopsis of the Councils.
His son Matthias was born in 1622, and died in 1646.
After his death was published, with his name, though
supposed to be his father's, a work entitled *An easy
and compendious Introduction for reading all sorts
of Histories*, 4to.

PRIE, *n. s.* An old name of privet.—John-
son.

Lop poplar and willow, elme, maple, and *prie*,
Well saved from cattle, till summer to lie. *Tusser.*

PRIEST, *n. s.* } Sax. þneort; Fr. *prestre* ;
PRIEST'RAFT, } a corruption of Gr. *πρεσ-*
PRIEST'ESS, } *βυρεος* ; the Span. retains
PRIEST'HOOD, } *presbytero*. A minister of
PRIEST'LY, *adj.* } religion offering sacrifices
PRIEST'RIDDEN, } or prayers; one of the
second order of the English hierarchy: priest-
craft is religious fraud; art of wicked priests :
priestess, a female who officiated in the heathen
rites: priesthood, the office or order of priests:
priestly, pertaining to, or becoming a priest:
priest-ridden, managed or governed by priests.

The high *priest* shall not cover his head.

Leviticus.

There were no *priests* and anti-*priests* in opposition
to one another, and therefore there could be no schism.

Lesley.

Jeroboam is reproved because he took the *priest-*
hood from the tribe of Levi.

Whitgift.

I'll to the vicar ;
Bring you the maid, you shall not lack a *priest*.

Shakspeare.

Our practice of singing differs from the practice
of David, the *priests*, and Levites.

Peacham.

These pray'rs I thy *priest* before thee bring.

Milton.

He pretends that I have fallen foul on *priesthood*.

Dryden.

How can incest suit with holiness,
Or *priestly* orders with a princely state ? *Id.*
Puzzle has half a dozen common-place topics ;
though the debate be about Douay, his discourse
runs upon bigotry and *priestcraft*.

Spectator.

These two, being the sons of a lady who was
priestess to Juno, drew their mother's chariot to the
temple. *Id.*

When too, our mighty sire, thou stood'st disarmed,
When thy rapt soul the lovely *priestess* charmed
That Rome's high founder bore.

Addison.

In the Jewish church none that was blind or
lame was capable of the *priestly* office.

South's Sermons.

No neighbours, but a few poor simple clowns,
Honest and true, with a well-meaning *priest*.

Rowe.

The *priesthood* hath in all nations, and all religions,
been held highly venerable.

Atterbury.

From *priestcraft* happily set free,
Lo ! ev'ry finished sun returns to thee. *Pope*
The inferior *priestess*, at her altar's side,
Trembling, begins the sacred rites of *pride*. *Id.*

Such a cant of high-church and persecution, and being *priestridden*.

Curanus is a holy *priest*, full of the spirit of the gospel, watching, labouring, and praying for a poor country village.

The state of parents is a holy state, in some degree like that of the *priesthood*, and calls upon them to bless their children with their prayers and sacrifices to God.

A *PRIEST*, in antiquity, was a person set apart for the performance of sacrifice, and other offices and ceremonies of religion. Before the promulgation of the law of Moses, the first born of every family, the fathers, the princes, and the kings, were priests. Thus Cain and Abel, Noah, Abraham, Melchizedec, Job, Isaac, and Jacob, offered their own sacrifices. Among the Israelites, after their exodus from Egypt, the priestly office was confined to one tribe; and it consisted of three orders, the high-priests, priests, and Levites. The priesthood was made hereditary in the family of Aaron; and the first-born of the oldest branch of that family, if he had no legal blemish, was always the high-priest. This divine appointment was observed with considerable accuracy till the Jews fell under the dominion of the Romans. Then, indeed, the high-priesthood was sometimes set up to sale; and instead of continuing for life, as it ought to have done, it seems to have been nothing more than a temporary office. There is sufficient reason, however, to believe that it was never disposed of but to some descendant of Aaron, capable of filling it had the older branches been extinct. In the time of David the inferior priests were divided into twenty-four companies, who were to serve in rotation, each company by itself, for a week. The order in which the several courses were to serve was determined by lot; and each course was in all succeeding ages called by the name of its original chief.

All nations have had their priests. The Pagans had priests of Jupiter, Mars, Bacchus, Hercules, Osiris and Isis, &c.; and some deities had priestesses. The Mahometans have priests of different orders, called mollah and mufti; and the Indians and Chinese have their brahmins and bonzes. The church of Rome, which holds the propitiatory sacrifice of the mass, has, of course, her proper priesthood. In the church of England, the word priest is retained to denote the second order in the hierarchy. Some few of her most eminent divines have maintained that the Lord's Supper is a commemorative and eucharistical sacrifice. These consider all who are authorised to administer that sacrament as in the strictest sense priests. Great numbers, however, of the English clergy, perhaps the majority, agree with the church of Scotland and with the Dissenters, in maintaining that the Lord's Supper is a rite of no other moral import than the commemoration of the death of Christ. These cannot consider themselves as priests in the rigid sense of the word, but only as presbyters, of which the word priest is a contraction of the same import with elder.

PRIESTLEY (Joseph), LL. D. F. R. S. and member of many foreign literary societies, was born March 13th, 1733, at Field-head, in Birstall parish, in the West Riding of Yorkshire.

His father was a manufacturer of cloth, and both his parents were persons of respectability among the Calvinistic Dissenters. Joseph was brought up, from an early period, in the house of Mr. Joseph Keighly, who had married his aunt. Showing an early fondness for reading, he was sent to a school at Batley, where he acquired a knowledge of the Latin, Greek, and Hebrew languages. In his nineteenth year he went to the academy at Daventry, where he became the first pupil of Dr. Ashworth, under whom he studied divinity. In 1755, his twenty-second year, he was chosen assistant minister to the Independent congregation of Needham Market, Suffolk; and at this time began to entertain Unitarian opinions. He also became a student and admirer of the metaphysical philosophy of Mr. Hartley, of which, during life, he continued the elucidator and advocate. In 1758 he was invited to be pastor of a congregation at Nampwich, in Cheshire; where he opened a school, exhibited philosophical experiments, and drew up an English Grammar, which was his first publication. Upon the death of the Rev. Dr. Taylor, tutor in divinity at Warrington Academy, Dr. Aikin being chosen to supply his place, Mr. Priestley was appointed to that of belles lettres in the doctor's room in 1761. He soon after married Mary, daughter of Mr. Wilkinson of Bersham, near Wrexham. Among the first of his publications at Warrington, were his *Chart of Biography*, and his *Chart of History*. He also published the substance of his *Lectures on General History and Politics*. He next published *Lectures on the Theory and History of Language*; and on the *Principles of Oratory and Criticism*. He next published his great work, the *History of Electricity*, wherein he gave an account of many of his own experiments. The first edition appeared at Warrington in 1767, 4to., and the fifth in 4to. in 1794. In 1768 he accepted of an invitation from a numerous and respectable congregation at Leeds. Here he published many tracts upon polemical theology, particularly, *Institutes of Natural and Revealed Religion*; and a *View of the Principles and Conduct of the Protestant Dissenters*. In these works he showed himself an open enemy to all unions of ecclesiastical with political systems. His next publication at Leeds was *The History and Present State of Discoveries relating to Vision, Light, and Colors*, 2 vols. 4to. 1772. About this period he began his celebrated experiments upon the atmospheric air. In 1770, through the recommendation of Dr. Price, the earl of Shelburne invited him to reside with him, as his librarian. At this time his family resided at Calne in Wilts, near Bowwood, lord Shelburne's seat. In 1775 he published his *Examination of Dr. Reid's Enquiry into the Human Mind*, of Dr. Beattie's *Essay on Truth*, and Dr. Oswald's *Appeal to Common Sense*. His object was to prepare the way for the *Hartleian Theory of the Human Mind*, which he next published, wherein he expressed his doubts of the immateriality of the soul: and in 1777, notwithstanding the obloquy occasioned by this work, he published *Disquisitions relating to Matter and Spirit*, in which he supported the

same doctrine. At this time also he stood forth as the champion of the philosophical doctrine of Necessity. As his friend, Dr. Price, differed from him on these two last mentioned points (as well as respecting the divinity of our Saviour), a correspondence relative to them took place, which was published in one volume. In the midst of these speculations, he carried on his experiments upon air with success, and enriched the science of chemistry with various discoveries.

About this period his Institutes of Religion were continued; his Letters to a Philosophical Unbeliever, and his Harmony of the Evangelists, and various similar tracts were published. The term of his engagement with lord Shelburne being concluded, and his lordship allowing him an annuity of £150, he took up his residence near Birmingham, not only on account of the advantage its manufactures afforded to his chemical pursuits, but also because of its being the residence of Messrs Watt, Bolton, Keir, Withering, and other eminent men of science. He was soon after invited to be pastor to a congregation of Dissenters at Birmingham, whom he found cordially attached to him. From the Birmingham press issued his Letters to Bishop Newcome on the Duration of Christ's Ministry; his History of the Corruptions of Christianity; and his History of Early Opinions Respecting Jesus Christ. Controversies now multiplied upon his hand. The disputes which took place upon the Dissenters' bill for relief from the test act furnished a new subject of contest; and he appealed to the people in his Familiar Letters to the Inhabitants of Birmingham. Previously to this Dr. Priestley had shown his attachment to freedom, by his Essay on the First Principles of Government, and by a pamphlet on the State of Public Liberty in this Country; and he had displayed a warm interest in the cause of America, when the disputes between Britain and her colonies broke out. The French Revolution was also viewed by him with satisfaction. His sanguine hopes, as well as those of many others, prognosticated from it the dawn of light and liberty throughout Europe; and he particularly expected from it the downfall of all ecclesiastical establishments. In this state of party exasperation, the celebration of the 14th of July, 1791, by a public dinner, at which Dr. Priestley was not present, afforded the signal for those savage riots which disgraced the town of Birmingham. Amidst the burning of chapels and private houses, Dr. Priestley was hunted like a proclaimed criminal; and his house, library, MSS. and chemical apparatus, were destroyed. Driven from his favorite residence, his losses were but poorly compensated. After passing some time as a wanderer, an invitation to succeed Dr. Price afforded him a new settlement at Hackney, where he expected to have ended his days in quiet; but he received an intimation of high authority that if he did not voluntarily leave the country the executive government would proceed against him. He therefore resolved to embark for America, and, accordingly, in 1794 arrived with his family at Northumberland, an inland town of Pennsylvania. In the

United States he was received with general respect; and was offered the place of Chemical Professor at Philadelphia, but declined it. Having collected a new apparatus and library, he resumed his experiments, and published the results in the American Philosophical Transactions, wherein he continued to defend the doctrine of Philogiston to the last. He also published a comparison of the Jewish with Mahometan and Hindoo religions. He even commenced the printing of two extensive works; viz. a Church History, and an Exposition of the Scriptures; but did not live to finish them; though he urged it upon his surviving friends. He also composed, transcribed, and left in MS. ready for the press, A Comparison of the different Systems of Grecian Philosophy with Christianity. His health began to decline in 1801; but his intellectual powers continued unimpaired to the last; in so much that he dictated some corrections of his unfinished works the last day of his life. He died on the 9th of February, 1804, between eight and nine P. M. with much calmness. Dr. Aikin thus sums up his character:—'He was naturally disposed to cheerfulness. In large and mixed companies he usually spoke little. In his domestic relations he was uniformly kind and affectionate, and not malice itself could ever fix a stain on his private conduct, or impeach his integrity.'

PRIG, *n. s.* A cant word derived from prick; as, he pricks up, he is pert; or from prickeared, an epithet of reproach bestowed upon the presbyterian teachers of the commonwealth. A pert, conceited, pragmatical fellow.

The little man concluded, with calling monsieur Mesnager an insignificant *prig*. *Spectator.*

There have I seen some active *prig*,
To shew his parts, bestride a twig.

Swift's Miscellanies.

PRILUKI, a town of European Russia, in the government of Poltava. It stands on the river Udai, and has 2500 inhabitants, who carry on a traffic in corn, cattle, horses, and silk. Eighty miles S. S. E. of Czernigov, and 128 W. N. W. of Poltava.

PRIM, *adj.* By contraction from primitive. Formal; precise; affectedly nice.

A ball of new-dropt horse's dung
Mingling with apples in the throng,
Said to the pippin, plump and *prim*,
See, brother, how we apples swim.

Swift's Miscellanies.

PRIME VIE, in medicine, a name some times given to the whole alimentary canal.

PRIMATE, *n. s.* } Fr. *primat*; Lat. *primus*.
PRIMARY. } A chief ecclesiastic: the station of a primate.

We may learn from the prudent pen of our most reverend *primate*, eminent as well for promoting unanimity as learning. *Holyday.*

When he had now the *primacy* in his own hand, he thought he should be to blame if he did not apply remedies. *Clarendon.*

When the power of the church was first established, the archbishops of Canterbury and York had then no pre-eminence one over the other; the former being *primate* over the southern, as the latter was over the northern parts. *Ayliffe.*

The late and present *primate*, and the lord archbishop of Dublin, have left memorials of their county.

Swift.

PRIMARY, *adj.*

PRIMAL,

PRIMARILY, *adv.*

PRIMARINESS, *n. s.*

PRIME, *n. s., adj., & v. a.*

PRIMELY, *adv.*

PRIME'NESS, *n. s.*

PRIMER.

Lat. *primarius*.
First; chief; principal: primal is a poetical word of the same signification: primarily, originally; in the first place: the

noun substantive corresponding: prime is the first part of the day; the beginning; best or chief part; spring or height of life or health; spring of the year; height of perfection: as an adverb, early; principal; first rate; blooming; original: to prime is, apply the first coat of paint; put in first powder, or the powder into the pan of a gun: primely and primeness correspond with prime, as an adjective: primer is an obsolete word for first; original.

His 'larum bell might loud and wide be heard
When cause required, but never out of time;
Early and late it rung at evening and at prime.

Spenser.

Make haste, sweet love, while it is prime,
For none can call again the passed time. *Id.*
Quickly sundry arts mechanical were found out in the very prime of the world. *Hooker.*

Will she yet debase her eyes on me,
That cropt the golden prime of this sweet prince,
And made her widow to a woful bed? *Shakspeare.*

We smothered

The most replenished sweet work of nature,
That from the prime creation e'er she framed. *Id.*
We are contented with
Catharine our queen, before the primest creature
That's paragoned i' the world. *Id.*

It hath been taught us from the primal state,
That he, which is, was wished, until he were. *Id.*
Before that beginning, there was neither primarily
matter to be informed, nor form to inform, nor any
being but the eternal. *Raleigh.*

As when the primer church her councils pleased
to call,
Great Britain's bishops there were not the least of
all. *Drayton.*

The figurative notation of this word, and not the
primary or literal, belongs to this place. *Hammond.*
Divers of prime quality, in several counties, were,
for refusing to pay the same, committed to prison.
Clarendon.

Sure pledge of day that crown'st the smiling
morn
With thy bright circlet, praise him in thy sphere
While day arises, that sweet hour of prime. *Milton.*

Nor can I think that God will so destroy
Us his prime creatures dignified so high. *Id.*
Nature here wanted as in her prime. *Id.*
In fevers, where the heart primarily suffereth, we
apply medicines unto the wrists.

Broune's Vulgar Errours.

The church of Christ, in its primary institution,
was made to be of a diffusive nature, to spread and
extend itself. *Pearson.*

Hope waits upon a flowery prime,
And summer, though it be less gay,
Yet is not looked on as a time
Of declination or decay. *Waller.*
A pistol of about a foot in length, we primed with
well dried gunpowder. *Boyle.*
Short was her marriage joys; for, in the prime
Of youth, her lord expired before his time. *Dryden.*

Humility and resignation are our prime virtues. *Id.*

Moses being chosen by God to be the ruler of his
people, will not prove that priesthood belonged to
Adam's heir, or the prime fathers. *Locke.*

These I call original or primary qualities of body,
which produce simple ideas in us, viz. solidity, ex-
tension, figure and motion. *Id.*

That which is peculiar must be taken from the
primariness and secondariness of the perception. *Norris.*

When the ruins both primary and secondary were
settled, the waters of the abyss began to settle too. *Burnet.*

Words signify not immediately and primely things
themselves, but the conceptions of the mind about them
South.

Nought treads so silent as the foot of time:
Hence we mistake our autumn for our prime. *Young.*

That little orb in days remote of old,
When angels yet were young, was made for man,
And titled earth, her primal virgin name. *Pollok.*

PRIMATE (*primas regni*, head of the kingdom);
in the European states, the chief archbishop in
the state, and the first subject of the realm; in
the Catholic church, the primate is also perpetual
legate of the pope, and has a sort of spiritual
jurisdiction over the other archbishops. There are
also primates of provinces. The archbishop of
Toledo is primate of Spain; the archbishop
of Braga is styled primate of Portugal, although
he is actually inferior to the patriarch of Lisbon.
In England, the archbishop of Canterbury is
styled primate of all England, and the arch-
bishop of York primate of England. In the
Irish church, the archbishop of Armagh is pri-
mate of all Ireland; the archbishop of Dublin
primate of Ireland; the archbishop of Cashel,
primate of Munster; and the archbishop of Tuam,
primate of Connaught. In the German em-
pire, the archbishop of Salsburgh was primate
of Germany. In France, the archbishop of
Lyons is primate of France; that of Bourges,
primate of Aquitania, and that of Rheims, of
Normandy. In Hungary, the archbishop of
Gran is primate; in Poland, the archbishop of
Gresen.

PRIME, in fencing, is the first of the chief
guards. See FENCING.

PRIME FIGURE, in geometry, one which can-
not be divided into any other figures more sim-
ple than itself, as a triangle among planes, and
the pyramid among solids.

PRIME VERTICAL is that vertical circle which
passes through the poles of the meridian, or the
east and west points of the horizon; whence
dials projected on the plane of this circle are
called prime vertical or north and south dials.

PRIMER, *n. s.* A small prayer-book in which
children were taught to read, so named from the
Romish book of devotions; an elementary book;
an office of the Virgin Mary.

Another prayer to her is not only in the manual,
but in the primer or office of the blessed Virgin. *Stillingfleet.*

The Lord's prayer, the creed, and ten command-
ments he should learn by heart, not by reading them
himself in his primer, but by somebody's repeating
them before he can read. *Locke.*

PRIMER SEASIN, in feudal law, was a feudal
burden, only incident to the king's tenants in

capite, and not to those who held of inferior or mesne lords.—It was a right which the king had when any of his tenants in capite died, seized of a knight's fee, to receive of the heir (provided he were of full age), one whole year's profits of the lands if they were in immediate possession, and half a year's profits if the lands were in reversion expectant on an estate for life. This seems to be little more than an additional relief, but grounded upon this feudal reason, that, by the ancient law of feods, immediately upon the death of a vassal, the superior was entitled to enter and take seisin or possession of the land, by way of protection against intruders, till the heir appeared to claim it, and receive investiture; and, for the time the lord so held it, he was entitled to take the profits; and, unless the heir claimed within a year and day, it was by the strict law a forfeiture. This practice, however, seems not to have long obtained in England, if ever, with regard to tenures under inferior lords; but, as to the king's tenures in capite, this prima seisina was expressly declared under Henry III. and Edward II. to belong to the king by prerogative, in contradistinction to other lords. And the king was entitled to enter and receive the whole profits of the land, till livery was sued; which suit being commonly within a year and day next after the death of the tenant, therefore the king used to take at an average the first-fruits, that is to say, one year's profits of the land. And this afterwards gave a handle to the popes, who claimed to be feudal lords of the church, to claim in like manner from every clergyman in England the first year's profits of his benefice, by way of primitiæ, or first fruits.—All the charges arising by primer seisin were abolished by 12 Car. II. c. 24.

PRIME'RO, *n. s.* Span. *primero*. A game at cards.

I left him at *primero*
With the duke of Suffolk.

Shakspeare. Henry VIII.

PRIME'VAL, *adj.* } Lat. *primævus*. Ori-
PRIME'VOUS, } ginal; such as was at first.

All the parts of this great fabric change,
Quit their old stations and *primeval* frame,
And lose their shape, their essence, and their name.

Prior.

Immortal dove,
Thou with almighty energy didst move,
On the wild waves incumbent didst display
Thy genial wings, and hatch *primeval* day.

Blackmore.

Thou, who didst put to flight
Primeval silence, when the morning stars,
Exulting, shouted o'er the rising ball.

Young.

PRIMING, among painters, signifies the laying of the first color.

PRIMING, in gunnery, the train of powder that is laid, from the opening of the vent, along the gutter or channel on the upper part of the breech of the gun: which, when fired, conveys the flame to the vent, by which it is further communicated to the charge, in order to fire the piece. This is only used on shipboard at the proof, and sometimes in garrison; for, on all other occasions, tubes are used for that purpose.

PRIMING WIRE, in gunnery, a sort of iron needle employed to penetrate the vent or touch-

hole of a piece of ordnance when it is loaded, in order to discover whether the powder contained therein is thoroughly dry and fit for immediate service; as likewise to search the vent, and penetrate the cartridge, when the guns are not loaded with loose powder.

PRIMPILUS, in antiquity, the centurion of the first cohort of a legion, who had the charge of the Roman eagle. This officer also went under the several titles of *dux legionis*, *præfectus legionis*, *primus centurionum*, and *primus centurio*; and was the first centurion of the *triarii* in every legion. He presided over all the other centurions, and generally gave the word of command by order of the tribunes. Having the care of the eagle, or chief standard of the legion, *aquilæ præesse* was used for the dignity of *primipilus*; and hence *aquila* is used by Pliny for that office. Nor was this station honorable only, but also very profitable; for he had a special stipend allowed him, and, when he left that charge, was reputed equal to the members of the equestrian order, bearing the title of *primipilarius*, as those who had discharged the greater civil offices were styled ever after *consulares*, *ensorii*, &c.

PRIMITIÆ, the first-fruits gathered of the earth, whereof the ancients made presents to the gods.

PRIMITIVE, *adj.* } Fr. *primitif*; Lat.
PRIM'ITIVELY, *adv.* } *primitivus*. Ancient;
PRIM'ITIVENESS, *n. s.* } original; from the beginning: formal; precisely grave: the adverb and noun substantive correspond.

Their superstition pretends, they cannot do God greater service than utterly to destroy the *primitive* apostolic government of the church by bishops.

King Charles.

The scripture is of sovereign authority, and for itself worthy of all acceptance. The latter, namely the voice and testimony of the *primitive* church, is a ministerial, and subordinate rule and guide, to preserve and direct us in the right understanding of the scriptures.

White.

Our *primitive* great sire to meet

His godlike guest, walks forth.

Milton.

Solemnities and ceremonies, *primitive* enjoined, were afterward omitted, the occasion ceasing.

Browne.

The doctrine of purgatory, by which they mean an estate of temporary punishments after this life, was not known in the *primitive* church, nor can be proved from scripture.

Tillotson.

David reflects sometimes upon the present form of the world, and sometimes upon the *primitive* form of it.

Burnet.

The purest and most *primitively* reformed church in the world was laid in the dust.

South.

His memory was large and tenacious, yet, by a curious felicity, chiefly susceptible of the finest impressions it received from the best authors he read, which it always preserved in their *primitive* strength and amiable order.

Johnson.

PRIMOGENIAL, *adj.* } Lat. *primigenius*.
PRIMOGEN'ITURE, *n. s.* } Firstborn; original; primary; constituent: primogeniture is seniority; eldership.

Are we so foolish, that, while we may sweetly enjoy the settled estate of our *primogeniture*, we will needs bring upon ourselves the curse of Reuben?

Bp. Hall.

The *primogenial* light at first was diffused over the face of the unfashioned chaos.

Glanville.

Because the scripture affordeth the priority of order unto *Shem*, we cannot from hence infer his *primogeniture*.

Browne.

It is not easy to discern, among many differing substances obtained from the same matter, what *primogenial* and simple bodies convened together compose it.

Boyle.

The first or *primogenial* earth, which rose out of the chaos, was not like the present earth.

Burnet.

The first provoker has by his seniority and *primogeniture* a double portion of the guilt.

Government of the Tongue.

PRIMOGENITURE, the right of the first born, has among most nations been very considerable. The first-born son in the patriarchal ages had a superiority over his brethren, and in the absence of his father was priest to the family. Among the Jews he was consecrated to the Lord, had a double portion of the inheritance, and succeeded in the government of the family or kingdom. But if a woman's first child was a girl, neither she, nor the children that came after her, were consecrated. In every nation of Europe, the right of primogeniture prevails in some degree at present, but it did not prevail always. The law which calls the first-born to the crown, preferably to the others, was unknown to the first race of French kings, and even to the second. It was not till the end of the tenth century, under the race of Hugh Capet, that the prerogative of succession to the crown was appropriated to the first-born. By the ancient custom of gavel-kind, still preserved in some parts of our island, primogeniture is of no account; the paternal estate being equally shared by all the sons. And it has been a matter of violent and learned dispute, whether, at the death of Alexander III. Baliol or Bruce was, by the law as it then stood, heir to the crown of Scotland. The former had undoubtedly the right of primogeniture, but the latter stood in one degree of nearer relation to the deceased sovereign; and the Scottish barons, not being able to determine whose claim was best founded, referred the question to Edward I. of England, and thereby involved their country in a long and ruinous war.

PRIMORDIAL, *adj.* Fr. *primordial*; Lat. *primordium*. Original; existing from the beginning.

The *primordials* of the world are not mechanical, but spermatical and vital.

More.

Salts may be either transmuted or otherwise produced, and so may not be *primordial* and immutable beings.

Boyle.

Not every thing chymists will call salt, sulphur, or spirit, that needs always be a *primordiate* and ingenerable body.

Id.

PRIMORIE, a hilly district of Austrian Dalmatia, between the Cettina and Narenta. It produces wine, oil, and figs. The chief town is Macarsca. This district was called Dalmatia by the Romans, and by the Greeks Parathalassia. Inhabitants 15,000.

PRIMROSE, *n. s. & adj.* Lat. *primula veris*. A flower that appears early in the year: gay; flowery.

I had thought to have let in some of all professions, that go the *primrose* way to the everlasting bonfire.

Shakspeare.

Pale *primroses*,
That die unmarried ere they can behold
Bright Phœbus in his strength.

Shakspeare. Winter's T. s.

There followeth, for the latter part of January, *primroses*, anemonies, the early tulip.

Bacon's Essays.

How pleasant thy banks and green valleys below,
Where wild in the woodlands the *primroses* blow;
There, oft as mild evening weeps over the lea,
The sweet-scented birk shades my Mary and me.

Burns.

PRIMROSE, in botany. See **PRIMULA**.

PRIMULA, the primrose, a genus of the monogynia order, and pentandria class of plants; natural order twenty-first, *preciaë*. The involucrum lies under a simple umbel; the tube of the corolla is cylindrical; with the mouth or limb patulous. This genus, including also the *polyanthus* and *auricula*, furnishes an excellent collection of low, herbaceous, flowery perennials.

1. *P. auricula* has a thick fibrous root, crowned by a cluster of oblong, fleshy, broad, serrated, smooth leaves, resembling the shape of a bear's ear; and amidst them upright flower stalks from about three or four, to six or eight, inches high, terminated by an umbellate cluster of beautiful flowers, of many different colors in the varieties. All of these have a circular eye in the middle of each flower, and of which there are different colors; whence the *auriculas* are distinguished into yellow-eyed, white-eyed, &c. The petals of most of the kinds are powdered with an exceedingly fine farina, which contributes greatly to the beauty of the flower. They all flower in April or May, continuing a month or six weeks in beauty, and ripening plenty of seeds in June.

2. *P. polyanthus* has thick fibrous roots, increasing into large bunches, crowned with a cluster of large oblong, indented, rough leaves; amidst them upright flower-stalks six or eight inches high, terminated mostly by a cluster of several spreading flowers of many different colors in the varieties. They all flower beautifully in April and May, and frequently again in autumn; and sometimes even in winter, if the season is mild. The *polyanthus* is one of the noted prize flowers among the florists; many of whom are remarkably industrious in raising a considerable variety of different sorts, as well as in using every art to make them blow with all requisite perfection. The chief properties required in a florist's *polyanthus* are—1. The stem or flower-stalk should be upright, moderately tall, with strength in proportion, and crowned by a good regular bunch of flowers on short pedicles, strong enough to support them nearly in an upright position. 2. The florets of each branch should be equally large, spreading open flat, with the colors exquisite, and the stripes and variegations lively and regular. 3. The eye in the centre of each floret should be large, regular, and bright; and the antheræ, by the florists called the *thrum*, should rise high enough to cover the mouth of the tube or hollow part in the middle of the florets, and render them what they call *thrum-eyed*; but, when the style elevates the stigma above the antheræ, the eye of the tube generally appears hollow, showing the stigma in the middle, like the head of a pin, and

is rejected as an incomplete flower, though its other properties should be ever so perfect. This pin-eyed polyanthus, however, though rejected by the florists, is the flower in its most perfect state, and great numbers of them are of as beautiful forms and colors as the thrum-eyed varieties.

3. *P. veris*, the spring primrose, has thick and very fibrous roots, crowned by a cluster of large oblong indented rough leaves, and numerous flower-stalks, from about three or four, to five or six, inches high; each terminated commonly by one flower. All the varieties flower abundantly in March and April, and continue for a month or six weeks. The cowslip primrose, or cowslip, or oxlip, has very thick fibrous roots, crowned by a cluster of oblong, indented, round, leaves, and upright, firm, flower-stalks five or six inches high, terminated each by a cluster of small flowers. They flower in April or May, continuing in succession a month or six weeks. All the varieties of the common spring primrose multiply so fast by the roots that it is scarcely worth while to raise them from seeds. However, though many single kinds may be raised from seed, yet parting the roots is the only method by which the double kind can be preserved; and the same thing is to be observed of all the rest.

PRINCE, *n. s. & v. n.* } Fr. *prince*; Lat. *prin-*
PRINCE'DOM, *n. s.* } *ceps*. A sovereign; a
PRINCE'LIKE, *adj.* } chief ruler of either
PRINCE'LY, } sex; the son of a king;
PRIN'CESS, *n. s.* } to play the prince:
princedom is the rank or state of a prince;
Wicliff uses 'prynshood,' see the extract: prince-
like, becoming a prince: princely, having the
rank of princes; befitting that rank; royal; grand;
sumptuous: princess, the feminine of prince.

He reseruyde undir derknesse aungelis that kepten
not her prynshood, but forsooken their hous into the
doom of the gret God, into euerlastinge boondis.

Wicliff. Judas i.

A prince of great courage and beauty, but fostered
up in blood by his haughty father. Sidney.

Meaning only to do honour to their princely birth,
they flew among them all. Id.

Next Archigald, who, for his proud disdain,
Deposed was from *princedom* sovereign. Spenser.
Heaven forbid that such a scratch should drive
The prince of Wales from such a field as this.

Shakespeare.

Nature prompts them,

In simple and low things, to *prince* it, much
Beyond the trick of others. Id. *Cymbeline*.

Here the bracelet of the truest *princess*

That ever swore her faith. Id.

The wrongs he did me were nothing *princelike*.

Shakespeare.

Be opposite all planets of good luck

To my proceeding; if with pure heart's love

I tender not thy' beauteous *princely* daughter.

Id.

Queen Elizabeth, a *prince* admirable above her sex
for her princely virtues. Camden.

Many townes of *princely* youths he leveled with
the ground. Chapman.

To use the words of the *prince* of learning here-
upon, only in shallow and small boats they glide
over the face of the Virgilian sea. Peucham.

Celestial! whether among the thrones, or named
Of them the highest; for such of shape may seem
Prince above *princes*. Milton's *Paradise Lost*.

Under thee, as head supreme,
Thrones, *princedom*s, powers, dominions, I reduce.

Milton.

Princely counsel in his face yet shone.

Id.

I expressed her commands

To mighty lords and *princely* dames. Waller.

Forces come to be used by good *princes*, only upon
necessity of providing for their defence. Temple.

Ask why God's anointed he reviled;

A king and *princess* dead. Dryden.

Esau founded a distinct people and government,
and was himself a distinct *prince* over them. Locke.

Had we no histories of the Roman emperors, but
on their money, we should take them for most virtuous
princes. Addison.

God put it into the heart of one of our *princes*,
towards the close of her reign, to give a check to that
sacrilege. Atterbury.

Princess adored and loved, if verse can give

A deathless name, thine shall for ever live.

Granville.

Our tottering state still distracted stands,
While that *prince* threatens, and while this com-
mands. Pope.

Under so excellent a *princess* as the present queen,
we suppose a family strictly regulated. Swift.

Happy those *princes*, who are educated by men
who are at once virtuous and wise, and have been
for some time in the school of affliction; who weigh
happiness against glory, and teach their royal pupils
the real value of fame. Goldsmith.

PRINCE also denotes a person who is a sove-
reign in his own territories, yet holds of some
other as his superior. Also the issue of princes, or
those of any royal family. In England the king's
children are called sons and daughters of Eng-
land; the eldest son is created prince of Wales;
the cadets are created dukes or earls as the king
pleases; and the title of all the children is royal
highness; all subjects are to kneel when ad-
mitted to kiss their hand, and at table out of
the king's presence they are to be served on the
knee. See ROYAL FAMILY.

PRINCE FREDERICK'S SOUND, an inlet of the
North Pacific Ocean, on the west coast of North
America; so named by Vancouver in honor of
the late duke of York. Long. 225° 42' to 227°
20', lat. 56° 52' to 57° 12' N.

PRINCE OF THE SENATE, in ancient Rome,
the person who was called over first in the roll
of senators, whenever it was renewed by the
censors: he was always of consular and censo-
rian dignity.

PRINCE OF WALES'S ARCHIPELAGO, a large
island of the North Pacific Ocean, surrounded
by a number of smaller ones, chiefly in the bays
on its coast. They lie in long. 226° 20' to 228°
26', and lat. 54° 42' to 56° 21' N., and were so
called by Vancouver.

PRINCE OF WALES'S, PULO PINANG, or BE-
TEL NUT, ISLAND, an island off the west coast
of the Malay peninsula, from which it is sepa-
rated by a narrow strait, about two miles broad,
which forms the harbour, and affords excellent
anchorage for the largest ships. There is also
an inner harbour, where ships may receive all
repairs that can be performed without going
into dock. The principal entrance into the
harbour is from the north-west; but there is
also a fine channel to the southward. Here is
always at least four fathoms, or four fathoms and

a half of water, but it deepens within to fourteen fathoms. The south channel is obstructed by mud banks, but which are buoyed, and leave a safe channel with three fathoms and a half.

The island is five leagues long, and two to three broad. On the north-west it rises in high hills, covered with large trees; on the east side is an extent of level ground well-cultivated. The island has two rivers considerable for its size. That called Paz winds through the level part of the island for twenty miles; its mouth is crossed by a mud bank with twelve feet in the springs, but boats can ascend it a considerable way. The second river, called Taloo Moodoo, is a rapid torrent stream that often overflows; its mouth is crossed by a sand bank.

Fort Cornwallis is situated on the north-east point of the island, and, though considerable sums have been expended on it, is little more than a sufficient defence against the Malays, and is incapable of any resistance to a regular attack by European tactics. The town, named George Town by the English, and Panjang Panaique by the Malays, is of considerable extent; the streets wide and straight, with many good houses. A river runs close past it, and it has a good wharf for loaded boats, to which water is conveyed by pipes. A government house, a jail, a church, and several bridges have been latterly built, and other improvements executed.

Pulo Pinang was granted by the king of Queda, 1787, to captain Light, who married his daughter, and who transferred it to the East India Company. Its situation rendering it an eligible rendezvous for the British China trade, as well as a retreat for the king's ships when obliged to quit the Coromandel coast in the monsoon, a small detachment of troops was sent from Bengal to occupy it; and several English merchants, engaged in the Malay trade, making it their depôt, it rapidly increased in population, particularly by the arrival of Chinese and Malays. In 1805 it was erected into a separate government, and a large establishment appointed to it. In 1801 the population was 10,000, exclusive of Europeans and military; of those 2000 are Chinese, who chiefly follow the mechanical trades and shopkeeping, while the Malays, who constitute the mass of the remaining population, cultivate the soil, and chiefly pepper, rice, areca, and cocoa palms.

Though situated within five degrees of the equator, the climate of Prince of Wales's Island is remarkably temperate: the sea breeze that blows regularly throughout the day moderates the heat, and the vapors collected by the woody mountains condense in the night in heavy dews, that perpetuate a verdant herbage, unknown in southern India. One of the mountains rises with a steep ascent to a considerable elevation, and on its summit, which forms a platform of forty yards in diameter, is a signal-house. The thermometer at this elevation seldom rises above 75°, and in the night falls to 60°. At the town the extremes are 85° and 75°. Among several waterfalls which this beautiful island possesses, one in particular attracts the notice of travellers, by its wildly picturesque effect: it precipitates itself down a rocky precipice

into a natural basin, surrounded by perpendicular walls of rock, whose craggy projections are covered with lofty trees and evergreen shrubs, and forming a fit retreat for Diana and her nymphs, or for Thomson's more interesting Muses.

To taste the lucid coolness of the flood.

Pinang has no beasts of prey, nor any wild quadrupeds but wild hogs, the little animal named hog-deer, and the bandicoot, a species of rat. Alligators are very numerous, and the termites, or white ants, are here peculiarly destructive. Pinang is abundantly supplied with poultry from the opposite coast, whence are also brought buffaloes for draft, and horses are procured from Sumatra. The sheep for the tables of the English come from Bengal. Fruits are in extreme plenty, particularly pine-apples, which grow wild, shaddocks, oranges, limes, &c.

The harbour abounds in fish, principally of the flat kind. The rocks are covered with a delicate small oyster, and on the banks, before the entrance of the rivers, common oysters are found. In short there is nothing wanting to render this island the most pleasant residence in India. A building-yard has been established at Pinang, and a ship of war and Indiaman of 1000 tons have been built here, the principal part of the timber being brought from Pegu. The rise of tide is nine feet. The value of the goods imported hither in 1807 from England amounted to £76,000; in 1810 to £38,253. Large quantities of Bengal and Madras piece-goods are imported for the Malay trade, and the consumption of European residents. Other imports are opium, grain, tobacco, red wood, sandal-wood, shark-fins, myrrh, pepper, rice, betel-nut, benzoin, camphor, gold dust, elephants' teeth, &c. A great many of these commodities are re-exported to Sumatra, Junk Ceylon, and the other Indian islands; also to China, to Bengal, and Coromandel. Long. of the north-east point 100° 19' E., lat. 5° 25' N.

PRINCE'S ISLAND, a low woody island in the Eastern Seas, off the north-western extremity of Java, at the distance of about two leagues, and six from Sumatra. On the south-west side is a bay, into which two small fresh-water rivulets flow. There has of late been a town erected here, called Samadang, consisting of about 400 houses, and this island was formerly much frequented by the Indian ships of many nations. Here may be had some excellent turtle and fowls, and deer, besides all the usual vegetable productions of the neighbourhood. Long 105° 15' E., lat. 6° 25' S.

PRINCE'S ISLAND, an island in the gulf of Benin, and Bight of Biafara, about 100 miles off the coast of West Africa. It is ninety miles in circumference, and is fertile in rice, tobacco, millet, manioc, sugar-canes, and fruits. It was discovered and settled by the Portuguese in 1471. On the north coast there is a town with a good harbour, containing about 200 houses. Long. 7° 10' E., lat. 1° 50' N.

PRINCE'S ISLANDS, four small islands inhabited by the Greeks, in the sea of Marmora, near the straits of Constantinople, being only

about twenty miles from that capital, called Prinkipo, Prote, Kalke, and Antigone. They are situated near the entrance of the gulf of Nicomedia, and are frequently resorted to from Constantinople.

PRINCE WILLIAM HENRY'S ISLAND, an island in the East Indian Ocean, W. N. W. of Tench's Island, about seventy miles in circumference; discovered by Ball and Philip in 1790. It is fertile, and inhabited by naked savages, who, however, have houses, canoes, &c. There is a high mountain in the centre, called St. Philip. Long. 149° 30' E., lat. 1° 32' S.

PRINCE WILLIAM HENRY'S ISLAND, an island in the South Pacific Ocean, discovered in 1767, by Captain Wallis.

PRINCE WILLIAM'S SOUND, a name given by captain Cook, in 1778, to an inlet of the sea on the north-west coast of America; which occupies at least two degrees of longitude and one and a half of latitude, exclusive of its arms and branches, the extent of which is unknown.

From this sound or bay the name has been extended to a considerable territory on the coast. The men, women, and children, are all clothed in a sort of close frock, or robe, which sometimes reaches only to the knees, but generally down to the ancles. These frocks are composed of the skins of various animals, and commonly worn with the hairy side outwards. The men often paint their faces of a black color, and of a bright red, and sometimes of a bluish or leaden hue; but not in any regular figure. The women puncture and stain the chin with black, that comes to a point in each cheek. Their canoes are of two sorts; the one large and open, the other small and covered. The framing consists of slender pieces of wood, and the outside is composed of the skins of seals, or sea animals, stretched over the wood. Their weapons, and implements for hunting and fishing, are the same as those used by the Greenlanders and Esquimaux. Many of their spears are headed with iron, and their arrows are generally pointed with bone. The food they were seen to eat was the flesh of some animal, either roasted or broiled, and dried fish. Some of the former that was purchased had the appearance of bear's flesh. They also eat a larger sort of fern-root, either baked, or dressed in some other method. Their drink is water; in their canoes, they brought snow in wooden vessels, which they swallowed by mouthfuls. The skins, that were brought by the natives for sale, were principally of bears, common and pine martins, sea otters, seals, racoons, ermines, foxes, and whitish cats or lynxes. The birds were the halcyon, or great king's fisher, which had fine bright colors; the white headed eagle, and the humming bird. The fish brought to market for sale were chiefly torsk and halibut. The rocks were almost destitute of shell-fish; and the only other animal of this tribe that was observed was a reddish crab, covered with very large spines. Few vegetables of any kind were observed; and the trees that chiefly grew about this sound were the Canadian spruce pine, some of which were of a considerable size. Vancouver visited this sound in 1794, and says 'after a minute examination we were empowered to

make of Prince William's Sound, we were not only made acquainted with its utmost limits in every direction, but proved it to be a branch of the ocean that requires the greatest circumspection to navigate; and, although it diverges into many extensive arms, yet none of them can be considered as commodious harbours, on account of the rocks and shoals that obstruct the approach to them, or of the very great depth of water at or about their entrances: of the former, innumerable have been discovered, and there is great reason to suppose that many others may have existence, of which we gained no knowledge. By what may be collected from our enquiries, Snag-corner Cove, and the passage to it from the ocean, seem to be the least liable to these objections of all places of shelter which the sound affords.' Long. 147° W., lat. 20° to 61° N.

PRINCESS ROYAL ISLANDS, a considerable group of islands on the western coast of North America, east of Queen Charlotte's Islands, between Pitt's Archipelago and Fitzhugh's Sound. They were first visited by Mr. Duncan who found a navigable channel between them, and afterwards more fully explored by Vancouver.

PRINCIPAL, *adj.* & *n. s.* } Fr. *principal*;
PRINCIPALITY, } Lat. *principalis*.
PRINCIPALLY, *adv.* } Chief; princely; first; important: a head or chief; one primarily engaged; a capital sum of money: principality is sovereignty; superiority; one invested with sovereignty or great power; predominance; the country giving title to a prince: principally, chiefly; above the rest; above all the rest.

I am certeyn that neither deeth, neither lyf, neither angelis, neither *principalis*, neither vertues ——— mai departe us fro the charite of God that is in Iesu Crist oure Lord. *Wiclif. Rom. 8.*

Divine lady, who have wrought such miracles in me, as to make a prince none of the basest, to think all *principalities* base in respect of the sheep-hook. *Sidney.*

Suspicion of friend, nor fear of foe,
 That hazarded his health, had he at all;
 But walked at will, and wandered to and fro,
 In the pride of his freedom *principal*. *Spenser.*

Nothing was given to Henry but the name of king; all other absolute power of *principality* he had. *Id.*

This latter is ordered, partly and as touching *principal* matters by none but precepts divine only; partly and as concerning things of an inferior regard by ordinances, as well human as divine. *Hooker.*

Can you remember any of the *principal* evils that he laid to the charge of women? *Shakspeare.*

Thou wilt not only lose the forfeiture,
 But, touched with human gentleness and love,
 Forgive a moiety of the *principal*. *Id.*

Yet let her be a *principality*,
 Sovereign to all the creatures on the earth. *Id.*
 Seconds in factions, do many times, when the faction subdivideth, prove *principals*. *Bacon.*

In the chief work of elements, water hath the *principality* and excess over earth.

Digby on Bodies.

Nisroch of *principalities* the prime. *Milton.*

PRINCETON; a post-town of New Jersey, 10 miles north of Trenton, 40 north-east of Philadelphia, and 49 south-west of New York; lat. 40° 22' N.; lon. 74° 35' W. It is a pleasant town, and contains a college, a theological semi-

nary, a brick Presbyterian church, and more than 100 houses. The college of New Jersey was founded in 1746, at Elizabethtown; the next year it was removed to Newark, and a royal charter was granted to it in 1748, by its present title. It remained at Newark ten years, and was permanently established at Princeton in 1757. Its situation is peculiarly healthful and pleasant, and it has long been a highly respectable and flourishing seminary. The college edifice is styled Nassau Hall, and is one of the most prosperous literary establishments in North America. Princeton was distinguished during the revolution by a decisive battle between the British troops and a detachment of the American army under General Washington. The British lost 100 killed, and 300 prisoners, who had taken refuge in the college: One of the American generals fell in this action.

PRINCIPAL, in English law, is either the actor or absolute perpetrator of the crime, who is called a principal, in the first degree; or he who is present, aiding and abetting the fact to be done, who is denominated a principal in the second degree. The presence of a principal need not always be an actual immediate standing by, within sight or hearing of the fact; but there may be also a constructive presence, as when one commits a robbery or murder, and another keeps watch or guard at some convenient distance. In case of murder, by poisoning, a man may be a principal felon by preparing and laying the poison, or giving it to another (who is ignorant of its poisonous quality) for that purpose, and yet not administer it himself, nor be present when the very deed of poisoning is committed. The same reasoning holds, with regard to other murders committed in the absence of the murderer, by means prepared before-hand, and which could hardly fail of their mischievous effect. As by laying a trap or pit-fall for another, whereby he is killed; letting out a wild beast, with an intent to do mischief; or exciting a madman to commit murder; in every one of these cases the party offending is guilty of murder as a principal, in the first degree. For he cannot be called an accessory, that necessarily pre-supposing a principal; and the poison, the pit-fall, the beast, or the madman, cannot be held principals, being only the instruments of death. He must therefore be held certainly guilty in the first degree.

PRINCIPATO CITRA, or **CITERIORE**, a province in the central part of Naples, on the Mediterranean. It is of an irregular form, about ninety miles in length from north-west to south-east, and forty-five at its greatest breadth. Its territorial extent is 2400 square miles; for the most part mountainous, but traversed by a plain, extending from Salerno to Agropoli, and watered by the rivers Silaro, Sarno, Calore, and Negro. The mountains are in general well wooded, and a number of them covered with chestnut-trees. The plains are rich in corn and rice; but the too extended cultivation of the latter has in several places made the climate unhealthy. The other products are wine, olive-oil, and fruit. Hogs are reared in great numbers; and on the coast are considerable fisheries. The principal exports are chestnuts, timber, rice, dried fruit,

particularly figs; wine, hides, and pork. The capital is Salerno. Population about 245,000.

PRINCIPATO ULTRA, or **ULTERIORE**, a province of the kingdom of Naples, south of the above, with a superficial extent of 1800 square miles, and traversed by the Apennines. It consists of an intermixture of mountains and well-cultivated valleys, and is watered by the Sabato, Tammaro, Calore, and Ofanto. Its climate is pure and salubrious, and the products are corn, wine, fruit, chestnuts, olive oil, and timber for export. The breeding of cattle and sheep is carried on extensively in the mountainous parts; in warmer situations silk worms are reared. The only exports consist of raw products. The chief town is Avellino. Population 358,000.

PRINCIPIATION, *n. s.* Lat. *principium*. Analysis into constituent or elemental parts. A word not received.

The separating of any metal into its original or element, we will call *principiation*. *Bacon.*

PRINCIPLE, *n. s.* & *v. a.* Fr. *principe*; Lat. *principium*. Element; constituent part; primordial substance, or cause; fundamental truth; motive: to fix in any tenet or principle.

Touching the law of reason, there are in it some things which stand as *principles* universally agreed upon; and out of those *principles*, which are in themselves evident, the greatest moral duties we owe towards God or man, may, without any great difficulty, be concluded. *Hooker.*

Farewel, young lords; these warlike *principles* Do not throw from you. *Shakespeare.*

Such kind of notions as are general to mankind, and not confined to any particular sect, or nation, or time, are usually styled common notions, seminal *principles*; and *lex nata*, by the Roman orator.

Wisest and best men full oft beguiled,
With goodness *principled* not to reject
The penitent, but ever to forgive,
Are drawn to wear out miserable days. *Milton.*

The soul of man is an active *principle*, and will be employed one way or other. *Tillotson.*

Some few, whose lamp shone brighter, have been led,

From cause to cause to nature's secret head,
And found that one first *principle* must be. *Dryden.*

Governors should be well *principled* and good-natured. *L'Estrange.*

Let an enthusiast be *principled*, that he or his teacher is inspired, and you in vain bring the evidence of clear reasons against his doctrine. *Lock.*

The promiscuous reading of the bible is far from being of any advantage to children, either for the perfecting their reading, or *principling* their religion. *Id.*

For the performance of this, a vital or directive *principle* seemeth to be assistant to the corporeal. *Grew's Cosmologia.*

It is the concern of his majesty, and the peace of his government, that the youth be *principled* with a thorough persuasion of the justness of the old king's cause. *South.*

There are so many young persons, upon the well and ill *principling* of whom next under God, depends the happiness or misery of this church and state. *Id.*

I'll try

If yet . can pursue those stubborn *principles*
Of faith, of honour.

Addison's Cato.

Plato lays it down as a *principle*, that whatever is permitted to befall a just man, whether poverty or sickness, shall, either in life or death, conduce to his good.

Addison.

As no *principle* of vanity led me first to write it, so much less does any such motive induce me now to publish it.

Wake.

A feather shooting from another's head,
Extracts his brain, and *principle* is fled.

Pope.

He seems a settled and *principled* philosopher, thanking fortune for the tranquillity he has by her aversion.

Id.

All of them may be called *principles*, when compared with a thousand other judgments, which we form under the regulation of these primary propositions.

Watts's Logick.

All kinds of dishonesty destroy our pretences to an honest *principle* of mind, so all kinds of pride destroy our pretences to an humble spirit.

Law.

Man's obligations infinite of course,
His life should prove that he perceives their force,

His utmost he can render is but small,
The *principle* and motive all in all.

Cowper.

PRIN'COCK, *n. s.* } From *prink* or *prim-*
PRIN'COX. } cock. A coxcomb; a

conceited person. A ludicrous word. Obsolete.

You are a saucy boy ;

This trick may chance to scathe you I know what ;

You must contrary me ! you are a *princor*, go.

Shakspeare.

PRINGLE (Sir John), an eminent physician and younger son of Sir John Pringle of Roxburgh ; who took the degree of M. D. at Leyden, 1730 ; and published there *Dissertatio Inauguralis de Marcere Senili*, 4to. After having been some years professor of moral philosophy at Edinburgh, he was, in June 1745, appointed physician to the duke of Cumberland, and physician to the hospital of the forces in Flanders, where the earl of Stair appears to have been his patron. In February 1746 Dr. Pringle, Dr. Armstrong, and Dr. Barker, were nominated physicians to the hospital for lame, maimed, and sick soldiers, behind Buckingham House ; and in April 1749 Dr. Pringle was appointed physician in ordinary to the king. In 1750 and 1755 he published *Observations on the Nature and Cure of Hospital and Gaol Fevers*, in a Letter to Dr. Mead, 8vo. ; and in 1752 *Obser-*

vations on the Disorders of the Army in Camp and Garrison, 8vo. On the 14th of April, 1752, he married Charlotte, daughter of Dr. Oliver, an eminent physician at Bath. In 1756 he was appointed, jointly with Dr. Wintringham, physician to his majesty's hospital for the forces of Great Britain. After the accession of king George III. Dr. Pringle was appointed physician to the queen's household in 1761 ; physician in ordinary to the queen in 1763, when he was admitted of the College of Physicians in London ; and, on the 5th of June 1766, he was created a baronet of Great Britain. In 1772 he was elected president of the Royal Society, where his speeches for five successive years, on delivering the prize medal of Sir Godfrey Copley, gave great satisfaction. In 1777 he was appointed physician extraordinary to the king. He was also a fellow of the College of Physicians at Edinburgh, and of the Royal Medical Society at Paris ; member of the Royal Academies at Paris, Stockholm, Göttingen, and of the Philosophical Societies at Edinburgh and Haerlem ; and continued president of the Royal Society till November 1778 ; after which period he gradually withdrew from public life. He died January 18th, 1782.

PRINK, *v. n.* Belg. *pronken*. To prank ; deck for show. The diminutive of *prank*.

Hold a good wager she was every day longer *prinking* in the glass than you was. *Art of Tormenting*.

PRINKIPO, the most eastern and considerable of the Prince's Islands, in the bay of Marmora, about a league distant from the coast of Asia Minor. It is about a mile in length, and half a mile in breadth, containing a town, now in a ruinous condition. The French merchants used formerly to have country houses on this island, but they have abandoned them, on account of the badness of the water, and other inconveniences ; it is at present inhabited only by a few Greeks, who support themselves by selling wine and provisions to the pleasure parties which come from Constantinople. Long. 28° 56' E., lat. 40° 51' N.

PRINOS, winter berry, a genus of the monogynia order, and hexandria class of plants ; natural order forty-third, *dumosa* : *CAL.* sefid : *COR.* monopetalous, and rotaceous ; the belly exaspermous. Species ten, all native shrubs of North America and the West Indies.

P R I N T I N G.

PRINT, *v. a., v. n. & n. s.* }

Fr. *empreint* ;

PRINTER, *n. s.* }

Ital. *imprenta* ;

PRINTING,

Belg. *printe*. To

PRINTLESS, *adj.* }

indent or mark

by pressure ; impress a thing so as to leave its form ; to form by impression ; impress the form of type, &c., on paper, so as to make a book ; the term is likewise applied to taking off copper-plates by a press, and the figures of blocks, &c., used in calico, silk, and other printing ; as a neuter verb, to use the typographic art ; publish a book : a print is a mark or form impressed ; a feature made by impression ; the form, ar-

range or size, of printing types ; mould or pattern cut in wood, copper, &c. ; single sheet, printed for sale ; a newspaper : a printer is, 'par excellence,' one who prints books ; but also applied to similar operators on linen, calico, silk, &c. : printing, the art or business of a printer : printless, that which leaves no impression.

Ye shall not make any cuttings in your flesh for the dead, nor *print* any marks upon you. *Leviticus*.

Oh, that my words were now written ! Oh, that they were *printed* in a book. *Job xix. 23.*

My soul is but a wind,

Which passeth by, and leaves no *print* behind.

Sandys.

Your mother was most true to wedlock, prince,
For she did *print* your royal father off,
Conceiving you. *Shakspeare. Winter's Tale.*

Thou hast caused *printing* to be used; and, con-
trary to the king, his crown, and dignity, built a
paper-mill. *Shakspeare.*

Attend the foot,
That leaves the *print* of blood where'er it walks. *Id.*

I love a ballad in *print*, or a life. *Id.*
Ye elves,

And ye, that on the sands with *printless* foot
Do chase the ebbing Neptune. *Id. Tempest.*

Our life so fast away doth slide,
As doth an hungry eagle through the wind;
Or as a ship transported with the tide,
Which in their passage leave no *print* behind. *Davies.*

Up they tost the sand,
No wheel seen, nor wheels *print* was in the mould
imprest
Behind him. *Chapman's Iliad.*

It is so rare to see
Ought that belongs to young nobility
In *print*, that we must praise. *Suckling.*
I find, at reading all over, to deliver to the
printer, in that which I ought to have done to
comply with my design, I am fallen very short. *Digby.*

While the heaven, by the sun's team untrod,
Hath took no *print* of the approaching light,
And all the spangled host keep watch. *Milton.*

Whilst from off the waters fleet,
Thus I set my *printless* feet,
O'er the cowslip's velvet head,
That bends not as I tread. *Id.*

Perhaps some footsteps *printed* in the clay,
Will to my love direct your wand'ring way. *Rose.*

From my breast I cannot tear
The passion, which from thence did grow;
Nor yet out of my fancy raze
The *print* of that supposed face. *Waller.*

On his fiery steed betimes he rode,
That scarcely *prints* the turf on which he trod. *Dryden.*

Winds, bear me to some barren island,
Where *print* of human feet was never seen. *Id.*
The *prints*, which we see of antiquities, may con-
tribute to form our genius, and to give us great ideas. *Id.*

To refresh the former hint;
She read her maker in a fairer *print*. *Id.*
Is it probable that a promiscuous jumble of
printing letter should often fall into a method,
which should stamp on paper a coherent discourse? *Locke.*

As soon as he begins to spell, pictures of animals
should be got him, with the *printed* names to them. *Id.*

If they be not sometimes renewed by repeated
exercise of the senses or reflection, the *print* wears
out. *Id.*

Before the lion's den appeared the footsteps of
many that had gone in, but no *prints* of any that
ever came out. *South.*

His natural antipathy to a man who endeavours
to signalize his parts in the world, has hindered
many persons from making their appearance in *print*. *Addison.*

The *prints*, about three days after, were filled with
the same terms. *Id.*

I published some tables, which were out of *print*.
Arbutnot.

Inform us, will the emperor treat,
Or do the *prints* and papers lie? *Pope.*

This nonsense got in by a mistake of the stage
editors, who *printed* from the piecemeal written parts. *Pope.*

To buy books, only because they were published
by an eminent *printer*, is much as if a man should
buy clothes that did not fit him, only because made
by some famous tailor. *Id.*

See, the *printer's* boy below;
Ye hawkers all, your voices lift. *Swift.*

He was sent without any superintendent to con-
duct a *printing*-house at Norwich, and publish a
weekly paper. *Johnson.*

Satires and lampoons on particular people circu-
late more by giving copies in confidence to the friends
of the parties, than by *printing* them. *Sheridan.*

PRINTING, the art of taking impressions from
characters or figures, moveable and immoveable,
on paper, linen, silk, &c. There are three kinds
of printing; the one from moveable letters for
books; another from copper-plates for pictures;
and the last from blocks, in which the represen-
tation of birds, flowers, &c., are cut for printing
calicoes, linen, &c. The first is called common
or letter-press printing; the second rolling-press
printing; and the last calico, &c., printing. The
principal difference between the three consists in
this, that the first is cast in relievo, in distinct
pieces; the second engraven in creux; and the
third cut in relievo, and generally stamped, by
placing the block upon the materials to be
printed, and striking upon the back of it.

Of the above branches, letter-press printing is
the most curious, and deserves the most particu-
lar notice; for to it are owing chiefly our deli-
verance from ignorance and error, the progress
of learning, the revival of the sciences, and
numberless improvements in arts, which, without
this noble invention, would have been either lost
to mankind, or confined to the knowledge of a
few.

HISTORY.—It has been a matter of considera-
ble surprise that some method of printing was
not invented at a much earlier epoch in the his-
tory of the world. The arts of statuary and
sculpture arrived at very great perfection among
the Romans; the cutting of their seals and dies
may be considered as a kind of printing on
metals; and their impressing these seals, cut in
cornelians, agates, &c., on wax, was another
species of printing on this substance. This was
the very germ of the art; and it is perfectly as-
tonishing that no should have thought of printing
two words together as well as one; and that
they have multiplied them into a page. They set
their foot on the very pearl, without stopping to
notice or pick it up.

The origin of printing is completely enveloped
in mystery; and an art which commemorates
all other inventions—which hands down to pos-
terity every important event—which immortalises
the discoveries of genius and the exploits of
greatness—which has been the only effectual in-
strument that could banish the darkness, and
overturn the superstitions of a bigoted age; and
which, above all, extends and diffuses the word
of God to all mankind; this very art has left its
own origin in obscurity, and has given employ-
ment to the studies and researches of the most
learned men in Europe to determine to whom
the honor of its invention is justly due.

The art of printing combines such a number and variety of branches that it would be absurd to suppose any one person could have invented the whole. In its present state of perfection, it is divided into eight or ten different kinds of manufactures; and even in its rudest state must have required such an extensive acquaintance with mechanics, chemistry, and other branches of science, as could not be supposed to fall to the lot of any one or two men. It is this circumstance, doubtless, which has given plausibility to the claims of the numerous persons handed down to us as the original inventors of the art. The simple idea may have originated with a single individual, but a second person may have made such an important improvement as almost to eclipse the value of what his predecessor had accomplished. A third person may be supposed to have rendered a still greater addition to the art, and, either in reality or in idea, to attract to himself the merit of the whole: and indeed these appear to be the real merits of the case, and the only possible mode of reconciling the diversified and clashing statements which have been promulgated. The taking impressions from pages cut on blocks of wood, and from separate metal types cast for the purpose, are operations so entirely different, and the one is an art so decidedly inferior to the other, that they ought never to have been confounded under the same name: in the sequel we shall find that the merit of the two is not confined either to one person, or the honor to one place.

The honor of this invention has been appropriated to several places; to Mentz, to Strasburg, to Harlem, to Dordrecht, to Venice, to Rome, to Florence, to Basle, to Augsburg, &c. Three only of these places, however, deserve any serious consideration: viz. Harlem, Mentz, and Strasburg. At the last mentioned place many attempts appear to have been made towards the discovery and completion of the art by John Gutenberg; but, as there is no evidence that he actually brought his experiments to bear in the publication of any work at Strasburg, nothing more need be said of this city, though we shall have frequent occasion to introduce the name of this ingenious artist.

The most consistent account of the origin of the art of printing is that which is given by Hadrian Junius, and which favors the claims of Laurence Coster, of the city of Harlem. This account is contained in his *Batavia*, published after his death at Leyden, more than a century after the supposed invention of the art, and is the only paper or testimony upon which the partisans of the city of Harlem found their typographical pretensions. Junius had the relation from two respectable men, Nicholas Galius, his intimate friend and correspondent and the pupil of Galius, Quirinius Talesius, both of whom had informed him, that they had in their youth heard this same story related more than once, by a certain bookbinder, nearly eighty years of age, named Cornelius, who professed to have been one of Coster's domestics. The substance of the narration of Junius is as follows:—'It is now about 128 years,' he says, 'since Laurence, the son of John, a citizen of Harlem, and surnamed

Coster (that is, sacristan or church-warden, at that time an honorable office, and which his family had long held by hereditary right), amused himself, during his walks in the wood near that city, with forming letters of the bark of the beech tree, by means of which he printed upon paper some verses and short sentences, for the instruction of his grand-children. With the assistance of his son-in-law Thomas, the son of Peter, he afterwards invented an ink, more viscous and tenacious than common ink, which was found to blot and fill the letters; with this new ink he printed, in the Flemish language, the *Speculum nostræ Sæculi*, a work composed of images and letters. The leaves of this book being printed on one side only, the pages, which were left blank, were afterwards pasted together. After this, Coster abandoned the use of wooden letters, and adopted metal ones; forming them at first of lead, and latterly of tin, which metal is rather harder than the former: some metal wine cups, made from the remains of these letters, may yet be seen in the dwelling-house of his descendants. The great profits which the inventor derived from this new art induced him to increase his establishment, and with this view he took some workmen into his family. One of these, who was called John, surnamed Fust, as is suspected, or some other person bearing the name of John (it is of no great consequence which), after having learnt the art of arranging and casting types, as well as all other matters relating to the art of printing, in the knowledge of which he had been initiated under the obligation of an oath, seized the opportunity of his master being engaged at mass, on the night of Christmas eve, to carry off all the types and implements used in the printing office. He went with his plunder to Amsterdam, in the first instance, then to Cologne, and finally settled at Mentz, where he established a printing office, in which were printed, in the year 1442, with the types stolen from Harlem, the *Doctrinale Alexandri Galli*, and the *Tractatus Petri Hispani*.'

The narrative of Junius has been questioned, and indeed violently opposed, by writers of the first literary eminence: and it certainly appears a remarkable circumstance that no Dutch writer, nor any work of the fifteenth or of the beginning of the sixteenth century, has made the least mention of these facts—not even Erasmus, who, from having been born at Rotterdam in the year 1467, could hardly have been ignorant of events at once so singular and so creditable to his native country. There are several other objections to the above narrative, which we cannot here notice: but, without relying implicitly on all the statements of this narrative, it seems to us pretty evident that Coster carried the art of printing from impressions cut upon blocks to a greater extent, and applied it to a greater variety of purposes, than any person in Europe who had preceded him: though the merit of even this part of the art is not wholly due to himself; it had been practised in many countries for centuries, and especially in China, where it continues to the present day, with scarcely any variation or improvement.

It may be advisable to divide the history of the art into four parts:—the first embracing the

P R I N T I N G .

mode of striking impressions from signets, seals, and other emblems cut on wood, or other substances, the origin of which is totally lost. The second stage is that which introduces us to the name and labors of Laurence Coster, who applied block printing to the production of books, of which his *Speculum humanæ Salvationis* is said to be the first instance. This work consists of pictures out of the Bible, with some of the verses underneath each page, the whole being printed from a block of wood, like a wood-cut. He seems also to have had the merit of printing from separate wooden letters, cut so as to fit each other when composed together, and perhaps with the small words of most frequent use cut upon one block, to save the time and labor of the compositor. This occurred between the years 1431 and 1443. The third stage of the art was the adoption of cut metal instead of wooden letters, which is doubtless to be traced to the labors of John Geinsflesh, jun., distinguished by the name of Guttenberg. This person, with the assistance of his father, Geinsflesh the elder, invented cut metal types, and used them in printing the earliest edition of the Bible. This edition appeared in 1450, and the completing of it took up seven or eight years. The fourth and last stage of the art, and which brought it to almost as high a state of perfection as it attained for two centuries afterwards, was the mode of casting types in matrices, which was invented by a servant of Guttenberg's, of the name of Peter Schoeffer. For this valuable service he was admitted into the family of his master, Fust or Faustus, and was rewarded with the hand of one of his daughters. The first work printed on these improved types was the *Durandi Rationale*, in 1459. Most persons are acquainted with the legend of the Devil and Dr. Faustus. The origin of the tale is, that Faust carrying a parcel of his bibles to Paris, and offering them for sale as MSS., the French, upon considering the number of books, and their exact conformity with each other, even to a point, concluded that there was witchcraft in the case, and, it is said, that by either actually indicting him as a conjuror, or threatening to do so, they extorted the secret. This perhaps, however, is but a new edition of a fabulous tale; as a Dr. Faustus who had correspondence with his Satanic majesty lived at a much earlier period.

In the year 1462 the city of Mentz, where Faust had settled, was taken and plundered; and the art of printing, in the general ruin, was made public, and quickly spread itself over a great part of Europe. Harlem and Strasburg practised it very early; and whence it appears to have proceeded to Rome, to Paris, to Constantinople, and to most of the principal towns on the continent.

The date and mode of its introduction into England is a subject involved almost in as much mystery as the original invention of the art. It was an opinion regularly delivered down by our historians, that the art of printing was introduced and first practised in England by William Caxton, a mercer and citizen of London, who by his travels abroad, and a residence of many years in Holland, Flanders, and Germany, in the affairs of trade, had an opportunity of informing

himself of the whole method and progress of the art, and by the encouragement of the great, and particularly of the abbot of Westminster, first set up a press in that abbey, and began to print books soon after the year 1471. This was the tradition of our writers, till a printed book or chronicle, which had scarcely been observed by the curious, was discovered, as it is said, in the archbishop of Canterbury's Palace, with a date of its impression from Oxford, anno 1468; and was considered immediately as a clear proof and monument of the exercise of printing in that university, several years before Caxton returned from the continent.

The discovery of this book seemed at once to deprive Caxton of the glory he had long enjoyed—as the author of printing in this kingdom. Its authenticity, however, has been warmly disputed by Mr. Palmer, in his *History of Printing*; by Dr. Ducarvel, in his *Letters to Meerman*; and especially by Dr. Conyers Middleton, who maintains that there was no printing in England till the introduction of it by Caxton. Indeed, if the fact were as stated by the alleged Chronicle in the archbishop's palace, it would derogate but little from the honor of Caxton, who was certainly the first person in England who practised the art of printing with fusile types, and consequently the first who brought it to perfection: whereas Corsellis, the other claimant, printed from separate cut types in wood, that being the only method he had learnt at Harlem. Great opposition was frequently manifested by magistrates and others, when this useful art was first introduced into a new city or town. We are told, in an old pamphlet in the collection of the earl of Orford, that, when it was introduced into Norwich, a general petition was presented to the magistracy against this unnecessary innovation.

Caxton had been bred very reputationly in the way of trade, and served an apprenticeship to one Robert Large a mercer; who, after having been sheriff and lord mayor of London, died in the year 1441. From the time of his master's death he spent the following thirty years beyond sea in the business of merchandise. There is no clear account left of his age: but he was certainly very old, and probably above fourscore at the time of his death. In the year 1471 he complained of the infirmities of age creeping upon him, and enfeebling his body: yet he lived twenty-three years after, and pursued his business, with extraordinary diligence, in the abbey of Westminster, till the year 1494, in which he died; not in the year following as all who write of him affirm. This appears from some verses at the end of a book, called *Hilton's Scale of Perfection*, printed in the same year.

Before 1465 the uniform character was the old Gothic or German; whence our black was afterwards formed. But in that year an edition of Lactantius was printed in a kind of Semi-Gothic, of great elegance, and approaching nearly to the present Roman type; which last was first used at Rome in 1467, and soon after brought to great perfection in Italy, particularly by Jenson.

Towards the end of the fifth century, Aldus invented the Italic character which is now in use, called, from his name, Aldine or cursivus. This

sort of letter he contrived to prevent the great number of abbreviations that were then in use.

The first essays in Greek that can be discovered are a few sentences which occur in the edition of Tully's Offices, 1465, at Mentz; but these were miserably incorrect and barbarous. In the same year, 1465, was published an edition of Lactantius's Institutes, printed in monasterio Sublacensi, in the kingdom of Naples, in which the quotations from the Greek authors are printed in a very neat Greek letter. They seem to have had but a very small quantity of Greek types in the monastery; for, in the first part of the work, whenever a long sentence occurred, a blank was left, that it might be written in with a pen: after the middle of the work, however, all the Greek that occurs is printed.

In 1488, however, all former publications in this language were eclipsed by a fine edition of Homer's works at Florence, in folio, printed by Demetrius, a native of Crete. Thus printing (says Mr. Mattaire, p. 185) seems to have attained its acme of perfection, after having exhibited most beautiful specimens of Latin, Greek, and Hebrew. The earliest edition of the whole bible was, strictly speaking, the Complutensian Polygott of cardinal Ximenes; but as that edition, though finished in 1517, was not published till 1522, the Venetian Septuagint of 1518 may properly be called the first edition of the whole Greek Bible; Erasmus having published the New Testament only at Basil in 1516.

A very satisfactory account of Hebrew printing is thus given by Dr. Kennicott in his Annual Accounts of the Collation of Hebrew MSS., p. 112. 'The method which seems to have been originally observed in printing the Hebrew Bible was just what might have been expected: 1. The Pentateuch, in 1482. 2. The Prior Prophets, in 1484. 3. The Posterior Prophets, in 1486. 4. The Hagiographia, in 1487. And, after the four great parts had been thus printed separately (each with a comment), the whole text (without a comment) was printed in one volume in 1488; and the text continued to be printed, as in these first editions, so in several others for twenty or thirty years, without marginal Keri or Masora, and with greater arguments to the more ancient MSS. till about the year 1520 some of the Jews adopted later MSS. and the Masora; which absurd preference has obtained ever since.'

In 1642 a Hebrew bible was printed at Mantua under the care of the most learned Jews in Italy. This bible had not been heard of among the Christians in this country, nor perhaps in any other; though the nature of it is very extraordinary. The text indeed is nearly the same with that in other modern editions; but at the bottom of each page are various readings, amounting in the whole to above 2000, and many of them of great consequence, collected from MSS., printed editions, copies of the Talmud, and the works of the most renowned rabbies. And in one of the notes is this remark: 'That in several passages of the Hebrew bible the differences are so many and so great, that they know not which to fix upon as the true readings.'

We cannot quit this subject without observing, on Dr. Kennicott's authority, that as the first

printed bibles are more correct than the latter ones; so the variations between the first edition, printed in 1488, and the edition of Vander Hooght, in 1705, at Amsterdam, in 2 vols. 8vo amount upon the whole, to above 1200!

When the art of printing was first discovered, they only made use of one side of a page; they had not yet found out the expedient of impressing the other. When their editions were intended to be curious, they omitted to print the first letter of a chapter, for which they left a blank space, that it might be painted or illuminated at the option of the purchaser. Several ancient volumes of these early times have been found, where these letters are wanting, as they neglected to have them painted.

In the productions of early printing may be distinguished the various splendid editions they made of primers or prayer books. They were embellished with cuts finished in a most elegant taste: many of them were ludicrous, and several were obscene. In one of them an angel is represented crowning the Virgin Mary, and God the Father himself assisting at the ceremony. In a book of natural history the Supreme Being is represented as reading on the seventh day, when he rested from all his works.

PRACTICE OF THE ART.—The workmen employed in the art of printing are of two kinds: compositors, who range and dispose the letters into words, lines, pages, &c., according to the copy delivered to them by an author; and pressmen, who apply ink upon the same and take off the impression. In London, and other large cities and towns, these two branches are usually kept so distinct that few workmen are able to engage in both of them; and in small printing-offices, where of necessity they are alternately followed, very few men are able to attain either facility or beauty in their workmanship. The process of printing is now so common, but at the same time so diversified and peculiar, that any minuteness of description would be at once incomprehensible to those who have not seen it, and quite unnecessary to those who have. In place of any detail of this kind, we shall give some information which may be valuable to persons not immediately connected with the art; and then enumerate some of those improvements which the art of printing has received within the last few years.

As it is impossible but that in every page, almost every letter of which consists of a separate piece of metal, a number of mistakes must have been made, a sheet is first printed off, which is called a proof, and given to a person employed as a corrector; who having read and marked the errors, after these are corrected, another proof-sheet is pulled, and is usually sent to the author for his revision and correction.

When the art of printing was first established it was the glory of the learned to be correctors of the press to the eminent printers. Physicians, lawyers, and bishops themselves, occupied this department. The printers then added frequently to their names those of the correctors of the press; and editions were then valued according to the abilities of the corrector. As, however authors

and editors are now so numerous a race, we shall subjoin in the margin a familiar illustration of

The marks used in correcting a proof-sheet.

To strike out superfluous words in a sentence a line is drawn through them; and, should it afterwards be found advisable to retain the word, dots are placed beneath, and *stet* written in the margin. An illustration is also afforded in the following line of the mode of marking those words the distance between which is to be diminished.

The men ~~were~~ good *stet./*

To cause words to be changed from one character to another.

From Roman type into Italic was *Ital./*

Italic into Roman *was rom./*

Roman into small capitals *was sm. Caps./*

Roman into large capitals *was Caps./*

To introduce the proper stops in a sentence.

The punctuation may be corrected by employing either of the annexed corrections in the margin. *⊙ ⊙ ⊙*

To transpose a word *tr* is written in the margin.

The people good were *tr*

To strike out superfluous letters or words the pen is drawn through them, and the annexed characters introduced in the margin. *8//8*

To cause a letter that is turned to be placed aright, a line is drawn through it and this character introduced in the margin. *9/*

To make two words into one.

Any thing you please. *—*

The annexed marks denote the omission of an apostrophe, and also the manner in which a letter of a different fount should be noticed, when improperly used; being the initials of the words *wrong fount*. *v.w.f./*

STEREOTYPE PRINTING.

Among the improvements which have been introduced into the art of printing within the last century, the first in point of time, and perhaps in point of utility, was stereotype or block printing. This is in fact something like a revival of the first essays of the art; for a complete plate is made for every page of a work, and can only be appropriated to that single page. The advantages of this are, that only a very small impression need be taken at any one time, and, as long as the plate continues, subsequent editions can be procured at a very small charge.

The honor of this invention has been claimed by the French; and so far as the mere idea goes,

without the execution, perhaps the claim may be substantiated, but no further. It is said that a Frenchman of the name of Valleyre, before the year 1735, printed the calendars at the beginning of some church books from a set of stereotype plates; but his method of proceeding was so clumsy and unprofitable as to die with the man who had invented it. The real individual to whom the honor belongs of first bringing stereotype plates into actual service was an ingenious Scotchman, of the name of William Ged, of Edinburgh. Of his proceedings and misfortunes, in attempting to carry his invention into practical effect, an account was published about fifty years ago.

It appears from this narrative that in the year 1725, in consequence of a conversation he had with a printer, his attention was strongly drawn towards the practicability of forming plates from types when formed into pages. Having been furnished with a page, he instituted a series of experiments, and at last, after two years labor, he succeeded in producing impressions from his plates which could not be distinguished from those taken from types. By what method he obtained these plates it is now impossible to say, as his apparatus and the knowledge of his mode of using them was not communicated to any one at his death; indeed the tale of his sufferings and disappointments, and the selfish and dishonest hands into which it was his lot to fall, furnish the materials of an interesting and almost tragical narrative.

That part of his narrative which relates his first visit to London is possessed of sufficient interest to be placed upon durable record. Not finding any body in Scotland willing to patronise his exertions, he met with a London citizen in Edinburgh of the name of Fenner, who, while at a distance from home, could talk largely of his thousands of pounds, but who, in fact, was not worth as many shillings. With this man Ged entered into partnership, and had the deed legally signed before he left Scotland: coming, however, to London, he discovered to his sorrow that his pompous partner could scarcely give him a night's lodging. Disappointed in his expectation, he found his way into the company of Mr. Basket, the king's printer. He heard his proposals, and as Mr. Caslon the letter founder was present at the same time in the house, Mr. Basket proposed that they both should make plates from a page of type, by that day se'nnight, and that the overseer of the office should be the judge of the quality of each when produced.

The condition of this engagement was, that the person who failed should give the other, and all the company present, a handsome dinner and entertainment at his own sole cost and charge. To the utter astonishment of Mr. Basket, the very afternoon in which Ged received the page, he obtained three separate plates with impressions from them equal to those from the original type. But alas! poor man, he made more haste than good speed; for the circumstance of his instant success reached the ear of the other competitor, and sooner than encounter a certain defeat, he evaded the bargain and made no attempt. See a History of the origin and Progress of Stereotype Printing by Mr. F. Hodgson, Newcastle.

The ingenious individual to whom is to be attributed the honor of the present mode of casting stereotype plates is Alexander Tilloch, esq., LL. D., the editor of the *Philosophical Magazine*, who some time prior to the year 1780, without any knowledge of Ged's invention, suggested the practicability of founding whole pages. But, as his account of his invention is very short, we will give it in his own words:—'After mentioning some of the expected advantages,' he says, 'I communicated my ideas upon this subject to Mr. Foulis, printer to the University of Glasgow, my native city, and where I then resided, who furnished me with a page of types ready set up, or composed, for my first experiment, made in 1779, which had sufficient success to induce me to try others, and convinced Mr. Foulis of the possibility of producing plates, which would yield impressions not to be distinguished from those taken from types.

'If I had seen some of the advantages which such a plan promised, Mr. Foulis saw and pointed out many more, of such a nature as could only present themselves to a regular bred practical printer.—We agreed to prosecute the business together, and, if possible, to bring it to perfection, and in pursuance of this resolution performed, I may say, innumerable experiments, till we at last overcame every difficulty, and were able to produce plates, the impressions from which could not be distinguished from those taken from the types from which they were cast.

'In the mean time we learnt that our art, or one extremely similar, had been practised many years before by Mr. Ged, and soon after the world was favored by Mr. Nichols with an interesting pamphlet, entitled *Biographical Memoirs of William Ged*, including a particular account of his progress in the art of Block-Printing. Though we had reason to fear, from what we found Ged had met with, that our efforts would experience a similar opposition from prejudice and ignorance, we persevered in our object for a considerable time, and at last resolved to take out patents for England, Scotland, and Ireland, to secure to ourselves, for the usual term, the benefits of our invention; for the discovery was still as much our own as if nothing similar had been practised before; Ged's knowledge of the art having died with his son. The patents were accordingly obtained. As to benefits, however, I have as yet reaped none, and Mr. Foulis, I believe, has reaped as few, for owing to circumstances of a private nature, and which no way concern the public to know, the business was laid aside for a time, and having afterwards quitted Glasgow, and removed to London, I soon found myself so much occupied with other concerns that I have hardly had time to think upon it since. I ought, however, to observe here, that its being suspended was not on account of any imperfection attending the art, or objections against its being a fit subject to be prosecuted. On the contrary, several small volumes were printed from plates made by myself and Mr. Foulis, and the editions were sold to the trade without any intimation of their being printed out of the common way! We had heard whispers that our

work could not possibly be such as would pass for common printing! The trade knew what we were at, and would take care of any thing done in the new-fangled way. The first essays, therefore, were in the lowest sense of the word common: one or two histories, and a cheap edition of *The Economy of Human Life*. We also printed a Greek volume, Xenophon's *Anabasis*, 1783, and had plates for several small volumes of the English poets almost finished, but the latter were never put to press.'—*Philosophical Magazine*, vol. x. pages 272—275.

Stereotype printing is now practised in almost every country in Europe, but the mode of performing it differs almost in each of them. That adopted in this country generally is to make a mould in plaster of Paris taken from a page of types, to confine this mould in a box or pan made for the purpose, after the air and moisture are properly extracted, which is in about five minutes, and then to dip it into a pot of metal: the pan is lifted out by a crane or pulley, and the operation is completed. This department of the art of printing, though carried to an amazing extent within the last few years, is yet far from having obtained its maturity. The plan used by lord Stanhope, Mr. Wilson, and others, was so expensive as to deprive the publisher of almost all its advantages; it is now, however, executed on such an economical plan, and with such certainty and expedition, as to tempt its adoption for all standard works in the language, and indeed for every work where a second edition will be required.

PRESSES.

Iron-presses.—The art of printing has of late received very important improvements by the substitution of iron for wooden-presses. The advantages of the iron presses in working are very considerable, both in saving labor and time. The first arises from the beautiful contrivance of the levers, the power of the press being almost incalculable at the moment of producing the impression; and this is not attended with a correspondent loss of time, as is the case in all other mechanical powers, because the power is only exerted at the moment of pressure, being before that adapted to bring down the platten as quickly as possible. This great power of the press admits of a saving of time, by printing the whole sheet of paper at one pull, the platten being made sufficiently large for the purpose; whereas, in the old press, the platten is only half the size of the sheet.

For this change of the material of which presses are made, the trade are principally indebted to the late ingenious earl Stanhope. These presses, which still bear his name, have contributed very materially to the ease and beauty of the workmanship. There are likewise many other descriptions of iron presses, professing to be improvements upon the one suggested by lord Stanhope, but only one of them has obtained any celebrity, or possesses any superior advantages. This is the Columbian press, invented by Mr. Clymer; and from the amazing power of the

Fig. 1.

Fig. 2.

Fig. 4.

Fig. 3.

impression, the stability of the workmanship which it is next to impossible to break, as well as for other lesser advantages, perhaps will never be excelled. These two presses being now most in repute, we shall confine any minute descriptions to them alone, giving only a brief notice of several others, which have various degrees of merit.

The improved *Stanhope press* is exhibited in plate I. (PRINTING: fig. 1 is a side elevation; and fig. 2 a front view. AA shows a strong cast iron frame of the form represented in fig. 2. This frame is screwed down upon a piece of timber B, which has another timber C morticed into it at right angles, forming a frame in the shape of the letter E, to serve as a basis for the whole press. DD represent two horizontal rails, having channels formed along their upper surfaces, into which the two rails or ribs upon the underside of the carriage or table EE are adapted to slide. The carriage is put in motion by the action of the handle F and barrel W, which has three strong straps or belts passing round its circumference, as seen in fig. 2, the ends of the said belts being attached to the opposite ends of the carriage, in the manner of ordinary printing presses. The table EE is made perfectly flat upon its upper surface, in order to receive the form of the types: *m* represents the tympan, which is jointed to the end of the table; it is composed of a light frame of wrought iron, and fitted up in the usual manner.

The rails D, D, upon which the carriage runs, are secured to the main frame AA, by screw bolts *a, a*; the outer extremities of the rails D are united together by cross bars, and supported by an arched frame *v* and upright pillar G, the foot of which is bolted down to the timber C. HH represent the platen, which is guided in its perpendicular motion by a slide I, moving between angular ribs formed within the opening of the main frame, as seen in fig. 2. The upper part *d* of the frame is considerably enlarged, and is perforated in the centre to receive a brass nut or female screw, through which the main screw of the press works. M shows an upright spindle, the lower end of which is formed with a pivot adapted to turn in a hole at the top of the arch of the main frame; the upper part of the spindle M works through a collar *c*, formed in a piece of metal, which projects from the main frame, and is secured by a screw. N represents the handle of the press: it is firmly attached to the lower parts of the spindle M, and has a nut on the opposite side to keep it in its place. Thus, when the handle is moved backwards or forwards, it turns the spindle M round, and by the operation of the lever O, and connecting link P, the motion is communicated to the main screw, by the intervention of the arm or lever R fixed upon the top. The platen is raised up, and kept in contact with the end of the screw, by the operation of the balance weight S. The degree of pressure may be increased or diminished by the operation of the screw *p* at the end of the connecting link, being disposed so as to admit of varying the effective length of the link.

Columbian press.—A correct front view of this

press is represented in fig. 3, and a side elevation in fig. 4. AA shows the cheeks or main frame of cast iron; they are united together at the bottom, but separate at the top; the main frame is supported upon four legs, *x x*. B, B, represent the ribs or guides, upon which the carriage and table CC, with its appendages, is adapted to run, being moved backwards and forwards by the rounce E, and barrel F, round which strong linen belts are passed, and affixed at each end of the carriage, as in ordinary printing presses. D shows the platen, which is guided in its motion up and down by its square stem or pillar *d*, being placed angleways, and sliding between pieces of metal *a, a*; which project from the main frame AA. The pieces *a, a*, are furnished with adjusting screws and wedges, for the purpose of tightening them up, and preventing any looseness in the platen. The stem *d* has a square plate, *e*, upon it at the part where it joins to the platen. The pressure is produced by a combination of levers situated at the upper part of the frame. G, I, show the main lever, moving on a strong centre bolt at H, between a forked or divided part of the main frame; the end I of this lever also passes through an oblong opening formed between the bars *h*, and projects some distance beyond the outside of the frame. The central part G of the main lever has a strong pivot or trunnion cast upon it, which projects out sufficiently on each side to enter into collars formed at the top of the stem *d*, of the platen, being retained in their places by four screw bolts, two of which are seen at G in figure 3. *m, n, o*, show the second lever, moving on a fixed centre pin in the main frame at *m*; it has the links *n, I*, jointed to it at the point *n*; the uppermost ends of these links are also jointed on each side of the main lever at I. The point *o* of the second lever has the link or connecting-rod *p* jointed to it, whilst the opposite extremity of the connecting-rod is jointed to the lever or handle N, by which the pressman puts the system of levers into action. The handle N turns upon a fixed centre pin passing through projecting pieces of the main frame, as seen at *i i*; and the connecting-rod *p* is furnished with a double or universal joint, where it unites with the lever *o*, to admit of the oblique motion of the handle N, when it is pulled forwards to produce the pressure.

A counter-lever, *r s t*, is applied at the top of the press, moving upon a fulcrum at *s*; this lever has a balance weight in the form of an eagle clamped upon it by a screw at *r*, whilst the short end *t* of the lever is attached by a link to the end of the main lever at the end I. By this means the weight of the levers and platen is counterbalanced sufficiently to raise them up, when the handle N is left at liberty. The different levers in this press are so arranged that the first motion which is communicated to the handle N brings the platen down quickly; but, by the time that its under surface arrives upon the tympan, the second lever, *m n*, is brought nearly in a line with the direction of the links *n, I*, which causes them to draw down the end I of the main lever with great power; at the same time that the point *o*

of the second lever is in the most favourable position to be operated upon powerfully by the connecting-rod proceeding from the handle N. When the impression is produced, two balance weights act in concert to return the handle N, and raise up the platen.

The testimonies in favor of this press, by almost every master-printer who has used it, prove it to be the most complete press now in use; and at present appears scarcely susceptible of much improvement.

Several other presses are now in use, particularly the Albion press; but as they are somewhat similar in construction to the Columbian, though not so well approved, a particular specification need not be given. The Ruthven or horizontal press, invented by Mr. John Ruthven of Edinburgh, differs materially from all others, in the platen being moveable, and the types stationary. But, as it requires that a workman should almost learn his business over again to work at it, it is now seldom used. A beautiful and well-made press has lately been introduced into use by Messrs. Newman and Gillson, of Newark. Its power is produced by the use of inclined planes, and, these being fixed in a box which is well supplied with oil, the usual inconveniences experienced in that mode of obtaining pressure are in a great measure obviated. For all light work this press perhaps equals any press in use; but it is not adapted for large and heavy forms.

Several attempts have been made to apply a self-inking apparatus to the common press, and numerous patents have been obtained to this purpose; but as nothing has to this day been produced at all likely to succeed, however laudable and ingenious the attempts, we shall not supply any description of them.

Of machine printing.—Previous to the introduction of machines into the business of printing, the press department was one of great labor and difficulty, and the number of copies of a newspaper, which could be printed within the hour, seldom exceeded 750, even with extraordinary exertion. The consequence was, that in newspaper offices, where the circulation was extensive, it was found necessary, in order to get the paper published in time, to compose two or more copies, so that by going to press at the same time, the demands of the public might be complied with; thus occasioning an enormous increase of expenditure both in the compositors' and press departments. In a newspaper circulating 7000 or 8000 copies, this expense, annually could not have been less than £2000; all of which has been saved by the introduction of machines, which are worked by steam or hand.

The cylindrical mode of printing, which, in contradistinction to the old process, is called machine printing, was invented by the late Mr. Nicholson, well known in the scientific and literary world, who took out a patent in the year 1790, though it does not appear that his plans and experiments ended in any actually practical result. Whether M. König, who at a later period more successfully attempted to print by machinery, was indebted to Mr. Nicholson for his elementary principles, or whether almost the same ideas

spontaneously occurred to each individual, is a question that can only be satisfactorily solved by the former. Thus much is certain, that Mr. König's labors were the first which produced any fruit; and, surely, more is due to him who, after years of persevering toil, succeeds in the application of hitherto unapplied principles, than to one of whom we can only say that he was simply the first to suggest ideas, since no evidence is offered of their ever having been acted upon.

M. König, by birth a Saxon, and by occupation a printer, many years ago conceived it possible to print by steam, though he then expected no more than to be able to give accelerated speed to the common press, to which end his first efforts were bent. As from the nature of such an undertaking, considering the state of scientific pursuits in his native land, he could calculate on little success unaided by others, and failing in his application for encouragement and support at the hands of the most eminent printers in several of the continental capitals, he turned his eyes towards England. Arriving in London, about 1804, he submitted his scheme to several printers of repute, who, not being disposed to incur the risk of property which a series of experiments were sure to entail, and perhaps, placing little confidence in a successful issue, received his overtures very coolly; and it is probable his applications in this country would have shared the fate of similar attempts abroad, had he not finally been introduced to Mr. Bensley, senior, who, attracted by M. K.'s plans, speedily entered into an arrangement with him. After a short course of experiments on the fabrication of a press which should have accelerated motion, and at the same time render the work of the man who inks the type unnecessary, the above gentlemen were joined by Mr. G. Woodfall and Mr. R. Taylor, the former of whom, however, soon retired; the remaining three, in no wise discouraged by the tediousness and expense which all who are conversant with the progress of any invention in machinery well know to be unavoidable, persevered amidst unforeseen perplexities, which were doubtless not diminished by the party's deficiency in practical mechanical knowledge. It was at length discovered that the intended improvement of the common press could not be brought to bear, and that much labor and prodigious expense would be thrown away, unless some radical alterations were invented. CYLINDRICAL printing was now thought of, and, after some two or three years of renewed exertion, a small machine was brought forth, the characteristic of which was, that instead of the printing being produced by a flat impression (similar to the press), the sheet passed between a large roller and the types still flat; and, in lieu of the old-fashioned balls, used by hand to beat over the types, and to communicate the ink to their surface, skins were strained round smaller rollers on which it was contrived to spread the ink, and under which the form, i. e. the frame in which the types are fixed, passed in its way to the printing cylinder. Considerable promise of success attended this production; and, after continued experiments, it was deemed practicable to

extend the general principles to a more powerful machine. To print a newspaper was considered highly desirable; and on exhibiting to Mr. Walters, proprietor of the Times newspaper, the machine already erected, and showing what further improvements were contemplated, an agreement was entered into with that gentleman for the erection of two large machines for printing his journal. So secret had been the operations of the patentees that the first public intimation of their invention was given to the reader of The Times on Monday, the 28th of November, 1814, who was told that he then held in his hand one of many thousand impressions thrown off by steam. At this time but few persons knew of any attempt going on for the attainment of the above object; whilst, among those connected with printing, it had been often talked of, but treated as chimerical.

The machines at the Times Office, cumbersome and complicated as subsequent improvements have made them appear, were yet in many respects admirably adapted to the purpose for which they were erected.

The next advance in improvement was the manufacture of a machine for Messrs. Bensley, distinguished from those before mentioned by the mode of *perfecting* (or printing on both sides), so that the sheet of white paper is placed in the feeder and delivered from the machine printed on both sides! In addition to the essential difference between this machine and those previously made, it came forth with many obvious improvements, though still unquestionably complex:—and for the first attempt at effecting register (causing the pages to fall precisely on the back of one another), a greater degree of success than might have been expected was attained, subsequent experience showing the many difficulties to be surmounted in the accomplishment of this object. Deficiencies were now detected in the *inking*: the strained skins were found uneven in their surface; and attempts were made to clothe the rollers with an elastic preparation of glue, treacle, &c., which has at length attained perfection.

By this time the invention had attracted the attention of various individuals, who thought the manufacture of printing machines an easier task than they afterwards found it to be; and far the greater number of attempts, we believe, failed almost as soon as undertaken. A machine, however, similar in its capacities to that last mentioned, but much more simple in its construction, has been brought out, under the direction of some eminent English engineers. It was not long before these gentlemen were requested to apply their inking apparatus to Messrs. Bensley's machine, and at one stroke, as it were, forty wheels were removed—so great was the simplification: and at the same time the defects of the former system, of communicating the ink to the types, were most effectually remedied. Massive and complicated as it was, yet as an immense expense had been incurred in its erection, Messrs. Bensley went on using their machine until the destruction of their establishment by fire in 1819. And, even after the rebuilding of the premises, the machinery, which had been

only partially damaged, was reinstated, and worked for some time: it has now, however, given place to two large and admirable machines built on the improved plan, which, when inspected by a judicious eye, can create only wonder at the heretofore circuitous manner adopted to attain ends so apparently within easy reach. The original machine contained upwards of 100 wheels; whereas the new machine, with about ten wheels, accomplishes, in point of quantity, exactly the same object, with a marked advantage in regard to the quality of the printing. Another important point respecting the new machine is, that it occupies scarcely half the space of the original one.

This machine, notwithstanding the improvements which had been made upon it, has lately been replaced by one made by Augustus Applegarth, esq., several of whose machines are at present in use in the metropolis; and recently several have been exported to the continent. All the machines of his construction are worked by steam; but there are others which have for some years been brought into use which are turned by a fly wheel; and of course have the advantage of being far less cumbersome, and more applicable to the general purposes of the trade. One was invented by Mr. W. Nicholson, of London, for which a patent was obtained 29th April, 1790; a second by Mr. Bacon of Norwich, and made by Bryan Donkin, esq., of London; another was the invention of the late Charles Brightly, esq., of Bungay, and executed by the same engineer; none of them, however, have been brought into practical adoption, though they each possessed a considerable share of merit, and were constructed at a very great expense.

The adoption of printing machines rendered necessary a new mode of distributing the ink upon the type, and which is now transferred to the common press. The original mode was to moisten sheep-skins in liquor, to fasten them round a ball of wool, and then, having procured two of them, the ink was distributed on the surface of each by working them together. This is now entirely superseded by the use of rollers. These rollers are a composition of glue and treacle, which, when heated into a liquid state, are cast in a mould, round a cone of hard wood; and, when cold, are extracted from the mould, and are soon fit for use. This method of inking forms one of the most valuable improvements in modern printing; as it not only affords considerable ease to the workmen, but is calculated to perform the operation with much greater regularity and certainty.

The machines worked by hand now most in repute are those manufactured by Mr. D. Napier. They print both sides the sheet at one operation; and are calculated to do the work of about six or seven presses. This ingenious mechanist is now contriving one for printing newspapers, which is estimated to take off 300 impressions per minute,—a speed almost incredible. As this with some other machines for printing by the same engineer, are not yet completed, we must refer a minute description of them to the article **TYPOGRAPHY** which see.

PRINTING, COPPER-PLATE, requires some notice, though we hardly know a modern art or trade that has been so little improved in the mode of conducting it. It is performed by a machine called the rolling-press, which may be divided into two parts, the body and carriage.

The body consists of two cheeks of different dimensions, ordinarily about four feet and a half high, a foot thick, and two and a half apart, joined at top and bottom by cross pieces. The cheeks are placed perpendicularly on a wooden stand or foot, horizontally placed, and sustaining the whole press. From the foot likewise rise four other perpendicular pieces, joined by cross or horizontal ones, which may be considered as the carriage of the press, and as serving to sustain a smooth, even plank, about four feet and a half long, two feet and a half broad, and an inch and a half thick; upon which the engraven plate is to be placed. Into the cheeks go two wooden cylinders or rollers, about six inches in diameter, borne up at each end by the cheeks, whose ends, which are lessened to about two inches diameter, and called trunnions, turn in the cheeks between two pieces of wood, in form of half moons, lined with polished iron to facilitate the motion. The space in the half moons left vacant by the trunnion is filled with paper, pasteboard, &c., that they may be raised and lowered at discretion; so as only to leave the space between them necessary for the passage of the plank charged with the plate, paper, and blankets. Lastly, to one of the trunnions of the upper roller is fastened a cross, consisting of two levers or pieces of wood traversing each other. The arms of this cross serve in lieu of the handle of the common press; giving a motion to the upper roller, and that to the under one; by which means the plank is protruded, or passed between them.

The printing is performed nearly as follows:—The workmen take a small quantity of the ink on a rubber made of linen rags, strongly bound about each other, and with this smear the whole face of the plate as it lies on a grate over a charcoal fire. The plate being sufficiently inked, they first wipe it over with a foul rag, then with the palm of their left hand, and then with that of the right; and, to dry the hand and forward the wiping, they rub it from time to time in whitening. In wiping the plate perfectly clean, yet without taking the ink out of the engraving, the address of the workman consists. The plate thus prepared is laid on the plank of the press; over the plate is laid the paper, first well moistened, to receive the impression, and over the paper two or three folds of flannel. Things thus disposed, the arms of the cross are pulled, and by that means the plate with its furniture passed through between the rollers, which, pinching very strongly, yet equally, press the moistened paper into the strokes of the engravings, whence it licks out the ink.

PRINTING OF CALICO. The art of printing in colors is intimately connected with many of the chemical processes we have already described under the article DYEING; we shall therefore avoid any unnecessary repetition of those details by occasional references to the various sections of that treatise. This ingenious art

consists in dyeing cloth with certain colors or figures upon a ground of a different hue. The colors are usually fixed by mordants that have various degrees of chemical affinity for the body to be employed.

The art of calico printing is of considerable antiquity, and we have seen some Egyptian cotton dyed by figured blocks many hundred years old. A similar process has long been resorted to in the Sandwich Islands, though they usually employ a large leaf as a substitute for the block.

A popular view of the process of printing calicoes may, however, be furnished prior to a more scientific analysis of the various processes. Some calicoes are only printed of one color, others have two, others three or more, even to the number of eight, ten, or twelve. The smaller the number of colors, the fewer in general are the processes.

One of the most common colors on cotton prints is a kind of nankeen yellow, of various shades, down to a deep yellowish brown, or drab. It is usually in stripes or spots. To produce it, the printers slightly coat a block, cut out into the figure of the print, with acetate of iron, thickened with gum or flour; and apply it to the cotton, which, after being dried and cleansed in the usual manner, is plunged into a potash ley. The quantity of acetate of iron is always proportioned to the depth of the shade. For yellow the block is coated in a similar way with acetate of alumina. The cloth, after receiving this mordant, is dyed with quercitron bark, and then bleached. Red is communicated by the same process; only madder is substituted for the bark. The fine light blues which appear so often on printed cottons are produced by applying to the cloth a block covered with a composition, consisting partly of wax, which covers all those parts of the cloth which are to remain white. The cloth is then dyed in a cold indigo vat; and after it is dry the wax composition is removed by hot water. Lilac, flea brown, and blackish brown, are given by means of acetate of iron; the quantity of which is always proportioned to the depth of the shade. For very deep colors, a little sumach is added. The cotton is afterwards dyed in the usual manner with madder, and then bleached. Dove-color and drab, by acetate of iron and quercitron bark. When different colors are to appear in the same print, a greater number of operations are necessary. Two or more blocks are employed, upon each of which that part of the print only is cut, which is to be of some particular color. These are coated with different mordants, and applied to the cloth, which is afterwards dyed as usual.

Dr. Ure furnishes the following important observations on calico printing, for which he states that he is indebted to a much esteemed friend, who unites scientific knowledge to practical skill. It occurs in the second volume of Berthollet's Art of Dyeing.

To bleach cloth for printing, it is first of all to be singed, and then steeped in warm water (sometimes with an addition of spent ley) for a day or two. It is then well washed and boiled in potash ley, five different times.

For 2000 lbs. (original weight) of cloth, 1000

gallons of water, and forty to forty-five lbs. of potash are employed each time. The boiling is continued eight or ten hours.

Between each operation the cloth must be well washed, and after the third and fourth boil it must be spread upon the grass, or steeped for a night in a weak solution of chloride of lime. After this it is winced a few minutes in a warm dilute sulphuric acid, well washed, and dried.

The principal processes, or rather styles of work, as they are called, are the following:—

1. Single colored plates.
2. Ditto ditto grounded.
3. Light or dark chintzes.
4. Dark grounds, with a white discharge.
5. Blue grounds with a white resist.
6. Blue grounds, with a red and white resist together.

7. Chemical or spirit colors.

1. *Single colors* are called plates from their being generally printed with the copper plate. This process consists generally in printing a mordant upon the cloth; which mordant attracts a coloring matter when the cloth is dyed. The mordant is different, according to the color that is wanted.

For *black*. An acetate of iron is used of the specific gravity 1.040.

For *purple*. An acetate of iron, specific gravity 1.12, with six, eight, or twelve times its volume of water, according to the shade of color required, and the mass to be printed.

For *red*. A solution of three pounds alum in a gallon of water, one half of which is decomposed by acetate of lime or lead.

For *chocolate*. Mixtures of acetate of iron, specific gravity 1.12, with red mordant, in the proportions of one to two, four, six, according to the shade.

Each of these mordants is thickened with flour, or in some cases with gum, and printed upon the bleached cloth. After being exposed to the air for a few days, in a warm room, the goods are taken down and passed through the dung copper at a heat of from 150° to that of boiling water. They are then washed, and winced in another clean dung copper, at a lower degree of heat than before, and then washed again. They are now ready to be dyed.

All the colors last mentioned, viz. black, purple, red, and chocolate, are dyed with madder and sumach, except purple, in which the sumach is omitted. Different quantities of madder are used, according to the quantity of color on the cloth, from one pound per piece of twenty-one square yards, to three and even three and a half pounds; the sumach about one-eighth of the madder. The goods are entered when the copper is cool, and the heat is brought up gradually during two or three hours, and sometimes the ebullition is kept up for a quarter of an hour; the pieces all the while being turned over a wince, from the one side of the copper vessel to the other. They are then washed, and boiled in bran and water ten or fifteen minutes. If they have much white, they must be branned a second and a third time, washing between each operation. To complete the whitening, they are spread upon the grass for a few days; or what is

more expeditious, and more generally practised now, they are winced a short time in a warm but weak solution of chloride of lime.

For *indigo blue*. A strong solution of caustic potash is made, in every gallon of which, by the aid of as much orpiment, twelve or sixteen ounces of good indigo is dissolved. This solution, when clear, is thickened with gum. This being printed upon the cloth, nothing more is necessary than to wash it when dry.

For *Prussian blue*. The same mordant is used as for black; but, after cleansing, the piece is winced in a solution of prussiate of potash, in which the prussic acid has been set free by means of sulphuric acid.

For *gold*. Five pounds sulphate of iron and one pound and a half acetate of lead are dissolved in a gallon of water: the solution, thickened with gum, is printed on the cloth; and, after eight or ten days' age, is winced in a solution of potash made thick with lime. As soon as the black oxide of iron, which is precipitated, commences to redden, the piece is removed to a vessel of water, and then washed.

2. A second, and sometimes third color, is grounded or printed in with a small block, generally after the first has been dyed.

Bark yellow. A mordant is used, the same as for red. The piece, when slightly dunged, is dyed about an hour with one pound of querciton bark, the infusion being gradually heated during that time to 130° or 160°.

Berry yellow. A decoction of French, or Turkey, or Persian berries, with half a pound of alum per gallon, is thickened with flour or gum; and the piece, when dry, is passed through a weak alkaline carbonate, or lime-water.

Verdigris green. A solution of sulphate and acetate of copper is put on cloth, which is then passed through a strong solution of potash, in which some protoxide of arsenic has been dissolved.

Drab. The same mordant as is used for purple. Bark, the dye stuff.

Olive. The chocolate mordant dyed in bark. Both these very much diluted, and thickened with gum.

Buff. A weak acetate of iron is applied, and washed in water.

3. *Chintzes*.—A number of different colors printed upon cloth together, viz. black, red, one or two pale reds, purple, blue, green, and yellow. The black, red, and blue, are the same as in No. 1; the purple as No. 1 thickened with gum; the two pale reds are weaker solutions of alum and acetate of alumina, thickened with gum; the yellow is berry yellow, applied after the other colors are finished; the green is formed by the yellow falling upon the blue; and all the varieties of orange, olive, &c., by its falling upon the pale reds and purple. The dyeing and subsequent bleaching are the same as has been described in No. 1, with madder only.

4. *A dark ground discharged*.—When the discharge is printed before the mordant, it consists of concentrated lime juice alone, thickened with gum. The mordant, which is also thickened, is blotched over the whole piece, and dried off it as quickly as possible. When the mordant is applied first it is not thickened,

and the acid has an addition of one pound bisulphate of potash in each gallon. They are dunged and dyed like other single colors. Blacks, instead of madder, are generally dyed with logwood and galls.

5. *Blue grounds*.—To make a blue paste for dark blues, three or four pounds sulphate of copper are dissolved in a gallon of water, with a pound or a pound and a half of acetate of lead. The clear solution is thickened with pipe-clay and gum. The pieces printed with this paste are hooked upon a frame, and dipped in a weak blue vat five or six times; then taken out and kept in the air till they become blue. Alternate immersions and airings are thus continued till the requisite shade has been obtained. The goods are then washed and dipped in a weak sulphuric acid, to dissolve the oxide of copper. The blue vat, as is well known, is made by one part of indigo, with two parts sulphate of iron, and about two and a half parts hydrate of lime.

6. A mordant for red, to resist the blue vat, is made by dissolving about four ounces acetate of copper in a red mordant, made from four pounds of alum, and two pounds and a half acetate of lead per gallon, and thickening the solution with pipe-clay and gum. When this is printed upon the cloth, and dipped in the blue vat, it resists the blue, and a white is left, which, when dunged and dyed in madder, becomes red.

A white called *neutral* is made by dissolving sulphate of copper in concentrated lime juice, and is used along with this red. It must possess the three following properties:—1. Resisting the blue; 2. Remaining white after dyeing, when the red happens to go over it; 3. To leave no oxide of copper upon the cloth.

A berry yellow is grounded in after the blue, white, and red, in this style, are finished.

7. *Chemical colors*.—This name has been given to those colors which are applied topically; most of them are fugitive.

Black. A decoction of logwood and galls, thickened with flour, and, when cold, nitrate of iron mixed with it.

Red. A decoction of Brasil or peach wood, with the protomuriate or permuriate of tin.

Purple. A decoction of logwood with muriate of tin.

Blue. Ground Prussian blue is soaked in muriatic acid for a day or two, and then as much of it mixed with gum tragacanth water as is sufficient to give it the desired shade.

Yellow. A decoction of fustic with muriate of tin.

Green. A mixture of the blue and yellow.

All these colors are simply washed off in water.

M. Vitalis gives the following prescriptions in calico-printing:—

Mordant for reds. 240 litres of boiling water; 150 pounds of pure alum; fifty pounds of acetate of lead; six pounds of commercial potash or soda; six pounds of chalk; three pounds of ground Brasil wood.

Into a vat capable of holding 400 litres, and partly filled with the 240 litres of boiling water, the alum in powder is put, and then the decoction of Brasil wood. After stirring till the alum is dissolved, the acetate of lead in powder is

added. The mixture is to be carefully stirred for some time, and, when the liquor begins to clarify, the potash is put in, then the chalk, in small portions at a time, to avoid too great an effervescence. The whole must now be stirred for an hour and left to settle. The clear liquor is used as occasion requires.

For strong reds (full reds) the above mordant is thickened with starch. This is called *first red*.

If reds of a weaker tone be wanted, the mordant is thickened with gum.

For the *second red*, three pints of the mordant are thickened with two pounds and a half of gum dissolved in a pint of cold water. The whole is well mixed by due agitation.

For the *third red*, two litres (a pot) of mordant are mixed with the solution of five pounds of gum, dissolved in three pots of cold water.

The above red mordant serves also for weld fustic and quercitron yellows, with all their shades.

Mordant for blacks. Twelve pints of iron liquor (pyrolignite of iron). Four ounces of copperas.

Dissolve the copperas in the liquor; and, after having decanted the clear, mix in gradually four pounds of starch. Heat in a boiler, stirring continually, and take it out when the starch is well boiled.

Another black mordant. For eight pounds of iron liquor, take about two pounds and a half of superfine wheat flour, which is to be gradually mixed up with a portion of the liquor; then add the remainder of this, and leave at rest for twelve or twenty-four hours, or even longer. Then boil for half an hour, or till the mixture has acquired the consistence of a paste. The boiler is then to be removed from the fire, and the mordant is to be stirred till it becomes cold. It is now to be passed through a sieve, and used in printing.

These mordants give a beautiful black with logwood, and especially madder.

Under the Chemical Black, in Rees's Cyclopædia (article COLOR), we have the following recipes:—

To a decoction of Aleppo galls, in five times their weight of water, made into a paste with flour, add a solution of iron in nitrous acid, of specific gravity 1.25, in the proportion of one measure of nitrate of iron to eighteen or twenty of the decoction, and a black will be formed fit for almost all the purposes of calico printing, and possessing the chief requisites of this color, namely, tolerable fixity, and a disposition to work well with the block.

When a nitric solution of iron is added to a decoction of the galls, the solution is decomposed, the oxide of iron unites with gallic acid and tanning principle, while the nitrous acid is disengaged. This appears from the blackness which the solutions assume immediately on being mixed. The disengaged acid, however, re-acts in a short time on the new compound, the blackness gradually disappears, and, if the nitrate of iron has been added in proper quantity, the paste in a few days becomes, from a black, of a dirty olive green. When the proportion of nitrate of iron is greater than one-eighteenth, this change takes place sooner; and, if it amounts to one-tenth, the paste, when applied to the cloth,

will be a bright orange, like the acetate of iron. By exposure to heat and air this color generally deepens, becoming gray, and at last a full black. In this state it is permanent, and adheres powerfully to the cloth.

These changes of color depend on the solution of the tannate and gallate of iron in the disengaged nitrous acid, and the dissipation of the acid from the cloth, when it is exposed to heat and air. This solution of the tannate and gallate of iron is indeed an essential requisite to the goodness of the chemical black. If the disengaged acid is not sufficient to effect this, or if it is in a state of too great dilution, the color has but a feeble adherence to the cloth. It is not presented in a state favorable to its union with it, since the combination into which the iron has entered is insoluble in water. It lies merely on the surface, but does not penetrate its fibres, and gives way readily in the various operations to which it is subjected. This chemical black, therefore, is a solution of the tannate and gallate of iron in nitric acid.

Mordants for violets (from Vitalis). *First violet*.—Sixteen pints of iron liquor; eight pints of water; four ounces of Roman vitriol (sulphate of copper). This mixture is to be thickened with powdered gum, in the proportion of a pound to the pint.

Second violet.—Mix three parts of the preceding with one of water, and thicken as above.

Third violet.—Dilute two parts of the first mordant with three of water.

Coffee color.—Ten pints of iron liquor; two pints of the mordant of the first red; four pints of water. Thicken with starch.

Puce, or carmelite color.—Three pints of mordant of the first red; half pint of iron liquor.

Deep brown.—Two pints of red mordant; half pint of iron liquor.

Maroon color (*chestnut-brown*).—Two pints of violet mordant; one pint of red mordant; eight ounces of green copperas, to be dissolved in the mixed mordants.

Mordoré.—Eight pints of violet mordant; twelve pints of red mordant.

Deep lilac.—One pint of violet mordant; one pint of mordant for the second red.

Light lilac.—One pint of violet mordant; three pints of mordant of the second red.

Musk color.—One pint of red mordant; three pints of black mordant.

Incarinate (*flesh*) *color*; *color between cherry and rose*.—Ten pints of red mordant; one pint of black mordant.

Olive color.—Welding on the mordant of the first, second, or third violet.

Réséda color.—Welding on puce mordant.

We may now select from Vitalis some examples of the mode of managing the different styles of calico printing. We shall place them in the order in which they occur under each head. We may commence with

Calicoes of one block.—First example. Violet on a white ground. 1. Impression of violet mordant; 2. Dunging and washing; 3. Madding; 4. Branning and exposure on the grass for a few days, to clear the grounds.

Second example. Black on a yellow ground.

1. Bath of yellow mordant; 2. Welding; 3. Topical black.

Calicoes of two blocks.—First example. First olive and second olive on a white ground. 1. Impression of the first olive mordant; 2. Impression of the second olive mordant; 3. Welding.

Second example. Red and blue on a white ground. 1. Impression of the red mordant; 2. Madding; 3. Impression by the block of topical blue. When the calico is to have several colors, says M. Vitalis, for example, black, several reds, several violets, &c., as many mordants must be given as there are different colors, which must be inserted (*rentrés*) into the first plate (*figure*), called the plate of impression (*printing block, planche d'impression*). The insertion (*rentrage*) of the mordants is executed by means of blocks (*planches*), which take the name of *renreures*. These blocks are engraved with the same patterns as the printing blocks, but so as that they apply the new mordants only to the places of the pattern reserved in the first blocks. It may be readily conceived how necessary it is for these blocks to have an exact correspondence with one another, otherwise the colors would not be comprised within the limits of their outlines. This fault is too often met with in common prints, on account of the rapidity with which they are worked off, and the little care taken in their fabrication. In order that every color may occupy the place assigned to it in the drawn pattern (*le dessein enluminé*), adjusting brass points (*picots de rapports*) are made use of, which guide the printing on of the successive mordants, at precisely that place of the figure where the color to be produced from each mordant ought to fall.

Third example. Yellow and black on a white ground. 1. Impression of the yellow mordant, welding; 2. Impression of topical black.

Calicoes of three blocks.—Example. First olive, second olive, and yellow on a white ground. 1. Impression of the first olive mordant; 2. Impression of the second olive mordant; 3. Impression of the yellow mordant; 4. Welding.

The third block (*main*) might also be performed by the impression of the topical yellow.

Calicoes of four blocks.—Example. Black, red, violet, and yellow on white. 1. Impression of the black mordant; 2. Impression of the red mordant; 3. Madding; 4. Impression of topical yellow, or of the yellow mordant, and welding.

Calicoes of five blocks.—Example. Black, red, violet, yellow, and blue. 1. Impression of the black mordant; 2. Impression of the red mordant; 3. Impression of the violet mordant; 4. Madding, insertion of the blue, and afterwards of the yellow.

Calicoes of six blocks.—Example. First olive, second olive, black, first red, second red, and yellow on white ground. 1. Impression of the black mordant; 2. Impression of the first red mordant; 3. Impression of the second red mordant; 4. Madding; 5. Impression of the second olive mordant; 6. Impression of the yellow mordant; 7. Welding.

It is now very seldom, however, that the num-

ber of three blocks (courses) is exceeded, on account of the high price to which the labor would necessarily raise the calico. The following is an example of printing in fugitive colors: violet, black, red, and yellow, on white ground. These four topical colors are successively applied, in the order above mentioned.

Calicoes with fast colors, after receiving the impressions, are dried, and washed from the mordants, when they are ready for the madding.

Goods printed by reserve are so called, because the color does not strike the whole surface, but only certain unprotected portions of it. The reserve is composed of the reserve bath, and the thickening.

A *reserve bath* is thus formed: dissolve in a pint of water six ounces of sulphate of copper, three ounces of verdigris, two ounces of alum, and four ounces of gum arabic.

Another *reserve bath* may be noticed: dissolve in two litres of water four ounces of Roman vitriol (sulphate of copper), and six ounces of verdigris, to which add one pound of gum arabic; and, when it is dissolved, pass through a fine sieve, or let it settle, and decant.

To thicken the bath, knead a pound of pipe-clay, well ground and sifted, with three or four ounces of water: with this thick dough carefully mix the reserve bath, and triturate well before making use of it. The reserve is printed on the goods like the mordants. Twenty-four hours after the impression the goods are to be passed through the dyeing vat. This style is much used in blue dipping.

The theory of the reserve is very simple. The oxide of copper, which forms the basis of the reserve, restores to the indigo the oxygen which it had been deprived of by the sulphate of iron. The reoxygenated indigo loses its solubility, and consequently cannot fix on the stuff. Since the reserve, intended to nullify the action of the indigo essentially, acts merely by the oxide of copper which it contains, it follows that the proportions of this oxide are not indifferent, and that the measure will not perfectly accomplish its end, unless the dose of oxide of copper, which the sulphate, &c., can furnish, be adequate to neutralize the action of the indigo. A similar result would ensue, if the reserve be not suitably thickened. Some object to the introduction of alum.

The proportions of the cupreous salts ought, however, to be as little as can effect the purpose; if their quantity be too great, their operation would be extended to the indigo diffused through the bath. Sometimes the sulphate of copper is made to predominate, and sometimes the acetate.

The following recipes for reserves are given by M. Vitalis:—

1. Sulphate of copper	20 pounds
Acetate of copper	12
Gum	16
Alum	5
Water	32 litres
2. Sulphate of copper	16 pounds
Acetate	24
Alum	4
Gum	15 lb. 8 oz.
Water	8 litres.

The thickening is always made with pipe clay.

To make a *sky-blue* on a *dark blue*.—1. Dye the cloth of a sky-blue; 2. Apply the usual reserve; 3. Pass the cloth through a strong blue vat. Brighten in a bath, feebly acidulated with oil of vitriol (or muriatic acid), to carry off the particles of lime suspended in the vat. Wash and dry.

Sky-blue, dark-blue, and white.—1. Apply the reserve; 2. Dye sky-blue; 3. Apply the reserve anew; 4. Pass through a blue vat of sufficient strength.

Deep blue, sky-blue, green, yellow, and white.—

1. Print on the reserve; 2. Pass through a weak vat, giving two or three dips; dry, brighten with very dilute sulphuric acid, wash, dry again; 3. Print on once more the common reserve paste; 4. Dye in a stronger vat than the above, till the blue be sufficiently deep; dry, brighten as before, wash and dry; 5. Print on the red mordant, and dry; 6. Give the weld or quercitron. The mordant applied to the white spots, and to the pale blue (petit blanc), affords yellow and green. The white portions that have not been touched with the mordant remain white, in like manner as the pale blue spaces, not covered by this mordant, furnish the pale blue. Reserves are also applied to silks. For example, on the handkerchiefs called foulards, the reserve is styled waxing. A mixture of tallow and resin is melted, and applied to the silk with the block; this reserve being given, the silk is dipped in the blue vat. The reserved portions, being defended from the action of the indigo, remain white, while the rest of the surface takes a fast blue.

Sky-blue, red, and white.—1. Apply the usual reserve; 2. Apply the red mordant, thickened with pipe-clay, and dry; pass through a weak blue vat, to obtain sky-blue; wash at the river, madder, wash, and spread out on the grass to clear the white.

Printing with discharges (par rongeant) on a mordant.—This process serves to form mourning garments, composed of a white figure on a black ground. The piece of goods is first passed through the black mordant by means of the padding or blotching machine. When this mordant is very dry (by passing, for example, over steam cylinders), the white discharge is applied, prepared with nitric, oxalic, tartaric, or citric acid, or bisulphate of potash, thickened with roasted starch (British gum). It is dried, washed, and madded. On quitting the madder bath, the goods must be well washed, and exposed on the grass till the whites be very clear.

The portions of the cloth where the mordant has not been acted on by the discharge will take a black of a greater or less depth from the madder, while, on those places where the discharge has been applied, the mordant will be removed, and the madder color will not combine with the stuff. Exposure on the grass will carry off the loose madder. In like manner, by this process, white figures may readily be obtained on a ground of red, carmelite, violet, puce, &c.; since it will be necessary merely to pass through the mordant of one of these colors, then to apply the white discharge, and finally to madder. To have white figures on an olive ground, weld or quercitron must be used instead of madder.

Printing with a discharge on color (dyed goods).—Suppose that the calico has been dyed in a logwood bath, mixed with iron liquor, the cloth will take a black color. If, after dyeing, it be impressed with a solution of tin, properly thickened, the ferruginous portions of the cloth touched with the discharge will be removed, and they will pass from a deep black to a very brilliant crimson.

By subjecting to the same treatment calicoes dyed of different colors and shades, determined by the different degrees of oxidization of the iron, a multitude of varieties will be produced, either in the colors or in their shades.

By a similar operation, we may make figures of a beautiful green on goods, by dyeing them first of a pale blue in the indigo vat, passing them then through a bath of sumach and sulphate of iron, and finishing in a bath of quercitron with alum.

Here the green color produced by the indigo and the quercitron remains masked, as well as the other colors, by the oxide of iron in the sulphate, till the solution of tin be applied, which causes the other colors to disappear, and gives to those that remain a lustre which they would not otherwise have had; because the solution of tin renders the quercitron yellow more vivid, and because from this vivid yellow, associated with the blue, results a more brilliant green.

A figure of aurora color on an olive ground may be made, by passing the cloth first through a bath of sumach and sulphate of iron, then washing in an alkaline decoction of fustet, and printing on at last the solution of tin.

Let us give for an example the mode of making yellow figures on olive. The problem is reduced to find a discharge, which, in destroying the color communicated by iron, can at the same time change the color to yellow. This discharge is the thickened solution of tin. To the solution of salt of tin (muriate) a little muriatic acid is added. This is thickened with starch previously boiled, in a very thick and cold state, observing to pour in the solution in small portions, in order to ensure the thorough union of the ingredients. As soon as the piece has been impressed with this discharge, it is carried to the river to be washed, and to prevent the discharge from acting too long on the color. If the pattern required black, it would be necessary to apply it before the yellow discharge.

Calico printing by the combined methods of discharges on the mordant and on the dye.—First example. Olive, yellow, and white. 1. Pass through the olive mordant. 2. Print on the white discharge; wash and dry. 3. Weld. 4. Print on the yellow discharge.

Second example.—Bright red, and dull red; white, yellow, and black, on an olive ground. 1. Print on the red mordant. 2. Madder. 3. Pass through the olive mordant. 4. Print on the white discharge. 5. Weld. 6. Print on the yellow discharge and the topical black, and wash.

The colors by discharges, though bright, are not so fast as those given by the dye-baths. If, instead of applying the yellow discharge, thickened as usual with starch, one-third more starch be employed, and a coloring of decoction

of Turkey berries, or Brasil wood, be added, we shall obtain, in the first case, a richer yellow, and, in the second, an orange yellow.

The name of *lapis lazuli* is given to calicoes, which, after having been printed with reserve discharges, and different mordants, are passed in succession, first through the blue vat, and then through a madder bath. If a yellow or a green be wanted, there is given, in the sequel of the madder washing, a yellow mordant, and the goods are turned through a bath of weld or quercitron.

Suppose that we are to print on cloth a pattern into which there enter white, red, black, blue, green, and yellow. The goods being previously thoroughly whitened, we proceed as follow:—

1. Apply the reserve discharge.
2. Print on the red mordant, thickened with pipe-clay.
3. Print on the black mordant, thickened in the same manner.
4. Pass the goods through a strong vat in forty-eight hours at farthest after the printing has been given. The dipping ought to be for six minutes at most at two times: between each dip, the goods must be aired for five minutes. They are then carried to the river, allowed to steep in it for an hour, and washed.
5. They are dunged.
6. Passed through bran.
7. Madder.
8. Beetled very carefully and dried.
9. The red mordant is applied, which serves also as a yellow mordant. The pieces are now to be well cleaned.
10. They are passed through the quercitron bath, after which they are washed and finally dried. It may be proper to add that the reserve discharge is prepared by melting together hog's-lard and resin (arcanson), and, when the mixture is cool, diluting it with oil of turpentine; adding afterwards binarseniate of potash, and a little corrosive sublimate in powder. The whole, being well blended or ground together, is to be then printed on.

The lapis pattern may be put on a blue ground, a red, green, puce, &c.; whence result a great many varieties. The pattern was originally called lapis, from its resemblance to lapis lazuli. A slight reflection on the above process will show us how the different colors are produced.

The blue is the immediate effect of the blue vat; the red and black are developed by the madding on the respective mordants of these colors. The combination of blue with yellow on the yellow mordant gives green. The yellow results from the coloring matter of the quercitron bark fixed by the red mordant, which is, at the same time, the mordant for yellow. Finally, the white is occasioned by the white discharge of the reserve discharge.

The calico printer should be well acquainted with the nature of topical colors, or 'colors of application,' as they are sometimes called. The following are from Vitalis:—

Topical or pencil blue.—Boil in sixty pints of water, for half an hour, fifteen pounds of potash, and six pounds of quicklime, in order to render the potash caustic. Then add six pounds of orpiment (sulphuret of arsenic) reduced to fine power, and continue the boiling for a quarter of an hour, taking care to stir continually with a rod. When the boiler is a little cooled, pour into

it from six to eight pounds of indigo well ground at the mill, and stir again till the indigo be well dissolved, which is discovered by a drop of the liquor, when placed on a bit of glass, appearing yellow. The bath, while still hot, is to be thickened with a pound of gum for every pot (two litres) of liquor, or with eight ounces of starch. This operation must be carefully preserved from contact of air, and only employed when its color is yellow, or at least yellowish-green. If it become blue, the liquor is to be treated anew with some pounds of caustic potash and orpiment.

This blue application, says M. Vitalis, much used formerly, is seldom employed at the present day. Another blue, of less permanence, but more brilliant, is now preferred. It is made with Prussian blue, in the following manner:—Into an earthen pot, four ounces of finely ground and sifted Prussian blue are to be put. Over this must be slowly poured, stirring all the while sufficient muriatic acid, to bring it to the consistence of syrup. The mixture is to be stirred every hour for a day, and afterwards thickened with from four to eight pots (of two litres each) of gum-water, according to the shade wanted.

Topical red.—A pound of Brasil wood is to be boiled in four litres of water for two hours; the decoction is then to be decanted and boiled down to two litres. As much red mordant must now be added as is necessary to form a fine red; and it is to be finally thickened with eight ounces of starch. The color will be more beautiful the older the decoction of Brasil wood is.

Instead of Brasil wood, wood of Japan, Saint Martha, or Nicaragua (peach wood), may be used, provided their color has been refined from the dun which they contain, by the usual process with milk.

Topical yellow.—This is prepared by boiling four pounds of Turkey or Avignon berries in twenty-four litres of water, which is boiled down to one-half. The clear liquor is drawn off, and a pound and a half of alum is dissolved in it. For the light yellows, it is thickened with gum; for the deep, with starch. This topical yellow does not resist soap. The following is equally fast and agreeable:—

In eight pints of water, boil four pounds of quercitron bark in powder, down to one-half of the bulk. Pass through the searce, thicken with three pounds of gum, and mix in gradually, sufficiency of solution of tin to render the color of a brilliant yellow. This yellow resists vegetable acids and soap very well. When placed on a blue ground, it forms a fine green; and it may be applied by the plate or the pencil.

The best solution of tin which can be employed for this topical yellow is that made with a mixture of three ounces of muriatic acid, four ounces of nitric, and four ounces of pure water. Two ounces of grain tin are to be dissolved bit by bit in this liquor. When the solution is completed, half an ounce of sugar of lead is to be added. The mixture must then be well stirred; left to settle, and decanted. Half an ounce of the clear solution is to be taken for every pint of the yellow bath. On mixing with the yellow bath a little of the annotto bath, we have orange yellows.

Rust yellow.—This is made with acetate of iron, or the black cask. It is thickened with gum for the light yellows, and with starch for the deeper shades. Rust yellow, when applied on blue, gives a deep green, which serves for the stems of certain flowers.

Topical green.—This preparation is formed by a mixture of topical blue and yellow, in which the yellow predominates considerably. The mixture must be made by little and little with the utmost care, so as to hit the wished-for shade.

Topical aurora.—A sufficient quantity of alum in solution must be added to the anotto bath; and the mixture is to be thickened with gum.

Topical black.—To twelve pints of the black cask, or of pyrolignite of iron, at 4° Baumé (for salts), add four ounces of Roman vitriol dissolved in water, and a sufficient quantity of decoction of galls to form a good black. Thicken with three pounds and a half of starch, which is to be gradually worked up with a portion of the liquor. Boil, withdraw from the fire, and keep stirring, till the liquor be cool; it must then be passed through a searce or a linen cloth.

Another topical black.—In twenty-four pints of water, boil two pounds of logwood, two pounds of sumach, and eight ounces of galls, till the liquor be reduced to half its volume. Add then a pint of the black cask (or pyrolignite of iron); boil away six pints; take off the clear bath, dissolve in it two ounces of Roman vitriol, and one ounce of sal-ammoniac; after which thicken with starch, and pass through a searce before making use of the composition.

Topical violet and lilac.—In thirty pints of water boil six pounds of logwood, ground or in chips, till ten pints be evaporated; decant the clear, and dissolve in it one ounce of alum for every pint of liquor. The deep violets are thickened with starch, and the light violets with gum, which is to be dissolved in the cold. This color changes readily, for which reason it should be prepared only as wanted; and be immediately put to use.

In the manufacture of printed calicoes, colors are obtained from madder, which result from the mixture of red and black. For mordants, mixtures in different proportions, of acetate of iron and acetate of alumina, are employed.

By printing on a mordant, composed of equal parts of oxidised acetate of iron (black bouillon) and acetate of alumina, both concentrated, a deep mordoré is obtained with madder. One part of acetate of iron, and two of acetate of alumina, afford a less sombre mordoré, inclining towards puce-colored. On augmenting the quantity of acetate of alumina, the shade approaches more and more to red; and, on introducing, at last, only one-twelfth of acetate of iron, an amaranth color is obtained. If, on the contrary, the proportion of acetate of iron be increased, browns are produced.

This color is that which requires most madder. It may be boiled longer than for the reds, but not so long as for the violets, because, as the portion of the coloring matter which is combined with the alumina does not stand a prolonged ebullition so well as that which has the oxide of iron for a mordant, the shade is degraded, and

Fig. 7.

Fig. 9.

Fig. 5.

Fig. 4.

Fig. 1.

Fig. 2.

Fig. 6.

there is obtained only a poor and unequal color, instead of a substantial and well raised one. Great care should also be taken to put into the bath a sufficient quantity of madder, so as to saturate all the mordant; otherwise a uniform color can never be obtained, for the bath becomes exhausted, and some parts of the cloth would be saturated before other parts had been able to assume the proper shade. For conducting the operation properly, and for completely saturating the mordant, the madding should be given at two times. The bath is scarcely suffered to boil the first time, and, from the hue that the cloth has taken, the quantity of madder to be employed at the second madding may be determined. When the cloth is to have, besides the mordoré, fainter colors, they should not be printed on till after the first madding, because the heat of the bath in the double madding would degrade them. The mordorés have a more agreeable hue, when, previous to madding, they have been dyed with nearly half the quantity of weld or quercitron which would have been used had they been dyed with these substances alone. The mordants for mordoré and puce afford, with both these substances, the shades of olive, bronze, terre d'Egypte, &c. In this case, it is sufficient for restoring the white, to pass through bran on their quitting the boiler, and to expose them for about eight days on the grass, lifting them once in this interval in order to wash and beetle them. The color has more lustre when, before drying the cloth, we pass it through water acidulated so slightly with sulphuric acid as to be hardly perceptible to the taste.

The following example of a spirit red directly applied in calico printing is valuable:—Prepare an aqua regia, by dissolving two ounces of sal ammoniac in one pound of nitrous acid, specific gravity 1.25. To this add two ounces of fine grain tin; decant it carefully off the sediment, and dilute it with one-fourth its weight of pure or distilled water.

To one gallon of water add one pound of cochineal, ground as fine as flour; boil half an hour; then add two ounces of finely pulverised gum dragon (tragacanth), and two ounces of cream of tartar; and stir the whole till it is dissolved. When the liquor is cool, add one measure of the preceding solution of tin to two of the cochineal liquor, and incorporate well by stirring. Apply this with the pencil or block; suffer it to remain on the cloth six or eight hours; then rinse off in spring water. This color will be a bright and beautiful scarlet.

Boil twelve pounds of Brasil chips during an hour, in as much water as will cover them. Draw off the decoction, pour on fresh water, and boil as before. Add the two liquors together, and evaporate slowly down to one gallon. To the decoction, while warm, add four ounces of sal ammoniac, and as much gum dragon or senegal as will thicken it for the work required. When cool, add one of the solutions of tin above described to four, six, or eight, of the Brasil liquor, according to the color wanted. Suffer it to remain for eighteen or twenty hours on the cloth; then rinse off in spring water as before. The color will be a pale and delicate pink. If

it be required deeper, the decoction must be made stronger, and used in the proportion of three or four to one of the solution of tin. Nicaragua or peach wood, though not so rich in coloring matter as Brasil, yields a color, however, which is, if possible, more delicate and beautiful.

A process in calico printing, of peculiar elegance, with an alkaline solution of alumina, was invented by James Thomson, esq., of Primrose Hill, near Clithero. Its effect was to produce a fast green, by the mixture of a yellow mordant with the common solution of indigo in caustic potash, through the intervention of orpiment. This, as is obvious, could not be done with any acid solution of alumina. Mr. Thomson first formed a solution of that earth in potash, mixed this with the solution of indigo, and applied the mixture, properly thickened, to the cloth. But as, in the ordinary dunging operation, the alkali would naturally wash away with it the greater part of the alumina, the goods before being dunged were passed through a solution of sal ammoniac. It is easy to perceive the rationale of what takes place. The potash on the cloth combines with the muriatic acid of the sal ammoniac, and, as the two substances set free (the alumina and ammonia) have no tendency to combine, the former remains precipitated on the cloth at its points of application. It obtained currently, but very improperly, the name of Warwick's green, because Dr. Warwick made and sold the solution of aluminated potash to the printers.

Acetate of alumina is now most frequently made for the calico printers, by dissolving alum in a solution of crude acetate of lime (pyrolignite); a gallon of the acetate, of specific gravity 1.050, or 1.060, being used with two pounds and three quarters of alum. A sulphate of lime is formed, which precipitates, while an acetate of alumina mixed with some alum floats above. The specific gravity of this liquid is usually about 1.080. The acetate of alumina employed as a mordant for chintzes is still commonly made by the mutual decomposition of alum and acetate of lead. Fifteen parts of alum are equivalent to about twenty-four of acetate.

The madding of printed goods requires pains and precautions, which long practice alone can teach. The causes which make their effects to vary are too numerous for us to point them all out here. The quantity of madder employed, the duration of the madding, the manner of managing the fire, are, along with the dunging, the circumstances which have most influence; and they cannot be subjected to any rule, because they must differ more or less in almost every process.

It is plain that all these operations have for their objects, 1st, to remove the mordant uncombined with the cloth; 2dly, to fix the coloring matter; 3dly, to carry off, by the action of the air and bran, the dun coloring matter which is mixed with the madder, as well as the color which covers the parts of the cloth not impregnated with mordant.

The cloths intended for printing ought to be very carefully bleached. The more perfect the

white is, the more lustre do the colors take, and the more easy is the unredding. The fine whites on sale are not even sufficient; and it is right to give them at least one ley, one exposure on the grass, or one immersion in oxygenated muriatic acid, and to let them also soak some hours in water acidulated with sulphuric acid. Very frequently, several leys and several immersions must be given. Thus the dressing (paste) is completely removed, the remaining coloring matter of the cloth is destroyed, which, by fixing in a very durable manner, that of the madder, might render the unredding a difficult operation; and thus also the greater number of the stains formed during the madding, to which the name of madder spots are given, are prevented.

These stains, almost indelible, very common on certain kinds of cotton cloth, and of a color perfectly similar to what madder gives to those parts of the cloth impregnated with oil, seem to arise from a combination with grease or oil, analogous to what takes place in the preparations of Turkey red. It is very probable that they are produced by the grease employed in the parou, or by the soap which must be employed in bleaching. The combination which in that case may be formed on the stuff, resists the subsequent operations well; and it will be seen, in the process for the Adrianople red, that the action of alkaline solutions, even pretty concentrated, is insufficient to destroy the combination of the oil with the cotton. A strong ley, run off very hot, does not afford a complete guarantee against these spots, although it may be the surest means of avoiding them. It would be of great consequence for calico printers to be able to exclude from weaving and bleaching both grease and soap.

The Adrianople red has a lustre, which it is difficult to imitate by all the processes hitherto described. It has, besides, the property of resisting more completely the action of the different re-agents, as alkalies, soap, alum, acids. Vogler acknowledges that by his numerous processes he has not been able to obtain a red possessing a durability equal to that of Adrianople, although he formed one much more permanent than the false Adrianople reds, which are often used for the siamoises and other red goods.

Aquafortis (dilute nitric acid) is, according to the same author, the surest and most expeditious means for distinguishing the true red of Adrianople from the spurious. It is sufficient to plunge a thread of the latter into it. It is soon seen to grow pale, and in less than a quarter of an hour it becomes white, whilst the true Adrianople red remains an hour without being affected, and it never loses the color entirely, which only turns orange.

The Adrianople red, which for a long time came to us through our Levant trade only, stimulated the industry of our artisans; but the attempts were for a long time fruitless, or success was confined to a small number of dyehouses. Abbé Mazeas published experiments which threw much light on this dye; and the government promulgated in 1765, from information that it had procured, an instruction under the title of Memoir,

containing the process for the incarnate cotton red dye of Adrianople on cotton yarn. The same description is found in the treatise of Le Pileur d'Apligny; but this process has not completely succeeded.

Three processes are employed for giving blue in the art of calico-printing. The first of these processes is used for dyeing cloth whose ground is to be blue or green; and, whenever they bear colors which are to be kept from varying in the vat, these are covered with the white reserve.

If the cloth is to retain a white ground, and bear blue figures, of one shade, or of several, the second of these processes is had recourse to. Sometimes one or two colors are joined to the blue thus made; but, in this case, they must be applied after the blue dyeing, because there is not a color which may not be either destroyed, or powerfully altered, in the operations which it requires.

Lastly, in other circumstances, a blue is to be put on cloth covered with a pattern, all of whose parts are already colored, and which leaves merely small spaces to color blue. For this purpose, the blue is used which is applied with the pencil (small brush). This blue of application is thickened with gum, and put upon the pencil. It may be printed on, by covering with canvas the frame which contains the thickened color, and removing the regenerated indigo with a scraper before applying the plate; but only small objects of a slightly intense blue, which rarely succeeds, can be thus applied.

Bancroft says, that he has substituted sugar for the sulphuret of arsenic with success; which would be advantageous, on account of the price and poisonous qualities of this substance. The experiment did not succeed with us. The blue of application has been attempted to be prepared by means of the oxide of tin; but the degree of concentration of the alkaline solution adequate to the solution of the oxide and the indigo has not been hitherto ascertained, so as to be susceptible of thickening with the gums. This point once determined, a pencil blue will be had, which will possess the very great advantage of not occasioning a bulky deposit, which always embarrasses the vessels where this blue is made in the ordinary processes, and which, however well washed, causes a considerable waste of the indigo.

In printing on cloth, ground indigo with oxide of tin, and passing the cloth through a solution of oxide of tin in potash, delft-ware blues may be made in a single vat. We have been able to make in this way only light blues. Were this process brought to the point of producing more substantial blues, it would afford great advantages.

The application of the chromate of lead or Turkey red cloth, forms a brilliant style of calico printing, now carried to high perfection at the establishment of Messrs. Monteith at Glasgow. Nitrate of lead is dissolved in liquid tartaric acid, of a specific gravity about 1.250: this solution is thickened with gum, and applied with the block to cloth previously dyed Turkey red. Whenever the paste is dried, the cloth is slowly passed through an aqueous solution, nearly sa-

turated, of chloride of lime, kept at the temperature of about 100° in a stone trough. The tartaric acid, disengaging the chlorine, discharges the color of the Turkey red at the points of application; while the nitrate of lead, or rather perhaps the oxide of lead, remains attached to the cloth. This is immediately washed, and then passed through a solution of bichromate of potash, by means of the padding machine.

An orange color was a few years ago given to goods in calico printing, by means of the crystals of hydrosulphuret of soda and antimony, which are hence called orange crystals. But the use of the alkaline solution of sulphuret of antimony had been long known and practised by the Lancashire printers.

To produce violets on printed calicoes, the acetate of iron diluted with water is impressed, and they are maddered. This color is less easily degraded in the dyeing bath than the reds. It may also be kept boiling for a longer time, so as to raise the deep shades. The bath becomes very foul; the color comes out of it very dull, and assumes lustre only by exposure on the grass, and ebullition with bran water; it is even rare for the white to become beautiful again. But these inconveniences are obviated by dunging with a strong heat, which acts less upon this mordant than upon that employed for the reds.

For lilac, a mordant is printed on, composed of very dilute acetate of iron, mixed with a small quantity of acetate of alumina.

Few of the yellows produced from vegetable substances can acquire upon cotton permanence comparable to that of the colors producible from madder; and they never acquire this quality without losing their lustre. When a color rather fast than brilliant is wanted the cotton is colored with oxide of iron, by impregnating it with any of the various solutions of this metal. The processes employed for this dye are very numerous, and their shades may obviously be greatly multiplied, by varying the state of oxidation of the metal, or the nature of the acid which holds it in solution; as also by slight changes in the proportions of the materials, and in the manipulations.

In order to obtain a deep color, Chaptal treads the cotton in a solution of sulphate of iron, marking from 12° to 15° Baumé. He squeezes it very slightly but evenly. As soon as the whole portion (lot) is dipped, it is repressed, hank by hank, through the same solution, and immediately afterwards through a solution of potash, marking the same number of degrees. The color of the cotton becomes of a dirty blue-green, which changes in a few minutes to an agreeable golden yellow. At each dipping the vessel into which the cottons are plunged must be emptied, in order that the color may be equal and uniform.

For a pale and very soft yellow, he treads the cotton in a solution of sulphate of iron, marking three degrees, and represses it as in the preceding process. On the other hand, he prepares a liquor with solution of potash, marking from two to three degrees, to which he adds solution of alum till he observes that the floccs are no longer dissolved. He impregnates the cotton

with this liquid, and renews it for each dip. The cotton is dyed of a very agreeable yellow. When the colors are not sufficiently deep, the cotton may be repressed through stronger solutions.

Chaptal recommends, for making the colors evenly, to pass at once no more than one-fourth kilogramme of cotton, to employ weak solutions of sulphate of iron, to dip the cotton first in a solution of potash, then in one of sulphate of iron, repeating these alternate dips as often as shall be requisite to arrive at the desired shade, and to use the greatest care in impregnating and squeezing the cotton evenly.

A fresh-butter yellow is produced, by passing the cotton through slightly oxidised acetate of iron, mixed with nitrate of iron, which may be made to incline more to red, the greater the proportion of the latter salt.

With nitrate of iron alone, diluted with water, a pretty clear yellow may be had, which rises quickly. If the cotton be impregnated with nitrate of iron little diluted, allowed to dry, and then washed, it retains a very deep tint, similar to that of rust.

The rust-yellow, which is printed on cloth, is made with two parts of sulphate of iron, and one part of acetate of lead. By mixing with this, different proportions of highly oxidised oxide of iron, shades bordering on red may be procured.

Cotton dyed by these processes takes very different colors in the dye-baths. That which received a faint yellow color by the process of Chaptal, becomes of a walnut hue in the decoction of galls. When the color is deeper it becomes mouse-gray; with tan, or quercitron, it affords a yellow. When passed through a decoction of equal parts of nut-galls, sumach, logwood, and weld, the cotton becomes of a dirty gray-white. When dried, and passed through a strong solution of sulphate of iron, it assumes the bluish-gray color, which is called *ceil de roi*.

Bancroft describes a topical color (*couleur d'application*), which is obtained from quercitron. A strong decoction of quercitron is made, filtered, and evaporated at a gentle heat, and, when it is reduced to less than one-half, it is allowed to cool to the temperature of the living body. After this, one-fourth of acetate of alumina is mixed with this liquid. The mixture is thickened with as much gum as is necessary to prevent its running during the impression, but not so much as to obstruct its penetrating the stuff. The color obtained by this application has neither as much intensity, nor as much permanence, as that procured by previously impregnating the stuff with the mordant. Both qualities may, however, be increased by a mixture of nitrate of copper and nitrate of lime.

Quercitron ought undoubtedly to be considered as a very useful substance in dyeing; yet the attempts which we know to have been made, with the precautions prescribed by Bancroft, especially in reference to the temperature of the bath, seem to us to prove that the color derived from it is inferior in permanence to that producible from weld. A purer and more lively color may be obtained from quercitron, by adopting

the process which Chaptal has given for fustic (yellow wood).

For dyeing cotton yellow, preparatory to printing, the first thing is to scour it in a bath prepared with a lixivium of the ashes of green wood, then to wash and dry it. It is alumed with the fourth of its weight of alum. After twenty-four hours it is taken out of the aluming and dried, without washing. A weld bath is thereafter prepared, at the rate of one part and a quarter of weld for one of cotton. In this the cotton is dyed, by turning it round the sticks, and working it with the hands, till it has acquired the wished-for shade. It is taken out of this bath to be macerated for an hour and a half in a solution of sulphate of copper or blue vitriol, in the proportion of one-fourth of this salt to one part of cotton. It is next thrown, without washing it, into a boiling solution of white soap, made in the same proportions. After being well stirred, it is to be boiled for nearly an hour, after which it must be well washed and dried.

If a deeper yellow, bordering on jonquille, be wanted, the cotton is not passed through the aluming, but two parts and a half of weld are employed to one of cotton, with the addition of a little verdigris dissolved in a portion of the bath. The cotton is plunged into it, and worked, till it has taken a uniform color. It is lifted out of the bath that a little soda ley may be poured in, when it is again immersed and turned through the bath for a full quarter of an hour. It is then withdrawn, wrung, and dried.

Lemon yellow is made by the same process, except that only one part of weld is used (for one of cotton), while the quantity of verdigris can be diminished in proportion, or even entirely omitted, and aluming put in its place. Thus the shades of yellow may be varied in many ways. The operations on linen yarn are the same.

For the yellow colors, on printed cotton goods, these are impregnated, by means of engraved plates, with the mordant described in treating of madder, formed by the mixture of acetate of lead and alum: the yellow color induced on the parts not impregnated with the acetate of alumina is to be afterwards destroyed by the action of bran, and exposure on the grass. The same mordant may be successfully employed for cotton and linen which is to be dyed yellow.

In order to obtain from weld the whole color that it can yield, it must be boiled for three-quarters of an hour; the bundles of weld are now taken out of the bath, after which the cloths are passed through it, at a temperature a little below ebullition. They should not remain in it more than twenty minutes.

When the same piece of cloth is to exhibit the colors produced by both madder and weld, it is necessary to begin with the madding, and not to print on the mordant intended for the weld till the operations of the madder are finished. This rule is founded on the property which madder possesses of fixing itself in the room of the yellow of weld; so that if the madding be long continued, after dyeing with weld, the color of the latter entirely disappears. Weld, on the contrary, does not affect the color produced by

madder, provided the mordant has been saturated with the latter, for otherwise a mixed color would be produced.

The operations required for restoring the white are much longer, and demand much nicer management, after welding than after madding. See DYEING, par. 203.

By the following method we procure red colors, beautiful and permanent, without employing ley, oils, or galls:—Lime slaked in the air is to be dissolved in cold acetic acid. The solution marks from 5° to 6°; and it is reduced to 2° by the addition of water. Equal parts of this solution and acetate of alumina are mixed. The latter is prepared by pouring five kilogrammes of acetate of lead into a solution of twenty kilogrammes of alum for 175 kilogrammes of water. The above mixture is made tepid, and the cottons, merely scoured with care, are passed through it. They are dried, thoroughly washed, dried and madded with three-fourths of a kilogramme of madder for one kilogramme of cotton. They are brightened with ley and soap, then passed through a solution of tin, and revived with soap alone, in the proportion of twelve kilogrammes of soap for 100 kilogrammes of cotton.

Very durable reds may be had by passing the cotton through this mordant, after having submitted it to oiling without galling. They are even very deep. But on passing the cotton which has received a single oil and four leys through a mixture of acetate of alumina, with one-fourth, one-twelfth, or one-eighteenth of lime, various very lively shades are obtained.

For making a dead red without lustre, termed in some places burned red, or Indian red, on account of its resemblance to that of Indian handkerchiefs, the cotton is scoured, boiled for half an hour in lime water, passed through an oil mixed with some intestinal liquor, and through three leys. It is washed well and turned through a mordant composed of a tepid solution of twelve kilogrammes and a half of alum, to which four kilogrammes of acetate of lead have been added; and a moment afterwards, half a kilogramme of soda in powder, and 0.244 kilogrammes of sal-ammoniac. It is washed with care, and madded with its own weight of madder. If the color be poor, it is passed once more through an oil, two leys, the same mordant, and a madding. It may be brightened with soda and soap. The lime alone produces the difference between this color and the preceding. It renders the colors more permanent, but duller.

The durable rose (color) is produced by taking cotton passed through the oils, and which has received more numerous but weaker leys. It is galled with a ley of sumach (lessive de sumac?) in which two kilogrammes and a half of gall-nuts have been boiled; and alumed with seventeen kilogrammes and a half of alum. It is now washed, dyed with madder of the best quality, the madder bath being whitened (blanchi) with two kilogrammes of the oxide of tin, that precipitates from the solution of this metal in nitric acid. It is brightened with weak ley and soap, dried, and passed through a liquor formed of a solution of tin (in nitric acid at 32°, diluted with

an equal volume of water), reduced to 4°. It is now washed and brightened in a solution of fifteen kilogrammes of soap, till the color be rosed in perfection.

On passing the cotton through soap of wool made with soda, taking the same pains as with the soapy liquor prepared for the red, and using very weak leys in the interval, then washing the cotton, and treating it by the same process as for dyeing wool scarlet, it assumes a scarlet tint, paler than that of wool, but pretty brilliant.

Cotton dyed red may, moreover, be made to pass through all the shades, down to the palest orange. For this purpose, pure nitric acid is diluted with two-fifths (three-fifths?) of water; chips of tin are oxidised in it till the liquor grows opal, and the solution is employed at different strengths, from 2° to 20°.

Poerner made a great many researches on the methods which may be employed to dye cotton by means of brasil, employing different mordants, as alum, solution of tin, sal ammoniac, potash, &c., in the bath, or in the preparation of the stuff; but he did not obtain colors which could resist the action of soap, although some of them stood pretty well the action of the air and washing with water. He recommends us to dry in the shade the cottons which have received these colors.

To Brown, who is engaged with much zeal in the arts, we are indebted for a process which is used for a crimson on cotton in some manufactories.

A solution of tin is prepared in the following proportions:—Nitric acid four parts; muriatic acid two parts; tin one part; water two parts. The liquids are to be mixed, and the tin dissolved in them, by adding it in small bits at a time.

As the best colors that can be given to linen and cotton are derived from madder, attention must be paid to the methods described, in treating of madder, for rendering this dye more durable, and its color may be deepened by different black baths. For some hazels and snuff colors, a browning is given, after the welding and the madder bath, with soot, to which gall nuts and fustic are joined. Soot is sometimes mixed with this bath, and a browning is moreover given with solution of sulphate of iron.

Walnut peels are occasionally substituted for solutions of iron in browning colors. They have a great advantage for the wools intended for (tapisseries) tapestry. The color does not become yellow by long exposure to the air, as happens to the brownings from iron; but it keeps long without alteration. It has indeed a dull tone, suitable for shadows, and for representing the flesh in old figures, which would produce merely gloomy colors, without lustre, on cloths. The goodness of this color, however, and its cheapness, ought to extend its use for the sombre colors which are sometimes in fashion, at least on common stuffs.

A great number of shades are made at the Gobelins by means of this browning. To procure an assortment of them, a bouillon is first given to the woollen yarns with tartar and alum of different degrees of strength, according to the

shades required; they are then successively dyed red, yellow, or some other color, recurring to the bath from which most effect is wished to be obtained. When the color is found to be of the desired shade, it is passed, for a shorter or longer time, through the bath of walnut peels, of a strength adjusted to its purpose. This browning is likewise had recourse to for silk; but the bath must be hardly tepid, in order to avoid the inequalities to which it is so liable.

For the different shades of marrone the cotton is galled, passed with the ordinary manipulation through water, into which a greater or less quantity of the black cask (tonne au noir) has been poured. It is next worked in a bath in which verdigris has been dissolved; and a welding is given it. It is dyed in a bath of fustic, to which a solution of soda and alum is sometimes added. When the cotton which has received these preparations has been well washed, a good madding is given it. It is then passed through a weak solution of sulphate of copper, and lastly through soap water.

The cinnamon and mordoré colors are given to linen and cotton by commencing the dyeing with verdigris and weld; they are next passed through a solution of sulphate of iron, which is called the security bath (bain d'assurance), and they are wrung out and dried. When dry they are galled in the proportion of 122 grammes of gall-nuts per kilogramme; they are once more dried, alumed as for red, and maddered. When they are dyed and washed, they are passed through very hot soap water, in which they are turned round the sticks till they are sufficiently brightened. Decoction of fustic is sometimes added to the aluming.

By taking cotton which had received the requisite preparations for the Adrianople red, and had been galled, then passing it through nitrate of iron, galling it anew, and aluming, Chaptal obtained a pretty naaret. He prepares the nitrate of iron with the aquafortis of commerce, diluted with half its weight of water, into which he plunges fragments of iron, which he removes whenever he perceives the solution slackening. The liquor is now of a yellowish red, strongly acid, and marks from 40° to 50° on the aërometer of Baumé. See DYEING, 180.

If after galling the cotton that has passed through the oils it is alumed in a bath, to which one-eighth of this solution of iron, for one of cotton, is added, the cotton comes out black, and takes a violet sloe color by the madding and brightening.

James Thomson, esq., of Primrose Hill, F.R.S. obtained, in the years 1813 and 1815, two patents for certain improvements in calico printing. His processes, which are very elegant, have since been extensively and advantageously employed. The following is an outline of his specifications. That for 1813 is thus stated:—

First, Mix or combine with the acid called oxymuriatic acid (or dephlogisticated acid of sea salt) and water, some of the alkaline salts or earths hereinafter-named, which shall weaken or suspend the power of the said acid in such proportion that it shall not, in such mixed or combined state, of itself, and without any farther operation, be able

to remove the Turkey red color from the cloth, or materially to impair it, within the moderate space of time taken up in the performance of the process hereinafter described.

Secondly, Print, stamp, pencil, or otherwise apply to those parts of the said cloth, which are intended to be either wholly, or in a greater or less degree, deprived of their red color, some other acid, or metallic oxide, or calx, which has a greater affinity or attraction for the alkaline salt or earth with which the oxymuriatic acid is mixed or combined, than that acid itself possesses: and if any one of the stronger or more powerful acids be employed, which is either of a corrosive nature and cannot be safely used, or of a volatile nature and cannot be used conveniently, such acid must be combined with alkalies, earths, metals, or metallic oxides or calces, so as to form neutral salts, acid salts, or metallic salts, which shall not be too corrosive or too volatile; and such alkalies, earths, metals, or metallic oxides, or calces only, must be employed, as have a weaker affinity or attraction for the same acid than that acid has for the alkaline salt or earth with which the oxymuriatic acid has been mixed or combined.

Thirdly, After the said acid, oxides, neutral salts, acid salts, or metallic salts, so directed to be printed, stamped, pencilled, or otherwise applied to the cloth as aforesaid, are sufficiently dry, immerse the cloth in the solution of the said oxymuriatic acid, so mixed or combined with some of the alkaline salts or earths hereinafter named as aforesaid. When the acid or oxide, either in its simple or combined state, has been applied to parts of the cloth, it immediately seizes upon and combines with the alkaline salt or earth with which the oxymuriatic acid has been mixed or combined, and disengages that acid, which almost instantaneously deprives of their color those parts of the cloth to which the said acids or oxides, in their simple or combined state, have been so printed, stamped, pencilled, or otherwise applied as aforesaid.

Lastly, Wash or otherwise remove all the said acids, oxides, or salts, by the usual processes. For the more fully explaining and illustrating the invention herein before described, I add the following remarks:—The alkaline salts or earths which I mix or combine with the oxymuriatic acid, in order to suspend or prevent its action on those parts of the red cloth which are intended to retain their color, are the alkaline salts of potassa and soda, or the calcareous, magnesian, barytic, or strontic earths, of which I prefer the calcareous earth.

The acids which I apply to the parts intended to be made white, or to those places on the cloth intended to be deprived of their red color, in a greater or less degree, are any of the vegetable, mineral, or animal acids, which have a stronger attraction for the alkaline salt or earth with which the oxymuriatic acid has been mixed or combined, than that acid itself has; such, for instance, are the citric, oxalic, tartaric, malic, benzoic, sulphuric, sulphurous, phosphoric, fluoric, boracic, nitric, muriatic, arsenic, tungstic, succinic, and carbonic acids.

The stronger acids, or such as might corrode

the cloth, I saturate more or less with some alkaline salt, earth, or metallic oxide or calx, for which they have a weaker affinity or attraction than they have for the alkali or earth with which I have combined the oxymuriatic acid: for instance, I unite the sulphuric acid with potassa, so as to form the acid sulphate of potassa (or acid vitriolated tartar), or with aluminous earth, to form alum. The muriatic acid I combine with tin, or copper, or zinc, forming muriate of tin, muriate of copper, or muriate of zinc. In like manner, the nitric acid may be combined with the aluminous earth, or with the volatile alkali, or with the metals, or oxides of copper, or zinc, or iron, or mercury; and I take care, when I use acidulous compounds of such corrosive acids, not to suffer the acid so far to predominate as to render the compound injurious. In like manner I combine the volatile acids, or such as might evaporate too speedily, with some alkaline salt or earth, or metallic oxide or calx, for which they have a weaker affinity or attraction than they have for the alkali or earth with which I have combined the oxymuriatic acid: for instance, I combine the acetic acid with the earth of alum, so as to form acetate of alumina,—or with copper, forming acetate of copper,—or with zinc, forming acetate of zinc. The carbonic acid may also be fixed and combined with an alkali, as with soda, for example, forming carbonate of soda, which may be used, though with less advantage than the preceding combinations. Those acids which are not corrosive nor volatile, and which consequently are used with most advantage in their simple or combined state, may, however, be united like the preceding to the alkalies, earths, metals, or metallic oxides or calces, for which they have a weaker affinity or attraction than they have for the alkali or earth with which the oxymuriatic acid has been united. Thus the tartaric acid may be combined with potassa, to form cream of tartar,—and the oxalic acid with potassa, to form salt of sorrel,—and these two salts may be employed in the process, though it is not necessary so to combine the two acids; but, on the contrary, the acids may be used alone.

The combinations which I prefer, as uniting the greatest number of advantages upon the whole, are, the supersulphate of potassa (or acid vitriolated tartar), the sulphate of copper or blue vitriol, the muriate of tin or sal jovi, the nitrate of copper, and the muriate of copper. But I prefer to any single combination a mixture of the supersulphate of potassa, with the tartaric or citric acids.

Lastly, I employ, uncombined, such metallic oxides or calces as approach in their properties to the nature of acids, and are capable of combining either with the alkaline salts of potassa or soda, or with the calcareous, magnesian, or strontic earths, or of disengaging them, or any of them, from their combination with oxymuriatic acid: such, for instance, is the oxide of arsenic, or common white arsenic, and the oxides of tin and tungsten.

It is evident, from what I have set forth in the preceding part of this specification, that this process admits of great variety in its application, according to the combinations I make use of;

since not only the various acids, oxides, and salts I have enumerated, may be employed, but also various mixtures of them, and in various proportions; but I prefer and generally use the following process:—

First, I take one gallon of good vinegar, or rectified pyrolignous acid, which I thicken with starch or flour in the way practised by calico printers, in preparing the mordants or colors for printing. Whilst boiling hot I add to it five pounds of crystallised tartaric acid, and incorporate the whole very well by stirring.

Or, I take one gallon of strong concentrated lime juice or lemon juice, or one gallon of water, in which I have dissolved two pounds and a half of crystallised citric acid, which I thicken with starch or flour in the manner directed above, and to which, whilst hot, I add two pounds of supersulphate of potassa, and incorporate the whole very well by stirring. I prefer starch to any other thickening, though others may be used with more or less advantage.

Secondly, the paste so prepared I print, stamp, pencil, or otherwise apply to the cloth previously dyed turkey red, in the mode and with the precautions generally used in the printing or stamping of liens or cottons.

Thirdly, I prepare a solution of oxymuriate of lime, either by dissolving the dry oxymuriate of lime (commonly called bleaching powder, or bleaching salts) in water, or by passing the oxymuriatic acid gas into a vat, vessel, or cistern, in which, by agitation or otherwise, I keep suspended such quantity of quicklime as will more than saturate fully and completely the said oxymuriatic acid gas. In either way, I obtain a solution of oxymuriate of lime, with excess of lime. That which I use and prefer is of the specific gravity 1050, and I seldom employ it lower than 1030 (water being considered as 1000). The vat, vessel, or cistern, which contains the solution of oxymuriate of lime, in which I immerse the cloths, may be of any size or form best adapted to the purpose or situation. I use and prefer vessels of stone of from six to eight feet deep, six to seven feet long, and three and a half to four feet broad; but larger or smaller vessels will answer very well.

Fourthly, When the cloths are ready for immersion, which they are as soon as the paste is dry, I hook them on a frame, such as is used in dyeing indigo or China blues, commonly called a dipping frame, on which the cloth should be so disposed that no two folds can touch each other. I then plunge the frame with the cloth so attached into the vat containing the solution of oxymuriate of lime, and keep it gently in motion during the time of immersion, which should not be prolonged more than ten minutes, and which rarely need exceed five minutes. The object being either wholly or partially to remove the Turkey red dye from certain parts or places, as soon as that is done the cloth should be withdrawn from the solution of the oxymuriate of lime, and plunged or rinsed in clean water. I practise and approve the aforesaid plan of immersion; but any other plan or plans by which the cloth can be exposed a greater or less time to the action of the oxymuriate of lime, without bringing one part of the

said cloth into contact with another, will answer very well.

Lastly, After having, as before directed, rinsed or washed the cloths in clean water, I free them from all remains of the different agents or substances employed, by the ordinary means of washing, branning, or soaping, as practised by calico printers; and if those parts of the cloth that are intended to be made white should still retain any red, or other tinge or stain injurious to the effect, in order to render the white complete I clear it by the usual process of exposure to the air, or by passing the cloth through hot water, to which I have added as much of the solution of oxymuriate of lime as will remove the said stains or tinge, without material injury to those parts from which the red dye is not intended to be removed.

I then proceed, if other colors are to be applied to finish the cloths, by the ordinary and well known methods of calico printers; but these not being necessarily connected with, nor forming any part of the peculiar process or invention herein intended to be described, I purposely make no mention of here.

The above particulars and examples are given for the more full explanation of the said invention, and the manner in which the same is to be performed. But the invention, whereof I claim the sole and exclusive use, consists in printing, stamping, pencilling, or otherwise applying to those parts of the cloth which are intended to be either wholly, or in a greater or less degree, deprived of their red color, an acid, oxide, neutral salt, acid salt, or metallic salt, such as is herein before for that purpose directed, and immersing the whole cloth in such mixture or combination of oxymuriatic acid and water, with some of the alkaline salts or earths, as is herein directed for that purpose.

Mr. Thomson's patent for 1815 is specified as follows:—The ordinary practice of calico printers is to apply, with the block or pencil, what are termed after-colors, to certain spaces, originally left in their patterns, and intended to receive the said after-colors; or to certain spaces on the cloth, from which parts of the original pattern have been discharged, in order to admit, by a subsequent operation, the application of the said after-colors. Now the object of my invention is, by one application of the block, cylinder, roller, plate, pencil, or other mode, to remove parts of the original pattern or color from the cloth, and at the same time to deposit a metallic oxide, or earthy base, which shall of itself be a color, or shall serve as a mordant to some color to be produced, as hereinafter described.

First, mix or combine with the acid called oxymuriatic acid (or dephlogisticated acid of sea salt) and water, the alkaline salts of potash or soda, or, which is still better, calcareous earth or quicklime, in such proportion as will weaken or suspend the power of the said acid, so that it shall not in such mixed or combined state, of itself, and without any further operation, be able to remove, or materially to improve the colors, within the moderate space of time taken up in the performance of the process.

Secondly, Print, stamp, pencil, or otherwise

apply to those parts of the cloth which are intended to be deprived of one color and to receive another, a solution of some earthy or metallic salt; the acid of which, having a greater affinity or attraction for the alkaline salt or earth with which the oxymuriatic acid is mixed or combined than that acid itself possesses, will disengage it, and the metallic or earthy base of which, being deposited in the cloth, will either of itself be a color, or serve as a mordant to some other color, to be produced as hereinafter described.

Thirdly, After the metallic or earthy solution aforesaid has been printed, stamped, pencilled, or otherwise applied to the cloth, as before directed, and is sufficiently dry, immerse the cloth in the solution of oxymuriatic acid, combined with the alkaline salt of potash or soda, or, which I greatly prefer, with calcareous earth or lime, when the acid of the metallic or earthy solution which has been applied to parts of the cloth will immediately seize upon and combine with the alkaline salt or earth with which the oxymuriatic acid has been mixed or combined, and disengage that acid which will almost instantaneously deprive of their color those parts of the cloth to which the said earthy or metallic salt has been applied.

Fourthly, Wash or otherwise remove the said acids or salts by the usual processes, and when the earthy or metallic base, deposited in the cloth, is intended to receive another color, proceed to raise it by the usual operations of dyeing, as will be further illustrated in the examples hereafter given of particular applications of this invention. The earthy solutions which I apply to the parts intended to be deprived of their color, and to receive another, are the solutions of alumina, or earth of alum in acids; such, for example, as the sulphate of alumina, or common alum, the acetate of alumina, or the nitrate or muriate of alumina. The metallic solutions which I employ are, the sulphate of iron or coppers; the nitrate, or muriate, or acetate of iron; the muriate of tin, or nitro-muriate of tin; the sulphate of copper or blue vitriol, or the nitrate, muriate, or acetate of copper. All acids that form soluble compounds with the before-named metals, or the earth of alum, may be employed; but those only which form the most soluble compounds, such, for example, as those enumerated above, can be employed with advantage. For the more full and complete understanding of the principle laid down in the preceding part of this specification, I subjoin the following practical illustration of its application to various kinds of work. If I desire to have a yellow figure or stripe on the cloth, upon which a madder-red ground or pattern has been printed, after having, by the ordinary processes of calico printing, produced the red ground or pattern, I first print, stamp, pencil, or otherwise apply to those parts intended to be yellow, a strong aluminous mordant, composed of three pounds of sugar of lead, and six pounds of alum, dissolved in a gallon of water, and thickened with a due proportion of calcined starch, in the manner usually practised by calico printers.

Secondly, I prepare a solution of oxymuriate of lime, either by dissolving the dry oxymuriate

of lime (commonly called bleaching powder, or bleaching salts) in water, or by passing the oxymuriatic gas into a vat, vessel, or cistern, in which, by agitation or otherwise, I keep suspended such a quantity of quicklime as will more than saturate fully and completely the said oxymuriatic gas. In either way I obtain a solution of oxymuriate of lime, with excess of lime. That which I use and prefer is of the specific gravity 1050, and I seldom employ it lower than 1030 (water being considered as 1000). The vat, vessel, or cistern, which contains the solution of oxymuriate of lime in which I immerse the cloth, may be of any size or form best adapted to the purpose or situation. I use and prefer vessels of stone, of from six to eight feet deep, six to seven feet long, and three and a half to four feet broad; but larger or smaller vessels will answer very well.

Thirdly, When the cloth is ready for immersion, which it is as soon as the paste is dry, I hook it on a frame, such as is used in dyeing indigo or China blues, commonly called a dipping frame, on which the cloth should be so disposed that no two folds can touch each other. I then plunge the frame, with the cloth so attached, into the vat containing the solution of oxymuriate of lime, and keep it gently in motion during the time of immersion, which rarely need exceed five minutes. The object being to remove the red dye from certain parts or places, as soon as that is done the cloth should be withdrawn from the solution of the oxymuriate of lime, and plunged into, or rinsed in cold water. I practise and approve the aforesaid plan of immersion; but any other plan, or plans, by which the cloth can be exposed a greater or less time to the action of the oxymuriate of lime, without bringing one part of the said cloth into contact with another, will answer very well.

Lastly, After having, as before directed, rinsed or washed the cloth in clean water, I free it from all superfluous remains of the different substances employed, by the ordinary means of washing, dunging, and cleaning, as practised by calico printers; after which I dye the cloth and raise the yellow in the usual way, with quercitron bark, or any other yellow dye.

If, instead of yellow, it is proposed to have a buff pattern or figure, I add to the aluminous mordant, prepared and thickened as above, one-fourth or one-sixth, or some intermediate proportion, of a solution of nitrate of iron, and proceed to print and immerse in oxymuriate of lime as in the former case.

The red dye will be removed as before, and its place be occupied by a buff. If the buff be raised in quercitron bark, an olive will be obtained. By printing at separate times, and on different parts of the cloth, each of the above-mentioned mordants, both yellow and olive figures on a red ground may be obtained. Similar effects, with trifling variations, take place, when, instead of red grounds, purple or chocolate grounds are employed; but it must be observed, that these colors being produced from mordants, consisting wholly, or in part, of solutions of iron, and the oxide of that metal not being removeable by the process detailed in this

specification, the after colors produced will be modified more or less by the said oxide of iron. The foregoing examples are given for the more full explanation of the said invention, and the manner in which the same is to be performed; but the invention, whereof I claim the sole and exclusive use, consists in printing, stamping, pencilling, or otherwise applying to cloth, previously printed and dyed, or dyed any other color than turkey red, any of the earthy or metallic solutions herein before for that purpose directed, and immersing the whole cloth in such mixture or combination of oxymuriatic acid and water, with some of the alkaline salts or earths, as is herein directed for that purpose, so as to remove the color or pattern from the part so printed, stamped, pencilled, or receiving such application, and, by the same process, fix on such parts either a new color or a mordant for a new color.

In our treatise on the manufacture of cotton it was found necessary to describe the admirable printing apparatus employed at the Bandana works in Glasgow, and we now propose to furnish our readers with an account of Mr. Maudslay's press for a nearly similar purpose. Figs. 1. and 2, plate PRINTING, CALICO, represent an end and front view of the machine. A, A, are frames of cast-iron, wood, or other strong materials. B, B, are swinging frames of iron or wood; the upper surfaces of which are made flat, to receive engraved copper plates, fastened on and regulated by screws at *aa*. The screws at *bb* are to stop and regulate the swinging frames against pieces which project on the insides of the frames A, A, at *dd*. C, C, are slings or connecting rods of iron or other metal which have round holes at D, in the bottom end, to receive the ends of the strong bolt D, which is connected to the frame B B. The upper part of the connecting rods C are forked, to pass the pivots of wheels, &c., on the ends of the frames A, A, and are screwed in the usual way, have two metal nuts to each, to keep down and regulate the cross pieces of iron or other metal *e*, which fit on and into the eccentric wheels or cranks E. These are made of iron or other metal, for the purpose of lifting the swinging frame B, by means of the connecting rods C, C, and pressing the copper plates forcibly against the under part of the cylinder or press-head F, which is better seen in figs. 3 or 5. Through the eccentric wheels, &c., are made square or other formed holes, which are well fitted on the spindle G, close on the outsides or insides of the frames A, A; on the outsides of which are fitted the toothed wheel H, which works into and turns the wheel I, which is twice the diameter of H, and has on the rim a piece of metal of the proper curve with three whole teeth and one half tooth, which in their revolution fall into the teeth of the wheel R, fixed on the axis of the roller L; which wheel will be regulated as to its number of teeth by the circumference of the roller L, which must be twice or three times the

length of the engravings on the plate to be printed from; if twice it must have eight teeth, if three times twelve teeth; or in that proportion. The half of every fourth tooth must be taken away to let the tooth of the segment on I pass; that it may strike fairly on the pitch line of the next tooth. The small roller M may be used or not as occasion may require, as it is only to ease the motion of the blanket which passes over the roller N, which is to tighten the blanket by means of the screws and sockets O. At the opposite end of the spindle G is well fitted a large wheel P, which is turned by the pinion Q on the spindle of the fly-wheel R, and supported by the frame S, of iron or wood. This spindle may be turned by hand or by any other power given. The wheel and pinion may be varied to any power, by altering the sizes of them in the usual way. The plates may be cleaned by a scraper or doctor.

Fig. 3 is a transverse section of the machine, showing a different mode of using it. The frame A A is the same as in fig. 1 and 2, with the addition of two arms and brackets T, T, which support a frame of iron or wood, on which are fixed one, two, or more, copper plates. To print several colors they move to stops, and are regulated as in figs. 1 and 2. The cylinder E is made hollow, for the purpose of admitting steam, which will heat it to any temperature, to dry the color as quick as printed. The manner of letting in the steam is described in fig. 5. The lifting frame B acts the same as in figs. 1 and 2. Fig. 4 is a lifting frame, which has a cylinder similar to F, and may be used in the place of B, which makes it a hot-press for various purposes, by letting steam into the bottom as well as the top cylinder; and in case the color should dry in the plates, owing to the heat, cold water may be made to pass through the cylinder, which will always keep it cool. Fig. 5 is a longitudinal section of the cylinder, eccentric wheel, &c., with the manner of admitting steam by a small pipe at *f*, which may be connected with the boiler of a steam-engine, or a small boiler on purpose, which will serve one, two, or more presses, each having stop-cocks at convenient places. *g* is a pipe in the bottom of the cylinder to let out the condensed water.

Figs. 6 and 7 represent a side view of the upper part of the machine, with the roller L placed above the cylinder, by which means the blanket is closer, and may if required receive more heat from the cylinder. The roller is moved by the same wheels as in figs. 1 and 2, only differently placed.

We must not close our account of the theory and practice of calico printing without adverting to the great use we have made of Dr. Ure's edition of Berthollet's Elements of the Art of Dyeing, which is decidedly the best work on the subject that has yet appeared.

PRIOLO, or **PRIOLUS** (Benjamin), an eminent Italian historian, born in Venice, in 1602, and descended from the illustrious family of Prioli, some of whom had been doges of Venice. He studied at Orthez, Montauban, and at last at Leyden, under Heinsius and Vossius. He went to Paris to visit Grotius, and studied Aristotle at Padua, under Cremonius and Licetus. He became a confidant of the duke of Rohan; afterwards married and retired to Geneva; became intimate with the duke of Longueville, cardinal Chigi (afterwards Alexander VII.), and cardinal F. Barberini, and became a Roman Catholic. The civil war breaking out in France, he joined the malecontents, and his estate was confiscated. He then retired to Flanders, where he wrote his History of France, in Latin. He died at Lyons, in 1667, aged sixty-five.

PRIOR (Matthew), an eminent English poet, born in London in 1664. His father dying while he was very young, an uncle, a vintner, having given him some education at Westminster school, took him home to bring him up to his own trade. However, at his leisure hours, he prosecuted his study of the classics, and especially of his favorite Horace. This introduced him to some polite company, who frequented his uncle's house; among whom the earl of Dorset took particular notice of him, and procured him to be sent to St. John's College in Cambridge, where, in 1680, he took the degree of A. B. and afterwards became fellow of that college. Upon the revolution, Mr. Prior was brought to court by the earl of Dorset; and in 1690 he was made secretary to the earl of Berkeley, plenipotentiary at the Hague; as he was afterwards to the ambassador and the plenipotentiaries at the treaty of Ryswick in 1697; and in 1698 to the earl of Portland, ambassador to the court of France. He was in 1697 made secretary of state for Ireland; and in 1700 was appointed one of the lords commissioners of trade and plantations. In 1710 he was supposed to have had a share in writing the Examiner. In 1711 he was made one of the commissioners of the customs; and was sent minister plenipotentiary to France, for the negotiating a peace with that kingdom. Soon after the accession of George I. to the throne in 1714 he presented a memorial to the court of France, requiring the demolition of the canal and new works at Mardyke. In 1715 he was recalled; and upon his arrival being taken up by a warrant from the house of commons, and strictly examined by a committee of the privy council, Robert Walpole, Esq., moved the house of commons for an impeachment against him; and Mr. Prior was ordered into close custody. In 1717 he was excepted out of the act of grace; at the close of that year, however, he was set at liberty. The remainder of his days he spent in tranquillity; and died in 1721. His poems are well known and justly admired.

PRIOR, *adj.* } *Lat. prior.* Former; being
PRIORITY, *n. s.* } before something else; anterior; state of being antecedent.

Follow, Cominus, we must follow you,

Right worthy your *priority*.

Shakspeare.

From son to son of the lady, as they should be in *priority* of birth.

Hayward.

Men still affirm that it killeth at a distance, that it poisoneth by the eye, and by *priority* of vision.

Broune.

Whenever tempted to do or approve any thing contrary to the duties we are enjoined, let us reflect that we have a *prior* and superior obligation to the commands of Christ.

Rogers.

Though he oft renewed the fight,

And almost got *priority* of sight,

He ne'er could overcome her quite. *Swift.*

This observation may assist in determining the dispute concerning the *priority* of Homer and Hesiod.

Broome.

PRIOR, *n. s.* } *Fr. prieur.* The head of a
PRIORRESS, } convent of monks, inferior in
PRIORY. } dignity to an abbot: prioress, the feminine of this noun: priory is, the convent or establishment over which a prior is placed: prior, says Ayliffe, is such a person, as, in some churches, presides over others in the same churches.

Our abbies and our *priories* shall pay

This expedition's charge.

Shakspeare. King John.

When you have vowed, you must not speak with men

But in the presence of the *prioress*. *Shakspeare.*

The reeve, miller, and cook, are distinguished from each other, as much as the mincing lady *prioress* and the broad speaking wife of Bath. *Dryden.*

Neither she, nor any other, besides the *prior* of the convent, knew any thing of his name.

Addison's Spectator.

PRIORY, ALIEN. These *priories* were cells of the religious houses in England which belonged to foreign monasteries: for, when manors or tithes were given to foreign convents, the monks, either to increase their own rule, or rather to have faithful stewards of their revenues, built a small convent here for the reception of such a number as they thought proper, and constituted priors over them. Within these cells there was the same distinction as in those *priories* which were cells subordinate to some great abbey; some of these were conventual, and, having priors of their own choosing, thereby became entire societies within themselves, and received the revenues belonging to their several houses for their own use and benefit, paying only the ancient apport, acknowledgment, or obvention, at first the surplussage, to the foreign house; but others depended entirely on the foreign houses, who appointed and removed their priors at pleasure. These transmitted all their revenues to the foreign head houses; for which reason their estates were generally seized to carry on the wars between England and France, and restored to them again on return of peace. These alien *priories* were most of them founded by such as had foreign abbeys, founded by themselves or by some of their family. The whole number is not exactly ascertained; the Monasticon has given a list of 100. Weever says 110. Some of these cells were made indigenous or denizon. The alien *priories* were first seized by Edward I. 1285 on the breaking out of the war between France and England; and it appears from a roll that Edward II. also seized them, though this is not mentioned by our historians: and to these the act of restitution 1 Edw. III. seems to refer. In 1337 Edward III. confiscated their estates and

let out the priories themselves with all their lands and tenements, at his pleasure, for twenty-three years; at the end of which term, peace being concluded between the two nations, he restored their estates in 1361, as appears by his letters patent to that of Montacute, county of Somerset, printed at large in Rymer, vol. vi. p. 311, and translated in Weever's Funeral Monuments, p. 339. At other times he granted their lands, or lay pensions out of them, to divers noblemen. They were also sequestered during Richard II.'s reign, and the head monasteries abroad had the king's licence to sell their lands to other religious houses here, or to any particular persons who wanted to endow others. Henry IV. began his reign with showing some favor to the alien priories, restoring all the conventual ones, only reserving to himself in time of war what they paid in time of peace to the foreign abbays. They were all dissolved by act 2, Henry V., and all their estates vested in the crown, except some lands granted to the college of Fotheringay. The act of dissolution is not printed in the statute books, but it is to be found entire in Rymer's Fœdera, and in the Parliament Rolls, vol. iv. p. 22. In general, these lands were appropriated to religious uses. Henry VI. endowed his foundations at Eton and Cambridge with the lands of the alien priories. Others were granted in fee to the prelates, nobility, or private persons. Such as remained in the crown were granted by Henry VI., 1440, to archbishop Chicheley, &c., and they became part of his and the royal foundations.

PRYSAGE, *n. s.* From prise. See the extract.

Prisage, now called butlerage, is a custom whereby the prince challenges out of every bark laden with wine, two tuns of wine at his price. *Cowell.*

PRISCIANUS, an eminent grammarian, born at Cæsarea, who taught at Constantinople with great reputation about the year 525. He composed a work *De Arte Grammatica*, which was first printed by Aldus at Venice in 1476; and another, *De Naturalibus Questionibus*, which he dedicated to Chosroes king of Persia; besides which he translated Dionysius's description of the world into Latin verse.

PRISM, *n. s.* } French *prisme*; Gr. }
PRISMATIC, *adj.* } *πρίσμα*. See Sir I. }
PRISMATICALLY, *adv.* } Newton's definition }
 below: the adjective and adverb correspond.

Take notice of the pleasing variety of colours exhibited by the triangular glass, and demand what addition or decrement of either salt, sulphur, or mercury befalls the glass, by being *prismatically* figured; and yet it is known that, without that shape, it would not afford those colours as it does. *Boyle.*

A *prism* of glass is a glass bounded with two equal and parallel triangular ends, and three plain and well polished sides, which meet in three parallel lines, running from the three angles of one end to the three angles of the other end. *Newton.*

If the mass of the earth was cubick, *prismatically*, or any other angular figure, it would follow that one too vast a part would be drowned, and another be dry. *Derham.*

False eloquence, like the *prismatick* glass,
 Its gaudy colours spreads on every place;

The face of nature we no more survey,
 All glares alike, without distinction gay. *Pope*
 Here, awful Newton, the dissolving clouds
 Form, fronting on the sun, thy showery prism.

Thomson.

If oyster-shells were thrown into a common fire and calcined for about half an hour, and then brought to a person who had previously been some minutes in a dark room, that many of them would exhibit beautiful irises of *prismatic* colours. *Darwin.*

A **PRISM** is an oblong solid, contained under more than four planes, whose bases are equal, parallel, and alike situated. See **OPTICS**.

PRISON, *n. s. & v. a.* } *Fr. prison.* A strong }

PRISONER, } sons are confined; a }
PRISONHOUSE, } gaol: to confine or }
PRISONMENT. } captivate: prison- }

house is synonymous with prison: prison-base is a kind of rural play, described in the extract: prisoner, one confined in a prison; a captive: imprisonment, confinement; captivity.

The spachies of the court play every Friday at *giocho di canni*, which is no other than *prisonbase* upon horseback, hitting one another with darts, as the others do with their hands. *Sandys.*

So oft as homeward I from her depart,
 I go like one that, having lost the field,
 Is *prisoner* led away with heavy heart.

Spenser.

He hath commission
 To hang Cordelia in the *prison*. *Shakspeare.*

Universal plodding *prisuns* up
 The nimble spirits in the arteries. *Id.*

Cæsar's ill-erected tower,
 To whose flint bosom my condemned lord
 Is doomed a *prisoner*. *Id. Richard II.*
 I am forbid to tell the secrets of my *prisonhouse*.
Shakspeare.

May be he will not touch young Arthur's life,
 But hold himself safe in his *prisonment*. *Id.*
 These succeeded an absolute victory for the English, the taking of the Spanish general d'Ocampo *prisoner*, with the loss of few of the English.
Bacon.

Then did the king enlarge
 The spleen he *prisoned*. *Chapman's Iliad.*

A *prisoner* is an impatient patient, lingering under the rough hands of a cruel physician; his creditor knows his disease, and hath power to cure him, but takes more pleasure to kill him.

Essayes and Characters, 1638.

He that is tied with one slender string, such as one resolute struggle would break, he is *prisoner* only at his own sloth, and who will pity his thraldom?

Decay of Piety.

For those rebellious here their *prison* ordained.
Milton.

Culling their potent herbs and baleful drugs,
 They, as they sung, would take the *prisoned* soul,
 And lap it in Elysium. *Id.*

The tyrant Æolus,
 With power imperial curbs the struggling winds,
 And sounding tempests in dark *prisuns* binds.
Dryden.

He yielded on my word,
 And, as my *prisoner*, I restore his sword. *Id.*

A *prisoner* is troubled, that he cannot go whither he would; and he that is at large is troubled that he does not know whither to go. *L'Estrange.*

He, that has his chains knocked off, and the *prison* doors set open to him, is presently at liberty.
Locke.

At his first coming to his little village, it was as disagreeable to him as a *prison*, and every day seemed too tedious to be endured in so retired a place.

Law.

A PRISON, lord Coke observes, is only a place of safe custody, *salva custodia*, not a place of punishment. Any place where a person is confined may be said to be a prison; and, when a process is issued against one, he must, when arrested thereon, either be committed to prison, or be bound in a recognizance with sureties, or else give bail according to the nature of the case, to appear at a certain day in court, there to make answer to what is alleged against him. Where a person is taken and sent to prison in a civil case, he may be released by the plaintiff in the suit; but, if it be for treason or felony, he may not regularly be discharged, until he is indicted of the fact and acquitted. See *LAW*.

PRISON DISCIPLINE. This is a topic upon which every patriotic feeling of the Christian moralist will be exercised; and has been exercised in this country, very salutarily, we may add, for the last ten years. If no second Howard has arisen, investigations into the state of prisons more extensive than his have been successfully carried on in every part of Great Britain during this period, and, in the Society for the Improvement of Prison Discipline, an important centre of communication has been established for the benefit of the civilised world. In the retrospect of their proceedings much that is humiliating to our national pride will appear; but as the exposure of the evils in question has led to a very important diminution of them by legislative enactments, and to the full understanding of the chief causes of the rest, they may be adverted to with considerable satisfaction.

Mr. Buxton's Enquiry whether Crime and Misery are produced or prevented by our present System of Prison Discipline, and his personal exertions in this cause both in and out of parliament, were the first great means of arousing the late attention of the benevolent to the subject. There is a singular bonesty in the fabrication of his book; and it is one of those rare cases in which no victory has been gained over the candor and veracity of the writer, by the strong persuasions of a mind under the fullest conviction and most glowing impressions upon the subject of his publication. For the truth of the facts, as they stand in his statements, Mr. Buxton declares himself to require no indulgence. 'Nothing is stated,' says he, '(with the exception of the account of the Philadelphia gaol), which has not come within my own observation, and which has not been confirmed by the concurrent testimony of the gentlemen who have been my companions. The description of the Borough Compter, Totbill Fields, the Penitentiary, the gaols at St. Alban's, at Bury, at Ghent, and at Bristol, have been read to their respective gaolers; and that of Guildford was handed to a magistrate of the county of Surrey, with a request that he would point out any mistakes.' Mr. Buxton adds, 'I have generally mentioned the days on which I visited the gaols, the persons with whom I went, and, where I could do it with propriety, the names of any prisoners whose

case attracted my particular attention. I have done this as inviting enquiry, as placing my statements in a more tangible shape, and as furnishing a facility for the detection of errors.' For the honor of the writer of the severe censures on our past proceedings which this book contains, such proofs of authenticity speak very forcibly; but, for the honor of the British character, we have only to regret that they carry so high his pretensions to be believed. Of the reasoning in the introductory chapter, we do not hesitate to say that it is in a high degree moral, acute, and manly. We are not of opinion that prisoners should be indulged with Turkey carpets; and we agree in the positions of the committee of aldermen, that debtors should not be placed within the walls of a prison, with greater comparative comforts than the families of the citizens whom they have wronged, or perhaps ruined; neither do we feel any of that contumacious compassion for prisoners because authority and the law have made them such, which, we are persuaded, many do; but we cordially join with Mr. Buxton in opinion, that, where imprisonment is the legal consequence of debt, it should be only imprisonment, without any aggravations, or super-added sufferings; for it is not to be disputed that all beyond mere confinement is beyond the law, which has nowhere authorised any infliction for this cause beyond the evil necessarily implied in the suspension of personal liberty. It is still more plainly evident, that persons under confinement for imputed offences ought not to be subjected to any rigors beyond what may be necessary to secure their detention. Even on convicted delinquents, where safe custody is all that the law has in contemplation, any annexation of unnecessary hardship carries the punishment beyond the law; and, where imprisonment is part or the whole of the punishment, all that is inflicted of suffering or privation, beyond what the sentence has defined, or the common regulations of the prison require, is excess and abuse, so much the more to be dreaded, because it takes place where the eye of the public does not often pierce.

It is quite evident that as little as possible of judicial punishment should be submitted to the discretion or disposition of the gaoler, however necessary it may be to invest him with some degree of coercive authority to preserve the order and peace of the prison. A system of general rules only may and ought to be maintained, in which at least ordinary humanity suffers nothing supplicatory beyond the sentence of the court, in which respect should be had, as far as justice towards all will allow, to the common presumable differences of sentiment arising from previous habits, and in which all mischiefs that may affect the prisoner consequentially and permanently, after the law is satisfied, may, as far as possible, be prevented.

No language can better state the rights of a prisoner accused even of serious crimes than the following:— You have no right to abridge him of pure air, wholesome and sufficient food, and opportunities of exercise. You have no right to debar him from the craft on which his family depends, if it can be exercised in prison. You

have no right to subject him to suffering from cold, by want of bed-clothing by night, or firing by day; and the reason is plain,—you have taken him from his home, and have deprived him of the means of providing himself with the necessities or comforts of life, and therefore you are bound to furnish him with moderate indeed, but suitable accommodation.

You have for the same reason no right to ruin his habits by compelling him to be idle, his morals by compelling him to mix with a promiscuous assemblage of hardened and convicted criminals, or his health by forcing him at night into a damp unventilated cell, with such crowds of companions as very speedily render the air foul and putrid, or make him sleep in close contact with the victims of contagious and loathsome disease, or amidst the noxious effluvia of dirt and corruption. In short, attention to his feelings mental and bodily, a supply of every necessary, abstraction from evil society, the conservation of his health and industrious habits, are the clear, evident, undeniable rights of an unconvicted prisoner. He should be brought to his trial as speedily as possible; for every hour of unnecessary delay, in furnishing him with the opportunity of proving his innocence, is, or at least may be, an hour of unjust imprisonment.

At his trial, either he is acquitted,—in which case the least you can do is to replace him in the situation you found him, to pay his expenses home, and to furnish him with sufficient to support him till he has had an opportunity of looking out for work: or he is convicted,—and then it is for the law to appoint the punishment which is to follow his offence. That punishment must be inflicted; but you must carefully guard that it be not aggravated, and that circumstances of severity are not found in his treatment which are not found in his sentence. Now no judge ever condemned a man to be half starved with cold by day, or half suffocated with heat by night. Who ever heard of a criminal being sentenced to catch the rheumatism, or the typhus fever? Corruption of morals and contamination of mind, are not the remedies which the law in its wisdom has thought proper to adopt. We should remember, to use the words of a former writer on the subject, ‘that disease, cold, famine, nakedness, a contagious and polluted air, are not lawful punishments in the hands of the civil magistrate; nor has he a right to poison or starve his fellow creature, though the greatest of criminals.’ The convicted delinquent then has his rights. All measures and practices in prison, which may injure him in any way, are illegal, because they are not specified in his sentence:—he is therefore entitled to a wholesome atmosphere, decent clothing and bedding, and a diet sufficient to support him.

But besides the rights of the individual, there are duties to the community:—*Parum est improbus coercere pœnâ, nisi probos efficias disciplinâ.* One of the most important of these duties is, that you should not send forth the man committed to your tuition in any respect a worse man, a less industrious, a less sober, or a less competent man, than when he entered your

walls. Good policy requires that, if possible, you dismiss him improved.

For the improvement of the unconvicted prisoner you should labor, as a recompense for his confinement before trial—that thus you may convert the suspicion of crime into its prevention in future—that thus you may addict him to such habits, and instil such principles, and impart such instruction, as may repair the damage you have done him; and that he, being amerced of one period of his life, may be enabled to spend the remainder more respectably.

For the improvement of the debtor you should labor, because the grand causes of debt are sickness, idleness, or intemperance:—you must, therefore, provide against its recurrence by those measures which may secure the health, the industry, and the sobriety of your prisoners. The convicted criminal is also entitled to your care. Our law is not, in its true spirit, whatever it may be in its modern enactments, a system of bloody vengeance; it does not say, so much evil is repaired by so much misery inflicted. A merciful and enlightened jurisprudence, like the Author of all that is merciful and wise, does not rejoice in the death of a sinner; but rather that he should turn from his wickedness, and live. Punishments are inflicted that crime may be prevented, and crime is prevented by the reformation of the criminal. This may be accomplished. The prisoner, being separated from his former associates, ceases to think as they think; he has time for recollection and repentance; and seclusion will humble the most haughty, and often reform the most abandoned.

It is then necessary that he sleep alone, and that he be alone during a great portion of the day.

But, as idleness is one great cause of sin, industry is one great means of reformation. Measures must therefore be taken for his constant employment, and for making that employment agreeable, by allowing him to share largely in its profits.

The use of stimulating liquors is often the cause, and always the concomitant of crime. These, therefore, must be forbidden. The want of education is found to be a great source of crime; for this, therefore, a provision must be made. The neglect of religious duties is the grand cause of crime. Ministers of religion must, therefore, be induced to give their active and zealous labors to the prisoners daily, reading prayers in public, and giving private instruction. The assiduous services of such men will not be fruitless. Mr. Robinson of Leicester declared that no part of his ministry had been so signally successful as that in the gaols; and the Ladies’ Committee of Newgate have many proofs that reformation may be accomplished, even amongst the most dissolute and abandoned.²—Buxton, p. 11—15.

Mr. Buxton maintains, that, as our prison discipline stood in 1815, the prisoner, immediately on his commitment, was made to experience the violation of all these rights. In language still but too applicable in various parts of the country, ‘You give him,’ says he ‘(the pri-

soner) leisure, and for the employment of that leisure you give him tutors in every branch of iniquity. You have taken no pious pains to turn him from the error of his ways, and to save his soul alive. You have not cherished the latent seeds of virtue; you have not profited by the opportunity of awakening remorse for his past misconduct. His Saviour's awful name becomes, indeed, familiar to his lips, because he learns to use it to give zest to his conversation, and vigor to his execrations; but all that Saviour's office, his tenderness, and compassion, and mercy to the returning sinner, are topics of which he learns no more than the beasts that perish.'

That the reader may have before him a sort of specimen of some modern British prisons, we will exhibit a few particulars of the former condition of the Borough Compter. Of thirteen persons confined on criminal charges, there were five cases of fever. In a room, seven feet by nine, three persons had slept the night before his first visit, one of whom was ill with fever, with which the other two were infected, and so found on his second visit. Till lately no surgeon or apothecary; no infirmary; no separation of a sick criminal, however infectious his disorder. The apartments of the male debtors on the same floor with the female prisoners, and separated only by doors seven feet asunder, which are always open in the day time, and in hot weather at night. One yard only for male and female debtors; no cooking utensils—no soap—no work or employment provided—no school. We are not to wonder at the gaoler's declaration that, in an experience of nine years, he had never known an instance of reformation. In Guildford gaol at this period, there was no infirmary—no chapel—no work—no classification.

So far back as 1815 we find from Mr. Buxton that a committee of aldermen of London was appointed to visit several gaols in England, and directed to compare the allowances, and the rules and orders, then existing in the prisons of the metropolis, with those of Gloucester, and elsewhere, and to draw out such new system of allowances, and such new code of laws, as should appear to them to be salutary, and adapted to the prisons in question. That such of our readers as have not yet acquired any knowledge of this subject may have their attention drawn towards it, we offer to their notice the following improvements which their reports suggested,

'1. That the gaol should be divided into day-rooms, and distinct yards, having arcades in each.

'2. That warm and cold baths should be provided, as also ovens, for fumigating clothes.

'3. Circular apertures of open iron work, for the purpose of a thorough ventilation, should be made.

'4. Such shutters and windows shall be constructed as shall exclude the possibility of the prisoners' looking into any other apartment or yard.

'5. That day cells for labor should be distinct from the sleeping cells, as also exclusive cells for refractory prisoners.

'6. Kefray's evidence should be precluded from a possibility of communication with the other prisoners.

'7. That gratings should be fitted up in the apartments where the visitors of felons are admitted; and so constructed as not to admit of any dangerous instrument being passed through.

'8. Apartments for the reception of friends of the debtors should be constructed.

'9. The chapel should be so constructed that one class of prisoners should not be seen by another class.

'With respect to the classification of prisoners, according to their several degrees of offence:—

'10. That those before trial should never be mixed with those convicted; and that the respective classes should be arranged as nearly as possible in the following order:—

1. Capital felons.

2. Simple felony, and first offence.

3. Criminals under sentence of death.

4. Misdemeanors and persons wanting sureties.

5. Misdemeanors of the grossest kind.

6. Children.

'With respect to the internal regulations of the prison:—

'11. That all prisoners on coming in should be examined by the surgeon, and should be immediately washed, and their clothes purified; and proper apparel should be provided for their use in the mean time.

'12. That the prisoners should be required to wash themselves, at least once every day, at places appropriated for that purpose; and that clean towels of open network be supplied for their use, twice a week.

'13. That no beer should be admitted; nor wine, nor other strong liquors, except to the infirmaries, by direction of the surgeon, or to the debtors. No debtor to be allowed to have to himself more than one pint of wine, or one quart of strong beer per day.

'14. The friends of criminals to be admitted between the hours of nine in the morning, and two in the afternoon; and not to be allowed to converse with the prisoners, but in the presence of the keeper or turnkey, except solicitors for the purpose of preparing defences.

'15. The visitors of debtors to be admitted only at stated hours, into the rooms allotted for their reception, and not into the interior of the gaol, unless by order of a magistrate.

'16. Not any description of prisoners should be permitted to enter into the sleeping-rooms during the day.

'17. The transports, and those sentenced to hard labor or solitary confinement, to be kept in constant work suitable to their ability and strength; such prisoners not to be excused from work, unless on account of total inability, ill health, or other sufficient cause certified by the surgeon.

'18. Prisoners to be discharged in the morning, and, if they have acquired any trade in the prison, proper tools to be given to them.

'19. That gaming of every kind should be strictly prohibited.

'With respect to the allowances of food:—

'20. That one pound and a half of bread, at least one day old, should be allowed to each pri-

soner daily, and one pint of good gruel for breakfast,—and upon good behaviour half a pound of meat on a Sunday.

‘21. That proper scales, weights, and measures should be provided in the gaol.

‘22. A messenger to be appointed for the accommodation of the debtors.

‘23. A laundry, and a matron under whose directions the female prisoners should do all the washing.

‘24. A bell to be fixed for sounding alarms in cases of escape.

‘25. The chaplain to keep a diary of observations, subject to the inspection of the visiting magistrates. He should read prayers, and preach a sermon every Sunday morning, and read prayers in the evening, and also read prayers every Wednesday and Friday. He should visit the sick, instruct prisoners in their moral duties, give spiritual advice, and religious consolation to such as may desire it. He should distribute amongst them religious books, and form a sort of school for the instruction of the children.’—Buxton, p. 61—64.

Among the creditable exceptions to the neglected state of our prisons at this period stood the gaol of Bury; where the benefits of a simple mechanical, as well as moral arrangement, have been practically and decisively displayed for many years; and, connected with which, the name of Mr. Orridge, the governor, will long be mentioned with honor. The facts, as Mr. Buxton observes, will speak for themselves:—and the writer of this paper has verified them. No prisoner, at the time of Mr. B's visit, was ill; in eighteen years but one prisoner had escaped; in every 100 of the prisoners not five were found who had been there before; never any riots, or quarelling, or swearing. Yet, for twenty years, Mr. Orridge informed us he had never used irons in this prison.

The researches of the modern advocates of prison reform have not, as we have intimated, been confined to their own country.—At the Maison de Force, at Ghent, the same practical testimony is borne to the good effects of a sound system of gaol discipline. Here was observed by Mr. Buxton an entire separation of men from women, the sickly from the healthy, the untried from the convicted, and the misdemeanants from the felons. ‘The building, being yet unfinished, does not admit of more subdivisions of classes, which certainly might be carried farther, and probably will when the capacity of the structure will admit of it.’ A very important feature of the system of classification is that of children from men and women; and in general it may be observed that the division into classes should have reference to moral as well as technical distinctions. The utmost order and regularity were found to prevail in this prison. While at work, no prisoner was allowed to speak; and so strictly was the rule observed that the questions put to them by Mr. Buxton were not answered. No noise but the noise of the shuttle. Corporal punishment, formerly allowed, was then dispensed with, because, as the governor stated, it was found to be unnecessary. The penalty was privation of work. The behaviour of the prisoners was

subdued, civil, submissive, and decent throughout—their persons cleanly, and their looks cheerful—all the rooms clean and sweet. ‘By this excellent system,’ says Mr. Buxton, ‘the prisoner gains habits of order, self-restraint, and subjection of mind.—The most boisterous temper is not more distinct from the serenity of a summer's evening; the wildest beast of prey is not more different from our domesticated animals, than are the noise, contention, licentiousness, and tumult of Newgate, from the quietness, industry, and regularity of the Maison de Force.

In the prison of Philadelphia, where the great features of discipline are distribution, employment, and religious instruction, the effects are still more impressive. Mr. Turnbull, speaking of the various trades carried on in the prison, of blacksmith, carpenter, turner, shoemaker, tailor, weavers of cloth, linen, and carpeting, grinding of corn, sawing and polishing marble, cutting stone, and rasping logwood, observes, ‘that there was such a spirit of industry on every side, and such contentment pervaded the countenances of all, that it was with difficulty he divested himself of the idea that these men surely were not convicts, but accustomed to labor from their infancy.’ ‘An account is opened with every prisoner; he is debited with the amount of the sum stolen, or embezzled, with the expenses of his prosecution, with the fine imposed by the court, with the cost of his board and clothes; and he is credited with the produce of his labor.’ All the dress, every mattress, sheet, rug, and coverlid, is woven by the male, and made up by the female prisoners. All laughing, singing, and conversation, during the hours of work, are prohibited; and the silence which is observed is the first and most striking circumstance which arrests the attention of a stranger. Great attention is paid to the promotion of moral and religious improvement by a supply of useful books, and by the regular performance of divine service. No keeper is permitted to carry a stick, or any offensive weapon. No fetters or irons are seen in the prison, the punishment is solitude, and no instance has occurred of its being necessary to inflict it upon the same person twice. In the four years preceding the commencement of the new system 104 prisoners escaped: in the four succeeding (except on the day of its establishment) not one escaped.

Under the old system the number of the most heinous crimes committed in the city and county from January, 1787, to June, 1791, was 129. Under the new system in the whole state, during the same period, twenty-four. ‘At the time of the yellow fever, in 1793, great difficulty was found in obtaining nurses and attendants for the sick at Bush-hill hospital. Recourse was had to the prison. The request was made, and the apparent danger stated to the convicts. As many offered as were wanted. They continued faithful till the dreadful scene was closed—none of them making a demand for their services till all were discharged.

‘One man committed for a burglary, who had seven years to serve, observed, when the request was made to him, that having offended society

he should be happy to render it some services for the injury; and, if they could only place a confidence in him, he would go with cheerfulness. He went—he never left it but once, and then by permission to obtain some articles in the city. His conduct was so remarkable as to engage the attention of the managers, who made him a deputy-steward; gave him the charge of the doors, to prevent improper persons from going into the hospital, to preserve order in and about the house, and to see that nothing came to or went from it improperly. He was paid, and after receiving an extra compensation, at his discharge married one of the nurses. Another man, convicted of a robbery, was taken out for the purpose of attending a horse and cart, to bring such provisions from the vicinity of the city as were there deposited for the use of the poor, by those who were afraid to come in. He had the sole charge of the cart and conveying the articles for the whole period. He had many years to serve, and might at any time have departed with the horse, cart, and provisions. He despised, however, such a breach of trust, and returned to the prison. He was soon after pardoned, with the thanks of the inspectors. Another instance of the good conduct of the prisoners during the sickness happened among the women. When request was made to them to give up their bedsteads, for the use of the sick at the hospital, they cheerfully offered even their bedding, &c. When a similar request was made to the debtors, they all refused. A criminal, one of the desperate gangs that had so long infested the vicinity of Philadelphia, for several years before the alteration of the system, on being discharged, called upon one of the inspectors, and addressed him in the following manner:—‘ Mr. ———, I have called to return you my thanks for your kindness to me while under sentence, and to perform a duty which I think I owe to society, it being all in my power at this time to afford. You know my conduct and my character have been once bad and lost, and therefore whatever I might say would have but little weight were I not now at liberty. Pursue your present plan and you will have neither burglaries nor robberies in this place.’

Of the very deplorable state of the females in Newgate before Mrs. Fry’s well-known visits no one can be ignorant; of the change produced by the Bible, a school, and constant employment, among these desolate and vicious beings in a short compass of time, it is difficult to form an adequate conception. At the first visit, says a young lady who accompanied Mrs. Fry, and who related the circumstances to Mr. Buxton, ‘ the railing was crowded with half-naked women, struggling together for the front situations with the most boisterous violence, and begging with the utmost vociferation. She felt as if she was going into a den of wild beasts, and she well recollects quite shuddering when the door closed upon her, and she was locked in, with such a herd of novel and desperate companions. This day, however, the school surpassed their utmost expectations; their only pain arose from the numerous and pressing applications made by young women, who longed to be taught and em-

ployed. The narrowness of the room rendered it impossible to yield to these requests, whilst a denial seemed a sentence of destruction, excluding every hope, and almost every possibility of reformation.’—p. 122.

The visits of these ladies were incessant. They often spent the whole day in the conduct of this extraordinary school, joining in the employment, sharing the meals, and engaged in the inspection of their pupils. The first experiment was upon the untried part of the prisoners, and the success with which it was attended encouraged an extension of the scheme to those who had undergone their trials, and the inauguration of this great undertaking is thus set forth by Mr. Buxton:—‘ Nothing now remained but to prepare the room; and this difficulty was obviated by the sheriffs sending their carpenters. The former laundry speedily underwent the necessary alterations—was cleaned and white-washed—and in a very few days the Ladies’ Committee assembled in it all the tried female prisoners. One of the ladies began by telling them the comforts derived from industry and sobriety, the pleasure and the profit of doing right, and contrasted the happiness and the peace of those who are dedicated to a course of virtue and religion, with that experienced in their former life, and its present consequences; and, describing their awful guilt in the sight of God, appealed to themselves, whether its wages, even here, were not utter misery and ruin. She then dwelt upon the motives which had brought the ladies into Newgate; they had left their homes and their families, to mingle amongst those from whom all others fled; animated by an ardent and affectionate desire to rescue their fellow-creatures from evil, and to impart to them that knowledge which they, from their education and circumstances, had been so happy as to receive. She then told them that the ladies did not come with any absolute and authoritative pretensions; that it was not intended they should command, and the prisoners obey; but that it was to be understood, all were to act in concert; that not a rule should be made, or a monitor appointed, without their full and unanimous concurrence; that for this purpose each of the rules should be read, and put to the vote; and she invited those who might feel any disinclination to any particular freely to state their opinion’—Buxton, p. 127, 128. The rules were then read, and every hand was held up in testimony of approbation.

At the date of Mr. Buxton’s book a year had elapsed since this labor of love had been in operation, and it is surely enough to state that ‘ only one lady had in all that time heard an oath; that though card-playing had in some instances been resumed, and about half a dozen instances of intoxication had occurred, the rules had been generally observed; that the ladies had been treated with uniform respect and gratitude; that they had reason to rejoice in the improved conduct, and, as they trust, in the confirmed moral habits of the prisoners; several had received the rudiments of education, and had learned for the first time the truth of the Christian religion; many had left the prison who were then filling their stations in life uprightly and respectably. Only

one discharged from the prison had been again committed for a transgression of the law.'

The five golden rules of which the plan of this proceeding was composed were:—

'1st. 'Religious instruction,'—perusal of the Scriptures morning and evening. They have found the prisoners remarkably ignorant of the first principles of Christianity, and they have reason to think that a prison, in excluding many objects of worldly interest, occupation, and pleasure, and in the pause which it produces in the career of life, and in the apprehensions it sometimes excites, is well calculated for the inculcation of religious impressions.

2dly, Constant employment is a grand and an indispensable requisite in the reformation of a prison. They would feel themselves totally incompetent to restrain the passions of this unruly race, if their minds were not engaged in useful and active objects.

3dly, Rules simple and lenient, but rigidly enforced, and, if possible, the concurrence of the prisoners in their formation.

4thly, Classification and separation to the greatest possible extent.

5thly, They recommend that prisoners should be treated as human beings, with human feelings; with that disinterested kindness which will engage their affections; yet as human beings degraded by crime—with that degree of restraint, and with those symbols of degradation, which may recal a sense of their guilt, and humble their pride.'—Buxton, p. 139.

Of the success of Mrs. Fry and her associates it was well said at the time: 'Let us hear no more of the difficulty of regulating provincial prisons, when the prostitute felons of London have been thus easily reformed and converted. Let us never again be told of the impossibility of repressing drunkenness and profligacy, or introducing habits of industry in small establishments, when this great crater of vice and corruption has been thus stilled and purified. And above all let there be an end of the pitiful apology of the want of funds, or means, or agents, to effect those easier improvements, when women from the middle ranks of life—when quiet unassuming matrons, unaccustomed to business, or to any but domestic exertion, have, without funds, without agents, without aid or encouragement of any description, trusted themselves within the very centre of infection and despair, and, by opening their hearts only, and not their purses, have effected, by the mere force of kindness, gentleness, and compassion, a labor, the like to which does not remain to be performed, and which has smoothed the way, and ensured success, to all similar labors. We cannot envy the happiness which Mrs. Fry must enjoy from the consciousness of her own great achievements;—but there is no happiness or honor of which we should be so proud to be partakers: And we seem to relieve our own hearts of their share of national gratitude in thus placing on her simple and modest brow that truly civic crown, which far outshines the laurels of conquest, or the coronals of power—and can only be outshone itself by those wreaths of imperishable glory which await the champions of faith and charity in a

higher state of existence.'—Edinburgh Review, September, 1818.

We have been detained longer than we anticipated by the topics of Mr. Buxton's admirable volume; but they have enabled us to bring the great facts and elements of the subject before the reader.

Looking more at large into the subject, we shall find our English law to recognise from the earliest periods three great classes of prisoners—the debtor, the accused criminal, and the convicted criminal. It is clear that the imprisonment of each proceeds upon totally different principles, and there are even subdivisions of these classes of some importance. We imprison the man suspected of crime, for instance *solely* to secure his appearance on the day appointed for trial; it is matter of necessity, and the law has therefore only recourse to it where no adequate substitute by way of security can be provided; for, under the imputation of the heaviest crimes, it lodges a power with its higher officers of estimating and accepting such substitute. It is agreed, says Blackstone, that the Court of King's Bench, or any judge thereof in time of vacation, may bail for any crime whatsoever, be it treason, murder, or any other offence, according to the circumstances of the case. 4 Com. p. 299. We imprison the convict for punishment; and the debtor in execution partly for punishment of the fraud which he is presumed or proved to have committed on his creditor, and partly as a mode of compelling him to produce or render available for the discharge of his debts that property which cannot be directly reached. Though, however, the objects which the law has in view, in these three cases of imprisonment, are thus various, and though the duties which are incurred in consequence toward the unhappy subjects of it will naturally have proportionate varieties, yet in some respects they will be entirely the same; certain things are proper, certain things necessary in every prison, and for every prisoner.

In the first place a universal requisite is security; an insecure prison is a solecism in terms; on this point it would not be necessary to say a word, if all people were as well agreed in respect of the means as of the end. The ancient practice was to rely more upon fetters and manacles, than the walls of the prison or the vigilance of the gaoler; but the new prison bill enacts that 'no prisoner shall be put in irons by the keeper of any prison except in cases of urgent and absolute necessity, and the particulars of every such case shall be forthwith entered in the keeper's journal, and notice forthwith given thereof to one of the visiting justices; and the keeper shall not continue the use of irons on any prisoner longer than four days, without an order in writing from a visiting justice specifying the cause thereof.'—s. x. reg. 12. No one can doubt the propriety of such a regulation—we are satisfied that fettering the debtor or the accused criminal as a matter of course was always illegal; how far it stood within the protection of the law in the case of the convict seems not so clear. The common argument, that it is unlawful to exceed the terms of a sentence, and that a sentence of imprisonment says nothing of fetters, proves

nothing; the sentence says nothing of many other prison privations, the legality of which cannot be doubted; it is general in its terms, and includes every circumstance which goes to make up the idea of legal imprisonment, so that the question always comes round to what is legal imprisonment. Waiving, however, a legal discussion, which the statute just cited renders unnecessary, we agree with the warmest opposers of the practice that it was always inexpedient to iron even the convict, unless his own refractoriness or desperation made it necessary. Observation too will warrant us in going a step farther, and expressing an opinion that the frequent necessity for the use of fetters almost amounts to proof of some mismanagement in the prison in which it shall exist. It is not the least merit in the prison bill that, by the restrictions imposed on the use of them, greater care and more skillful management become necessary on the part of governors of prisons.

The next requisite of all prisons clearly is that they should be healthy and clean. Air and exercise, food and clothes such as are necessary for the sustentation of health, together with medicine and attendance when sick, stand upon the same principle; except in that short and awful interval which precedes execution, and which is spent in preparation for it, there can be no time or circumstance under which any prisoner may not demand all those things which are ordinarily necessary for the preservation of life. We are aware that, in some of these last particulars, we may be thought to push the claims of the prisoner farther than justice requires; there are those who deny in the whole any claim of right which he can set up to food, clothing or lodging, and others who, admitting the abstract right, would yet practically reduce the quantity and quality below the scale implied in our remarks. It is more difficult to decide, whether, in particular instances, the introduction of more generous food or greater comforts should be allowed according to other considerations than those of health; in other words, whether the ability of the party to purchase, or his industry and good behaviour, should procure him luxuries denied to his fellow-prisoners in general. There is long practice, and high authority in the favor of the affirmative; with regard to debtors, it is, we believe, universally allowed to them to procure from without any food or liquor, subject only to certain prohibitions and regulations; and as to prisoners who labor, it has long been the custom, in some of our best regulated prisons, to stimulate industry by allowing a portion of the profits earned by the prisoner to be spent by him in this way.

The prison bill steers a middle course, allowing the introduction of food, not extravagant or luxurious, to debtors, or accused criminals, who receive no allowance from the county; and prohibiting it in the case of convicts, except under the permission of the visiting justices, or the regulations of the quarter-sessions.—s. x. reg. 14 and 15. Mr. Holford asserts that, 'the prisoners whose labor is most productive in the Penitentiary at Millbank, are not those whose behaviour entitles them to most consid-

ration, or of whose eventual restoration with credit to society the chaplain entertains the most favorable expectation.' p. 53. It is obvious, indeed, that the system of allowing them in all cases a participation in the fruit of their labors, must be unfavorable in many respects to the reformation of prisoners; its tendency being to confirm in the habit of looking to immediate self-indulgence, as the motive for action, men who have already found that motive too strong for their prudence or their conscience. Such a system seems to us to be founded upon a mistaken view of many of the objects of imprisonment. Howard found one great evil of our prisons to be a total want of employment, and he described in very fascinating colors the appearance which those presented in which the prisoners were fully employed. Undoubtedly a salutary change was produced—the giving all prisoners an opportunity of working, and compelling some to work, were among the most efficient causes of the great improvement which has taken place in our prisons; but it is to mistake the means for the end, when prisons are estimated by the cheerful activity of the laborers, and the quantity of productive labor within their walls. A prison ought still to be a place of terror to those without, of punishment to those within; let us reform criminals if we can—it is a great and glorious object, uncertain in the result, but imperative in the obligation. Punishment, however, is certain; and it is one mode of punishment, severely felt by those who have led a life of self-indulgence, but unattended with any cruelty, to tie them down to a coarse, uniform diet. Two exceptions may be urged: we may be asked whether we would extend the rule to persons of the higher ranks of life, and convicted of offences such as libel, provocations to duel, &c., which ordinarily are understood to carry with them less of moral turpitude. We confess that we can see no reason for not carrying the rule so far; the health of the party must of course always be the first object, and it would be for the medical attendant to see that no change of habit was made so violent in its nature as to affect it; but rank or education ought not to lighten punishment; if they make the feelings more susceptible to an equal infliction, it must be remembered also that the moral restraint and social obligation were stronger, and that the violation of them merits a severer suffering. The case of debtors also may be here pressed; but, health being secured, we cannot say that there appears to us any injustice in subjecting them also to the mortification of their appetite. Every debtor in execution either can or cannot pay his creditor; if he can, and will not, preferring to spend in self-indulgence the substance which in truth belongs to his creditor, it is well that he should be prevented from gratifying so unjust a desire; if he cannot, then he is supposed to be in a state of destitution, and the prison allowance must be a relief to him.

We have been induced, from the importance of the subject, to hazard some repetition, after our extract from Mr. Buxton with regard to these rights of prisoners. But, waiving many minor, yet important considerations, such as the difficulty of preserving uniform discipline, or

consistent details in a prison, in which the prisoners are allowed a different scale of diet, varying according to their own fancies, we come to these conclusions—that all have a right to be fed, and that all should be confined to the same prison allowance, qualifying the rule in individual cases according to the directions of the medical officer of the prison; and, if any other variation be allowed, we should prefer the indulgence being granted as the reward of orderly behaviour, to the regulating it by the amount of the prisoner's earning.

The prisoner, of whatever description, has further claims to be protected from the corruption of bad society, and to be afforded an opportunity of performing uninterruptedly his religious duties.

Upon this head, of religious instruction and attendance, the prison bill has made a most important improvement in our criminal law. The duties of the chaplain are marked out with fullness and precision; the inmates of a gaol require, and they will henceforward receive, even more minute and constant attendance than the poor of the most favored parishes. He is made one of the most responsible and important officers of the prison; his salary is regulated, not extravagantly and yet liberally, with reference to the number of prisoners; a pension is provided for him in case of sickness, age, or infirmity; and the situation may be now made to present, if the magistracy are disposed to act in hearty accordance with the legislature, which we do not doubt, an ample, and not undesirable field for the exertion of zeal and talent in the Christian ministry. We have now stated, though not so concisely as we could have wished, the claims which we conceive prisoners of every description seem to us to have on the country: on the other hand, the rights which the country has over the inmates of its prisons will vary with the causes which place them there; but there are certain general powers which it may justly exercise in all cases.

It has a right to general order and decency within the prison; and for this purpose it may enforce proper discipline on every individual, and reasonably punish the breach of it. For the same purpose, it may regulate the prison hours, and the mode of employment of all the prisoners, even of those whom it has no power of compelling to labor, restricting it to such kinds of work as may be fittingly and wholesomely carried on within the walls, directing the sale of the produce, and apportioning the earnings in such manner as may best accord with the regulations of the place; it has a right to restrain the intercourse of the prisoners with each other, and to exercise an entire control over the visits of friends from without.

This last is a matter of importance, and of some difficulty; on the one hand, to deny even to the convicted prisoner al. intercourse with his family and friends is not merely a measure of great severity, requiring some clear advantage as its justification, but, in our opinion, is to throw away a powerful mean, under proper regulations, of encouragement and moral improvement;—on the other hand, it cannot be doubted that great injury is done to the discipline of the prison, and

to the public, by an indiscriminate admission of visitors. A prison whose gates are perpetually admitting idle spectators will necessarily lose half its terrors. Those salutary ideas of loathsomeness and misery which men associate with a gaol, and which naturally tend to the prevention of crime, cannot fail to be much weakened by a sight of the cleanliness and order, the decent apparel and seeming comfort, which are found within the walls; men commonly judge from what they see, and make little account of what they do not see, the solitude and wearisomeness, the hard fare and hard labor of the prisoners. They will therefore leave the prison, believing that the sufferings of confinement have been exaggerated; and what they believe they may act upon; or at least they will eagerly circulate the statement.

The notion of a fee on admission is rather strange to our feelings, but we take for granted that that is not the only requisite. The regulations of the Prison Bill, as we understand them, put the matter on the right footing; prisoners only committed for trial are to receive visits at proper times and under proper restrictions, settled by the governor, or visiting justices; and convicts only under such rules and regulations as may be determined on at the quarter-sessions.

In this part of our subject one more topic remains to be discussed, but of great importance, the employment of the prisoners. It is obvious that this can have reference only to those who are confined upon suspicion, or for punishment of crimes; but with regard to each of these classes great difference of opinion prevails as to the principle and the mode of enforcing it. The law and common sense agree in making a wide distinction between prison employment and hard labor. The former is undoubtedly desirable for all prisoners, and every proper and rational inducement should be held out to them to engage in it—inducements which experience warrants us in saying will scarcely ever fail of success. It is a question, however, to which late circumstances have attached some consequence, whether there is any legal power, directly or indirectly, to compel persons, either untried or sentenced simply to imprisonment, to labor. The general practice, we believe, varies much in this respect between these two classes; in a great, perhaps the greater number of prisons, in which the reformation of the prisoner is attempted, a convict sentenced to imprisonment only is directly or indirectly compelled to work as a part of prison discipline; but in scarcely any is the same rule observed with regard to persons only committed for trial. It would be as difficult, perhaps, to find a direct authority in law for compelling the convict to work as the untried prisoner; but many of the reasons which apply with great cogency against compulsion on the latter certainly do not exist in respect of the former. Where a man has been proved guilty of a crime against society, for which it is thought necessary to punish him by seclusion, society has a right to subject him to such discipline as may be thought likely to make him harmless to her interests when he shall be restored to liberty: this would warrant direct compulsion. And, as to the indirect compulsion of withholding

sustenance from him if he refuses to earn it by labor, there can be no injustice in this, for he can have no positive claim to maintenance; it is true that he has been withdrawn from his trade or occupation, but that is a necessary part of the punishment of his crime, the forfeiture of the means of resorting to his former mode of earning a livelihood. But with a man committed only on suspicion, whom the law still presumes to be innocent, and deprives of liberty only because it sees no other mode of securing his appearance at the day of trial, all the reason is in favor of his immunity from every other privation or interference. Direct compulsion, we believe, has not been attempted; the only ground on which it could be put would be the enforcement of discipline; and undoubtedly that must be preserved, if necessary, over every prisoner. We are not, therefore, disposed to deny, that for riot or disorderly behaviour an unconvicted criminal may, from the necessity of the case, be treated as a convict; in whatever character he comes, he is bound so far to submit to the laws of the place, as not to interfere with the peace and good order of others. But this is an argument which will never justify the compulsory labor of a peaceable and orderly, but slothful or even obstinate prisoner.

With respect to hard labor as a useful mode of punishment and correction there cannot well be much difference of opinion. When, however, this subject first attracted the public attention, the benevolent individuals in different counties who took the largest share in directing the measure, 'seldom ventured (as Sir George Paul says) to turn their eyes from income and profit to a county rate; every house of correction was to become a busy manufactory, and to maintain itself.' Much as we are advocates for industry in prisoners, and economy of public money, we think both may be purchased too dearly; and we are not sorry, we confess, that in almost every place in which the manufactory-system has been tried it has proved, if not a failing concern on the whole, yet certainly far less profitable than was expected. We do not, of course, mean to condemn all profitable labor of the prisoners, but we are anxious that it should never be the primary object; in truth the best economy is in that system which produces the fewest recommitments, and prevents the most crimes.

The tread-wheel is an invention which has certainly been exposed to most unfounded attacks, and perhaps been praised far beyond its real merits, but which we do not hesitate to pronounce an important instrument of prison discipline. The fifth Report of the Society for the Improvement of Prison Discipline is before us, and it is in no part more sensible or instructive than in what it communicates on this subject; on which, as might be expected, a great deal of ignorance prevails: and although almost every tread-wheel varies practically in the quantity of labor which it imposes, and consequently in a great measure in the effect which it is calculated to produce, the machine is praised or blamed as if it were one thing, the same in every prison. The labor of the wheel it should be remembered is by ascending steps, and the amount of ascent made must

depend on the number of hours employed, the velocity of the wheel (which, when there is no fly-regulator, will also vary with the number of men on it at the same time), the distance from step to step, and the proportion of those out of each gang who are on the wheel at one time, to those who are off. It is obvious, therefore, that what may be very true of one wheel may be entirely false of another. Thus, to select a few instances out of many, at Lewes each prisoner works at the rate of 6600 feet in ascent per day; at Ipswich, 7450; at St. Albans, 8000; at Bury, 8950; at Cambridge, 10,175; at Durham, 12,000; at Brixton, Guildford, and Reading the summer rate exceeds 13,000; while at Warwick the summer rate will be 17,000 feet in ten hours, if the present resolution be adhered to; which, upon reflection, we are quite sure it never will, as no strength could long endure such labor. In addition to these immense differences, those of the dietaries must also be taken into the account. Our remarks shall be confined to the principle of this machine considered generally.

Assuming then that it will be used with discretion and humanity, we will state what we conceive to be its disadvantages and advantages. In the first place, it is inapplicable to prisoners under long confinements; there is in it at once so much irksomeness, sameness, and real fatigue, that, after subduing a stubborn spirit, we should be afraid, with long continuance, it might go on almost to stupify the intellect; for, while the body labors, the mind is wholly unemployed. But, even if this be thought an extreme apprehension, it must be admitted that it not only teaches no trade or occupation by which a livelihood may afterwards be earned, but must in some measure render the parties less fit for manual labor by disuse of those parts and muscles of the body which are employed in handicraft trades. Making these deductions, of which the latter is capable of an answer when we limit the use of the tread-wheel to confinements of a short duration, in which a trade could not be learned, nor the body lose its aptness for one to which it had been accustomed, the advantages seem to be, that the tread-wheel is labor indeed, dreaded in the prospect, irksome in endurance, and remembered with disgust; that it has never failed to subdue the most turbulent spirit; that, requiring no instruction, every man who can walk may be set upon it from the moment that his sentence is pronounced; that he cannot avoid his portion of labor, the wheel turning by weight and not by exertion; that the occupation is so unceasing that conversation between the prisoners is much restrained; that it may without injury be employed for many hours in the day, and with a very little expense in the open air; that it affords great advantages for inspection, and thereby much facilitates the duties of the governor. Under these impressions, and with these restrictions, we cannot but say that we shall be glad to hear of the erection of a tread-wheel in every considerable prison in the country.

We conclude in the words of the Fifth Report:—"Of the progress of information and of public feeling, within these few years, on the subject of prison discipline, the former Reports

of this Society bear ample testimony. Parliamentary interference, the exertions of the magistracy, and diligence of enquiry, have combined to bring the subject prominently before the public mind. The principles on which punishments are enforced have undergone the deliberate investigation of the legislature. It is the general feeling that the unconvicted should be treated with as much lenity as is compatible with the safe custody of his person, and the good order of the prison; whilst, upon those on whom the law inflicts punishment, a salutary system of discipline ought to be enforced; that, in the treatment of the convicted, no severity should be allowed that is not warranted by the laws, nor consistent with justice; that the prevention of crime is the ultimate object of imprisonment, and that to attain this end it is necessary to insure the reformation, as well as the punishment of the prisoner. Uniform severity, it is generally admitted, hardens the offender, and prepares him for the perpetration of further crimes. It is necessary not only to inspire terror, but to kindle hope—to impress upon the mind not only a sense of guilt, but the love of virtue; and to implant those principles, and cherish those feelings, which religion only can impart.

The separate discipline of the common gaol, the House of Correction, and the Hulk or Penitentiary, might here be adverted to; but on this subject we can only refer to the Quarterly Review, No. LX., and the Reports of the Society for the Improvement of Prison Discipline.

PRISTINE, *adj.* Lat. *pristinus*. First; ancient; original.

Now their *pristine* worth

The Britons recollect.

Philips.

This light being trajected only through the parallel superficies of the two prisms, if it suffered any change by the refraction of one superficies, it lost that impression by the contrary refraction of the other superficies, and so, being restored to its *pristine* constitution, became of the same nature and condition as at first.

Newton.

PRISTIS, in ichthyology, the sawfish, is generally considered as a species of the squalus, or shark genus, comprehending under it several varieties. Mr. Latham, however, is of opinion that it ought to be considered as a distinct genus itself, and that the characteristics of the several varieties are sufficient to constitute them distinct species. He ranks it as a genus belonging to the order of amphibia nantes. Its characters are these: a plain long snout, with spines growing like teeth out of both edges; four or five spiracula, or breathing apertures, in the sides of the neck: the body is oblong and almost round, with a tough coriaceous skin; the mouth is situated in the lower part of the head; and the nostrils, before the mouth, are half covered with a membranaceous lobe; behind the eyes are two oval noles; the ventral fins approach one another, and in the male are placed about the organs of generation; there are no fins at the anus. Of this genus our author enumerates five species:

1. *P. antiquorum*. The head is rather flat at top; the eyes large, with yellow irides; behind each is a hole, which some have supposed may lead to an organ of hearing. The mouth is well

furnished with teeth, but they are blunt, serving rather to bruise its prey than to divide it by cutting. Before the mouth are two foramina, supposed to be the nostrils. The rostrum, beak, or snout, is in general about one-third of the total length of the fish, and contains in some eighteen, in others as far as twenty-three or twenty-four spines on each side; these are very stout, much thicker at the back part, and channelled, inclining to an edge forwards. The fins are seven in number—viz. two dorsal, placed at some distance from each other—two pectoral, taking rise just behind the breathing-holes, which are five in number—two ventral, situated almost underneath the first dorsal—and, lastly, the caudal, occupying the tail both above and beneath, but longest on the upper part. The general color of the body is a dull gray, or brownish, growing paler as it approaches the belly, where it is nearly white.

2. *P. cirratus*, of which, continues our author, we have only met with one specimen, which was brought from Port Jackson in New Holland. It is a male, and the total length about forty inches: the snout, from the tip of it to the eye, eleven: the spines widely different from any of the others; they are indeed placed, as usual, on the edge, but are continued on each side even beyond the eyes. The longer ones are slender, sharp, somewhat bent, and about twenty in number, and between these are others not half the length of the primal ones, between some three or four, between others as far as six; and in general the middle one of these smaller series is the longest: besides these a series of minute ones may be perceived beneath, at the very edge. In the snout, likewise, another singularity occurs:—about the middle of it on each side, near the edge, arises a flexible ligamentous cord, about three inches long, like the beards at the mouth of some of the gadus or cod genus, and as pliant in the recent state. The color of the fish is a pale brown: the breathing apertures four: the mouth furnished with five rows of minute, but very sharp teeth.

3. *P. cuspidatus*. Of this our author has seen only two specimens, the one about a foot and a half in length, and the other more than two feet and a half. In both of these were twenty-eight spines on each side; but the distinguishing feature is the spines themselves, being particularly flat and broad, and shaped at the point more like the lancet used by surgeons in bleeding, than any other figure.

4. *P. microdon*. Of this species the total length is twenty-eight inches, the snout occupying ten; from the base of this to that of the pectoral fins four inches; between the pectoral and ventral fins six. The two dorsal fins occupy nearly the same proportions in respect to each other; but the hinder one is the smallest, and all of them are greatly hollowed out at the back part, much more so than in the two first species. The snout differs from that of every other in several particulars; it is longer in proportion, being more than one-third of the whole fish. The spines do not stand out from the sides more than a quarter of an inch, and from this circumstance seem far less capable of doing injury than any other species yet known.

5. *P. pectinatus*. This, with the first species, grows to the largest size of any that have yet come under the inspection of the naturalist, some specimens measuring fifteen feet in length. The *pectinatus* differs from the *P. antiquorum* in having the snout more narrow in proportion at the base, and the whole of it more slender in all its parts; whereas the first is very broad at the base, and tapers considerably thence to the point. The spines on each side also are longer and more slender, and vary from twenty-five to thirty-four in the different specimens.

PRITHEE. A corruption of pray thee, or I pray thee.

Well, what was that scream for, *I prithee?*

L'Esrange.

Alas! why comest thou at this dreadful moment, To shock the peace of my departing soul?

Away! *I prithee* leave me! *Rowe's Jane Shore.*

PRIVASET, a small town in the department of the Dordogne, France, remarkable for the grotto of Miremont, which is at a little distance from it, and which is considered as the finest in the kingdom. It is situated about two-thirds up an extremely barren hill; its depth from the entrance to the extremity of the largest branch is 545 fathoms, and the extent of all its ramifications 2170 fathoms. If the different windings of the grotto and those which the traveller usually makes in order to observe the objects attached to the sides, were reckoned, they would amount to more than six miles; and it would be dangerous to adventure far into it, without the assistance of a guide accustomed to the place.

PRIVATE, *adj.* & *n. s.*

PRIVACY, *n. s.*

PRIVADO,

PRIVATEER, *n. s.* & *v. a.*

PRIVATELY, *adv.*

PRIVATENESS, *n. s.*

Lat. privatus. } *Lat. privatus.*
 } *cret; reserved; concealed; alone; particular; Shakespeare uses the noun substantive for a private message: privacy and privateness mean secrecy; retirement; state of being concealed or unexposed; it is used, by Arbuthnot improperly, for privacy: privado is adopted from the Spanish by Bacon for a private friend: a privateer is a vessel fitted out by private individuals against a public enemy: to privateer is to fit out or conduct such a vessel: privately follows the senses of private, adj.*

And, as he sat upon the Mount of Olives, the disciples came unto him *privately.* *Matthew xxiv. 3.*

To correct the particular faults of *private* men, would be a work too infinite; yet some there be of that nature, that though they be in *private* men, yet their evil reacheth to a general hurt, as the extortion of sheriffs, and their sub-sheriffs and bailiffs, the corruption of victuallers, &c. *Spenser.*

When publick consent of the whole hath established any thing, every man's judgment, being thereunto compared, were *private*, howsoever his calling be to some kind of public charge; so that of peace and quietness there is not any way possible, unless the probable voice of every entire society or body politick overrule all *private* of like nature in the same body. *Hooker's Preface.*

You shall go with me;

have some *private* schooling for you both.

Shakspeare.

What infinite heartease must kings neglect,

That *private* men enjoy? and what have kings,

That *private* have not too, save ceremony? *Id.*

His *private* with me of the dauphin's love,
 Is much more general than these lines impart. *Id.*

There, this night,

We'll pass the business *privately* and well. *Id.*
 Ambassadors attending the court in great number, he did content with courtesy, reward, and *privateness.* *Bacon.*

The lady Brampton, an English lady, embarked for Portugal at that time, with some *privado* of her own. *Id.*

He drew him into the fatal circle from a resolved *privateness*, where he bent his mind to a retired course. *Wotton.*

Peter was but a *private* man, and not to be any way compared with the dukes of his house.

Peacham of Antiquities.

Even the *privatest* person may shine forth in good counsel. *Bp. Hall.*

My end being *private*, I have not expressed my conceptions in the language of the schools. *Digby.*

Fancy retires

Into her *private* cell, where nature rests. *Milton.*
 Clamours our *privacies* uneasy make,
 Birds leave their nests disturbed, and beasts their haunts forsake. *Dryden.*

Dare you,

A *private* man, presume to love a queen? *Id.*
Private, or secret prayer, is that which is used by a man alone apart from all others. *Duty of Man.*

Her sacred *privacies* all open lie,

To each profane enquiring vulgar eye. *Rowe.*
 You see Frog is religiously true to his bargain, scorns to hearken to any composition, without your *privacy.* *Arbuthnot.*

In *private* grieve, but with a careless scorn;

In publick seem to triumph, not to mourn.

Granville.

The first principles of Christian religion should not be forced with school points and *private* tenets. *Saunderson.*

He is at no charge for a fleet, further than providing *privateers*, wherewith his subjects carry on a piratical war at their own expense.

Swift's Miscellanies.

Fame, not contented with her broad highway,
 Delights, for change, through *private* paths to stray. *Harte.*

PRIVATEERS are a kind of private men of war, the persons concerned wherein administer at their own costs a part of a war, by fitting out these ships of force, and providing them with all military stores; and they have, instead of pay, leave to keep what they take from the enemy, allowing the admiral his share, &c. *Privateers* may not attempt any thing against the laws of nations; as to assault an enemy in a port or haven, under the protection of any prince or republic, whether he be friend, ally, or neutral; for the peace of such places must be inviolably kept; therefore, before a commission shall be granted to any privateer, the commander is to give security, if the ship be not above 150 tons, in £1500, and, if the ship exceeds that burden, in £3000, that they will make satisfaction for all damages which they shall commit in their courses at sea contrary to the treaties with any state, on pain of forfeiting their commissions; and the ship is made liable. Besides these *private* commissions, there are special commissions for privateers, granted to commanders of ships, &c., who receive pay, are under marine discipline, and, if they do not obey their orders,

may be punished with death. In case we are at war with more potentates than one, privateers must have commissions for acting against each of them; otherwise, if a captain, carrying only one against the Danes, should in his course meet with and take a Frenchman, this prize is not good, but would be taken from him by any man of war he met, and could not be condemned (for him) in the admiralty. Ships taken by privateers were to be divided into five parts; four parts whereof go to the persons interested in the privateer, and the fifth to his majesty. By statute the lord admiral, or commissioners of the admiralty, may grant commissions to commanders of privateers for taking ships, &c., which being adjudged prizes, and the tenth part paid to the admiral, &c., wholly belong to the owners of the privateers and the captors, in proportions agreed on between themselves.

PRIVATION, *n. s.* } Fr. *privation*; Lat. *privatio*. Removal or
PRIVATIVE, *adj. & n. s.* }
PRIVATIVELY, *adv.* } destruction of any thing or quality; removal from office: privative is causing removal, obstruction, or absence of something; that of which the absence of some other thing forms the chief idea: privatively is negatively.

If part of the people or estate be somewhat in the election, you cannot make them nulls or cyphers in the *privation* or translation. *Bacon.*

Harmonical sounds and discordant sounds are both active and positive, but blackness and darkness are indeed but *privatives*, and therefore have little or no activity; somewhat they do contristate, but very little. *Id. Natural History.*

For, what is this contagious sin of kind,
 But a *privation* of that grace within? *Davies.*
 The duty of the new covenant is set down, first *privatively*, not like that of Mosaic observances external, but positively, laws given into the minds and hearts. *Hammond.*

The very *privative* blessings, the blessings of immunity, safeguard, liberty, and integrity, which we enjoy, deserve the thanksgiving of a whole life. *Taylor.*

So bounded are our natural desires,
 That wanting all, and setting pain aside,
 With bare *privation* sense is satisfied. *Dryden.*
 After some account of good, evil will be known by consequence, as being only a *privation* or absence of good. *South.*

A *privation* is the absence of what does naturally belong to the thing, or which ought to be present with it; as when a man or horse is deaf or dead, or a physician or divine unlearned; these are *privations*. *Watts's Logick.*

PRIVERNUM, a town of the Volsci, in Latium, east of Setia. Having revolted from the Romans, their ambassadors were asked, what punishment they themselves thought they deserved? They answered what those deserve who deem themselves worthy of liberty. Being asked, should the punishment be remitted, what peace was to be expected with them? they replied, If you grant a favorable peace, you may hope to have it sincere and lasting; but, if a bad one, you may expect it of short continuance. The Romans were so far from being displeas'd, that by a vote of the people they had the freedom of the city granted them. The town is now called **PIPERNO**. See that article.

PRIVET, in botany. See **LIGUSTRUM**.

PRIVET, EVERGREEN. See **RHAMNUS**.

PRIVILEGE, *n. s. & v. a.* Fr. *privilege*; Lat. *privilegium*. Peculiar advantage or right; immunity: to invest with peculiar rights or immunities.

The court is rather deemed as a *privileged* place of unbridled licentiousness, than as the abiding of him who, as a father, should give a fatherly example. *Sidney.*

Here's my sword,
 Behold it is the *privilege* of mine honours,
 My oath, and my profession. *Shakespeare.*
 He took this place for sanctuary,
 And it shall *privilege* him from your hands. *Id.*
 This place
 Doth *privilege* me, speak what reason will. *Daniel.*

He claims his *privilege*, and says 'tis fit,
 Nothing should be the judge of wit, but wit. *Denham.*

He went
 Invisible, yet stayed, such *privilege*
 Hath omnipresence. *Milton.*
 Many things are by our laws *privileged* from tythes,
 which by the canon law are chargeable. *Hale.*

When the chief captain ordered him to be scourged uncondemned, he pleads the legal *privilege* of a Roman, who ought not to be treated so. *Kettlewell.*

Smiles, not allowed to beasts, from reason move,
 And are the *privilege* of human love. *Dryden.*

The great are *privileged* alone,
 To punish all injustice but their own. *Id.*
 The *privilege* of birth-right was a double portion. *Locke.*

He happier yet, who *privileged* by fate
 To shorter labour, and a lighter weight,
 Received but yesterday the gift of breath,
 Ordained to-morrow to return to death. *Prior.*

As infallibility is no *privilege* of the human nature, it is no diminution to a man's good sense or judgment to be found in an error, provided he is willing to retract it. *Mason.*

PRIVY, *adj. & n. s.* } Fr. *privé*. Private;
PRIVILY, *adv.* } assigned to secret uses;
PRIVITY, *n. s.* } admitted to secrets; made
 conscious of: place of retirement, or for secret use: privily is, secretly; privately: privity, private communication; consciousness; joint knowledge; a secret part.

The sword of the great men that are slain entereth into their *privy* chamber. *Ezekiel* xxi. 14.

They have the profits of their lands by pretence of conveyances thereof unto their *privy* friends, who *privily* send them the revenues. *Spenser's State of Ireland.*

I will unto you in *privy* discover the drift of my purpose; I mean thereby to settle an eternal peace in that country, and also to make it very profitable to her majesty. *Spenser.*

The authority of higher powers hath force even in these things which are done without their *privy*, and are of mean reckoning. *Hooker.*

Upon this French going out, took he upon him, Without the *privy* of the king, 't' appoint Who should attend him. *Shakespeare. Henry VIII.*

The party, 'gainst the which he doth contrive,
 Shall seize on half his goods; the other half
 Comes to the *privy* coffer of the state. *Shakespeare.*

Sir Valentine
 This night intends to steal away your daughter;
 Myself am one made *privy* to the plot. *Id.*

Few of them have any thing to cover their *privities*.

Abbot.

Many being *privy* to the fact,
How hard is it to keep it unbetrayed?

Daniel.

One, having let his beard grow from the martyrdom of king Charles I. till the Restoration, desired to be made a *privy* counsellor.

Spectator.

All the doors were laid open for his departure, not without the *privy* of the prince of Orange, concluding that the kingdom might better be settled in his absence.

Swift.

He would rather lose half of his kingdom, than be *privy* to such a secret, which he commanded me never to mention.

Id.

Your fancy

Would still the same ideas give ye,
As when you spied her on the *privy*.

Id.

PRIVY COUNCIL. See **COUNCIL.** The king's will is the sole constituent of a *privy* counsellor; and it also regulates their number, which in ancient times was about twelve. Afterwards it was increased to so large a number that it was found inconvenient for secrecy and despatch; and therefore Charles II. in 1679 limited it to thirty, whereof fifteen were principal officers of state, and to be counsellors *ex officio*; and the other fifteen were composed of ten lords, and five commoners of the king's choosing. Since that time, however, the number has been much augmented, and now continues indefinite. At the same time also the ancient office of lord president of the council was revived, in the person of Anthony earl of Shaftesbury. *Privy* counsellors are made by the king's nomination, without either patent or grant. Any natural born subject of Great Britain is capable of being a member of the *privy* council, taking the proper oaths for security of the government. By the act of settlement, 12 and 13 W. III. c. 2, it is enacted that no person born out of the dominions of the crown of England, unless born of English parents, even though naturalised by parliament, shall be capable of being of the *privy* council. The duty of a *privy* counsellor appears from the oath of office, which consists of seven articles. 1. To advise the king according to the best of his cunning and discretion. 2. To advise for the king's honor and good of the public, without partiality, through affection, love, meed, doubt, or dread. 3. To keep the king's council secret. 4. To avoid corruption. 5. To help and strengthen the execution of what shall be there resolved. 6. To withstand all persons who would attempt the contrary. And, lastly, in general, 7. To observe, keep, and do all that a good and true counsellor ought to do to his sovereign lord. The *privy* council is the *primum mobile* of the state, and that which gives the motion and direction to all the inferior parts. It is likewise a court of justice of great antiquity: the primitive and ordinary way of government in England being by the king and *privy* council. It has been frequently used by all our kings for determining controversies of great importance; the ordinary judges have sometimes declined giving judgment, till they had consulted the king and *privy* council; and the parliament have frequently referred matters of high moment to the same, as being, by long experience, better able to judge of, and by their

secrecy and expedition to transact some state affairs, than the lords and commons. At present the *privy* council takes cognizance of few or no matters except such as cannot be well determined by the known laws and ordinary courts; such as matters of complaint and sudden emergencies: their constant business being to consult for the public good in affairs of state. This power of the *privy* council is to enquire into all offences against the government, and to commit the offenders to safe custody, in order to take their trial in some of the courts of law. But their jurisdiction herein is only to enquire, and not to punish; and the persons committed by them are entitled to their *habeas corpus* by stat. 16 Car. I. c. 10, as much as if committed by an ordinary justice of the peace. In plantation or admiralty causes, which arise out of the jurisdiction of this kingdom, and in matters of lunacy and idiocy, the *privy* council has cognizance, even in questions of extensive property, being the court of appeal in such cases; or rather the appeal lies to the king's majesty himself in council. From all the dominions of the crown, excepting Great Britain and Ireland, an appellate jurisdiction (in the last resort) is vested in this tribunal; which usually exercises its judicial authority in a committee of the whole *privy* council, who hear the allegations and proofs, and make their report to his majesty in council, by whom the judgment is finally given. Anciently, to strike in the house of a *privy* counsellor, or elsewhere in his presence, was grievously punished: by 3 Hen. VII. c. 14, if any of the king's servants of his household conspire or imagine to take away the life of a *privy* counsellor, it is felony, though nothing shall be done upon it; and by 9 Ann. c. 16, it is enacted that any person who shall unlawfully attempt to kill, or shall unlawfully assault, and strike or wound any *privy* counsellor in the execution of his office, shall be felons, and suffer death as such. With advice of this council, the king issues proclamations that bind the subject, provided they be not contrary to law. In debates, the lowest delivers his opinion first, the king last, and thereby determines the matter. A council is never held without the presence of a minister of state. The dissolution of the *privy* council depends upon the king's pleasure; and he may, whenever he thinks proper, discharge any particular member, or the whole of it, and appoint another. By the common law also it was dissolved *ipso facto* by the king's demise, as deriving all its authority from him. But now, to prevent the inconveniences of having no council in being at the accession of a new prince, it is enacted by 6 Ann. c. 7, that the *privy* council shall continue for six months after the demise of the crown, unless sooner determined by the successor. Blackstone's Commentaries, book. i. p. 220, &c. The officers of the *privy* council are four clerks of the council in ordinary, three clerks extraordinary, a keeper of the records, and two keepers of the council chamber. See **PRESIDENT**.

PRIVY COUNSELLOR, a member of the *privy* council.

PRIVY SEAL, a seal which the king uses previously to such grants, &c., as are afterwards to pass the great seal. The *privy* seal is also some

times used in matters of less consequence, which do not require the great seal.

PRIZE, *n. s. & v. a.* } Fr. *prix*; Teut. *preiss*;
PRIZER, } Lat. *pretium*. Reward;
PRIZE-FIGHTER. } something gained in contest or adventure; value; price: to rate; value; esteem: prizier is he who values: prize-fighter, he who publicly fights for hire or reward.

A goodly price that I was *prized* at of them.
Zechariah xi. 13.

The king of Scots she did send to France,
To fill king Edward's fame with prisoner kings,
And make his chronicle as rich with *prize*,
As is the ozy bottom of the sea
With sunken wreck. *Shakespeare. Henry V.*
Life I *prize* not a straw; but for mine honour
Which I would free. *Shakespeare.*

It holds its estimate and dignity,
As well wherein 'tis precious of itself,
As in the *prizer*. *Id. Troilus and Cressida.*
Age, that all men overcomes, has made his *prize*
on thee. *Chapman.*

True poets empty fame and praise despise;
Fame is the trumpet, but your smile the *prize*.
Dryden.

I go to free us both of pain;
I *prized* your person, but your crown disdain. *Id.*

The raising such silly competitions among the ignorant, proposing *prizes* for such useless accomplishments, and inspiring them with such absurd ideas of superiority, has in it something immoral as well as ridiculous. *Addison.*

He acquitted himself like a valiant, but not like an honest man; for he converted the *prizes* to his own use. *Arbutnot.*

Martin and Crambe engaged like *prizefighters*.
Id. and Pope.

Then prostrate falls, and begs with ardent eyes
Soon to obtain and long possess the *prize*. *Pope.*

Some the French writers, some our own despise;
The ancients only, or the moderns *prize*. *Id.*

They are not indeed suffered to dispute with us the proud *prizes* of arts and sciences, of learning and elegance, in which I have much suspicion they would often prove our superiours. *Law.*

So strong the zeal to immortalize himself
Beats in the breast of man, that e'en a few,
Few transient years, won from the' abyss abhorred
Of blank oblivion, seem a glorious *prize*,
And even to a clown. *Cowper.*

PRIZE [*prise*, French, i. e. taken], in maritime affairs, a vessel taken at sea from the enemies of a state, or from pirates; and that either by a man of war, or privateer, &c., having a commission for that purpose. Vessels are looked on as prizes if they fight under any other standard than that of the state from which they have their commission; if they have no charter party, invoice, or bill of lading aboard; if laden with effects belonging to the king's enemies, or with contraband goods. In ships of war the prizes are to be divided among the officers, seamen, &c., as his majesty shall appoint by proclamation; but, among privateers, the division is according to the agreement between the owners. By stat. 13 Geo. II. c. 4, judges and officers failing of their duty in respect to the condemnation of prizes, forfeit £500 with full costs of suit; one moiety to the king, and the other to the informer.

PRO. Lat. *pro*. For; in defence of; *pro* and *con*, for *pro* and *contra*, for and against.

Doctrinal points in controversy had been agitated in the pulpits with more warmth than had used to be; and thence the animosity increased in books *pro* and *con*. *Clarendon.*

Matthew met Richard, when
Of many knotty points they spoke,
And *pro* and *con* by turns they took. *Prior.*

PROA, flying, in navigation, a vessel used in the South Seas, so named because, with a brisk trade wind, it sails nearly twenty miles an hour. In the construction of the proa, the head and stern are exactly alike, but the sides are very different; the side intended to be always the lee-side being flat; and the windward side made rounding, in the manner of other vessels; and to prevent her oversetting, which from her small breadth, and the straight run of her leeward side, would without this precaution infallibly happen, there is a frame laid out to her from windward, to the end of which is fastened a log, fashioned into the shape of a small boat, and made hollow. The weight of the frame is intended to balance the proa, and the small boat is by its buoyancy (as it is always in the water) to prevent her oversetting to windward; and this frame is usually called an outrigger. The body of the vessel is made of two pieces joined end-wise, and sewed together with bark, for there is no iron used about her; she is about two inches thick at the bottom, which at the gunwale is reduced to less than one. The sail is made of matting, and the mast, yard, boom, and outriggers, are all made of bamboo.

Their rigging consists of two stays that set up at the ends of the proa, and four shrouds that set up at the four corners of the frame. The sail is shaped like a settee-sail; and the lower end of the yard is confined forward in a shoe-block. In going about they keep her way, so that the stern becomes the head; and, to shift the sail, the yard is raised, and the lower end taken along the gunwale, and fixed in a shoe-block as before; the boom is shifted at the same, by slackening the sheet, and peaking the boom up along the mast; then, by hauling upon another sheet, the end of the boom is brought to the place where the lower yard-arm was before, and is hauled aft at the other end. They are steered by paddles at each end.

PROBABLE, *adj.* } Fr. *probable*; Lat. *pro-*
PROBABILITY, *n. s.* } *babilis*. Likely; having
PROBABLY, *adv.* } more evidence than the
contrary: the noun substantive and adverb corresponding.

As for *probabilities*, what thing was there ever set down so agreeable with sound reason, but some *probable* shew against it might be made? *Hooker.*

The public approbation, given by the body of this whole church unto those things which are established, doth make it but *probable* that they are good, and therefore unto a necessary proof that they are not good it must give place. *Id.*

The only reasonable inquiry is, which is of *probables* the most, or of *improbables* the least such.

The reason why men are moved to believe a *probability* of gain by adventuring their stock into such foreign countries as they have never seen, and of which they have had no trial, is from the testimony of other credible persons. *Wilkins*

I do not say that the principles of religion are merely *probable*; I have before asserted them to be morally certain: and that to a man who is careful to preserve his mind free from prejudice, and to consider, they will appear unquestionable, and the deductions from them demonstrable. *Id.*

Though moral certainty be sometimes taken for a high degree of *probability*, which can only produce a doubtful assent; yet it is also frequently used for a firm assent to a thing upon such grounds as fully satisfy a prudent man. *Tillotson.*

If you like not my poem, the fault may possibly be in my writing; but more *probably* 'tis in your morals, which cannot bear the truth of it. *Dryden.*

Distinguish betwixt what may possibly, and what will *probably*, be done. *L'Estrange's Fables.*

Probability is the appearance of the agreement or disagreement of two ideas, by the intervention of proofs, whose connection is not constant; but appears for the most part to be so. *Locke.*

If a truth be certain, and thwart interest, it will quickly fetch it down to but a *probability*; nay, if it does not carry with it an impregnable evidence, it will go near to debase it to a downright falsity. *South.*

They assented to things that were neither evident nor certain, but only *probable*; for they conversed, they merchandized, upon a *probable* persuasion of the honesty and truth of those whom they corresponded with. *Id.*

Our constitution in church or state could not *probably* have been long preserved without such methods. *Swift.*

Which tempers, if they were duly improved by proper studies, and sober methods of education, would in all *probability* carry them to greater heights of piety than are to be found amongst the generality of men. *Law.*

PROBAT, or PROBATE, of a will or testament, in law, is the exhibiting and proving of last wills and testaments before the ecclesiastical judge delegated by the bishop, who is ordinary of the place where the party died.

PROBATION, *n. s.* } Fr. *probation*; Lat. PROBATIONARY, *adj.* } *probatio*, from Lat. PROBATIONER, *n. s.* } *bo*. Proof; testimony; PROBATIONERSHIP, } act or time of proving, PROBATORY, *adj.* } or of trial: probationary and probatory mean serving for trial: probationer, one who is on his trial; hence, a novice: probationership, his state or time of trial; noviciate.

Of the truth herein,

This present object made *probation*.

Shakespeare. Hamlet.

In the practical part of knowledge, much will be left to experience and *probation*, whereunto indication cannot so fully reach. *Bacon's Natural History.*

This root of bitterness was but a *probationer* in the soil; and, though it set forth some offsets to preserve its kind, yet Satan was fain to cherish them. *Decay of Piety.*

Job's afflictions were no vindictory punishments, but *probatory* chastisements to make trial of his graces. *Bramhall.*

The kinds of *probation* for several things being as much disproportioned as the objects of the several senses are to one another. *Wilkins.*

Hear a mortal muse thy praise rehearse,

In no ignoble verse;

But such as thy own verse did practise here,

When thy first fruits of poesy were given,

To make thyself a welcome inmate there;

While yet a young *probationer*,

And candidate of heaven. *Dryden.*

When these principles, what is, is, and it is impossible for the same thing to be and not to be, are made use of in the *probation* of propositions, wherein are words standing for complex ideas, as man or horse, there they make men receive and retain falsehood for manifest truth. *Locke.*

He has afforded us only the twilight of *probability*, suitable to that state of mediocrity and *probationer*-ship he has been pleased to place us in here, wherein to check our over-confidence. *Id.*

At the end of the world, when the state of our trial and *probation* shall be finished, it will be a proper season for the distribution of publick justice. *Nelson.*

I suffer many things as an author militant, whereof, in your days of *probation*, you have been a sharer. *Pope to Swift.*

Build a thousand churches, where these *probationers* may read their wall lectures. *Swift.*

PROBATION, in the universities, is the examination and trial of a student who is about to take his degrees.

PROBATION, in the monastic sense, signifies the year of a noviciate, which a religious must pass in a convent to prove his virtue and vocation, and whether he can bear the severities of the rule.

PROBATIONER, in the church of Scotland, a student in divinity, who, bringing a certificate from a professor in a university of his good morals, and his having performed his exercises to approbation, is admitted to undergo several trials; and, upon his acquitting himself properly in these, receives a license to preach.

PROBATUM EST. Lat. *probatum est*. A phrase added to the end of a receipt, signifying it is tried or proved.

Vain the concern that you express,

That uncall'd Alard will possess

Your house and coach both day and night,

And that Macbeth was haunted less

By Banquo's restless sprite:

Lend him but fifty louis d'or,

And you shall never see him more;

Take my advice, *probatum est*.

Why do the gods indulge our store,

But to secure our rest? *Prior.*

PROBE, *n. s.* } Lat. *probo*. A slender

PROBE-SCISSORS, } wire by which surgeons

search the depth of wounds: probe-scissors, are scissors attached to a probe.

A round white stone was lodged, which was so fastened in that part, that the physician with his probe could not stir it. *Fell.*

He'd raise a blush where secret vice he found;

And tickle while he gently *probed* the wound. *Dryden.*

Nothing can be more painful, than to *probe* and search a purulent old sore to the bottom. *South.*

I made search with a *probe*.

Wiseman's Surgery.

The sinus was snipt up with *probe-scissors*.

Wiseman.

PROBITY, *n. s.* Fr. *probité*; Lat. *probitas* Honesty; sincerity; veracity.

The truth of our Lord's ascension might be deduced from the *probité* of the apostles. *Fiddes.*

So near approach we their celestial kind,
By justice, truth, and *probité* of mind. *Pope.*

PROBLEM, *n. s.* } French *probleme*;

PROBLEMATICAL, *adj.* } Gr. *προβλημα*. A

PROBLEMATICALLY, *adv.* } question proposed:

problematical is, uncertain; questionable, the adverb corresponding.

The *problem* is, whether a man constantly and strongly believing that such a thing shall be, it doth help any thing to the effecting of the thing.

Bacon.

It is a question *problematical* and dubious, whether the observation of the sabbath was imposed upon Adam, and his posterity in paradise? *White.*

Deeming that abundantly confirmed to advance it above a disputable *problem*, I proceed to the next proposition.

Hammond.

Although in general one understood colours, yet were it not an easy *problem* to resolve, why grass is green?

Browne.

I promised no better arguments than might be expected in a point *problematical*.

Boyle.

This *problem* let philosophers resolve, What makes the globe from West to East revolve?

Blackmore.

Diligent enquiries into remote and *problematical* guilt, leave a gate wide open to the whole tribe of informers.

Swift.

PROBLEM, in geometry, is a proposition, wherein some operation or construction is required; as to divide a line or angle, erect or let fall perpendiculars, &c. See **GEOMETRY**.

PROBLEM, in logic, is a proposition that neither appears absolutely true nor false; and consequently may be asserted either in the affirmative or negative.

PROBOSCIS, *n. s.* Latin *proboscis*. A snout; particularly the trunk of an elephant.

The elephant wreathed, to make them sport, His lithe *proboscis*.

Milton.

PROBUS (Marcus Aurelius), from the son of a gardener, became, by his great valor as a soldier, and his eminent virtues, emperor of Rome, to which dignity he was raised by the army, After having subdued the barbarous nations that had made incursions into different parts of the empire, and governed with great wisdom and clemency, he was massacred in the seventh year of his reign, by some soldiers weary of the public works at which he made them labor, in 282. See **ROME**.

PROCAS, a king of Alba, one of the descendants of Æneas, the son and successor of Aventinus, father of Amulius and Numitor, and great-grandfather to Romulus.

PROCATARCTICK, *adj.* Gr. *προκαταρκτικος*. Forerunning; remotely antecedent.

PROCATAR'XIS, *n. s.* An antecedent or preexistent cause.

The physician enquires into the *procatarctick* causes.

Harvey.

Procatarxis is the pre-existent cause of a disease, which co-operates with others that are subsequent, whether internal or external; as anger or heat of climate, which brings such an ill disposition of the juices, as occasions a fever: the ill disposition being the immediate cause, and the bad air the *procatarctick* cause.

Quincy.

PROCEED, *v. n. & n. s.* Fr. *proceder*; **PROCEED'ER**, *n. s.* } Lat. *proceda*. To
PROCEED'ING, } pass from one
PROCEDURE, } thing or place to another; advance; go forth in form or state; issue; be propagated; transact; carry on an affair methodically; prosecute a legal suit; take effect; have its course: a procee-der is, he who

proceeds in any way; proceeding, and procedure, process; issue; transaction; manner of proceeding; course of conduct: legal method of process.

I *proceeded* forth and came from God; neither came I of myself, but he sent me. *John viii. 42.*

Temperately *proceed* to what you would Thus violently redress. *Shakspeare. Coriolanus.*

A dagger of the mind, a false creation *Proceeding* from the heat oppressed brain.

Shakspeare.

He will after his sour fashion, tell you What hath *proceeded* worthy note to-day. *Id.*

I'll acquaint our duteous citizens With all your just *proceedings* in this case. *Id.* No known substance, but earth and the *proceedures* of earth, as tile and stone, yield:ah any moss or herby substance.

Bacon.

He that seeketh victory over his nature, let him not set himself too great nor too small tasks; for the first will make him dejected by often failing; and the second will make him a small *proceeder*, though by often prevailings.

Id.

These things, when they *proceed* not, they go backward.

Ben Jonson's Catiline.

Adam

Proceeded thus to ask his heavenly guest.

Milton.

To judgment he *proceeded* on the accused. *Id.*

O Adam, one Almighty is, from whom

All things *proceed*, and up to him return. *Id.*

Although the distinction of these several *proceedures* of the soul do not always appear distinct, especially in sudden actions, yet in actions of weight all these have their distinct order and *procedure*.

Hale's Origin of Mankind.

Instead of a ship to levy upon his county such a sum of money for his majesty's use, with direction in what manner he should *proceed* against such as refused.

Clarendon.

Then to the prelude of a war *proceeds*;

His horns, yet sore, he tries against a tree.

Dryden.

All this *proceeded* not from any want of knowledge.

Id.

I shall *proceed* to more complex ideas.

Locke.

The understanding brought to knowledge by degrees, and in such a general *proceeding*, nothing is hard.

Id.

Clear the justice of God's *proceedings*, it seems reasonable there should be a future judgment for a suitable distribution of rewards and punishments.

Nelson.

This is the true *procedure* of conscience, always supposing a law from God, before it lays obligation upon man.

South.

Since husbandry is of large extent, the poet singles out such precepts to *proceed* on as are capable of ornament.

Addison.

This rule only *proceeds* and takes place, when a person cannot of common law condemn another by his sentence.

Ayliffe.

It is a very unusual *proceeding*, and I would not have been guilty of it for the world.

Arbuthnot.

How severely with themselves *vroceed*, The men who write such verse as who can read? Their own strict judges, not a word they spare, That wants or force, or light, or weight, or care.

Pope.

From the earliest ages of christianity there never was a precedent of such a *proceeding*.

Swift.

Parts of the judicial *procedure*, which were at first only accidental, become in time essential. *Johnson.*

A cheek and lip—but why proceed?

I loved her then—I love her still;

And such as I am love indeed

In fierce extremes—in good and ill. *Byron.*

PROCELSMATICUS, in the ancient poetry, a foot consisting of four short syllables, or two pyrrhics, as *hōmīnībūs*.

PROCELLARIA, in ornithology, a genus of birds, belonging to the order of anseres. The beak is somewhat compressed, and without teeth; the mandibles are equal, the superior one being crooked at the point; the feet are palmated, the hind claw being sessile, without any toe. Latham enumerates twenty-four species, chiefly distinguished by their colors. The most remarkable are the following:—

1. *P. aequinoctialis*. It is nearly of the size of a raven; its color is a deep sooty brown or blackish; on the chin there is a small patch of white running down a little on each side from the lower mandible: the beak is of yellowish white.

2. *P. cinerea*, the petrel. The size of this bird is rather superior to that of the common gull: the bill very strong, much hooked at the end, and of a yellow color. The nostrils are composed of two large tubes, lodged in one sheath; the head, neck, whole under side of the body and tail are white; the back and coverts of the wings ash-colored; the quill-feathers dusky; and the legs yellowish. In lieu of a back toe, it has only a sort of spur, or sharp straight nail. These birds feed on the fat of whales, &c., and are likewise said to eat sorrel, to qualify the unctuous diet they live on. This species inhabit the isle of St. Kilda; appear there in November, and continue the whole year, except September and October; lay a large, white, and very brittle egg; and the young are hatched in the middle of June. No bird is of such use to the islanders as this; it supplies them with oil for their lamps, down for their beds, a delicacy for their tables, a balm for their wounds, and a medicine for their distempers. It is also a certain prognosticator of the change of the wind: if it comes to land, no west wind is expected for some time; and the contrary when it returns and keeps the sea. The whole genus of petrels have a peculiar faculty of spouting from their bills, to a considerable distance, a large quantity of pure oil; which they do by way of defence, into the face of any one that attempts to take them; so that they are, for the sake of this panacea, seized by surprise, as this oil has been applied to medical purposes. Frederick Martens, who had an opportunity of seeing vast numbers of these birds at Spitzbergen, says they are very bold, and resort after the whale fishers in great flocks; and that, when a whale is taken, they light on it, and pick out large lumps of fat, even while the animal is alive; that the whales are often discovered at sea by the multitudes of them flying; and that, when one is wounded, they immediately follow its bloody track.

3. *P. pelagica*, the stormy petrel, is about the bulk of the house swallow: the length six inches, the extent of wings thirteen. The whole bird is black, except the coverts of the tail and vent-feathers, which are white; the bill is hooked at the

end; the nostrils tubular; the legs slender and long. It has the same faculty of spouting oil from its bill as the other species. Excepting in breeding time, they are always at sea; and are seen all over the vast Atlantic Ocean, at the greatest distance from land; often following the vessels in great flocks, to pick up any thing that falls from on board. They presage bad weather, and caution the seamen of the approach of a tempest, by collecting under the stern of the ships; they brave the utmost fury of the storm, sometimes skimming with incredible velocity along the hollows of the waves, sometimes on the summits. These birds are the cypseli of Pliny, which he places among the apods of Aristotle; not because they wanted feet, but were *Κακοποδα*, or had bad or useless ones; an attribute he gives to these species, on the supposition that they are almost always on the wing. In August, 1772, Pennant found them on the rocks called Macdonald's Table, off the north end of the isle of Skye; and conjectures they breed there. They lurked under the loose stones, but their twittering noise betrayed them.

4. *P. puffinus*, the shear-water, is fifteen inches long, and thirty-one broad; the weight seventeen ounces; the bill is an inch and three-quarters long; nostrils tubular, but not very prominent; the head, and whole upper side of the body, wings, tail, and thighs, are of a sooty blackness; the under side from chin to tail, and inner coverts of the wings, white; the legs weak, and compressed sidewise; dusky behind, whitish before. These birds are found in the Calf of Man; and, as Mr. Ray supposes, in the Scilly Isles. They resort to the former in February; take possession of the rabbit burrows, and disappear till April. They lay one egg, white and blunt at each end; and the young are fit to be taken in the beginning of August; when great numbers are killed by the person who farms the isle; they are salted and barrelled; and, when they are boiled, are eaten with potatoes. During the day, they keep at sea fishing; and toward evening return to their young; whom they feed, by discharging the contents of their stomachs into their mouths, which by that time is turned into oil. They quit the isle about the end of August; and are dispersed over the Atlantic. This species inhabits also the Orkney Isles, where it makes its nest in holes on the earth near the shelves of the rocks and headlands; it is called there the lyre; and is much valued both as food, and for its feathers. The inhabitants salt them in August for winter provisions. They also take the old ones in March; but they are then poor, and not so well tasted as the young: they first appear in those islands in February.

PROCEPTION, *n. s.* Lat. *pro* and *capio*. Preoccupation; act of taking something sooner than another. A word not in use.

Having so little power to offend others that I have none to preserve what is mine own from their *proception*.
King Charles.

PROCRITY, *n. s.* Lat. *procerus*. Tallness; height of stature.

We shall make attempts to lengthen out the human figure, and restore it to its ancient *procrity*.

Addison.

When he met a tall woman he immediately commanded one of his Titanian retinue to marry her, that he might propagate *procerity*, and produce heirs to the father's habiliments. *Johnson.*

Mr. Higgins says he has observed that *procerity* is much promoted by the equal length of the legs, more especially when they are long legs. *Canning.*

PROCESS, n. s. Fr. *proces*; Lat. *processus*. Tendency; progressive course; progress; flux; methodical arrangement or management; legal course or proceeding.

That there is somewhat higher than either of these two, no other proof doth need, than the very *process* of man's desire, which being natural should be frustrate, if there were not some farther thing wherein it might rest at the length contented, which in the former it cannot do. *Hooker.*

They declared unto him the whole *process* of that war, and with what success they had endured. *Knolles.*

Commend me to your honourable wife;
Tell her the *process* of Antonio's end;
Say how I lov'd you; speak me fair in death. *Shakspeare.*

Proceed by *process*,

Lest parties, as he is beloved, break out. *Id.*
All *processes* ecclesiastical should be made in the king's name, as in writs at the common law. *Hayward.*

Immediate are the acts of God, more swift
Than time or motion; but to human ears
Cannot without *process* of speech be told. *Milton.*

Many acts of parliament have, in long *process* of time, been lost, and the things forgotten. *Hale.*

Experiments, familiar to chymists, are unknown to the learned who never read chymical *processes*. *Boyle.*

That a suit of law, and all judicial *process*, is not in itself a sin, appears from courts being erected by consent in the apostle's days, for the management and conduct of them. *Kettlewell.*

Saturnian Juno

Attends the fatal *process* of the war. *Dryden.*
The *process* of that great day, with several of the particular circumstances of it, are fully described by our Saviour. *Nelson.*

An age they live released
From all the labour, *process*, clamour, woe,
Which our sad scenes of daily action know. *Prior.*

In the parable of the wasteful steward, we have a lively image of the force and *process* of this temptation. *Rogers.*

The patricians they chose for their patrons, to answer for their appearance, and defend them in any *process*. *Swift.*

PROCESSION, n. s. } French *procession*;
PROCESSIONAL, adj. } Lat. *processio*. Pro-
PROCESSIONARY. } gress; a train march-
ing in ceremonious solemnity: the adjective corresponding.

If there be cause for the church to go forth in solemn *procession*, his whole family have such business come upon them that no one can be spared. *Hooker.*

Rogations or litanies were then the very strength and comfort of God's church, whereupon, in the year 506, it was by the council of Aurelia decreed, that the whole church should bestow yearly, at the feast of Pentecost, three days in that *processionary* service. *Id.*

Him all his train
Followed in bright *procession*. *Milton.*
Vol. XVIII.

The priests, Pontitus at their head,
In skins of beasts involved, the long *procession* led. *Dryden.*

When this vast congregation was formed into a regular *procession*, to attend the ark of the covenant, the king marched at the head of his people, with hymns and dances. *Addison.*

The Ethiopians held an annual sacrifice of twelve days to the gods; all that time they carried their images in *procession*, and placed them at their festivals. *Broome.*

PROCESS IN LAW. See **LAW.**

PROCHEIN AMY, in law, the person next akin to a child in non-age, and who, in that respect, is allowed to act for him, and be his guardian, &c., if he hold land in soccage. To sue, an infant is not allowed to make an attorney: but the court will admit his next friend as plaintiff, or his guardian as defendant.

PROCIDA, an island, with a sea-port of the same name, on the coast of Naples, between the island of Ischia and the promontory of Misenum. Though containing only seven square miles, the population of this island exceeds 12,000, of whom a large proportion lives in the chief town, carrying on a brisk trade. Others derive their support from fishing, and a few from rearing vines and silk. Game is uncommonly abundant here. This island was taken by the English in 1809, but soon after evacuated. It is twenty-two miles west of Naples.

PROCIINCT', n. s. Lat. *procinctus*. Complete preparation; preparation to the point of action.

When all the plain

Covered with thick imbattled squadrons bright,
Chariots, and flaming arms, and fiery steeds,
Reflecting blaze on blaze, first met his view,
War he perceived, war in *procinct*. *Milton.*

PROCKIA, in botany, a genus of the monogynia order, and polyandria class of plants; natural order doubtful: CAL. triphyllous, besides two leaflets at the base: COR. berry quinqueangular, and polyspermous.

PROCLAIM', v. a. } Fr. *proclamer*; Lat
PROCLAIM'ER, n. s. } *proclamo*. To promul-
PROCLAMA'TION. } gate or denounce so-
lemnly: openly tell; outlaw: proclamation is publication by authority; declaration of the king's will openly published.

When thou comest nigh unto a city to fight against it, *proclaim* peace unto it. *Deut. xx. 10.*

I *proclaim* a liberty for you, saith the Lord, to the sword and to the pestilence. *Jer. xxxiv. 17.*

I heard myself *proclaimed*. *Shakspeare.*

If the king sent a *proclamation* for their repair to their houses, some nobleman published a protestation against those *proclamations*. *Clarendon.*

Heralds,

With trumpet's sound, throughout the host *proclaim*
A solemn council. *Milton.*

The great *proclaimer*, with a voice
More awful than the sound of trumpet, cried
Repentance, and heaven's kingdom nigh at hand
To all baptised. *Id. Paradise Regained.*

She to the palace led her guest,

Then offered incense, and *proclaimed* a feast. *Dryden.*

Some profligate wretches, were the apprehensions of punishments of shame taken away, would as openly *proclaim* their atheism as their lives do. *Locke.*

While the deathless muse
Shall sing the just, shall o'er their head diffuse
Perfumes with lavish hand, she shall *proclaim*
Thy crimes alone. *Prior.*

Then view him self-*proclaimed* in a gazette
Chief monster that has plagued the nations yet :
The globe and sceptre in such hands misplaced,
Those ensigns of dominion how disgraced !

Cowper.

PROCLAMATIONS are a branch of the king's prerogative (see **PREROGATIVE**); and have then a binding force, 'when,' as Sir Edward Coke observes, 'they are grounded upon and enforce the laws of the realm. For, though the making of laws is entirely the work of a distinct part, the legislative branch of the sovereign power, yet the manner, time, and circumstances of putting those laws into execution, must frequently be left to the discretion of the executive magistrate. And therefore his constitutions or edicts, concerning those points which we call proclamations, are binding upon the subject, where they do not either contradict the old laws, or tend to establish new ones, but only enforce the execution of such laws as are already in being, in such manner as the king shall judge necessary.'

PROCLÉS, a king of Sparta, the son of Aristodemus and Argia, and the twin brother of Eurysthènes, who reigned jointly with him, and gave rise to the two royal families of Proclidæ and Eurysthenidæ, who governed Sparta for several centuries, exhibiting the singular political phenomena of a binarchy, or two hereditary kings governing with equal, but limited power.

PROCLÉS, the son of Eucrates, a Carthaginian historian, who wrote some historical treatises, which are lost, except a few fragments preserved in the works of Pausanias.—Paus. iv. c. 35.

PROCLIVITY, *n. s.* Lat. *proclivitas*, *proclivis*. Tendency: natural inclination; propensity.

He had such a dextrous *proclivity* as his teachers were fain to restrain his forwardness, that his brothers might keep pace with him. *Wotton.*

The sensitive appetite may engender a *proclivity* to steal, but not a necessity to steal. *Bramhall.*

PROCLUS, surnamed Diadocus, a Greek philosopher and mathematician, was born at Ly-sia, and lived about the year 500. He was the disciple of Syrianus. It is said that, when Vitallian laid siege to Constantinople, Proclus burnt his ships with large brazen specula. This philosopher was a Pagan, and wrote against the Christian religion. There are still extant his Commentaries on some of Plato's books, and others of his works written in Greek.

PROCONSUL, *n. s.* Latin *proconsul*. A Roman officer who governed a province with consular authority.

Every child knoweth how dear the works of Homer were to Alexander, Virgil to Augustus, Ausonius to Gratian, who made him *proconsul*, Chaucer to Richard II., and Gower to Henry IV. *Peacham.*

PROCONSULS were appointed out of the body of the senate; and usually as the year of any one's consulate expired, he was sent *proconsul* into some province. The *proconsuls* decided cases of equity and justice, either privately in their prætorium or palace, where they received petitions, heard complaints, granted writs under

their seal, and the like; or else publicly in the common hall, with the usual formalities observed in the court of judicature at Rome. They had besides, by virtue of their edicts, the power of ordering all things relating to the tribunes, taxes, contributions, and provisions of corn and money, &c. Their office lasted only a year. See **CONSUL**.

PROCOPIUS, a celebrated Greek historian, born in Cæsarea, who acquired great reputation by his works in the reign of Justinian, and was secretary to Belisarius during all the wars carried on by that general, in Persia, Africa, and Italy. He at length became senator, obtained the title of illustrious, and was made prætor of Constantinople.

PROCRASTINATE, *v. a. & v. n.* } Latin
PROCRASTINATION, *n. s.* } *procrasti-*
nor. To defer; delay; be dilatory: the noun substantive corresponds.

Hopeless and helpless doth Ægeon wind,
But to *procrastinate* his lifeless end. *Shakspeare.*
Let men seriously and attentively listen to that voice within them, and they will certainly need no other medium to convince them, either of the error or danger of thus *procrastinating* their repentance. *Decay of Piety.*

How desperate the hazard of such *procrastination* is, hath been convincingly demonstrated by better pens. *Id.*

Set out early and resolutely without *procrastinating* or looking back. *Hammond.*

I *procrastinate* more than I did twenty years ago, and have several things to finish, which I put off to twenty years hence. *Swift to Pope.*

Procrastination is the thief of time,
Year after year it steals, till all are fled,
And to the mercies of a moment leaves
The vast concerns of an eternal scene. *Young.*

PROCREATE, *v. a.* } Fr. *procreer*; Lat.
PROCREANT, *adj.* } *procreo, procreans*. To
PROCREATION, *n. s.* } generate; produce:
PROCREATIVE, *adj.* } *procreant* and *procrea-*
PROCREATIVENESS. } *tive* mean producing;
pregnant: procreation and procreativeness corresponding.

The temple-haunting martlet does approve,
By his loved mansionry, that heaven's breath
Smells woovingly here: no jutting frieze,
But this bird
Hath made his pendant bed, and *procreant* cradle. *Shakspeare.*

The inclosed warmth, which the earth hath stirred up by the heat of the sun, assisteth nature in the speedier *procreation* of those varieties which the earth bringeth forth. *Raleigh.*

These have the accurst privilege of propagating and not expiring, and have reconciled the *procreativeness* of corporeal, with the duration of incorporeal substances. *Decay of Piety.*

Neither her outside formed so fair, nor aught
In *procreation* common to all kinds. *Milton.*
The ordinary period of the human *procreative* faculty in males is sixty-five, in females forty-five. *Hale.*

Uncleanness is an unlawful gratification of the appetite of *procreation*. *South.*

Since the earth retains her fruitful power,
To *procreate* plants the forest to restore;
Say, why to nobler animals alone
Should she be feeble, and unfruitful grown ? *Blackmtrc.*

Flies crushed and corrupted, when inclosed in such vessels, did never *procreate* a new fly.

Bentley.

PROCRIIS, a daughter of Pandion, or, according to others, of Erechtheus, king of Athens, and wife of Cephalus. See **CEPHALUS**.

PROCRUSTES, in fabulous history, a famous robber of Attica, who was killed by Theseus, near the Cephisus. He used to tie travellers upon a bed; and, if their length exceeded that of his bed, he cut off their feet and as much of their legs as exceeded; but if they were shorter, he racked and stretched them till their length was equal to his own—an emphatic emblem of bigotry. He is called by some Damastes.

PROCTOR, *n. s.* Contracted of Lat. *procurator*. A manager of another man's affairs: an ecclesiastical and university officer.

The most clamorous for this pretended reformation are either atheists, or else *proctors* suborned by atheists.

Hooker.

I cannot *proctor* mine own cause so well
To make it clear.

Shakspeare. Antony and Cleopatra.

From a scholar he became a fellow, and the president of the college, after he had received all the graces and degrees, the *proctorship* and the doctorship.

Clarendon.

The *proctor* sent his servitor to call him. *Walter.*

I find him charging the inconveniences in the payment of tythes upon the clergy and *proctors*.

Swift.

PROCULEIUS, a Roman knight, who was very intimate with Augustus. He is justly famed for his fraternal affection to his brothers, Muræna and Scipio, with whom he divided his possessions, after they had forfeited their estates, and offended Augustus, by joining with Pompey the younger. He was sent by Augustus to queen Cleopatra, to persuade her to surrender to him, but failed.

PROCURE', *v. a. & v. n.*

PROCURABLE, *adj.*

PROCURACY, *n. s.*

PROCURATION,

PROCURATOR,

PROCURATORIAL, *adj.*

PROCUREMENT, *n. s.*

PROCURER,

PROCURESS.

Fr. *procurer*;

Lat. *procurero*. To

manage; transact

for another; ob-

tain; forward;

contrive; persuade;

prevail on; to

pimp: procurable

is obtainable; to

be acquired: procuracy and procuration, management or transaction of a thing, particularly for another: procurator, he who so manages or transacts affairs: procuratorial, made by, or pertaining to a proctor: procurement is the act of procuring: procurer, one who gains; obtains, or acquires, particularly for others; a pander: procureess, a bawd.

They shall fear and tremble, for all the prosperity that I *procure* unto it.

Jeremiah xxxiii. 9.

I had in charge at my depart from France,

As *procurator* for your excellence,

To marry princess Marg'et for your grace.

Shakspeare.

Is it my lady mother?

What unaccustomed cause *procures* her hither? *Id.*

Proceed, Salinus, to *procure* my fall,

And by the doom of death end woes and all. *Id.*

Whom nothing can *procure*,
When the wide world runs bias, from his will
To writhe his limbs, and share, not mend the ill.

Herbert.

They confirm and seal

Their undertaking with their dearest blood,

As *procurators* for the commonweal. *Daniel.*

Happy, though but ill,

If we *procure* not to ourselves more woe. *Milton.*

Angling was, after tedious study, a moderator of passions, and a *procurer* of contentedness.

Walton.

Though it be a far more common and *procurable* liquor than the infusion of lignum nephriticum, it may yet be easily substituted in its room.

Boyle.

We no other pains endure,

Than those that we ourselves *procure*. *Dryden.*

PROCURATOR, among the Romans; an agent, an overseer of an estate; at a later period, the title of a provincial officer, inferior to the governor (see Province, and Proconsul), who managed the revenue. In some of the small provinces, or in a part of a large province, the procurator discharged the office of a governor, and had the power of punishing capitally, as was the case with Pontius Pilate, in Judæa, which was attached to the province of Syria.

In the civil law, the procurator, or proctor, answers to the attorney in the common law. (See advocate of the crown.)—Procurator, or proctor, in monasteries, is the conventual, to whom is intrusted the care of the temporal concerns.—Procurator di San Marco was the title of the chief officers or senators in the Venetian republic.

Beside the nine actual procuratori, from among whom the Doge was chosen, there were also many titular procurators, who paid a great sum for this title, which was much coveted by the Venetian patricians on account of the rank it conferred.

PROCYON, in ancient astronomy, a star near the dog-star, before which it generally rises in July. Cicero calls it Anticanis, which signifies the same with *πρόκυων*.

PRODANO (the ancient Prote), a small island of Greece, on the west coast of the Morea, and separated from it only by a narrow channel. It forms a small but secure bay, sixteen miles north by west of Navarin. Lat. 37° 10' N.

PRODICUS, a celebrated sophist and rhetorician of Cos, who flourished about A. A. C 396. He was sent ambassador by the Coans to Athens, where he taught publicly, and had among his pupils Socrates, Euripides, Theramenes, and Isocrates. He travelled through most towns of Greece, and made his auditors pay to hear his lectures. His writings were numerous; and among them was the well known beautiful episode of Hercules's Choice, when addressed by Pleasure and Virtue, when the hero became the votary of the latter goddess. Prodicus experienced the fate of his excellent pupil, Socrates, being at last put to death by the Athenians, on pretence that he corrupted the morals of their youth. Xenoph. Mem.

PRODIGAL, *adj.* } Fr. *prodigue*; Lat.

PRODIGALITY, *n. s.* } *prodigius*. Profuse;

PRODIGALLY, *adv.* } wasteful; expensive; lavish; with *of* before the object, and the noun substantive and adverb corresponding.

Be now as *prodigal* of all dear grace,
As nature was in making graces dear,
When she did starve the general world beside,
And *prodigally* gave them all to you. *Shakspeare.*

A sweeter and lovelier gentleman,
Framed in the *prodigality* of nature,
The spacious world cannot again afford. *Id.*

Diogenes did beg more of a *prodigal* man than the
rest; whereupon one said, see your baseness, that
when you find a liberal mind, you will take most of
him; no, said Diogenes, but I mean to beg of the
rest again. *Bacon.*

Lest I should seem over *prodigal* in the praise of
my countrymen, I will only present you with some
few verses. *Camden.*

We are not yet so wretched in our fortunes,
Nor in our wills so lost, as to abandon
A friendship *prodigally*, of that price
As is the senate and the people of Rome.

Ben Jonson.

A beggar grows rich, becomes a *prodigal*; for to
obscure his former obscurity, he puts on riot and ex-
cess. *Id.*

Lucian has well described the fate of *prodigals* in
his picture of Opulentia, whose residence he repre-
sents to be on a lofty mountain, the summit of which
her fond votaries are eagerly endeavouring to reach.
Burton.

I cannot well be thought so *prodigally* thirsty of
my subject's blood as to venture my own life.

King Charles.

As a hero, whom his baser foes
In troops surround; now these assail, now those,
Though *prodigal* of life, disdains to die
By common hands. *Denham.*

He that decries covetousness, should not be held
an adversary to him that opposeth *prodigality*.

Glanville.

The *prodigal* of soul rushed on the stroke
Of lifted weapons, and did wounds provoke.

Dryden.

Let the wasteful *prodigal* be slain.

The most severe censor cannot but be pleased
with the *prodigality* of his wit, though at the same
time he could have wished, that the master of it had
been a better manager. *Id.*

Nature not bounteous now, but lavish grows,
Our paths with flow'rs she *prodigally* strows.

Id.

O! beware,

Great warrior, nor, too *prodigal* of life,
Expose the British safety. *Philips.*

It is not always so obvious to distinguish be-
tween an act of liberality and act of *prodigality*.

South.

PRODIG'IOUS, *adj.* } Fr. *prodigieux*;
PRODIG'IOUSLY, *adv.* } Lat. *prodigiosus*;
PRODIG'IOUSNESS, *n. s.* } Amazing; astonish-
PROD'IGY. } ing; portentous;

enormous; monstrous: the adverb and noun
substantive corresponding: prodigy is, any thing
out of the ordinary process of nature; portent.

Be no more an exhaled meteor,

A *prodigy* of fear, and a portent

Of broached mischief to the unborn times.

Shakspeare.

If e'er he have a child, abortive be it,
Prodigious and untimely brought to light! *Id.*

An emission of immateriate virtues we are a
little doubtful to propound, it being so *prodigious*;
but that it is constantly avouched by many. *Bacon.*

Most of mankind, through their own sluggish-
ness, become nature's *prodigies*, not her children.

Ben Jonson.

It is *prodigious* to have thunder in a clear sky.

Browne.

Then ent'ring at the gate,
Concealed in clouds, *prodigious* to relate,
He mixed, unmarked, amongst the busy throng.

Dryden.

I do not mean absolutely according to philoso-
phic exactness infinite, but only infinite or innume-
rable as to us, or their number *prodigiously* great.

Ray on the Creation.

They would seem *prodigies* of learning.

Spectator.

The party opposite to our settlement seem to be
driven out of all human methods, and are reduced
to the poor comfort of *prodigies* and old woman's
fables. *Addison.*

The Rhone enters the lake, and brings along with
it a *prodigious* quantity of water. *Id.*

I am *prodigiously* pleased with this joint volume.

Pope.

It is a scandal to Christianity that in towns, where
there is a *prodigious* increase in the number of houses
and inhabitants, so little care should be taken for
churches. *Swift.*

PROD'ITOR, *n. s.* Lat. *proditor*. A traitor.
Not in use.

Pieled priest, dost thou command me be shut out?
—I do, thou most usurping *proditor*. *Shakspeare.*

Solid and conclusive characters are emergent from
the mind, and start out of children when themselves
least think of it; for nature is *proditorious*.

Wotton on Education.

Now *proditorious* wretch! what hast thou done,
To make this barb'rous base assassinate? *Daniel.*

PRODUCE', *v. a. & n. s.* } Fr. *produire*;
PRODUC'ENT, *n. s.* } Lat. *produco*. To
PRODUC'ER, } exhibit or offer to
PRODUC'IBLE, *adj.* } notice; bring for-
PRODUC'IBLENESS, *n. s.* } ward; bear; bring
PRODUC'T, *n. s.* } forth; cause; be-
PRODUC'TION, } get; generate;
PRODUC'TIVE, *adj.* } effect: as a noun

substantive, that which is produced; amount;
profit: producent and producer mean, one that
offers or exhibits; one that generates or brings
forth: producible, such as may be exhibited;
may be made or generated: product, something
yielded by nature; composition; work; effect;
result; sum: production, the act of producing,
or thing produced: productive, having efficient
or generative power; fruitful.

Produce your cause, saith the Lord; bring forth
your strong reasons. *Isaiah xli. 21.*

This soil produces all sorts of palm trees.

Sandys.

It seems not meet, nor wholesome to my place,
To be produced against the Moor. *Shakspeare.*

Somewhat is produced of nothing; for lies are
sufficient to breed opinion, and opinion brings on
substance. *Bacon.*

By examining how I, that could contribute no-
thing to mine own being, should be here, I came
to ask the same question for my father, and so am
led in a direct line to a first *producer* that must be
more than man. *Suckling.*

Many warm expressions of the fathers are *pro-
ducible* in this case. *Decay of Piety.*

There is no reason *producible* to free the Christian
children and idiots from the blame of not believing,
which will not with equal force be *producible* for
those heathens to whom the gospel was never re-
vealed. *Hammond.*

They by imprudence mixed
Produce prodigious births of body or mind.

Milton.

Thou all this good of evil shalt produce. *Id.*

These are the *product*

Of those ill-mated marriages. *Id.* *Paradise Lost.*

In thee,

Not in themselves, all their known virtue appears
Productive as in herb and plant. *Milton.*

The best of queens and best of herbs we owe

To that bold nation, which the way did show

To the fair region, where the sun does rise,

Whose rich *productions* we so justly prize.

Waller.

The salts *producibile*, are the alcalis or fixed salts,
which seem to have an antipathy with acid ones.

Boyle.

To confirm our doctrine of the *producibleness* of
salts, Helmont assures us that, by Paracelsus's salt
circulatum, solid bodies, particularly stones, may
be transmuted into actual salt equiponderant. *Id.*

You hoard not health for your own private use,
But on the publick spend the rich *produce*.

Dryden.

A painter should foresee the harmony of the lights
and shadows, taking from each of them that which
will most conduce to the *production* of a beautiful
effect. *Id.*

Be thou my aid, my tuneful song inspire,

And kindle with thy own *productive* fire. *Id.*

Observing in ourselves, that we can at pleasure
move several parts of our bodies; the effects also,
that natural bodies are able to *produce* in one another,
occurring every moment to our senses, we both
these ways get the idea of power. *Locke.*

Whenever want of money, or want of desire in the
consumer, makes the price low, that immediately
reaches the first *producer*. *Id.*

The landholder, having nothing but what the
product of his land will yield, must take the market-
rate. *Id.*

In Staffordshire, after their lands are marled, they
sow it with barley, allowing three bushels to an
acre. Its common *produce* is thirty bushels.

Mortimer's Husbandry.

If the *productive* fat of the marl be spent, it is
not capable of being mended with new. *Mortimer.*

Range in the same quarter the *products* of the
same season. *Spectator.*

This is turning nobility into a principle of virtue,
and making it *productive* of merit, as it is understood
to have been originally a reward of it. *Id.*

That is accounted probable which has better argu-
ments *producibile* for it, than can be brought against
it. *South.*

This wonder of the sculptor's hand
Produced, his art was at a stand. *Addison.*

This tax has already been so often tried, that we
know the exact *produce* of it. *Id.* *Freeholder.*

Our British *products* are of such kinds and quanti-
ties, as can turn the balance of trade to our advan-
tage. *Addison.*

If an instrument be *produced* with a protestation
in favour of the *producent*, and the adverse party does
not contradict, it shall be construed to the advantage
of the *producent*. *Ayliffe.*

See thy bright altars

Heaped with the *products* of Sabeen springs. *Pope.*

Hymen's flames like stars unite,

And burn for ever one;

Chaste as cold Cynthia's virgin light

Productive as the sun. *Id.*

Your parents did not *produce* you much into the
world, whereby you avoided many wrong steps.

Swift.

We have had our names prefixed at length to
whole volumes of mean *productions*. *Id.*

Numbers of Scots are glad to exchange their barren
hills for our fruitful vales so *productive* of that grain. *Id.*

Plutarch in his life of Theseus, says, that that
age was *productive* of men of prodigious stature. *Broome.*

Most of those books which have obtained great
reputation in the world are the *products* of great and
wise men. *Watts.*

It is generally known that he who expects much
will be often disappointed; yet disappointment sel-
dom cures us of expectation, or has any other effect
than that of *producing* a moral sentence or peevish
exclamation. *Johnson.*

PROEM, *n. s.* Old Fr. *proëme*; Lat. *pro-
æmium*; Gr. *προοίμιον*. Preface; introduction.

One and the same *proem*, containing a general
motive to provoke people to obedience of all and
every one of these precepts, was prefixed before the
decalogue. *White*

So glozed the tempter, and his *proem* tuned.

Milton.

Justinian has, in the *proem* to the digests, only
prefixed the term of five years for studying the laws.

Ayliffe.

Thus much may serve by way of *proem*,

Proceed we therefore to our poem.

Swift's Miscellanies.

PROETIDES, in fabulous history, the daugh-
ters of Proetus, king of Argos; who, preferring
themselves to Juno, were struck with insanity,
and believed themselves to be turned into cows.
They soon infected the rest of the Argian women,
but were cured by Melampus, who received one
of these princesses, and two-thirds of Argos, for
his reward. See MELAMPUS. Their names were
Lysippe, Iphinoe or Ipponoe, and Iphianassa,
or Cyrianassa.

PROETUS, in fabulous history, a king of
Argos; the son of Abas and Ocalea, and twin
brother of Acrisius, with whom he is said to have
quarrelled even in the womb. Their dissensions
increased with their years, and, on Abas's death,
they contended for the kingdom; but, Acrisius
prevailing, Proetus retired to Iobates, king of
Lycia, whose daughter, Sthenoboea, he married,
by whom he had Megapenthes, and the Proe-
tides. By Iobates's assistance, he took Tiry-
nthus. Homer. *Iliad*. vi.

PROFANE, *adj.* & *v. a.* Fr. *profane*; Lat.
PROFANATION, } *profanus*. Irrever-
PROFANE'LY, } tent to sacred
PROFANE'N, *n. s.* } things; polluted;
PROFANE'NESS, *n. s.* } impure; not sac-
red: to pollute; violate; wrongly use: profana-
tion, the act or habit of violating or treating
irreverently things sacred: the adverb and other
noun substantives corresponding.

Pity the temple *profaned* of ungodly men.

2 Maccabees.

He knew how bold men are to take even from God
himself; how hardly that house would be kept from
impious *profanation* he knew. *Hooker.*

The argument which our Saviour useth against
profaners of the temple, he taketh from the use
whereunto it was with solemnity consecrated. *Id.*

Profane fellow!

Were thou the son of Jupiter, and no more
But what thou art besides, thou wert too base
To be his groom. *Shakspeare. Cymbeline.*

He then, that is not furnished in this sort,
Doth but usurp the sacred name of knight,
Profaning this most honourable order.

Shakspeare.

I feel me much to blame,

So idly to *profane* the precious time. *Id.*
Great men may jest with saints, 'tis wit in them:
But, in the less, foul *profanation*. *Id.*

Rebellious subjects, enemies to peace,
Profaners of this neighbour-stained steel. *Id.*

Apollo, pardon

My great *profaneness* 'gainst thy oracle! *Id.*
Nothing is *profane* that serveth to holy things.

Raleigh.

'Twere *profanation* of our joys,

To tell the laity our love. *Donne.*

Let none of things serious, much less of divine,
When belly and head's full, *profanely* dispute.

Ben Jonson.

Profanation of the Lord's day, and of other solemn
festival days, which are devoted to divine and reli-
gious offices, is impious. *White.*

Foretasted fruit

Profaned first by the serpent, by him first
Made common and unhallowed. *Milton.*

Far hence be souls *profane*,
The Sibyl cried, and from the grove abstain.

Dryden.

How far have we

Profaned thy heavenly gift of poesy!
Made prostitute and profigate the muse,
Debased. *Id.*

You can banish from thence scurrility and *pro-
faneness*, and restrain the licentious insolence of
poets and their actors. *Id.*

Others think I ought not to have translated
Chaucer: they suppose a veneration due to his old
language, and that it is little less than *profanation* and
sacrilege to alter it. *Id.*

How are festivals *profaned*? When they are not
regarded, nor distinguished from common days;
when they are made instruments of vice and vanity;
when they are spent in luxury and debauchery; when
our joy degenerates into sensuality, and we express
it by intemperance and excess. *Nelson.*

The universality of the deluge is attested by *pro-
fane* history; for the fame of it is gone through the
earth, and there are records or traditions concerning
it in all parts of this and the new found world.

Burnet's Theory.

These have caused the weak to stumble, and the
profane to blaspheme, offending the one, and harden-
ing the other. *South.*

All *profanation* and invasion of things sacred is
an offence against the eternal law of nature. *Id.*

There are a lighter ludicrous sort of *profaners*, who
use the scripture to furnish out their jests.

Government of the Tongue.

Edicts against immorality and *profaneness*, laws
against oaths and execrations, we trample upon.

Atterbury.

That proud scholar, intending to erect altars to
Virgil, speaks of Homer too *profanely*. *Broome.*

PROFECTION, *n. s.* Lat. *profectio*. Ad-
vance; progression.

This, with *profection* of the horoscope unto the
seventh house or opposite signs, every seventh year
oppresseth living creatures. *Browne.*

PROFESS', *v. a. & v. n.*

PROFESS'EDLY, *adv.*

PROFESS'ION, *n. s.*

PROFESS'IONAL, *adj.*

PROFESS'OR, *n. s.*

PROFESS'OR-SHIP.

Fr. *professer*;
Lat. *professus*. To
declare or make an
open show of
opinion respecting
any thing; assert

one's skill in any art or science; to declare
openly; enter on a state of life by a public pro-
fession; declare friendship: professedly is,
declaratively; according to one's own declara-
tion: profession, declaration; act of declaring
one's own party or opinion; calling; known
pursuit; technically distinguished from a trade,
and applied to divinity, physic, and law, as vo-
cations: professional, relating to, or befitting a
profession: professor, one who publicly declares
himself of a particular party or opinion; or pub-
licly teaches an art or science: professorship, his
station or office.

Profess unto the Lord, that I am come unto the
country which the Lord sware unto our fathers.

Deut. xxvi. 3.

They *profess* that they know God, but in works
they deny him. *Titus i. 16.*

The *professions* of princes, when a crown is the
bait, are a slender security. *Lesley.*

Love well your father;

To your *professing* bosoms I commit him.

Shakspeare.

The day almost itself *professes* yours,
And little is to do. *Id. Macbeth.*

Would you have me speak after my custom,
As being a *professed* tyrant to their sex?

Shakspeare.

As he does conceive,

He is dishonoured by a man, which ever

Professed to him; why, his revenges must

In that be made more bitter. *Id.*

I must tell you

You tender more your person's honour, than

Your high *profession* spiritual. *Id.*

If we confound arts with the abuse of them, we
shall condemn all honest trades; for there are that
deceive in all *professions*, and bury in forgetfulness all
knowledge. *Raleigh.*

When the holiness of the *professors* of religion is
decayed, you may doubt the springing up of a new
sect. *Bacon's Essays.*

But Purbeck, as *profest* a huntress and a nun,
The wide and wealthy sea, nor all his pow'r respects.

Drayton.

I could not grant too much to men, that, being
professedly my subjects, pretended religious strictness.

King Charles.

An ill Christian is the worst of all men; an ill
professor the worst of all Christians; an ill minister
the worst of all *professors*. *Bp. Hall.*

The whole church of *professors* at Philippi to whom
he writes was not made up wholly of the elect, sin-
cere, and persevering Christians, but like the net, in
Christ's parable, that caught both good and bad, and
had no doubt some insincere persons, hypocrites, and
temporaries in it. *Hammond.*

Pretending first

Wise to fly pain, *professing* next the spy.

Milton.

A naked *profession* may have credit, where no
other evidence can be given. *Glanville's Scepsis.*

Dr. Prideaux succeeded him in the *professorship*;
being then elected bishop of Worcester; Sanderson
succeeded him in the regius *professorship*. *Wotton.*

For by oil in their lamps, and the first lighting
of them which was common to them both, is
meant that solemn *profession* of faith and repent-
ance, which all christians make in baptism.

Tillotson.

A servant to thy sex, a slave to thee,

A foe *profest* to barren chastity. *Dryden.*

Virgil, whom he *professedly* imitated, has surpassed
him among the Romans. *Id.*

Ordinary illiterate people, who were *professors*, that shewed a concern for religion, seemed much conversant in St. Paul's epistles. *Locke.*

Let no man that *professes* himself a christian, keep so heathenish a family; as not to see *God* be daily worshipped in it. *Duty of Man.*

No other one race, not the sons of any one other *profession*, not perhaps altogether, are so much scattered amongst all *professions*, as the sons of clergymen. *Sprat's Sermons.*

England I travelled over, *professedly* searching all places as I passed along. *Woodward.*

Some of our *profession* keep wounds tented. *Wiseman.*

Most profligately false, with the strongest *professions* of sincerity. *Swift.*

Professors in most sciences are generally the worst qualified to explain their meanings to those who are not of their tribes. *Id.*

This is a practice in which multitudes, besides those of the learned *professions*, may be engaged. *Watts.*

Professional, as well as national, reflections are to be avoided. *Clarissa.*

A PROFESSOR, in the universities, is a person who teaches or reads public lectures in some art or science from a chair for the purpose.

PROFFER, *v. a. & n. s.* } Fr. *proferer*; } Lat. *profero*. To propose; offer to acceptance; attempt; essay; offer or attempt made: he who offers.

He seide han ye here oney thing that schal be etun? And they *proffred* to him a part of a fish roostyd, and a honeycomb. *Wiclif. Luke 24.*

Basilius, content to take that, since he could have no more, allowed her reasons, and took her *proffer* thankfully. *Sidney.*

To them that covet such eye-glutting gain, *Proffer* thy gifts, and fitter servants entertain. *Spenser.*

Proffers, not took, reap thanks for their reward. *Shakespeare.*

Maids, in modesty, say no, to that Which they would have the *profferer* construe ay. *Id.*

It is done with time, and by little and little, and with many essays and *proffers*. *Bacon's Essays.*

Great *proffers* sends of pardon and of grace; If they would yield, and quietness embrace. *Daniel.*

He made a *proffer* to lay down his commission of command in the army. *Clarendon.*

None, among the choice and prime Of those heaven-warring champions, could be found So hardy as to *proffer*, or accept, Alone, the dreadful voyage. *Milton's Paradise Lost.*

But these, nor all the *proffers* you can make, Are worth the heifer which I set to stake. *Dryden.*

Does Cato send this answer back to Cæsar, For all his generous cares and *proffered* friendship? *Addison.*

He who always refuses, taxes the *profferer* with indiscretion, and declares his assistance needless. *Collier.*

The parent pair their secret homage pay, And *proffer* up to heaven the warm request— That He who stills the raven's clamorous nest, And decks the lily fair in flowery pride, Would, in the way his wisdom sees the best, For them and for their little ones provide; But chiefly in their hearts with grace divine preside: *Burns.*

A weel-stocked mailen, himsel for the laird, And marriage aff-hand, were his *proffers*:

I never loot on that I kenn'd it, or car'd, But thought I might hae waur offers, waur offers, *Id.*

But thought I might hae waur offers. *Id.* For when one near displayed the absolving cross, And *proffered* to his touch the holy bead, Of which his parting soul might own the need, He looked upon it with an eye profane, And smiled—Heaven pardon! if 'twere with disdain. *Byron.*

PROFICIENCE, *n. s.* } Lat. *proficio*. Pr } PROFICIENCY, } fit; advancement, } PROFICIENT. } improvement } gained: a proficient is, he who progresses or advances in any study or pursuit.

I am so good a proficient in one quarter of an hour, that I can drink with any tinker in his own language. *Shakespeare.*

I am disposed to receive further light in this matter, from those whom it will be no disparagement for much greater *proficients* than I to learn. *Boyle.*

Persons of riper years, who flocked into the church during the three first centuries, were obliged to pass through instructions, and give account of their *proficiency*. *Addison.*

Some reflecting with too much satisfaction on their own *proficiencies*, or presuming on their election by God, persuade themselves into a careless security. *Rogers's Sermons.*

Young deathlings were, by practice made *Proficients* in their fathers' trade. *Swift.*

PROFICUOUS, *adj.* Lat. *proficius*. Advantagous; useful.

It is very *proficiuous* to take a good large dose. *Harvey.*

To future times

Proficiuous, such a race of men produce, As in the cause of virtue firm, may fix Her throne inviolate. *Philips.*

PROFILE, *n. s.* Fr. *profile*. The side face; half face.

The painter will not take that side of the face which has some notorious blemish in it; but either draw it in *profile*, or else shadow the more imperfect side. *Dryden.*

Till the end of the third century, I have not seen a Roman emperor drawn with a full face: they always appear in *profile*, which gives us the view of a head very majestic. *Addison.*

PROFILE, in architecture, is the draught of a building, fortification, &c., wherein are expressed the several heights, widths, and thicknesses, such as they would appear were the building cut down perpendicularly from the roof to the foundation. Whence the *profile* is also called the section, sometimes orthographical section.

PROFILE, in sculpture and painting. A head, a portrait, &c., are said to be in *profile*, when they are represented sidewise, or in a side view; as, when in a portrait there is but one side of the face, one eye, one cheek, &c., shown, and nothing of the other. On almost all medals, the faces are represented in *profile*.

PROFIT, *n. s., v. a., & v. n.* } Fr. *profit*. } PROFITABLE, *adj.* } *profter*; Ital. } PROFITABLY, *adv.* } *profitto*; Lat. } PROFITABLENESS, *n. s.* } *profectus*. } PROFITLESS, *adj.* } Gain; advan-

tage; proficiency: to benefit, improve, or advantage; to gain advantage or improvement; be of use or advantage: profitable is, gainful, advantageous, lucrative; the adverb and noun substantive corresponding: profitless, worthless; without advantage or recompense.

Whereto might the strength of their hands *profit* me? *Job.*

Wisdom that is hid, and treasure that is hoarded up, what *profit* is in them both? *Eccclus. xx. 30.*

Meditate upon these things, give thyself wholly to them, that thy *profiting* may appear to all.

1 *Tim.*

Then Judas, thinking indeed that they would be *profitable* in many things, granted them peace.

2 *Mac. xii.*

Thou must know

'Tis not my *profit* that does lead mine honour.

Shakspeare.

A pound of man's flesh, taken from a man,

Is not so estimable or *profitable*,

As flesh of muttons, beefs, or goats.

Id.

We must not think the Turk is so unskilful,

To leave that latest, which concerns him first;

Neglecting an attempt of ease and gain,

To wake and wage a danger *profitless*.

Id.

The king did not love the barren wars with Scotland, though he made his *profit* of the noise of them.

Bacon.

The planting of hop-yards, sowing of wheat and rape-seed, are found very *profitable* for the planters, in places apt for them, and consequently *profitable* for the kingdom.

Id.

Let it *profit* thee to have heard,

By terrible example, the reward

Of disobedience. *Milton's Paradise Lost.*

We will now briefly take notice of the *profitableness* of plants for physic and food.

More.

'Tis a great means of *profiting* yourself, to copy diligently excellent pieces and beautiful designs.

Dryden.

What *profited* thy thoughts, and toils, and cares,

In vigour more confirmed, and riper years? *Prior.*

What shall be the just portion of those, whom neither the condescension or kindness, nor wounds and sufferings of the Son of God could persuade, nor yet the excellency, easiness and *profitableness* of his commands invite? *Calamy's Sermons.*

The Romans, though possessed of their ports, did not *profit* much by trade.

Arbutnot on Coins.

What was so *profitable* to the empire, became fatal to the emperor.

Id.

You have had many opportunities to settle this reflection, and have *profitably* employed them.

Wake.

He thinks it highly just, that all rewards of trust, *profit*, or dignity, should be given only to those whose principles direct them to preserve the constitution.

Swift.

PROFLIGATE, *adj., n. s.* } *Lat. profligatus.*
PROFLIGATELY, [*& v. a.*] } Abandoned; lost
PROFLIGATENESS, *n. s.* } to virtue and decency; shameless: a rake; an abandoned wretch: Harvey uses the verb after the *Lat. profligo*, but has not been followed: the adverb and noun substantive correspond with the adjective in sense.

Lavatories, to wash the temples, hands, wrists, and jugulars, do potently *profligate* and keep off the venom.

Harvey

Time sensibly all things impairs;
 Our fathers have been worse than theirs,
 And we than ours; next age will see

A race more *profligate* than we,
 With all the pains we take, have still enough to be.

Roscommon.

How far have we

Prophaned thy heavenly gift of poesy?

Made prostitute and *profligate* the muse,

Debased to each obscene and impious use,

Whose harmony was first ordained above

For tongues of angels, and for hymns of love.

Dryden.

Though Phalaris his brazen bull were there,

And he would dictate what he'd have you swear,

Be not so *profligate*, but rather chuse

To guard your honour, and your life to lose. *Id.*

It is pleasant to see a notorious *profligate* seized with a concern for his religion, and converting his spleen into zeal.

Addison.

I have heard a *profligate* offer much stronger arguments against paying his debts, than ever he was known to do against Christianity; because he happened to be closer pressed by the bailiff than the parson.

Swift's Miscellanies.

Most *profligately* false, with the strongest professions of sincerity.

Id.

How could such a *profligate* as Antony, or a boy of eighteen like Octavius, ever dare to dream of giving the law to such an empire and people?

Swift.

Melancholy objects and subjects will, at times, impress the most *profligate* spirits.

Clarissa.

PROFLUENCE, *n. s.* } *Lat. profluens.* Pro-
PROFLUENT, *adj.* } gress; course: flowing forward.

In the *profluence* or proceedings of their fortunes there was much difference between them.

Wotton.

Teach all nations what of him they learned,

And his salvation; them who shall believe

Baptizing in the *profluent* stream, the sign

Of washing them from guilt of sin.

Milton.

PROFOUND, *adj., n. s. & v. n.* } *Fr. profond;*

PROFOUNDLY, *adv.* } *Lat. profun-*

PROFOUNDNESS, *n. s.* } *us. Deep;*

PROFUNDITY. } far below the

surface; intellectually deep; learned; skilful; cunning; lowly; humble: the deep or main sea; the abyss: as a verb, a barbarism, meaning to dive or penetrate: the adverb corresponds with the adjective: profoundness and profundity mean depth of place, knowledge, or thought.

The revolters are *profound* to make slaughter, though I have been a rebuker of them. *Hoseu v. 2.*

God, in the fathomless *profound*,

Hath all his choice commanders drowned.

Sandys.

Their wits, which did every where else conquer hardness, were with *profoundness* here overmatched.

Hooker.

Not orators only with the people, but even the very *profoudest* disputers in all faculties, have hereby often, with the best learned, prevailed most.

Id.

Upon the corner of the moon,

There hangs a vapourous drop *profound*.

Shakspeare.

The most *profoundly* wise.

Drayton.

What words wilt thou use to move thy God to hear thee? what humble gestures? what *profound* reverence?

Duppa.

All else deep snow and ice,

A gulf *profound*, as that Serbonian bog

Betwixt Damiaata and mount Casius old. *Milton.*

If some other place the' ethereal king

Possesses lately, thither to arrive,

I travel this *profound*.

Id. Paradise Lost.

The other turned
Round, through the vast *profundity* obscure.

Milton.

We cannot *profound* into the hidden things of nature, nor see the first springs that set the rest a-going.

Glanville.

Now I die absent in the vast *profound* ;
And me without myself the seas have *drown'd*.

Dryden.

The virgin started, at her father's name,
And sigh'd *profoundly*, conscious of the shame. *Id.*
Domeuchino was *profoundly* skilled in all the
arts of painting; but, wanting genius, he had less
of nobleness. *Id.*

Deep learned in the philosophy of heaven,
He searched the causes out of good and ill,
Profoundly calculating their effects
Far past the bounds of time. *Pollak.*

PROFUSE, *adj.* } Lat. *profusus*. Lavish;
PROFUSELY, *adv.* } prodigal; liberal to licen-
PROFUSENESS, *n. s.* } tiousness; exuberant: the
PROFUSION. } adverb corresponding:

profuseness is lavishness; prodigality; extravagance: profusion, abundance; exuberant plenty; also lavish or extravagant expense.

He was desirous to avoid not only *profusion*, but the least effusion of Christian blood. *Hayward.*

The great *profusion* and expence
Of his revenues bred him much offence. *Daniel.*

On a green shady bank, *profuse* of flowers,
Pensive I sat. *Milton's Paradise Lost.*

Profuseness of doing good, a soul unsatisfied with all it has done, and an unextinguished desire of doing more. *Dryden.*

In *profuse* governments it has been ever observed that the people, from bad example, have grown lazy and expensive, the court has become luxurious and mercenary, and the camp insolent and seditious.

Duvenant.

What meant thy pompous progress through the
empire? *Roue.*

Thy vast *profusion* to the factious nobles?
Oh liberty, thou goddess heavenly bright,
Profuse of bliss, and pregnant with delight.

Addison.

Trade is fitted to the nature of our country, as it abounds with a great *profusion* of commodities of its own growth, very convenient for other countries.

Id.

Hospitality sometimes degenerates into *profuseness*, and ends in madness and folly. *Atterbury.*

Then spring the living herbs *profusely* wild.

Thomson.

The raptured eye,

The fair *profusion*, yellow Autumn spies. *Id.*

The prince of poets, who before us went,

Had a vast income, and *profusely* spent. *Harte.*

PROG, or PRIG, *v. n. & n. s.* Goth. *trigda*.

To rob; steal; pilfer; shift meanly for provisions; victuals; food. A low word.

She went out *progging* for victuals as before.

L'Estrange.

Spouse tuckt up doth in pattens trudge it,
With handkerchief of *prog*, like trull with budget;
And eat by turns plumcake and judge it. *Congreve.*

O nephew! your grief is but folly,

In town you may find better *prog*.

Swift's Miscellanies.

PROGENITOR, *n. s.* } Lat. *progenitus*. A
PROGENY. } } forefather; and ancestor
in a direct line: progeny is offspring; race;
issuë.

Although these things be already past away by her *progenitor's* former grants unto these lords, yet I could find a way to remedy a great part thereof.

Spenser's State of Ireland.

The sons of God have God's own natural Son as a second Adam from heaven, whose race and *progeny* they are by spiritual and heavenly birth.

Hooker.

Like true subjects, sons of your *progenitors*,
Go cheerfully together. *Shakspeare.*

Not me begotten of a shepherd's swain,
But issued from the *progeny* of kings. *Id.*

Oh! admirable temperance, worthy the *progenitor* of him, in whose lips or heart was no guile.

Bp. Hall

All generations then had hither come,
From all the ends of the earth, to celebrate
And reverence thee, their great *progenitor*.

Milton.

By promise he receives
Gift to his *progeny* of all that land.
Thus shall we live in perfect bliss, and see,
Deathless ourselves, a num'rous *progeny*.

Dryden.

Power by right of fatherhood is not possible in any one, otherwise than as Adam's heir, or as *progenitor* over his own descendants.

Locke.

The principal actors in Milton's poems are not only our *progenitors*, but representatives. *Addison.*

We are the more pleased to behold the throne surrounded by a numerous *progeny*, when we consider the virtues of those from whom they descend.

Id. Freeholder.

PROGNOSTIC, *adj. & n. s.* } Fr. *prognos-*
PROGNOSTICABLE, *adj.* } *tique*; Gr.
PROGNOSTICATE, *v. a.* } *προγνωστικός*.
PROGNOSTICATION, *n. s.* } Foretelling or
PROGNOSTICATOR. } foreshowing;

applied particularly to foreshowing health or disease: a prediction or token, and (gallicism) the skill of foretelling diseases: prognosticable is such as may be foreshown or fore-known: prognosticate, to foretel; foreshow: prognostication, the act of doing so, or the token, sentence, or determination given: prognosticator he who gives it forth.

He bid him farewell, arming himself in a black armour, as a badge or *prognostication* of his mind.

Sidney.

If an oily palm be not a fruitful *prognostication*.
I cannot scratch mine ear.

Shakspeare. Antony and Cleopatra.

He had now outlived the day which his tutor Sandford had *prognosticated* upon his nativity he would not outlive.

Clarendon.

The causes of this inundation cannot be regular, and therefore their effects not *prognosticable* like eclipses.

Broune's Vulgar Errors.

Unskilled in schemes by planets to foreshow,

I neither will, nor can *prognosticate*,
To the young gaping heir, his father's fate.

Dryden.

This theory of the earth begins to be a kind of prophecy or *prognostication* of things to come, as it hath been hitherto an history of things past.

Burnet.

Whatsoever you are or shall be, has been but an easy *prognostic* from what you were.

There is nothing so inconsiderable, which may not appear dreadful to imagination, that is filled with omens and *prognostics*.

Addison.

That astrologer made his almanack give a tolerable account of the weather by a direct inversion of

the common prognosticators, to let his belief run counter to reports. *Government of the Tongue.*

Hippocrates's prognostic is generally true, that it is very hard to resolve a small apoplexy.

Arbutnot.

Careful observers

By sure prognostics may foretel a shower.

Swift.

PROGRESS, *n. s. & v. n.*

PROGRESSION, *n. s.*

PROGRESSIONAL, *adj.*

PROGRESSIVE,

PROGRESSIVELY, *adv.*

PROGRESSIVENESS, *n. s.*

to pass; move forward: progression and progressiveness are synonymous with progress as a noun substantive: progressional, in a state of increase or advance: progressive, advancing; going forward; the adverb corresponding.

I cannot, by the progress of the stars,
Give guess how near to day.

Shakspeare. Julius Cæsar.

Let me wipe off this honourable dew,
That silverly doth progress on thy cheeks.

Shakspeare.

He hath framed a letter, which accidentally, or by the way of progression, hath miscarried. *Id.*

Out of Ethiopia beyond Egypt has been a strange progress for ten hundred thousand men. *Raleigh.*

Princes, if they use ambitious men, should handle it so as they may be still progressive, and not retrograde. *Bacon.*

He gave order that there should be nothing in his journey like unto a warlike march, but rather like unto the progress of a king in full peace. *Id.*

Solon the wise his progress never ceased,
But still his learning with his days increased.

Denham.

From Egypt arts their progress made to Greece,
Wrapt in the fable of the golden fleece. *Id.*

The morn begins

Her rosy progress smiling.

Milton.

Their course

Progressive, retrograde, or standing still. *Id.*

Those worthies, who endeavour the advancement of learning are likely to find a clearer progression, when so many rubs are levelled. *Browne.*

Thus { 2, 4, 6, 8, 10, &c. increasing } by the difference 2.
{ 10, 8, 6, 4, 2, &c. decreasing }

PROGRESSION, GEOMETRICAL, OR CONTINUED GEOMETRIC PROPORTION, is when the terms do increase or decrease by equal ratios: thus,

2, 4, 8, 16, 32, 64, increasing } from a continual { multiplication } by 2.
64, 32, 16, 8, 4, 2, decreasing }

PROHIBIT, *v. a.*

PROHIBITION, *n. s.*

PROHIBITORY, *adj.*

Fr. *prohiber*; Lat. *prohibeo*.

To forbid;

interdict; hinder; debar:

the noun substantive and adjective corresponding.

She would not let them know of his close lying in that prohibited place, because they would be offended. *Sidney.*

The weightiest, which it did command them, are to us in the gospel prohibited. *Hooker.*

Might there not be some other mystery in this prohibition, than they think of? *Id.*

'Gainst self-slaughter

There is a prohibition so divine,

That cravens my weak haad.

Shakspeare. Cymbeline.

They maintain their accomplished ends, and relapse not again into their progressional imperfections. *Id.*

In progressive motion, the arms and legs move successively; but, in natation, both together. *Id. Vulgar Errors.*

The reason why they fall in that order, from the greatest epacts progressively to the least, is, because the greatest epacts denote a greater distance of the moon before the sun, and consequently a nearer approach to her conjunction. *Holder.*

It is impossible the mind should ever be stopped in its progress in this space. *Locke.*

In philosophical enquiries, the order of nature should govern, which in all progression is to go from the place one is then in, to that which lies next to it. *Id.*

The progressive motion of this animal is made not by walking, but by leaping. *Ray on the Creation.*

Whoever understands the progress and revolutions of nature, will see that neither the present form of the earth, nor its first form, were permanent and immutable. *Burnet.*

O may I live to hail the day,

When the glad nation shall survey

Their sov'reign, through his wise command,

Passing in progress o'er the land. *Addison.*

Ere the progressive course of restless age

Perform three thousand times its annual stage,

May not our power and learning be suppress'd,

And arts and empire learn to travel west? *Prior.*

The squares of the diameters of these rings, made by any prismatic color, were in arithmetical progression. *Newton.*

The Sylphs behold it kindling as it flies,

And pleased pursue its progress through the skies. *Pope.*

Perhaps I judge hastily, there being several, in whose writings I have made very little progress. *Swift's Miscellanies.*

You perhaps have made no progress in the most important Christian virtues; you have scarce gone half way in humility and charity. *Law.*

PROGRESSION, in mathematics, is either arithmetical or geometrical.

PROGRESSION, ARITHMETICAL, OR CONTINUED ARITHMETIC PROPORTION, is, where the terms do increase and decrease by equal differences, and is called arithmetical progression:

A prohibition will lie on this statute, notwithstanding the penalty annexed; because it has words prohibitory, as well as a penalty annexed. *Ayliffe.*

PROJECT, *v. a., v. n. & n. s.* } Fr. *projeter*;
PROJECTILE, *n. s. & adj.* } Lat. *projicio*,
PROJECTION, *n. s.* } *projectus*. To
PROJECTOR, *n. s.* } throw or cast

out; cast forward; exhibit as in the manner of an image on a mirror; form in the mind; contrive; scheme: a scheme; design; contrivance: a projectile is a body put into motion: as an adjective it means impelled forward: projection is the act of shooting forwards; plan; scheme; crisis of a chemical operation: projector, one who forms schemes or designs; a mere schemer.

A little quantity of the medicine in the projection will turn a sea of the baser metal into gold by multiplying. *Bacon.*

It ceases to be counsel, to compel men to assent to whatever tumultuary patrons shall project.

King Charles.

What sit we then projecting peace and war?

Milton.

If the electric be held unto the light, many particles will be discharged from it, which motion is performed by the breath of the effluvium issuing with agility; for, as the electric cooleth, the projection of the atoms ceaseth. *Browne.*

Diffusive of themselves where e'er they pass,

They make that warmth in others they expect;

Their valour works like bodies on a glass,

And does its image on their men project.

Dryden.

Chymists, and other projectors, propose to themselves things utterly impracticable. *L'Estrange.*

What desire, by which nature projects its own pleasure or preservation, can be gratified by another man's personal pursuit of his own vice? *South.*

It is a discovering the longitude, and deserves a much higher name than that of a project. *Addison.*

The following comes from a projector, a correspondent as diverting as a traveller; his subject having the same grace of novelty to recommend it.

Id.

In the various projects of happiness, devised by human reason, there appeared inconsistencies not to be reconciled.

Rogers.

Among all the projectors in this attempt, none have met with so general a success as they who apply themselves to soften the rigour of the precept.

Id.

Good blood, and a due projectile motion or circulation, are necessary to convert the aliment into laudable juices. *Arbuthnot.*

Projectiles would for ever move on in the same right line, did not the air, their own gravity, or the ruggedness of the plane stop their motion.

Cheyne's Philosophical Principles.

The ascending villas

Project long shadows o'er the crystal tide.

Pope.

Astrologers that future fates foreshow,

Projectors, quacks, and lawyers not a few. *Id.*

If we had a plan of the naked lines of longitude and latitude, projected on the meridian, a learner might more speedily advance himself in the knowledge of geography. *Watts.*

For the bulk of the learners of astronomy, that projection of the stars is best, which includes in it all the stars in our horizon, reaching to the 38½ degree of the southern latitude. *Id.*

PROJECTILES.

PROJECTILES is a term under which has been comprehended that branch of mechanical philosophy which treats of the motion of bodies projected in any way from the surface of the earth, and influenced by the action of gravity. The principal application of this science in modern times, particularly in Europe, has been to gunnery, an art totally unknown to the ancients; yet they were far from being ignorant of other branches of this science. Machines were known among the Greeks and Romans by the names of Ballista, Catapulta, &c., which produced effects by the elastic action of a strongly twisted cordage, and formed of tough animal substances, hardly less terrible than the artillery of the moderns; and the various tremendous engines of this kind, invented by the celebrated Archimedes, show to what considerable perfection the direction of projectiles had then been brought. See ARCHIMEDES and ARTILLERY. Such instruments continued in use down to the twelfth and thirteenth centuries, and the use of bows still longer; nor were they totally laid aside till they were superseded by the use of gunpowder and the modern ordnance.

The first application of gunpowder to military affairs was made, as we have shown in the article just referred to, early in the fourteenth century: the first pieces of artillery being charged with gunpowder and stone bullets of a prodigious

size. Thus, when Mahomet II. besieged Constantinople in 1543, he battered the walls with stones of this kind, and with pieces of the calibre of 1200 lbs.; which could not be fired more than four times a day. It was, however, soon discovered that iron bullets, of much less weight, would be more efficacious if impelled by quantities of stronger powder. This occasioned an alteration in the matter and form of the cannon, which were now cast of brass. These were lighter and more manageable than the former, and at the same time stronger in proportion to their bore.

By these means powder compounded in the manner now practised over all Europe came first in use. But the change of the proportion of materials was not the only improvement. The method of graining was of great advantage. The additional strength which the grained powder was found to acquire, from the free passage of the air between the grains, occasioned the meal powder to be entirely laid aside.

For the last 250 years the formation of cannon has been little improved; the best pieces of modern artillery differing little in their proportions from those used in the time of Charles V. Indeed lighter and shorter pieces have been often proposed and essayed; but, though they have advantages in particular cases, yet it seems now to be agreed that they are altogether insufficient

for general service. On the whole, however, small pieces of artillery have been brought into use: thus the battering pieces now approved are the demi-cannon of former times; it being found that their stroke, though less violent than that of a larger piece, is yet sufficiently adapted to the strength of the usual profiles of fortification; and that the facility of their carriage and management, and the ammunition they spare, give them great advantages beyond the whole cannon formerly employed. The method of making a breach, by first cutting off the whole wall as low as possible before its upper part is attempted to be beaten down, seems also to be a considerable modern improvement. But the most important advance in this art is the method of firing with small quantities of powder, and elevating the piece so that the bullet may just go clear of the parapet of the enemy, and drop into his works. By these means the bullet, coming to the ground at a small angle, and with a small velocity, does not bury itself, but bounds or rolls along in the direction in which it was fired: and therefore, if the piece be placed in a line with the battery it is intended to silence, or the front it is to sweep, each shot rakes the whole length of that battery or front; and has thereby a much greater chance of disabling the defendants, and dismounting their cannon. This method was invented by Vauban, and was by him styled *Batterie à Ricochet*. It was first practised in 1692 at the siege of Aeth. Something similar was practised by the king of Prussia at the battle of Rosbach in 1757.

PART I.

THEORY OF PROJECTILES.

SECT. I.—OF THE EFFECTS OF GRAVITY ON PROJECTED BODIES.

It has been demonstrated that a body projected in the usual way from the surface of the earth in the atmosphere, must describe a conic section, having the centre of the earth in one focus, and that it will describe round that focus areas proportional to the times: it follows that, if the velocity of projection exceeds 36,700 feet in a second, the body (if not resisted by the air) would describe a hyperbola; if it be just 36,700 it would describe a parabola; and, if it be less, it would describe an ellipsis. If projected directly upwards, in the first case, it would never return, but proceed for ever; its velocity continually diminishing, but never becoming less than an assignable portion of the excess of the initial velocity above 36,700 feet in a second; in the second case it would never return, its velocity would diminish without end, but never be extinguished. In the third case, it would proceed till its velocity was reduced to an assignable portion of the difference between 36700 and its initial velocity; and would then return, regaining its velocity by the same degrees, and in the same places as it lost it. These are necessary consequences of a gravity directed to the centre of the earth, and inversely proportional to the square of the distance. But, in the greatest projections that we are able to make, the gravitations are so nearly equal, and in directions so

nearly parallel, that it would be ridiculous affectation to pay any regard to the deviations from equality and parallelism. A bullet rising a mile above the surface of the earth loses only $\frac{1}{1000}$ of its weight, and a horizontal range of four miles only four of deviation from parallelism. Gravitation may be therefore assumed as equal and parallel. The errors arising from this assumption are quite insensible in all the uses which can be made of this theory; which was the first fruits of mathematical philosophy, and the effort of the genius of the great Galileo.

Gravity is a constant or uniform accelerating or retarding force, according as it produces the descent, or retards the ascent, of a body: and, all other forces being ascertained by the accelerations which they produce, they are conveniently measured by comparing their accelerations with the acceleration of gravity. This therefore has been assumed by all the latest and best writers on mechanical philosophy, as the unit by which every other force is measured. It gives a perfectly distinct notion of the force which retains the moon in its orbit, to say it is the 3600th part of the weight of the moon at the surface of the earth: i. e. if a bullet were here weighed by a spring steel-yard, and pulled it out to the mark 3600, if it were then taken to the distance of the moon, it would pull it out only to the mark 1. This assertion is made from observing that a body at the distance of the moon falls from that distance $\frac{1}{1000}$ part of sixteen feet in a second. Forces therefore which are imperceptible are not compared, but the accelerations, which are their indications, effects, and measures. For this reason philosophers have been anxious to determine with precision the fall of heavy bodies, to have an exact value of the accelerating power of terrestrial gravity. This measure may be taken in two ways; by taking the space through which the heavy body falls in a second; or the velocity which it acquires in consequence of gravity having acted on it during a second. The last is the proper measure; for the last is the immediate effect on the body. The action of gravity has changed the state of the body, by giving it a determination to motion downward: this both points out the kind and the degree or intensity of the force of gravity. The space described in a second by falling is not an invariable measure; for, in the successive seconds, the body falls through 16, 48, 80, 112, &c., feet, but the changes of the body's state in each second is the same. At the beginning it had no determination to move with any appreciable velocity; at the end of the first second it had a determination by which it would have gone on for ever (had no subsequent force acted on it) at the rate of thirty-two feet per second. At the end of the second second, it had a determination by which it would have moved for ever, at the rate of sixty-four feet per second. At the end of the third second, it had a determination by which it would have moved for ever, at the rate of ninety-six feet per second, &c. &c. The difference of these determinations is a determination to the rate of thirty-two feet per second. This is therefore constant, and the indication and proper measure of the constant or invariable

force of gravity. The space fallen through in the first second is of use only as it is one-half of the measure of this determination; and, as halves have the proportion of their wholes, different accelerating forces may be safely affirmed to be in the proportion of the spaces through which they uniformly impel bodies in the same time. But we must always recollect that this is but one-half of the true measure of the accelerating force. Mathematicians of the first rank have committed great mistakes by not attending to this; and it is necessary to notice it here, because cases will occur, in the prosecution of this subject, where we shall be very apt to confound our reasonings by a confusion in the use of those measures.

SECT. II.—OF THE MEASURE OF THE ACCELERATIVE POWER OF GRAVITY.

The accurate measure of the accelerative power of gravity is the fall $16\frac{1}{2}$ feet, if measured by the space, or the velocity of $32\frac{1}{2}$ feet per second, if the velocity be taken. It will greatly facilitate calculation, and will be sufficiently exact for every purpose, to take 16 and 32, supposing that a body falls sixteen feet in a second, and acquires the velocity of thirty-two feet per second. Then, because the heights are as the squares of the times, and as the squares of the acquired velocities, a body will fall one foot in one fourth of a second, and will acquire the velocity of eight feet per second. Let h express the height in feet, and call it the producing height; v the velocity in feet per second, and call it the produced velocity, the velocity due; and t the time in seconds.—The following formulæ, which are of easy recollection, will serve, without tables, to answer all questions relative to projectiles.

I. $v = 8\sqrt{h}$, $h = 8 \times 4t$, $= 32t$

II. $t = \frac{\sqrt{h}}{4}$, $= \frac{v}{32}$

III. $\sqrt{h} = \frac{v}{8}$, $= 4t$

IV. $h = \frac{v^2}{64}$, $= 16t^2$

To give some examples of their use, let it be required,

1. To find the time of falling through 256 feet.

Here $h = 256$, $\sqrt{256} = 16$, and $\frac{16}{4} = 4$. Answer 4".

2. To find the velocity acquired by falling four seconds. $t = 4 \cdot 32 \times 4 = 128$ feet per second.

3. To find the velocity acquired by falling 625 feet. $h = 625 \cdot \sqrt{h} = 25 \cdot 8 \sqrt{h} = 200$ feet per second.

4. To find the height to which a body will rise when projected with the velocity of fifty-six feet per second, or the height through which a body must fall to acquire this velocity.

$v = 56 \cdot \frac{56}{8} = 7$, $= \sqrt{h \cdot 7^2} = h$, $= 49$ feet.

or $56^2 = 3136 \cdot \frac{3136}{64} = 49$ feet.

5. Suppose a body projected directly downwards with the velocity of ten feet per second; what will be its velocity after four seconds? In four seconds it will have acquired, by the action of gravity, the velocity of 4×32 , or 128 feet,

and therefore its whole velocity will be 138 feet per second.

6. To find how far it will have moved, compound its motion of projection, which will be forty feet in four seconds, with the motion which gravity alone would have given it in that time, which is 256 feet; and the whole motion will be 296 feet.

7. Suppose the body projected as already mentioned, and that it is required to determine the time it will take to go 296 feet downwards, and the velocity it will have acquired. Find the height x , through which it must fall to acquire the velocity of projection, ten feet, and the time y of falling from this height. Then find the time z of falling through the height $296 + x$, and the velocity v acquired by this fall. The time of describing the 296 feet will be $x - y$, and v is the velocity required. From such examples it is easy to see the way of answering every question of the kind.

Writers on the higher parts of mechanics always compute the actions of other accelerating and retarding forces, by comparing them with the acceleration of gravity; and, to render their expressions more general, use a symbol, such as g for gravity, leaving the reader to convert it into numbers. Agreeably to this view, the general formulæ will stand thus:

I. $v = \sqrt{2gh}$, i. e. $\sqrt{2 \frac{g}{g} \sqrt{h}} = g t$,

II. $t = \frac{v}{g} = \frac{\sqrt{4h}}{\sqrt{2g}} = \sqrt{\frac{4h}{2g}} = \sqrt{\frac{2h}{g}}$

III. $h = \frac{v^2}{2g} = \frac{g t^2}{2}$

Gravity, or its accelerating power, is estimated in all these equations, as it ought to be, by the change of velocity which it generates in a particle of matter in a unit of time. But many mathematicians, in their investigations of curvilinear and other varied motions, measure it by the deflection which it produces in this time from the tangent of the curve, or by the increment by which the space described in a unit of time exceeds the space described in the preceding unit. This is but one-half of the increment which gravity would have produced, had the body moved through the whole moment with the acquired addition of velocity. In this sense of the symbol g , the equations stand thus:

I. $v = 2\sqrt{gh}$, $= 2gt$

II. $t = \sqrt{\frac{h}{g}}$, $= \frac{v}{2g}$

IV. $h = \frac{v^2}{4g}$, $= gt^2$, and $\sqrt{h} = \frac{v}{2\sqrt{g}}$

It is likewise very common to consider the accelerating force of gravity as the unit of comparison. This renders the expressions much more simple. In this way v expresses not the velocity, but the height necessary for acquiring it, and the velocity itself is expressed by \sqrt{v} . To reduce such an expression of a velocity to numbers, multiply it by $\sqrt{2g}$, or by $2\sqrt{g}$ according as g is the generated velocity, or the space fallen through in the unit of time. This will suffice for the perpendicular ascents or descents of heavy bodies; and we proceed to con-

sider their motions when projected obliquely. The circumstance which renders this an interesting subject is, that the flight of cannon shot and shells are instances of such motion, and the art of gunnery must in a great measure depend on this doctrine. Let a body B (fig. 1) be projected in any direction, BC, not perpendicular to the horizon, and with any velocity. Let AB be the height producing this velocity; that is, let the velocity be that which a heavy body would acquire by falling freely through AB. It is required to determine the path of the body, and all the circumstances of its motion in this path?

Fig. 1.

1. By the continual action of gravity, the body will be continually deflected from the line BC, and will describe a curve line BVG, concave towards the earth.

2. This curve line is a parabola, of which the vertical line ABE is diameter, B the vertex of this diameter, and BC a tangent in B. Through any two points, V, G, of the curve draw VC, GH, parallel to AB, meeting BC in C and H, and draw VE, GK, parallel to BC, meeting AB in E, K. It follows, from the composition of motions, that the body would arrive at the points V, G, of the curve in the same time that it would have uniformly described BC, BH, with the velocity of projection; or that it would have fallen through BE, BK, with a motion uniformly accelerated by gravity; therefore the times of describing BC, BH, uniformly, are the same with the time of falling through BE, BK. But, because the motion along BH is uniform, BC is to BH as the time of describing BC to the time of describing BH, which we may express thus, $BC : BH = T, BC : T, BH = T, BE : T, BK$. But, because the motion along BK is uniformly accelerated, we have $BE : BK = T^2, BE : T^2, BK = BC^2 : BH^2 = EV^2 : KG^2$; therefore the curve BVG is such, that the abscissæ BE, BK, are as the squares of the corresponding ordinates EV, KG; that is, the curve BVG is a parabola, and BC, parallel to the ordinates, is a tangent in the point B.

3. If the horizontal line ADd be drawn through the point A, it is the directrix of the parabola. Let BE be taken equal to AB. The time of falling through BE is equal to the time of falling through AB; but BC is described with the velocity acquired by falling through AB: and therefore by number 4 of perpendicular descents, BC is double of AB, and EV is double of BE; therefore, $EV^2 = 4 BE^2 = 4 BE \times AB = BE \times 4 AB$, and 4 AB is the parameter or latus rectum of the parabola BVG, and, AB being one fourth of the parameter, AD is the directrix.

4. The times of describing the different arches BV, VG, of the parabola are as the portions BC, BH, of the tangent, or as the portions AD, Ad, of the directrix, intercepted by the same vertical lines AB, CV, HG; for the times of describing BV, BVG, are the same with those of describing the corresponding parts BC, BH, of the tangent, and are proportional to these parts, because the motion along BH is uniform; and BC, BH, are proportional to AD, Ad. Therefore the motion estimated horizontally is uniform.

5. The velocity in any point G of the curve is the same with that which a heavy body would acquire by falling from the directrix along dG. Draw the tangent GT, cutting the vertical AB in T; take the points a, f, equidistant from A and a, and extremely near them, and draw the vertices a, b, f, g; let the points a, f, continually approach A and d, and ultimately coincide with them. B b will therefore ultimately be to g G in the ratio of the velocity at B to the velocity at G (for the portions of the tangent ultimately coincide with the portions of the curve, and are described in equal times); but B b is to G g as BH to TG: therefore the velocity at B is to that at G as BH to TG. But, by the properties of the parabola, BH^2 is to TG^2 as AB to dG ; and AB is to dG as the square of the velocity acquired by falling through AB to the square of the velocity acquired by falling through dG; and the velocity in BH, or in the point B of the parabola, is the velocity acquired by falling along AB; therefore the velocity in TG, or in the point G of the parabola, is the velocity acquired by falling along dG.

The preceding propositions contain all the theory of the motion of projectiles in vacuo, or independent on the resistance of the air; and being a very easy and neat exhibition of mathematical philosophy, and connected with a very interesting practice, they have been much commented on, and have furnished matter for many splendid volumes. But the resistance of the air occasions such a prodigious diminution of motion in the great velocities of military projectiles, that this parabolic theory, as it is called, is of little practical use. A musket ball, discharged with the ordinary allotment of powder, issues from the piece with the velocity of 1670 feet per second: this velocity would be acquired by falling from the height of eight miles. If the piece be elevated to an angle of 45°, the parabola should be of such extent that it would reach sixteen miles on the horizontal plain; whereas it does not reach much above half a mile. Similar deficiencies are observed in the ranges of cannon shot. It is unnecessary, therefore, to enlarge upon this theory.

Facts prove, beyond all doubt, how deficient the parabolic theory is, and how unfit for directing the practice of the artillery. A very simple consideration is sufficient for rendering this obvious to the most un instructed. The resistance of the air to a very light body may greatly exceed its weight. Any one will feel this in trying to move a fan very rapidly through the air; therefore this resistance would, occasion a greater deviation from uniform motion than gravity would in that body. Its path, therefore, through the

air may differ more from a parabola than a parabola itself deviates from the straight line. For these reasons, we affirm that the voluminous treatises which have been published on this subject are nothing but ingenious amusements for young mathematicians. All that seems possible to do for the practical artillerist is, to multiply judicious experiments on real pieces of ordnance, with the charges that are used in actual service, and to furnish him with tables calculated from such experiments.

SECT. III.—OF THE CAUSES OF THE DEFICIENCY OF THE PARABOLIC THEORY.

It is, however, the business of the philosopher to enquire into the causes of such a prodigious deviation from a well founded theory; and, having discovered them, to ascertain precisely the deviations they occasion. Thus we shall obtain another theory, either in the form of the parabolic theory corrected, or as a subject of independent discussion.

The motion of projectiles being performed in the atmosphere, the air is displaced, or put in motion. Whatever motion it acquires must be taken from the bullet. The motion communicated to the air must be in the proportion of the quantity of air put in motion, and of the velocity communicated to it. If, therefore, the displaced air be always similarly displaced, whatever be the velocity of the bullet, the motion communicated to it, and lost by the bullet, must be proportional to the square of the velocity of the bullet and to the density of the air jointly. Therefore the diminution of its motion must be greater when the motion itself is greater; and in the very great velocity of shot and shells it must be prodigious. From Mr. Robins's experiments it is plain that a globe of four inches and a half in diameter, moving with the velocity of twenty-five feet in a second, sustained a resistance of 315 grains, nearly three-quarters of an ounce. Suppose this ball to move 800 feet in a second, that is, thirty-two times faster, its resistance would be 32×32 times three-quarters of an ounce, or 768 ounces, or forty-eight pounds. This is four times the weight of a ball of cast iron of this diameter; and, if the initial velocity had been 1600 feet per second, the resistance would be at least sixteen times the weight of the ball. It is indeed much greater.

So great a resistance, operating constantly and uniformly on the ball, must take away four times as much from its velocity as its gravity would do in the same time. In one second gravity would reduce the velocity 800 to 768, if the ball were projected straight upwards. This resistance of the air would therefore reduce it in one second to 672, if it operated uniformly; but as the velocity diminishes continually by the resistance, and the resistance diminishes along with the velocity, the real diminution will be somewhat less than 128 feet. We shall, however, find, that in one second its velocity will be reduced from 800 to 687. From this instance it is clear that the resistance of the air must occasion great deviation from parabolic motion.

To judge accurately of its effect, we must consider it as a retarding force, as we consider

gravity. The weight W of a body is the aggregate of the action of the force of gravity g on each particle of the body. Suppose the number of equal particles, or the quantity of matter, of a body, to be M , then W is equivalent to gM . In like manner, the resistance R , observed in any experiment, is the aggregate of the action of a retarding force R' on each particle, and is equivalent to $R'M$: and as g is equal to $\frac{W}{M}$, so R' is equal to $\frac{R}{M}$. Let us keep this distinction in

view, by adding the differential mark ' to the letter R or r , which expresses the aggregate resistance.

If we thus consider resistance as a retarding force, we can compare it with any other such force by means of the retardation which it produces in similar circumstances. We would compare it with gravity by comparing the diminution of velocity which its uniform action produces in a given time with the diminution produced in the same time by gravity. But we have no opportunity of doing this directly; for, when the resistance of the air diminishes the velocity of a body, it diminishes it gradually, which occasions a gradual diminution of its own intensity. This is not the case with gravity, which has the same action on a body in motion or at rest. We cannot, therefore, observe the uniform action of the resistance of the air as a retarding force. We must make the comparison in some other way. We can state them both as dead pressures. A ball may be fitted to the rod of a spring steelyard, and exposed to the impulse of the wind. This will compress the steelyard to the mark 3, for instance. Perhaps the weight of this ball will compress it to the mark 6. Half this weight would compress it to 3. We reckon this equal to the pressure of the air, because they balance the same elasticity of the spring. In this way we can estimate the resistance by weights whose pressures are equal to its pressure; and we can thus compare it with other resistances, weights, or any other pressures. In fact, we are measuring them by all the elasticity of the spring. This elasticity in its different positions is supposed to have the proportions of the weights which keep it in these positions. Thus we reason from the nature of gravity, no longer considered as a dead pressure, but as a retarding force; and we apply our conclusions to resistances which exhibit the same pressures, but which we cannot make to act uniformly. This sense of the words must be remembered whenever we speak of resistances in pounds and ounces.

The most convenient and direct way of stating the comparison between the resistance of the air and the accelerating force of gravity, is to take a case in which we know that they are equal. Since the resistance is here assumed as proportional to the square of the velocity, it is evident that the velocity may be so increased that the resistance shall equal or exceed the weight of the body. If a body be already moving downwards with this velocity, it cannot accelerate; because the accelerating force of gravity is balanced by an equal retarding force of resistance. It follows

from this remark that this velocity is the greatest that a body can acquire by the force of gravity only. Nay, we shall see that it never can completely attain it; because, as it approaches to this velocity, the remaining accelerating force decreases faster than the velocity increases. It may therefore be called the limiting or terminal velocity by gravity.

Let a be the height through which a heavy body must fall, in vacuo, to acquire its terminal velocity in air. If projected directly upwards with this velocity, it will rise again to this height, and the height is half the space which it would describe uniformly, with this velocity, in the time of its ascent. Therefore, the resistance to this velocity being equal to the weight of the body, it would extinguish this velocity, by its uniform action, in the same time, and after the same distance, that gravity would. Now let g be the velocity which gravity generates or extinguishes during an unit of time, and let u be the terminal velocity of any particular body. The theorems

for perpendicular ascents give us $g = \frac{u^2}{2a}$, u

and a being both numbers representing units of space; therefore, in the present case, we have

$r' = \frac{u^2}{2a}$. For the whole resistance r , or $r' M$,

is supposed equal to the weight, or to $g M$;

and therefore r' is equal to g , $= \frac{u^2}{2a}$ and $2a =$

$\frac{u^2}{g}$. There is a consideration which ought to

have place here. A body descends in air, not by the whole of its weight, but by the excess of its weight above that of the air which it displaces. It descends by its specific gravity only as a stone does in water. Suppose a body thirty-two times heavier than air, it will be buoyed up by a force

equal to $\frac{1}{32}$ of its weight; and, instead of acquiring

the velocity of thirty-two feet in a second, it will only acquire a velocity of thirty-one, even though it sustained no resistance from the inertia of the air. Let p be the weight of the body, and π that of an equal bulk of air: the accelerative force of relative gravity on each particle will be

$g \times 1 - \frac{\pi}{p}$; and this relative accelerating force

might be distinguished by another symbol γ . But in all cases in which we have any interest,

and particularly in military projectiles, $\frac{\pi}{p}$ is so

small a quantity that it would be pedantic affectation to attend to it. It is much more than compensated when we make $g = 32$ feet, instead of $32\frac{1}{2}$, which it should be.

Let e be the time of this ascent in opposition to gravity. The same theorems give us $eu = 2a$; and, since the resistance competent to this terminal velocity is equal to gravity, e will also be the time in which it would be extinguished by the uniform action of the resistance; for which reason we may call it the extinguishing time for this velocity. Let R and E mark the resistance and extinguishing time for the same body moving with the velocity 1.

As the resistances are as the squares of the ve-

locities, and the resistance to the velocity u is $\frac{u^2}{2a}$, R will be $= \frac{1}{2a}$. Moreover, the times in which the same velocity will be extinguished by different forces, acting uniformly, are inversely as the forces, and gravity would extinguish the velocity 1 in the time $\frac{1}{g} =$ (in these measures)

to $\frac{1}{u^2} = \frac{2a}{u^2}$. Therefore we have the following

proportion, $\frac{1}{2a} (= R) : \frac{u^2}{2a} (= g) = \frac{2a}{u^2} : 2a$,

and $2a$ is equal to E , the time in which the velocity 1 will be extinguished by the uniform action of the resistance competent to this velocity. The velocity 1 would in this case be extinguished after a motion uniformly retarded, in which the space described is one-half of what would be uniformly described during the same time with the constant velocity 1. Therefore the space thus described by a motion which begins with the velocity 1, and is uniformly retarded by the resistance competent to this velocity, is equal to the height through which this body must fall in vacuo in order to acquire its terminal velocity in air.

The following description may render all these circumstances more easily conceived by some readers. The terminal velocity is that where the resistance of the air balances and is equal to the weight of the body. The resistance of the air to any particular body is as the square of the velocity; therefore let R be the whole resistance to the body moving with the velocity 1, and r the resistance to its motion with the terminal velocity u ; we must have $r = R \times u^2$, and this must be $= W$, the weight. Therefore, to obtain the terminal velocity, divide the weight by the resistance to the velocity 1, and the quotient is the square of the terminal velocity, or $\frac{W}{R} = u^2$: and

this is a very expeditious method of determining it, if R be previously known. Then the common theorems give a , the fall necessary for producing this velocity in vacuo $= \frac{u^2}{2g}$, and the time

of the fall $= \frac{u}{g} = e$, and $eu = 2a$, = the

space uniformly described with the velocity u during the time of the fall, or its equal, the time of the extinction by the uniform action of the resistance r ; and, since r extinguishes it in the time e , R which is u^2 times smaller will extinguish it in the time $u^2 e$, and R will extinguish the velocity 1, which is u times less than u , in the time ue , that is, in the time $2a$; and the body moving uniformly during the time $2a = E$, with the velocity 1, will describe the space $2a$; and if the body begin to move with the velocity 1, and be uniformly opposed by the resistance R , it will be brought to rest when it has described the space a ; and the space in which the resistance to the velocity 1 will extinguish that velocity by its uniform action is equal to the height through which that body must fall in vacuo in order to acquire its terminal velocity in air. And thus every thing is regulated by the

time E in which the velocity 1 is extinguished by the uniform action of the corresponding resistance, or by $2a$, which is the space uniformly described during this time, with the velocity 1 . And E and $2a$ must be expressed by the same number. It is a number of units, of time, or of length.

Thus, having ascertained these leading circumstances for a unit of velocity, weight, and bulk, we proceed to deduce the similar circumstances for any other magnitude; and, to avoid unnecessary complications, we shall always suppose the bodies to be spheres, differing only in diameter and density. First, then, let the velocity be increased in the ratio of 1 to v .

The resistance will now be $\frac{v^2}{2a} = r$

The extinguishing time will be $\frac{E}{v} = e, = \frac{2a}{v}$ and $e v = 2a$; so that the rule is general, that the space along which any velocity will be extinguished by the uniform action of the corresponding resistance is equal to the height necessary for communicating the terminal velocity to that body by gravity. For $e v$ is twice the space through which the body moves while the velocity v is extinguished by the uniform resistance

2dly, Let the diameter increase in the proportion of 1 to d . The aggregate of the resistance changes in the proportion of the surface similarly resisted, that is, in the proportion of 1 to d^2 . But the quantity of matter, or number of particles among which this resistance is to be distributed, changes in the proportion of 1 to d^3 . Therefore the retarding power of the resistance changes in the proportion of 1 to $\frac{1}{d}$. When the diameter

was 1 the resistance to a velocity 1 was $\frac{1}{2a}$. It must now be $\frac{1}{2ad}$. The time in which this

diminished resistance will extinguish the velocity 1 must increase in the proportion of the diminution of force, and must now be $E d$, or $2ad$, and the space uniformly described during this time with the initial velocity 1 must be $2ad$; and this must still be twice the height necessary for communicating the terminal velocity w to this body. We must still have $g = \frac{w^2}{2ad}$; and therefore $w^2 = 2gad$, and $w = \sqrt{2gad} = \sqrt{2ga} \sqrt{d}$. But $u = \sqrt{2ga}$. Therefore the terminal velocity w for this body is $u \sqrt{d}$; and the height necessary for communicating it is ad . Therefore the terminal velocity varies in the subduplicate ratio of the diameter of the ball, and the fall necessary for producing it varies in the simple ratio of the diameter. The extinguishing time for the velocity v must now be $\frac{E d}{v}$

3dly, If the density of the ball be increased in the proportion of 1 to m , the number of particles among which the resistance is to be distributed is increased in the same proportion, and therefore the retarding force of the resistance is equally diminished; and, if the density of the air is in-

creased in the proportion of 1 to n , the retarding force of the resistance increases in the same proportion: hence we easily deduce these general expressions.

$$\text{The terminal velocity} = u \sqrt{\frac{d m}{n}} = \sqrt{2 g a d \frac{m}{n}}$$

$$\text{The producing fall in vacuo} = a d \frac{m}{n}$$

$$\text{The retarding power of resistance to any velocity} = r = \frac{v^2}{2 a d \frac{m}{n}}$$

$$\text{The extinguishing time for any velocity } v = \frac{E d m}{v n}$$

Thus we see that the chief circumstances are regulated by the terminal velocity, or are conveniently referred to it.

To communicate distinct ideas, and render the deductions from these premises perspicuous, it will be proper to assume some convenient units, by which all these qualities may be measured; and, as this subject is chiefly interesting in the case of military projectiles, we shall adapt our units to this purpose. Therefore let a second be the unit of time, a foot the unit of space and velocity, an inch the unit of diameter of a ball or shell, and a pound avoirdupois the unit of pressure, whether of weight or of resistance: therefore g is thirty-two feet. The great difficulty is to procure an absolute measure of r , or u , or a ; any one of these will determine the others.

Sir Isaac Newton attempted to determine r by theory, and employed a great part of the second book of the Principia in demonstrating, that the resistance to a sphere moving with any velocity is to the force which would generate or destroy its whole motion in the time that it would uniformly move over eight-thirds of its diameter with this velocity as the density of the air is to the density of the sphere. This is equivalent to demonstrating, that the resistance of the air to a sphere, moving through it with a velocity, is equal to half the weight of a column of air having a great circle of the sphere for its base, and for its altitude the height from which a body must fall in vacuo to acquire this velocity. This appears from Newton's demonstration; for, let the specific gravity of the air be to that of the ball as 1 to m ; then, because the times in which the same velocity will be extinguished by the uniform action of different forces are inversely as the forces, the resistance to this velocity would extinguish it in the time of describing eight-thirds $m d$, d being the diameter of the ball. Now 1 is to m as the weight of the displaced air to the weight of the ball, or as two-thirds of the diameter of the ball to the length of a column of air of equal weight. Call this length a ; a is therefore equal to two-thirds $m d$. Suppose the ball to fall from the height a in the time t , and acquire the velocity u . If it moved uniformly with this velocity, during this time, it would describe a space $= 2a$, or four-thirds $m d$. Now its weight would extinguish this velocity, or destroy

this motion, in the same time, that is, in the time of describing four-thirds md ; but the resistance of the air would do this in the time of describing eight-thirds md ; that is, in twice the time. The resistance therefore is equal to half the weight of the ball, or to half the weight of the column of air whose height is the height producing the velocity. But the resistance to different velocities are as the squares of the velocities; and therefore as their producing heights, and, in general, the resistance of the air to a sphere moving with any velocity, is equal to the half weight of a column of air of equal section, and whose altitude is the height producing the velocity.

The result of this investigation has been acquiesced in by all Sir Isaac Newton's commentators. Many faults have indeed been found with his reasoning, and even with his principles; and it must be acknowledged that although this investigation is by far the most ingenious of any in the Principia, and sets his acuteness and address in the most conspicuous light, his reasoning is liable to serious objections, which his most ingenious commentators have not completely removed. Yet the conclusion has been acquiesced in, but as if derived from other principles, or by more logical reasoning. The reasonings, or assumptions, however, of these mathematicians are no better than Newton's; and all the causes of deviation from the duplicate ratio of the velocities, and the causes of increased resistance, which the latter authors have valued themselves for discovering and introducing into their investigations, were actually pointed out by Sir Isaac Newton, but purposely omitted by him to facilitate the discussion in re difficillima (See Schol. prop. 37. b. 2).

The weight of a cubic foot of water is $62\frac{1}{2}$ lbs. and the medium density of the air is $\frac{1}{810}$ of water; therefore let a be the height producing the velocity (in feet), and d the diameter of the ball (in inches), and π the periphery of a circle whose diameter is 1; the resistance of the air will be =

$$\frac{62\frac{1}{2}}{840} \times \frac{\pi}{4} \times \frac{1}{144} \times \frac{a}{2} \times d^2 = \frac{a^2 d^2}{4928\frac{1}{2}} \text{ pounds,}$$

very nearly, = $\frac{v^2}{4928\frac{1}{2} \times 64} d^2 = \frac{v^2 d^2}{315417}$ pounds.

Example.—A ball of cast iron weighing twelve pounds is four inches and a half in diameter. Suppose this ball to move at the rate of 25 $\frac{1}{10}$ feet in a second. The height which will produce this velocity in a falling body is 9 $\frac{1}{2}$ feet. The area of its great circle is 0.11044 feet, or $\frac{11044}{100000}$ of one foot. Suppose water to be 840 times heavier than air, the weight of the air incumbent on this great circle, and 9 $\frac{1}{2}$ feet high, is 0.081151 lbs. half of this is 0.0405755 or $\frac{405755}{10000000}$, or nearly $\frac{1}{25}$ of a pound. This should be the resistance of the air to this motion of the ball.

It is proper, in all matters of physical discussion, to confront every theoretical conclusion with experiment. This is particularly necessary in the present instance, because the theory on which this proposition is founded is extremely uncertain. Newton speaks of it with the most cautious diffidence, and secures the justness of the conclusions by the conditions which he as-

sumes in his investigation. He describes with the greatest precision the state of the fluid in which the body must move, so as that the demonstrations may be strict, and leaves it to others to pronounce whether this is the real constitution of our atmosphere. It must be granted that it is not; and that many other suppositions have been introduced by his commentators and followers to suit his investigation (for little or nothing has been added to it) to the circumstances of the case.

Sir Isaac Newton himself, therefore, attempted to compare his proportions with experiment. Some were made by dropping balls from the dome of St. Paul's cathedral; and all these showed as great a coincidence with his theory as they did with each other: but the irregularities were too great to allow him to say with precision what was the resistance. It appeared to follow the proportion of the squares of the velocities with sufficient exactness; and, though he could not say that the resistance was equal to the weight of the column of air having the height necessary for communicating the velocity, it was always equal to a determinate part of it; and might be stated = na , n being a number to be fixed by numerous experiments. One great source of uncertainty in his experiments seems to have escaped his observation: the air in that dome is almost always in a state of motion. In summer there is a very sensible current of air downwards, and frequently in winter it is upwards: and this current bears a very great proportion to the velocity of the descents. Sir Isaac takes no notice of this. He made another set of experiments with pendulums; and pointed out some very curious and unexpected circumstances of their motions in a resisting medium. There is hardly any part of his noble work in which his address, his patience, and his astonishing penetration, appear in greater lustre. It requires the utmost intenseness of thought to follow him in these disquisitions. Their results were much more uniform, and confirmed his general theory; and it has been acquiesced in by the first mathematicians of Europe.

But the deductions from this theory were so inconsistent with the observed motions of military projectiles, when the velocities are prodigious, that no application could be made which could be of any service for determining the path and motion of cannon shot and bombs; and although John Bernouilli gave, in 1718, a most elegant determination of the trajectory and motion of a body projected in a fluid which resists in the duplicate ratio of the velocities (a problem which even Newton did not attempt), it has remained a dead letter. Mr. Benjamin Robins was the first who suspected the true cause of the imperfection of the usually received theories; and in 1737 he published a small tract, in which he showed clearly that even the Newtonian theory of resistance must cause a cannon ball, discharged with a full allotment of powder, to deviate farther from the parabola, in which it would move in vacuo, than the parabola deviates from a straight line. But he farther asserted, from good reasoning, that in such great velocities the resistance must be much greater than this

theory assigns; because, besides the resistance arising from the inertia of the air which is put in motion by the ball, there must be a resistance arising from a condensation of the air on the anterior surface of the ball, and a rarefaction behind it: and there must be a third resistance, arising from the statical pressure of the air on its anterior part, when the motion is so swift that there is a vacuum behind. Even these causes of disagreement with the theory had been foreseen and mentioned by Newton (see the Scholium to prop. 37, Book II. Princip.); but the subject seems to have been little attended to. Some authors, however, such as St. Remy, Antonini, and Le Blond, have given most valuable collections of experiments, ready for the use of the profound mathematician.

SECT. IV.—OBSERVATIONS BY MR. ROBINS, ON VELOCITY AND RESISTANCE.

Two or three years after the appearance of his first publication, Mr. Robins discovered that ingenious method of measuring the velocities of military projectiles which has handed down his name to posterity with great honor: and, having ascertained these velocities, he discovered the prodigious resistance of the air, by observing the diminution of velocity which it occasioned. This made him anxious to examine what was the real resistance to any velocity whatever, in order to ascertain what was the law of its variation; and he was equally fortunate in this attempt likewise. From his Mathematical Works, vol. i. p. 205, it appears that a sphere of four inches and a half in diameter, moving at the rate of twenty-five feet one-fifth in a second, sustained a resistance of 0.04914 lb. or $\frac{4914}{100000}$ of a pound. This is a greater resistance than that of the Newtonian theory, which gave $\frac{495755}{1000000}$ in the proportion of 1000 to 1211, or very nearly in the proportion of five to six in small numbers. And we may adopt as a rule, in all moderate velocities, that the resistance to a sphere is equal to $\frac{R}{100}$ of the weight of a column of air having the great circle of the sphere for its base, and for its altitude the height through which a heavy body must fall in vacuo to acquire the velocity of projection. The importance of this experiment is great, because the ball is precisely the size of a twelve pound shot of cast iron; and its accuracy may be depended on. There is but one source of error. The whirling motion must have occasioned some whirl in the air, which would continue till the ball again passed through the same point of its revolution. The resistance observed is therefore probably somewhat less than the true resistance to the velocity of twenty-five feet one-fifth, because it was exerted in a relative velocity which was less than this, and is, in fact, the resistance competent to this relative and smaller velocity. Accordingly, Mr. Smeaton places great confidence in the observations of Mr. Rouse of Leicestershire, who measured the resistance by the effect of the wind on a plane properly exposed to it. He does not tell us how the velocity of the wind was ascertained; but our opinion of his penetration and experience leads us to believe that this point was well determined. The resistance observed by Mr. Rouse exceeds that

resulting from Mr. Robins's experiments nearly in the proportion of seven to ten. Chev. de Borda made experiments similar to those of Mr. Robins, and his results exceeded those of Robins in the proportion of five to six.

We must content ourselves, however, at present with the experimental measure mentioned above. To apply to our formulæ, therefore, we reduce this experiment, which was made on a ball of four inches and a half diameter, moving with the velocity of twenty-five feet and one-fifth per second, to what would be the resistance to a ball of one inch, having the velocity a foot.

This will give $R = \frac{0.04919}{4.5^2 \times 25^2 \cdot 2^2}$, being diminished in the duplicate ratio of the diameter and velocity. This gives $R = 0.00000381973$ pound, or $\frac{3.81973}{1000000}$ of a pound. The logarithm is,

4.58204. The resistance here determined is the same whatever substance the ball be of; but the retardation occasioned by it will depend on the proportion of the resistance to the vis insita of the ball; that is, to its quantity of motion. This in similar velocities and diameters is as the density of the ball. The balls used in military service are of cast iron, or of lead, whose specific gravities are 7.207 and 11.37 nearly, water being 1. There is considerable variety in cast iron, and this density is about the medium. These data will give us,

	For Iron.	For Lead.
W, or weight of a ball one inch in diameter . . . lbs.	0.13648	0.21533
Log. of W	9.13509	9.33310
E ^r	1116 ^r ,6	1761 ^r ,6
Log. of E	3.04790	3.24591
u, or terminal velocity . . .	189,03	237.43
Log. u	2.27653	2.37553
a, or producing height . . .	558,3	880,8

These numbers are of frequent use in all questions on this subject. Mr. Robins gives an expeditious rule for readily finding *a*, which he calls *F*, by which it is made 900 feet for a cast-iron ball of an inch diameter. But no theory of resistance which he professes to use will make this height necessary for producing the terminal velocity. His *F*, therefore, is an empirical quantity, analogous indeed to the producing height, but accommodated to his theory of the trajectory of cannon-shot, which he promised to publish, but did not live to execute. We need not be very anxious about this; for all our quantities change in the same proportion with *R*, and need only a correction by a multiplier or divisor, when *R* shall be accurately established.

The use of these formulæ may be illustrated by an example or two.

Ex. 1. To find the resistance to a twenty-four pound ball moving with the velocity of 1670 feet in a second, which is nearly the velocity communicated by sixteen pounds of powder. The diameter is $\frac{1}{603}$ inches.

Log. R	+ 4.58204
Log. d ²	+ 1.49674
Log. 1670 ²	+ 6.44548

Log. 3344 lbs. = *r* 2.52426
L 2

But it is found, by unequivocal experiments on the retardation of such a motion, that it is 504 lbs. This is owing to the above causes, the additional resistance to great velocities, arising from the condensation of the air, and from its pressure into the vacuum left by the ball.

Ex. 2. Required the terminal velocity of this ball?

Log. R	+ 4.58204
Log. d^2	+ 1.49674
<hr/>	
Log. resist. to veloc. 1	6.07878 = a
Log. W	1.38021 = b
Diff. of a and b , = $\log. u^2$	5.30143
Log. 4474 = u	2.65071

We proceed to consider these motions through their whole course: and we shall first consider them as affected by the resistance only; then we shall consider the perpendicular ascents and descents of heavy bodies through the air; and, lastly, their motion in a curvilinear trajectory, when projected obliquely. This must be done by the help of the abstruser parts of fluxionary mathematics. To make it more perspicuous, we shall consider the simply resisted rectilinear mo-

tions geometrically, in the manner of Sir Isaac Newton. As we advance, we shall quit this track, and prosecute it algebraically, having by this time acquired distinct ideas of the algebraic quantities.

We must remember the fundamental theorems of varied motions.

1. The momentary variation of the velocity is proportional to the force and the moment of time jointly, and may therefore be represented by $\pm \dot{v} = f t$, where v is the momentary increment or decrement of the velocity v, f the accelerating or retarding force, and t the moment or increment of the time t .

2. The momentary variation of the square of the velocity is as the force, and as the increment or decrement of the space jointly; and may be represented by $\pm v \dot{v} = f s$. The first proposition is familiarly known. The second is the 39th of Newton's Principia, B. I. It is demonstrated in the article OPTICS, and is the most extensively useful proposition in mechanics.

Having premised these things, let the straight line AC (fig. 2) represent the initial velocity V, and let CO, perpendicular to AC, be the time

Fig. 2.

in which this velocity would be extinguished by the uniform action of the resistance. Draw through the point A an equilateral hyperbola $A e B$ having OF, OCD, for its asymptotes; then let the time of the resisted motion be represented by the line CB, C being the first instant of the motion. If there be drawn perpendicular ordinates $\kappa e, fg, DB, \&c.$, to the hyperbola, they will be proportional to the velocities of the body at the instant; $\kappa, g, D, \&c.$, and the hyperbolic areas $A C \kappa e, A C, f g, A C D B, \&c.$, will be proportional to the spaces described during the times $C \kappa, C g, C B, \&c.$ For suppose the time divided into an indefinite number of small and equal moments, $C c, D d, \&c.$, draw the ordinates $a c, b d$, and the perpendiculars $b \beta, a \alpha$. Then, by the nature of the hyperbola, $A C : a c = O c : O C$, and $A C - a c = A C - O c = O C : O C$, that is, $A \alpha : a c = C c : O C$, and $A \alpha : C c = a c : O C, = A C \cdot a c : A C \cdot O C$; in like manner, $B \beta : D d = B D \cdot b D : B D \cdot O D$. Now $D d = C c$, because the moments of time were

taken equal, and the rectangles $A C \cdot C O, B D \cdot D O$, are equal by the nature of the hyperbola; therefore $A \alpha : B \beta = A C \cdot a c : B D \cdot b d$; but as the points c, d , continually approach, and ultimately coincide with C, D , the ultimate ratio of $A C \cdot a c$ to $B D \cdot b d$ is that of $A C^2$ to $B D^2$; therefore the momentary decrements of $A C$ and $B D$ are as $A C^2$ and $B D^2$. Now, because the resistance is measured by the momentary diminution of velocity, these diminutions are as the squares of the velocities; therefore the ordinates of the hyperbola and the velocities diminish by the same law; and the initial velocity was represented by $A C$; therefore the velocities at all the other instants κ, g, D , are properly represented by the corresponding ordinates. Hence,

1. As the abscissa of the hyperbola are as the times, and the ordinates are as the velocities, the areas will be as the spaces described, and $A C \kappa e$ is to $A C g f$ as the space described in the time $C \kappa$ to the space described in the time $C g$ (first theorem on varied motions).

2. The rectangle ACOF is to the area ACDB as the space formerly expressed by $2a$, or E to the space described in the resisting medium during the time CD ; for AC being the velocity V , and OC the extinguishing time e , this rectangle is $= eV$, or E , or $2a$, of our former disquisitions; and because all the rectangles such as $ACOF$, $BDOG$, &c., are equal, this corresponds with our former observation, that the space uniformly described with any velocity during the time in which it would be uniformly extinguished by the corresponding resistance is a constant quantity, viz. that in which we always had $v = E$, or $2a$.

3. Draw the tangent $A\kappa$; then, by the hyperbola $C\kappa = CO$: now $C\kappa$ is the time in which the resistance to the velocity AC would extinguish it; for the tangent coinciding with the elemental arc Aa of the curve, the first impulse of the uniform action of the resistance is the same with its first impulse of its varied action. By this the velocity AC is reduced to ac . If this operated uniformly, like gravity, the velocities would diminish uniformly, and the space described would be represented by the triangle $AC\kappa$. This triangle, therefore, represents the height through which a heavy body must fall in vacuo, in order to acquire the terminal velocity.

4. The motion of a body resisted in the duplicate ratio of the velocity will continue without end, and a space will be described which is greater than any assignable space, and the velocity will grow less than any that can be assigned; for the hyperbola approaches continually to the asymptote, but never coincides with it. There is no velocity BD so small, but a smaller ZP will be found beyond it; and the hyperbolic space may be continued till it exceeds any surface that can be assigned.

5. The initial velocity AC is to the final velocity BD as the sum of the extinguishing time and the time of the retarded motion is to the extinguishing time alone; for $AC : BD = OD$ (or $OC \times CD$) : OC : or $V : v = e : e \times t$.

6. The extinguishing time is to the time of the retarded motion as the final velocity is to the velocity lost during the retarded motion: for the rectangles $AFOC$, $BDOG$, are equal; and therefore $AVGF$ and $BVCD$ are equal and $VC : VA = VG : VB$; therefore $t = \frac{eV-v}{v}$,

and $e = t \frac{v}{V-v}$.

7. Any velocity is reduced in the proportion of m to n in the time $\frac{m-n}{n}$. For, let $AC : BD = m : n$; then $DO : CO = m : n$, and $DC : CO = m-n : n$, and $DC = \frac{m-n}{n} CO$, or $t = e \frac{m-n}{n}$. Therefore any velocity is

reduced to one-half in the time in which the initial resistance would have extinguished it by its uniform action.

The chief circumstances of this motion may thus be determined by the hyperbola, the ordinates and abscissæ exhibiting the relations of the

times and velocities, and the areas exhibiting the relations of both to the spaces described. But we may render the conception of these circumstances much more easy and simple, by expressing them all by lines, instead of this combination of lines and surfaces. We shall accomplish this purpose by constructing another curve LKP , having the line $ML\delta$, parallel to OD for its abscissa, and of such a nature that if the ordinates to the hyperbola $A C e \kappa$, $f g$, BD , &c. be produced till they cut this curve in L , p , n , K , &c., and the abscissa in L , ϵ , h , δ , &c., the ordinates ϵ , p , h , n , δ , K , &c., may be proportional to the hyperbolic areas $A C e \kappa$, $f A c g$, $\delta A c K$. Let us examine what kind of curve this will be. Make $OC : O\kappa = O\kappa : Og$; then (Hamilton's Conics, IV. 14. Cor.) the areas $AC\kappa e$, $e\kappa g f$ are equal: therefore drawing ps , nt , perpendicular to OM , we shall have (by the assumed nature of the curve LpK), $Ms = st$; and if the abscissa OD be divided into any number of small parts in geometrical progression, (reckoning the commencement of them all from O), the axis Vi of this curve will be divided by its ordinates into the same number of equal parts; and this curve will have its ordinates LM , ps , nt , &c., in geometrical progression, and its abscissæ in geometrical progression. Also, let KN , MV , touch the curve in K and L , and let OC be supposed to be to OC , as OD to Od , and therefore Cc to Dd as OC to OD ; and let these lines Cc , Dd , be indefinitely small; then (by the nature of the curve) Lo is equal to Kr ; for the areas $aACc$, $bBDd$ are in this case equal. Also lo is to kr , as LM to KI , because $cC : dD = CO : DO$:

$$\begin{aligned} \text{Therefore } IN : IK &= rK : r\kappa \\ IK : ML &= r\kappa : ol \\ ML : MV &= ol : oL \\ \text{and } IN : MN &= rK : oL \end{aligned}$$

That is the subtangent IN , or MV , is of the same magnitude, or is a constant quantity in every part of the curve.

Lastly, the subtangent IN , corresponding to the point K of the curve, is to the ordinate $K\delta$ as the rectangle $BDOG$ or $ACOF$ to the parabolic area $BDC A$. For let $fghn$ be an ordinate very near to $BD\delta K$; and let hn cut the curve in n , and the ordinate KI in g ; then we have

$$\begin{aligned} Kq : qn &= KI : IN, \text{ or} \\ Dg : qn &= DO : IN; \\ \text{but } BD : AC &= CO : DO; \end{aligned}$$

therefore $BD \cdot Dg : AC \cdot qn = CO : IN$: Therefore the sum of all the rectangles $BD \cdot Dg$ is to the sum of all the rectangles $AC \cdot qn$, as CO to IN ; but the sum of the rectangles $BD \cdot Dg$ is the space $ACDB$; and, because AC is given, the sum of the rectangles $AC \cdot qn$ is the rectangle of AC , and the sum of all the lines qn ; that is, the rectangle of AC and RL ; therefore the space $ACDB : AC \cdot RL = CO : IN$, and $ACDB \times IN = AC \cdot CO \cdot RL$: and therefore $IN : RL = AC \cdot CO : ACDB$

Hence it follows that QL expresses the area BVA , and, in general, that the part of the line parallel to OM , which lies between the tangent KN and the curve LpK , expresses the corresponding area of the hyperbola which lies with-

out the rectangle BDOG. And now, by the help of this curve, we have an easy way of conceiving and computing the motion of a body through the air. For the subtangent of our curve now presents twice the height through which the ball must fall in vacuo, in order to acquire the terminal velocity; and therefore serves for a scale on which to measure all the other representatives of the motion.

It remains to make another observation on the curve LpK, which will save us all the trouble of geographical operations, and reduce the whole to a very simple arithmetical computation. In constructing this curve we were limited to no particular length of the line LR, which represented the space ACDB; and all that we had to take care of was, that when OC, Oκ, Og, were taken in geometrical progression, Ms, Mt, should be in arithmetical progression. The abscissæ having ordinates equal to ps, nt, &c., might have been twice as long as is shown in the dotted curve which is drawn through L. All the lines which serve to measure the hyperbolic spaces would then have been doubled. But NI would also have been doubled, and our proportions would have still held good; because this sub-tangent is the scale of measurement of our figure, as E or 2a is the scale of measurement for the motions.

Since then we have tables of logarithms calculated for every number, we may make use of them instead of this geometrical figure, which still requires considerable trouble to suit it to every case. There are two sets of logarithmic tables in common use. One is called a table of hyperbolic or natural logarithms. It is suited to such a curve as is drawn in the figure, where the subtangent is equal to that ordinate τv which corresponds to the side πO of the square πθλO inserted between the hyperbola and its asymptotes. This square is the unit of surface, by which the hyperbolic areas are expressed; its side is the unit of length, by which the lines belonging to the hyperbola are expressed; τv is = 1, or the unit of numbers to which the logarithms are suited, and then IN is also 1. Now the square θπOλ being unity, the area BACD will be some number; πO being also unity, OD is some number: call it x. Then, by the nature of the hyperbola, OB : Oπ = πθ : DB; that is, x : 1 = 1 : $\frac{1}{x}$, so that DB is $\frac{1}{x}$. Now, calling Dδ the area, B D d b, which is the fluxion (ultimately) of the hyperbolic area, is $\frac{x}{x}$.

Now in the curve LpK, MI has the same ratio to NI that BACD has to θλOπ. Therefore, if there be a scale of which NI is the unit, the number on this scale corresponding to MI has the same ratio to 1 which the number measuring BACD has to 1; and Ii, which corresponds to BD db, is the fluxion (ultimately) of MI; Therefore, if MI be called the logarithm of $x, \frac{x}{x}$ is properly represented by the fluxion of MI. In short, the line MI is divided precisely as the line of numbers on a Gunter's scale, which is therefore a line of logarithms; and the numbers

called logarithms are just the lengths of the different parts of this line measured on a scale of equal parts.

Reasons of convenience have given rise to another set of logarithms: these are suited to a logistic curve whose subtangent is only $\frac{43429}{100000}$ of the ordinate τv, which is equal to the side of the hyperbolic square, and which is assumed for the unit of number. We shall suit our applications of the preceding investigation to both these, and shall first use the common logarithms whose subtangent is 0.43429. The whole subject will be best illustrated by taking an example of the different questions which may be proposed: Recollect that the rectangle ACOF is = 2a, or $\frac{v^2}{g}$, or E, for a ball of cast iron one inch diameter, and, if it has the diameter d, it is $\frac{v^2 d}{g}$, or 2ad, or E d.

I. It may be required to determine what will be the space described in a given time t by a ball setting out with a given velocity V, and what will be its velocity v at the end of that time. Here we have NI : MI = ACOF : BDC A; now NI is the subtangent of the logistic curve; MI is the difference between the logarithms of OD and OC; that is, the difference between the logarithms of e + t and e; ACOF is 2ad, or $\frac{v^2 d}{g}$, or E d. Therefore by common logarithms 0.43429 : log. e + t - log. e = 2ad : S, = space described,

$$\text{or } 0.43429 : \log. \frac{e+t}{e} = 2ad : S,$$

$$\text{and } S = \frac{2ad}{0.43429} \times \log. \frac{e+t}{e},$$

by hyperbolic logarithms S = 2ad × log. $\frac{e+t}{e}$.

Let the ball be a twelve pounder; the initial velocity 1600 feet, and the time twenty seconds.

We must first find e, which is $\frac{2ad}{V}$.

Therefore, log. 2a	+ 3.03236
log. d (4, 5)	+ 0.65321
log. V. (1600)	- 3.20412

Log. of 3",03, = e 0.48145
 And e + t is 23",03, of which the log. is 1.36229
 from which take the log. of e 0.48145

remains the log. of $\frac{e+t}{e}$ 0.88084

This must be considered as a common number by which we are to multiply $\frac{2ad}{0.43429}$. Therefore add the logarithms of 2ad + 3.68557
 log. $\frac{e+t}{e}$ + 9.94490
 log. 0.43429 - 9.63778

Log. S. 9833 feet 3.99269

For the final velocity,
 OD : OC = AC : BD, or e + t : e = V : v.
 23",03 : 3",03 = 1600 : 210 $\frac{1}{2}$, = v.

The ball has therefore gone 3278 yards, and its velocity is reduced from 1600 to 210.

The gradual progress of the ball, during some seconds of its motion, is as follows:—

T.	S.	Diff.	V.	Diff.
1	1383		1203	397
2	2456	1073	964	239
3	3336	880	804	160
4	4080	744	690	114
5	4725	645	604	86
6	5294	569	537	67

The first column shows the time of the motion; the second the space described; the third the differences of the spaces, showing the motion during each successive seconds; the fourth the velocity at the end of the time t ; and the last the differences of velocity, showing its diminution in each successive second. At the distance of 1000 yards the velocity is reduced to one-half, and at the distance of less than a mile it is reduced to one-third.

II. Required to determine the distance at which the initial velocity V is reduced to any other quantity v . This question is solved in the very same manner by substituting the logarithms of V and v for those of $e+t$ and e ; for AC :

$BD = OD : OC$, and therefore $\log. \frac{AC}{BD} =$

$\log. \frac{OD}{OC}$, or $\log. \frac{V}{v} = \log. \frac{e+t}{e}$. Required to

determine the distance which in the velocity of 1780 of a twenty-four pound ball (which is the medium velocity of such a ball discharged with sixteen pounds of powder), will be reduced to 1500. Here d is 5.68, and therefore

the logarithm of $2ad$ is . . . + 3.78671

$\log. \frac{V}{v} = 0.07433$, of which the log. is + 8.87116

$\log. 0.43429$ - 9.63778

$\log. 1047.3$, feet or 349 yards . . . 3.02009

This reduction will be produced in about seven-eighths of a second.

III. To determine the time which a ball, beginning to move with a certain velocity, employs in passing over a given space, and the diminution of velocity which it sustains from the resistance of the air; proceed thus:—

$2ad : S = 0.43429 : \log \frac{e+t}{e} = t$. Then to $\log.$

$\frac{e+t}{e}$ add $\log. e$, and we obtain $\log. e+t$, and

$e+t$; from which if we take e we have t . Then, to find v , say $e+t : e = V : v$.

These examples may be concluded by applying this last rule to Mr. Robins's experiments on a musket bullet of three-fourths of an inch in diameter, which had its velocity reduced from 1670 to 1425 by passing through 100 feet of air. This we do to discover the resistance which it sustained, and compare it with the resistance to a velocity of one foot per second. We must first ascertain the first term of our analogy. The ball was of lead, and therefore $2a$ must be multiplied by d and by m , which expresses the ratio of the density of lead to that of cast iron, d is

0.75, and m is $\frac{11.37}{7.21} = 1.577$.

Therefore $\log. 2a$ 3.03236
 d 9.87506
 m 0.19782

$\log. 2adm$ 3.10524

and $2adm = 1274.2$. Now $1274.2 : 100 =$

$0.43429 : 0.03408 = \log. \frac{e+t}{e}$. But $e = \frac{2adm}{V}$

$= 0.763$, and its logarithm $= 9.88252$, which,

added to 0.03408 , gives 9.91660 , which is the

log. of $e+t$, $= 0.825$, from which take e , and

there remains $t = 0.062$, or $\frac{62}{1000}$ of a second,

for the time of passage. Now, to find the remain-

ing velocity, say $825 : .763 = 1670 : 1544$,

$= v$. But in Mr. Robins's experiment the remain-

ing velocity was only 1425, the ball having

lost 245; whereas by this computation it should

have lost only 126. It appears, therefore, that

the resistance is double of what it would have

been if the resistance increased in the duplicate

proportion of the velocity. Mr. Robins says it

is nearly triple. But he supposes the resistance

to slow motions much smaller than his own ex-

periment, so often mentioned, fully warrants.

The time e in which the resistance of the air

would extinguish the velocity is 0.763 . Gravity,

or the weight of the bullet, would have done it

in $\frac{1670}{32}$ or $52'$; therefore the resistance is $\frac{52'}{0.763}$

times, or nearly sixty-eight times its weight, by

this theory, or 5.97 pounds. If we calculate

from Mr. Robins's experiment, we must say $\log.$

$\frac{V}{v} : 0.43429 = 100 : eV$, which will be 630.23 ,

and $e = \frac{630.23}{1670} = 0.3774$, and $\frac{52}{0.3774}$ gives

138 for the proportion of the resistance to the

weight, and makes the resistance 12.07 pounds,

fully double of the other.

With this velocity, which greatly exceeds

that with which the air can rush into a void,

there must be a statical pressure of the at-

mosphere equal to six pounds and a half. This will

make up the difference; and allows us to con-

clude that the resistance, arising solely from the

motion communicated to the air, follows very

nearly the duplicate proportion of the velocity.

The next experiment, with a velocity of 1690

feet, gives a resistance equal to 157 times the

weight of the bullet, and this bears a much

greater proportion to the former than 1690 does

to 1670²; which shows that, although these ex-

periments clearly demonstrate a prodigious aug-

mentation of resistance, yet they are by no

means susceptible of the precision which is

necessary for discovering the law of this aug-

mentation, or for a good foundation of practical

rules; and it is still greatly to be wished that a

more accurate mode of investigation could be

discovered.

We have thus explained, in detail, the princi-

ples and the process of calculation for the simple

case of the motion of projectiles through the air.

The learned reader will think that we have been

unreasonably prolix, and that the whole might have been comprised in less room, by taking the algebraic method. We acknowledge that it might have been done even in a few lines. But we have observed, and our observation has been confirmed by persons well versed in such subjects, that in all cases where the fluxionary process introduces the fluxion of a logarithm, there is a great want of distinct ideas to accompany the hand and eye. The solution comes out by a sort of magic or legerdemain, we cannot tell either how or why. We therefore thought it necessary to furnish the reader with distinct conceptions of the things and quantities treated of. For this reason, after showing, in Sir Isaac Newton's manner, how the spaces described in the retarded motion of a projectile followed the proportion of the hyperbolic areas, we showed the nature of another curve, where lines could be found which increase in the very same manner as the path of the projectile increases; so that a point describing the abscissa MI of this curve moves precisely as the projectile does. Then, discovering that this line is the same with the line of logarithms on a Gunter's scale, we showed how the logarithm of a number really represents the path or space described by the projectile.

SECT. V.—OF THE PERPENDICULAR ASCENTS AND DESCENTS OF HEAVY PROJECTILES.

Having thus enabled the reader to conceive distinctly the quantities employed, we shall leave the geometrical method, and prosecute the rest of the subject in a more compendious manner. We are next to consider the perpendicular ascents and descents of heavy projectiles, where the resistance of the air is combined with the action of gravity: and we shall begin with the descents.

Let u , as before, be the terminal velocity, and g the accelerating power of gravity: when the body moves with the velocity u , the resistance is equal to g ; and in every other velocity v , we must have $u^2 : v^2 = g : \frac{g}{u^2} v^2 = r$, for the resistance to that velocity. In the descent the body is urged by gravity g , and opposed by the resistance $\frac{g}{u^2} v^2$: therefore the remaining accelerating

force, which we shall call f , is $g - \frac{g v^2}{u^2}$, or $\frac{g u^2 - g v^2}{u^2}$, or $\frac{g(u^2 - v^2)}{u^2} = f$.

The fundamental theorem for varied motion is $f s = u \dot{v}$, and $s = \frac{v \dot{v}}{f} = \frac{u}{g} \times \frac{\dot{v} v}{u^2 - v^2}$, and $s = \frac{u^2}{g} \times \int \frac{\dot{v} v}{u^2 - v^2} + C$. Now the fluent of $\frac{\dot{v} v}{u^2 - v^2}$ is $-\text{hyper. log. of } \sqrt{u^2 - v^2}$. For the fluxion of $\sqrt{u^2 - v^2}$ is $-\frac{v \dot{v}}{\sqrt{u^2 - v^2}}$, and this divided by the quantity $\sqrt{u^2 - v^2}$, of which it is the fluxion, gives precisely $\frac{\dot{v} v}{u^2 - v^2}$, which is therefore the fluxion of its hyperbolic logarithm. Therefore $S = -\frac{u^2}{g} \times \text{L} \sqrt{u^2 - v^2} + C$. Where L means

the hyperbolic logarithm of the quantity annexed to it, and λ may be used as to express its common logarithm. See article FLUXIONS.

The constant quantity C for completing the fluent is determined from this consideration, that the space described is o , when the velocity is o :

$$C - \frac{u^2}{g} \times \text{L} \sqrt{u^2} = o, \text{ and } C = \frac{u^2}{g} \times \text{L} \sqrt{u^2},$$

and the complete fluent $S = \frac{u^2}{g} \times$

$$\frac{\text{L} \sqrt{u^2} - \text{L} \sqrt{u^2 - v^2}}{\frac{g}{u^2}} = \frac{u^2}{g} \times \text{L} \sqrt{\frac{u^2}{u^2 - v^2}} = \frac{u^2}{0.43429 g} \times \lambda \sqrt{\frac{u^2}{u^2 - v^2}} \text{ or } (\text{putting } M \text{ for } 0.43429, \text{ the modulus or subtangent of the common logistic curve}) = \frac{u^2}{Mg} \times \lambda \sqrt{\frac{u^2}{u^2 - v^2}}.$$

This equation establishes the relation between the space fallen through and the velocity acquired

by the fall. We obtain by it $\frac{g S}{u^2} = \text{L} \sqrt{\frac{u^2}{u^2 - v^2}}$,

and $\frac{2 g S}{u^2} = \text{L} \frac{u^2}{u^2 - v^2}$, or, which is still more convenient for us, $\frac{M \times 2 g S}{u^2} = \lambda \frac{u^2}{u^2 - v^2}$ that is,

equal to the logarithm of a certain number: therefore having found the natural number corresponding to the fraction $\frac{M \times 2 g S}{u^2}$, consider

it as a logarithm, and take out the number corresponding to it: call this n . Then, since n is equal to $\frac{u^2}{u^2 - v^2}$, we have $n u^2 - n v^2 = u^2$, and $n u^2 - u^2 = n v^2$, or $n v^2 = u^2 \times \frac{n - 1}{n}$, and $v^2 = \frac{u^2 \times n - 1}{n}$.

To expedite all the computations on this subject, it will be convenient to have multipliers ready computed for $M \times 2 g$, and its half,

viz. 27.794, whose log. is 1.44396
and 13.897 1.14293

But v may be found much more expeditiously by

observing that $\sqrt{\frac{u^2}{u^2 - v^2}}$ is the secant of an arch of a circle whose radius is u , and whose sine is v , or whose radius is unity and sine $= \frac{v}{u}$; therefore, considering the above fraction as a logarithmic secant, look for it in the tables, and then take the sine of the arc of which this is the secant, and multiply it by u ; the product is the velocity required.

An example may be given of a ball whose terminal velocity is 689½ feet, and ascertain its velocity after a fall of 1848 feet. Here,

$u^2 = 475200$, and its log.	$= 5.67688$
$u = 689\frac{1}{2}$	$. 2.83844$
$g = 32$	$. 1.50515$
$S = 1848$	$. 3.26670$
Then log. 27.794	$+ 1.44396$
log. S	$+ 3.26670$
log. u^2	$- 5.67688$

Log. of 0.10809 = lo . n 9.03378

0.10809 is the logarithm of $1.2826 = n$, and $n - 1 = 0.2826$, and $\frac{u^2 \times n - 1}{n} = 323.6^2 = v^2$; and $v = 323.6$.

In like manner, 0.054045 (which is half of 0.10809) will be found to be the logarithmic secant of 28° , whose sine 0.46947 multiplied by 689½ gives 324 for the velocity. The process of this solution suggests a very perspicuous manner of conceiving the law of descent; and it may be thus expressed: M is to the logarithm of the secant of an arch whose sine is $\frac{v}{u}$ and radius 1 as 2 a is to the height through which the body must fall to acquire the velocity v. Thus, to take the same example:—

1. Let the height h be sought which will produce the velocity 323.62, the terminal velocity of the ball being 689.34. Here 2 a, or $\frac{u^2}{g}$ is 14850, and $\frac{323.62}{689.35} = 0.46947$, which is the sine of 28° . The logarithmic secant of this arch is 0.05407. Now M or $0.43429 : 0.05407 = 14850 : 1848$, the height wanted.

2. Required the velocity acquired by the body by falling 1848 feet. Say $14850 : 1848 = 0.43429 : 0.05407$. Look for this number among the logarithmic secants. It will be found at 28° , of which the logarithmic sine is . 9.67161
Add to this the log. of u . . . 2.38344

The sum 2.51005

is the logarithm of 323.62, the velocity required.

From these solutions we see that the acquired velocity continually approaches to, but never equals, the terminal velocity. For it is always expressed by the sine of an arch of which the terminal velocity is the radius.

The motion of a body projected downwards next merits consideration. While the velocity of projection is less than the terminal velocity; the motion is determined by what we have already said; for we must compute the height necessary for acquiring this velocity in the air, and suppose the motion to have begun there. But, if the velocity of projection be greater, this method fails. We pass it over (though not in the least more difficult than what has gone before) because it is of mere curiosity, and never occurs in any interesting case. We may just observe that, since the motion is swifter than the terminal velocity, the resistance must be greater than the weight, and the motion will be retarded. The very same process will give us for the space

described $S = \frac{u^2}{g} \times \text{L}\sqrt{\frac{V^2 - u^2}{v^2 - u^2}}$, V being the velocity of projection greater than u. Now as this space evidently increases continually (because the body always falls, but does not become infinite in any finite time), the fraction $\frac{V^2 - u^2}{v^2 - u^2}$

does not become infinite; that is, v^2 does not become equal to u^2 : therefore, although the velocity V is continually diminished, it never becomes so small as u. Therefore u is a limit of diminution as well as of augmentation.

The relation between the time of the descent

and the space described, or the velocity acquired, must now be ascertained. For this purpose we may use the other fundamental proposition of varied motions $\frac{f t}{u^2} = v$, which, in the present

case, becomes $\frac{g u^2 - v^2}{u^2} t = v$; therefore $t = \frac{u^2}{g} \times \frac{v}{u^2 - v^2} = \frac{u}{g} \times \frac{v}{u - v}$, and $t = \frac{u}{g} \times \int \frac{u}{u^2 - v^2}$
 $= \frac{u}{g} \times \text{L}\sqrt{\frac{u+v}{u-v}} = \frac{u}{Mg} \times \lambda \sqrt{\frac{u+v}{u-v}}$.

This fluent needs no constant quantity to complete it, or rather C = 0; for t must be = 0 when v = 0. This will evidently be the case; for then

$$\text{L}\sqrt{\frac{u+v}{u-v}} \text{ is } \text{L}\sqrt{\frac{u}{u}} = \text{L} 1, = 0.$$

This rule may be illustrated by the same example. In what time will the body acquire the velocity 323.62? Here $u+v = 1012.96$, $u-v = 365.72$; therefore $\lambda \sqrt{\frac{u+v}{u-v}} = 0.22122$, and $\frac{u}{g}$

(in feet and seconds) is $21'' \cdot 542$. Now, for greater perspicuity, convert the equation $t = \frac{u}{Mg} \times \lambda \sqrt{\frac{u+v}{u-v}}$ into a proportion: thus M : $\lambda \sqrt{\frac{u+v}{u-v}} = \frac{u}{g} : t$, and we have $0.43429 : 0.22122 = 21'' \cdot 542 : 10'' \cdot 973$, the time required.

We should remember that the numbers or symbols which we call logarithms are really parts of the line MI in the figure of the logistic curve, and that the motion of a point in this line is precisely similar to that of the body. The marquis Poleni, in a dissertation published at Padua in 1725, has with great ingenuity constructed logarithmics suited to all the cases which can occur.

It is easy to see that $\sqrt{\frac{u+v}{u-v}}$ is the cotangent of the $\frac{1}{2}$ complement of an arch whose radius is 1, and whose sine is $\frac{v}{u}$: For let KC (see diagram) be = u, and BE = v; then KD = u + v,

and DA = u - v. Join KB and BA, and draw CG parallel to KB. Now GA is the tangent of $\frac{1}{2}$ BA, = $\frac{1}{2}$ complement of HB. Then, by similarity of triangles, GA : AC = AB : BK, = $\sqrt{AD} : \sqrt{DK} = \sqrt{u-v} : \sqrt{u+v}$ and $\frac{AC}{GA}$

(= cotan. $\frac{1}{2}$ BA) = $\sqrt{\frac{u+v}{u-v}}$; therefore look for $\frac{v}{u}$ among the natural sines, or for log. $\frac{v}{u}$ among the logarithmic sines, and take the logarithmic cotangent of the half complement of the corresponding arch. This, considered as a common number, will be the second term of our proportion. This is a shorter process than the former

By reversing this proportion we get the velocity corresponding to a given time. To compare this descent of 1848 feet in the air with the fall of the body in vacuo during the same time, say $21'' \cdot 542^2 : 10'' \cdot 973 = 1848 : 1926 \cdot 6$, which makes a difference of seventy-nine feet.

COR. 1. The time in which the body acquires the velocity u by falling through the air, is to the time of acquiring the same velocity by falling in vacuo, as $u \int \sqrt{\frac{u+v}{u-v}}$ to v ; for it would acquire this velocity in vacuo during the time $\frac{v}{g}$, and it acquires it in the air in the time $\frac{u}{g} \int \sqrt{\frac{u+v}{u-v}}$.

2. The velocity which the body acquires by falling through the air in the time $\frac{u}{g} \int \sqrt{\frac{u+v}{u-v}}$ is, to the velocity which it would acquire in vacuo during the same time as v to $u \int \sqrt{\frac{u+v}{u-v}}$; for the velocity would acquire in vacuo during the time $\frac{u}{g} \int \sqrt{\frac{u+v}{u-v}}$ must be $u \int \sqrt{\frac{u+v}{u-v}}$ (because in any time $\frac{v}{g}$ the velocity v is acquired).

Next, let a body whose terminal velocity is u be projected perpendicularly upwards, with any velocity V . It is required to determine the height to which it ascends, so as to have any remaining velocity v , and the time of its ascent; as also the height and time in which its whole motion will be extinguished. We have now $\frac{g(u^2 + v^2)}{u^2}$ for the expression of f ; for both gravity and resistance act now in the same direction and retard the motion of the ascending body; therefore $\frac{g(u^2 + v^2)}{u^2}$

$\dot{s} = -v \dot{v}$, and $\dot{s} = -\frac{u^2}{g} \times \frac{v \dot{v}}{u^2 + v^2}$ and $\dot{s} = -\frac{u^2}{g} \times \int \frac{v \dot{v}}{u^2 + v^2} + C = -\frac{u^2}{g} \times \int \frac{v \dot{v}}{u^2 + v^2} + C$ (see art. FLUXIONS). This must be $= 0$ at the beginning of the motion, that is, when $v=V$, that is, $-\frac{u^2}{g} \times \int \frac{v \dot{v}}{u^2 + v^2} + C = 0$, or $C = \frac{u^2}{g} \times \int \frac{v \dot{v}}{u^2 + v^2}$, and the complete fluent will be $s = \frac{u^2}{g} \times \left(\int \frac{v \dot{v}}{u^2 + v^2} - \int \frac{v \dot{v}}{u^2 + v^2} \right) = \frac{u^2}{g} \times \int \frac{v \dot{v}}{u^2 + v^2} = \frac{u^2}{Mg} \times \lambda \sqrt{\frac{u^2 + V^2}{u^2 + v^2}}$

Let h be the greatest height to which the body will rise. Then $s = h$ when $v = 0$; and $h = \frac{u^2}{g} \times \int \frac{v \dot{v}}{u^2 + v^2} = \frac{u^2}{Mg} \times \lambda \sqrt{\frac{u^2 + V^2}{u^2}}$. We have $\lambda \sqrt{\frac{u^2 + V^2}{u^2 + v^2}} = s \frac{Mg}{u^2}$; therefore λ

$\left(\frac{u^2 + V^2}{u^2 + v^2} \right) = \frac{2Mgs}{u^2}$. Therefore let u be the number whose common logarithm is $\frac{2Mgs}{u^2}$; we

shall have $n = \frac{u^2 + V^2}{u^2 + v^2}$, and $v = \frac{u^2 + V^2}{n^2} - u^2$; and thus we obtain the relation of s and v , as in the case of descents; but we obtain it still easier by observing that $\sqrt{u^2 + V^2}$ is the secant of an arch whose radius is u , and whose tangent is V , and that $\sqrt{u^2 + v^2}$ is the secant of another arch of the same circle whose tangent is v .

Let the same ball be projected upwards with the velocity 411.05 feet per second. Required the whole height to which it will rise? Here $\frac{V}{u}$ will be found the tangent of $30 \cdot 48 \frac{1}{2}$, the logarithmic secant of which is 0.06606. This, multiplied by $\frac{u^2}{Mg}$, gives 2259 feet for the height. It would have risen 2640 feet in a void.

Suppose this body to fall down again. We can compare the velocity of projection with the velocity with which it again reaches the ground. The ascent and descent are equal; therefore $\sqrt{\frac{u^2 + V^2}{u^2}}$, which multiplies the constant factor in the ascent, is equal to $\sqrt{\frac{u^2}{u^2 - v^2}}$, the multiplier in the descent. The first is the secant of an arch whose tangent is V ; the other is the secant of an arch whose sine is v . These secants are equal, or the arches are the same; therefore the velocity of projection is to the final returning velocity as the tangent to the sine, or as the radius to the cosine of the arch. Thus suppose the body projected with the terminal velocity, or

$V = u$; then $v = \frac{u}{\sqrt{2}}$. If $V = 689$, $v = 487$.

Lastly, the relation of the space and the time must be ascertained. Here $\frac{g(u^2 + v^2)}{u^2} \dot{t} = -\dot{v}$ and $\dot{t} = -\frac{u^2}{g} \times \frac{\dot{v}}{u^2 + v^2} = -\frac{u}{g} \times \frac{u \dot{v}}{u^2 + v^2}$ and $t = -\frac{u}{g} \times \int \frac{u \dot{v}}{u^2 + v^2} + C$. Now (art. FLUXIONS) $\int \frac{u \dot{v}}{u^2 + v^2}$, is an arch whose tangent $= \frac{v}{u}$, and radius 1; therefore $t = -\frac{u}{g} \times \text{arc. tan. } \frac{v}{u} + C$. This must be $= 0$, when $v = V$, or $C = \frac{u}{g} \times \text{arc. tan. } \frac{V}{u} = 0$, and $C = \frac{u}{g} \times \text{arc. tan. } \frac{V}{u}$ and the complete fluent is $t = \frac{u}{g} \times \left(\text{arc. tan. } \frac{V}{u} - \text{arc. tan. } \frac{v}{u} \right)$. The quantities

within the brackets express a portion of the arch of a circle whose radius is unity; and are therefore abstract numbers, multiplying $\frac{u}{g}$, which we have shown to be the number of units of time in which a heavy body falls in vacuo from the height a , or in which it acquires the velocity u .

From this expression of the time we learn that however great the velocity of projection, and the height to which this body will rise, may be the time of its ascent is limited. It never can exceed the time of falling from the height a in vacuo in a greater proportion than that of a quadrantal arch to the radius, nearly the proportion of eight to five. A twenty-four pound iron ball cannot continue rising above fourteen seconds, even if the resistance to quick motions did not increase faster than the square of the velocity. It probably will attain its greatest height in less than twelve seconds, let its velocity be ever so great. In the preceding example of the whole ascent $v = 0$, and the time $t = \frac{u}{g} \times \text{arc. tan. } \frac{V}{u}$

or $\frac{u}{g} \text{ arc. } 30^\circ 48'$. Now $30^\circ 48' = 1848'$, and the radius 1 contains 3433: therefore the arch $= \frac{1848}{3433} = 0.5376$; and $\frac{u}{g} 21''.54$. Therefore $t = 21''.54 \times 0.5376$, $+ 11''.58$, or nearly $11\frac{1}{2}$ seconds. The body would have risen to the same height in a void in $10\frac{1}{2}$ seconds.

COR. 1. The time in which a body, projected in the air with any velocity V , will attain its greatest height, is to that in which it would attain its greatest height in vacuo as the arch whose tangent expresses the velocity is to the tangent; for the time of the ascent in the air is $\frac{u}{g} \times \text{arch}$; the time of the ascent in vacuo is $\frac{V}{g}$. Now $\frac{V}{g}$ is $= \tan.$ and $V = u \times \tan.$ and $\frac{V}{u} = \frac{u}{g} \times \tan.$

From inspecting the diagram p. 153, it is evident that the arch AI is to the tangent AG as the sector ICA to the triangle CGA ; therefore the time of attaining the greatest height in the air is to that of attaining the greatest height in vacuo (the velocities of projection being the same) as the circular sector to the corresponding triangle. If therefore a body be projected upwards with the terminal velocity, the time of its ascent will be to the time of acquiring this velocity in vacuo as the area of a circle to the area of the circumscribed square.

2. The height H to which a body will rise in a void is to the height h to which it would rise through the air when projected with the same velocity V as $M \cdot V^2$ to $u^2 \times \lambda \frac{u^2 + V^2}{u^2}$; for the height to which it will rise in vacuo is $\frac{V^2}{2g}$, and the height which it rises in the air is $\frac{u^2}{Mg} \lambda \sqrt{\frac{u^2 + V^2}{u^2}}$; therefore $H : h = \frac{V^2}{2g} : \frac{u^2}{Mg} \lambda \sqrt{\frac{u^2 + V^2}{u^2}}$, $= V^2 : \frac{u^2}{M} \times 2 \lambda \sqrt{\frac{u^2 + V^2}{u^2}} = V^2 : \frac{u^2}{M} \times \lambda \frac{u^2 + V^2}{u^2} = M \cdot V^2 : u^2 \times \lambda \frac{u^2 + V^2}{u^2}$.

If the body, therefore, be projected with its terminal velocity, so that $V = u$, the height to

which it will rise in the air is $\frac{30103}{43429}$ of the height to which it will rise in vacuo, or $\frac{5}{7}$ in round numbers.

We thought it necessary to treat of the perpendicular ascents and descents of heavy bodies through the air thus particularly, that the reader may conceive distinctly the quantities which he is thus combining in his algebraic operations, and may see their connexion in nature with each other. We shall also find that, in the present state of our mathematical knowledge, this simple state of the case contains almost all that we can determine with any confidence.

SECT. VI.—OF THE OBLIQUE PROJECTION.

We would now proceed to the general problem to determine the motion of a body projected in any direction, and with any velocity. But our readers will believe that this must be a difficult subject, when they see the simplest cases of rectilinear motion abundantly abstruse: it is indeed so difficult that Sir Isaac Newton has not given a solution of it, and has thought himself well employed in making several approximations, in which the fertility of his genius appears in great lustre. In the tenth and subsequent propositions of the second book of his Principia he shows what state of density in the air will comport with the motion of a body in any curve whatever; and then, by applying this discovery to several curves which have some similarity to the path of a projectile, he finds one which is not very different from what we may suppose to obtain in our atmosphere. But even this approximation was involved in such intricate calculations that it seemed impossible to make any use of it.

In the second edition of the Principia, published in 1713, Newton corrects some mistakes in the first, and carries his approximations much farther, but still does not attempt a direct investigation of the path which a body will describe in our atmosphere. This is somewhat surprising. In prop. 14, &c., he shows how a body, actuated by a centripetal force, in a medium of density varying according to certain law, will describe an eccentric spiral, of which he assigns the properties, and the law of description. Had he supposed the density constant, and the difference between the greatest and least distances from the centre of centripetal force exceedingly small in comparison with the distances themselves, his spiral would have coincided with the path of a projectile in the air of uniform density, and the steps of his investigation would have led him immediately to the complete solution of the problem. For this is the real state of the case. A heavy body is not acted on by equal and parallel gravity, but by a gravity inversely proportional to the square of the distance from the centre of the earth, and in lines tending to that centre nearly; and it was with the view of simplifying the investigation that mathematicians have adopted the other hypothesis.

Not long after the publication of this second edition of the Principia, the dispute about the in-

vention of the fluxionary calculus became very violent, and the great promoters of that calculus upon the continent proposed difficult problems to the mathematicians. Challenges of this kind frequently passed between the British and foreigners. Dr. Keill of Oxford had keenly espoused the claim of Sir Isaac Newton to this invention, and had engaged in a very acrimonious altercation with the celebrated John Bernouilli of Basle. Bernouilli had published in the *Acta Eruditorum Lipsiæ*, an investigation of the law of forces, by which a body, moving in a resisting medium, might describe any proposed curve, reducing the whole to the simplest geometry. This is perhaps the most elegant specimen which he has given of his great talents. Dr. Keill proposed to him the particular problem of the trajectory and motion of a body moving through the air, as one of the most difficult. Bernouilli very soon solved the problem in a way much more general than it had been proposed, viz. without any limitation either of the law of resistance, the law of the centripetal force, or the law of density, provided only that they were regular, and capable of being expressed algebraically. Dr. Brooke Taylor, the celebrated author of the *Method of Increments*, solved it at the same time, in the limited form in which it was proposed. Other authors since that time have given other solutions; but they are all (as indeed they must be) the same in substance with Bernouilli's. Indeed they are all (Bernouilli's not excepted) the same with Newton's first approximations, modified by the steps introduced into the investigation of the spiral motions mentioned above; and we still think it most strange that Sir Isaac did not perceive that the variation of curvature, which he introduced in that investigation, made the whole difference between his approximations and the complete solution.

All the solutions given of this problem depend upon a particular law of resistance assumed, without proving that to be the law by which a body is resisted in its motion through the air. This resistance is supposed to be in the duplicate ratio of the velocity; but even theory points out many causes of deviation from this law, such as the pressure and condensation of the air, in the case of very swift motions: and Mr. Robins's experiments are sufficient to prove that the deviations must be exceedingly great in such cases. Euler and all subsequent writers have allowed that it may be three times greater, even in cases which frequently occur; and Euler gives a rule for ascertaining with tolerable accuracy what this increase and the whole resistance may amount to. Let H be the height of a column of air whose weight is equivalent to the resistance taken in the duplicate ratio of the velocity. The whole resistance will be expressed by $H + \frac{H^2}{28845}$. This number 28845 is the height in feet

of a column of air whose weight balances its elasticity. We shall not at present call in question his reasons for assigning this precise addition. They are rather reasons of arithmetical conveniency than of physical import. It is enough to observe that, if this measure of the resistance is introduced into the process of inves-

tigation, it is totally changed: and it is not too much to say that with this complication it requires the knowledge and address of a Euler to make even a partial and very limited approximation to a solution.

Any law of the resistance, therefore, which is more complicated than what Bernouilli has assumed, namely, that of a simple power of the velocity, is abandoned by all the mathematicians, as exceeding their data: and they have attempted to avoid the error arising from the assumption of the duplicate ratio of the velocity either by supposing the resistance throughout the whole trajectory to be greater than what it is in general, or they have divided the trajectory into different portions, and assigned different resistances to each, which vary, through the whole of that portion, in the duplicate ratio of the velocities. Thus they make up a trajectory and motion which corresponds, in some tolerable degree, with what? With an accurate theory? No; but with a series of experiments. For, in the first place, every theoretical computation which we make proceeds on a supposed initial velocity; and this cannot be ascertained with any thing approaching to precision by any theory of the action of gunpowder that we are yet possessed of. In the next place, our theories of the resisting power of the air are entirely established on the experiments on the flight of shot and shells, and are corrected and amended till they tally with the most approved experiments we can find. We do not learn the ranges of a gun by theory, but the theory by the range of the gun.

After all, therefore, the practical artillerist must rely chiefly on the records of experiments contained in the books of practice at the academies, or those made in a more public manner. Even a perfect theory of the air's resistance can do him little service, unless the force of gunpowder were uniform. But this is far from being the case.

The experiments of Mr. Robins and Dr. Hut-ton show, in the most incontrovertible manner, that the resistance to a motion exceeding 1100 feet in a second is almost three times greater than in the duplicate ratio to the resistance to moderate velocities. Euler's translator, in his comparison of the author's trajectories with experiment, supposes it to be no greater. Yet the coincidence is very great. The same may be said of the Chevalier de Borda's. Nay, the same may be said of Mr. Robins's own practical rules; and yet his rules are confirmed by experience.

But we must not infer, from all this, that the physical theory is of no use to the practical artillerist. It plainly shows him the impropriety of giving the projectile an enormous velocity. This velocity is of no effect after 200 or 300 yards at farthest, because it is so rapidly reduced by the prodigious resistance of the air. Mr. Robins has deduced several practical maxims of the greatest importance from what we already know of this subject, and which could hardly have been even conjectured without this knowledge. And we must still acknowledge that this branch of physical science is highly interesting to the philosopher; nor should we despair of carrying it to greater perfection.

Certainly the most complete set of experiments made with a view of obtaining a rational theory of projectiles are those of Dr. Hutton, which were carried on at Woolwich during the years 1775, 1783, 1784, 1785, 1787, 1788, 1789, and 1791, the objects of which were very various, and some of the results highly important. The latter are thus enumerated by the author in the second volume of his Tracts:—

‘1. It is made evident, by these experiments, that powder fires almost instantaneously, seeing that nearly the whole of the charge fires, though the time be much diminished.

‘2. The velocities communicated to the shot of the same weight, with different quantities of powder, are nearly in the subduplicate ratio of those quantities; a very small variation, in defect, taking place when the quantities of powder become great.

‘3. And when shot of different weights are fired with the same quantities of powder the velocities communicated to them are nearly in the reciprocal subduplicate ratio of their weights.

‘4. So that, universally, shots which are of different weights, and impelled by the firing of different quantities of powder, acquire velocities which are directly as the square roots of the quantity of powder, and inversely as the square roots of the weight of the shot, nearly.

‘5. It would therefore be a great improvement in artillery to make use of shot of a long form, or of heavier matter; for thus the momentum of the shot, when fired with the same weight of powder, would be increased in the ratio of the square root of the weight of the shot.

‘6. It would also be an improvement to diminish the windage; for, by so doing, one-third or more of the quantity of powder might be saved.’ (This, however, must be understood only to be true within certain limits.)

‘7. When the improvements mentioned in the two last cases are considered as both taking place it is evident that about half the quantity of powder might be saved, which is a very considerable object. But, important as this saving may be, it seems still to be exceeded by that of the guns: for thus a small gun may be made to have the effect of one of two or three times its size, in the present way, by discharging a long shot of two or three times the weight of its natural ball, or round shot: and thus a small ship might discharge shot as heavy as those of the greatest now made use of.’

The objects of the latter courses of experiments are thus detailed: viz. to ascertain,

‘1. The velocities with which balls are projected by equal charges of powder, from pieces of the same weight and calibre, but of different lengths.

‘2. The greatest velocities due to the different charges of powder, the weight and length of the gun being the same.

‘3. The greatest velocity due to the different lengths of guns; to be obtained by increasing the charge as far as the resistance of the piece is capable of sustaining.

‘4. The effect of varying the weight of the piece; every thing else being the same.

‘5. The penetration of balls into blocks of wood.

‘6. The ranges and times of flight of balls, with the velocities, by striking the pendulum at various distances, to compare them with initial velocities, for determining the resistance of the medium.

‘7. The effects of wads, of ramming, of windage, &c.’

We shall now quote this author’s expression for the resistance of the air, deduced from these experiments, and thence determine the ranges, times of flight, &c., of projectiles according to that hypothesis.

THEOREM.—The resistance of the air, to a ball projected into it with any considerable velocity, is expressed by the formula $r = (\cdot 000007565 v^2 - 00175 v) d^2$. But, for the smaller velocities, $r = \cdot 0000044 d^2 v^2$ will be a sufficiently near approximation, where r represents the resistance in avoirdupois pounds, d the diameter of the ball in inches, v the velocity in English feet. See Hutton’s Tracts, vol. iii. p. 232.

PROB. I.—To determine the height to which a ball, projected perpendicularly upwards, will ascend, being resisted by the atmosphere.

Putting x to denote any variable and increasing height ascended by the ball; v its variable and decreasing velocity there; d the diameter of the ball, its weight being w ; $m = \cdot 000007565$, and $n = \cdot 00175$, the co-efficients of the two terms in the above theorem. Then $(m v^2 - n v) d^2$ will be the resistance of the air against the ball in avoirdupois pounds, to which, if the weight of the ball be added, then $(m v^2 - n v) d^2 + w$ will be the whole resistance to the ball’s motion, and consequently

$$\frac{(m v^2 - n v) d^2 + w}{w} = \frac{(m v^2 - n v)}{w} d^2 + 1 = f,$$

the retarding force. Hence the general formula $v \dot{v} = 2 g f \dot{x}$ becomes $-v \dot{v} = 2 g x \times \frac{(m v^2 - n v) d^2 + w}{w}$ making v negative, because the velocity is decreasing, where $g = 16\frac{1}{2}$ feet, or sixteen feet, the descent of a body in one second by gravity.

Hence $\dot{x} = -\frac{w}{29} \times \frac{v \dot{v}}{(m v^2 - n v) d^2 + w} = -\frac{w}{2 g m d^2} \times \frac{v \dot{v}}{v^2 - \frac{n}{m} v + \frac{w}{m d^2}}$. The fluent of

$$\frac{v \dot{v}}{v^2 - \frac{n}{m} v + \frac{w}{m d^2}}$$

which being taken, and corrected for the instant of the first velocity V , when $x = 0$, gives $x =$

$$\frac{w}{2 g m d^2} \times \left\{ \frac{1}{2} \log. \left(V^2 - \frac{n}{m} V + \frac{w}{m d^2} \right) - \frac{1}{2} \log. \frac{w}{m d^2} + \frac{p}{q^2} (\text{arc. tan. } (V - p) - \text{arc. tan. } -p \text{ to rad. } q) \right\}$$

where $p = \frac{n}{2m}$, and $p^2 + q^2 = \frac{w}{m d^2}$.

But as part of this fluent, denoted by $\frac{p}{q^2} +$ the difference of the two arcs to $\tan. (V - p)$ and $-\tan. p$, is always very small in comparison with the other preceding terms, it may be omitted without any material error in practical cases; in which case we have,

$$x = \frac{w}{4 g m d^2} \times \text{hyp. log.} \frac{V^2 - \frac{n}{m} V + \frac{w}{m d^2}}{\frac{w}{m d^2}}$$

for the greatest height to which the ball will ascend in air; supposing its density uniformly the same as at the earth's surface. Now for the numerical value of the general coefficient $\frac{w}{4 g m d^2}$,

and the term $\frac{w}{m d^2}$; because the mass of the ball to the diameter d is $\cdot 5236 d^3$, if its specific gravity be s , its weight will be $\cdot 5236 s d^3 = w$; therefore $\frac{w}{d^3} = \cdot 5236 s d$, and $\frac{w}{m d^2} = 69259 s d$;

this divided by $4 g$ or 64 , gives $\frac{w}{4 g m d^2} = 1082 s d$ for the value of the general coefficient, to any diameter d , and specific gravity s . And if we farther suppose the ball to be cast iron, the specific gravity of which, or the weight of a cubic inch, is $\cdot 26855$ lbs., it becomes $290 \cdot s d$ for that co-efficient; also $69259 s d = 18600 d = \frac{w}{m d^2}$,

$$\text{and } \frac{n}{m} = 231 \cdot 5.$$

Hence the preceding fluent becomes

$$x = 290 \cdot 6 \times \text{hyp. log.} \frac{V^2 - 231 \cdot 5 V + 18600 d}{18600 d}$$

$$x = 669 d \times \text{com. log.} \frac{V^2 - 231 \cdot 5 V + 18600 d}{18600 d}$$

which is in general expression for the altitude in feet ascended by an iron bullet whose diameter is d , and projectile velocity V .

Example 1.—Suppose a ball of cast iron, whose diameter is two inches, and, therefore, its weight $1\frac{1}{8}$ lb., to be projected upwards with a velocity of 2000 feet per second, to find the greatest height to which it will ascend.

Here, substituting for d, w , and V their respective values, we have

$$x = 669 d \times \text{com. log.} \frac{V^2 - 231 \cdot 5 V + 18600 d}{18600 d}$$

$$= 2653 \text{ feet.}$$

Example 2.—Again, let the ball weigh twenty-four pounds, and, therefore, its diameter $5 \cdot 6$, and velocity 2000 feet per second, as before; then

$$x = 669 d \times \text{com. log.} \frac{V^2 - 231 \cdot 5 V + 18600 d}{18600 d}$$

$$= 5782 \text{ feet, the height required.}$$

In the first of these examples, where the height is found to be only about half a mile, the ball would ascend to nearly twelve miles in a non-resisting medium; and hence we may see the immense effect of atmospheric resistance to the motion of projectiles.

PROB. II.—To determine the time in which a ball will have acquired its greatest height, using the same formula of resistance as in the last case.

Here the general value of t , determined on principles similar to those above employed, gives

$$t = \frac{w}{2 g m q d^2} \times \left(\text{arc. tan.} \frac{V-p}{q} \text{arc. tan.} \frac{v-p}{q} \right),$$

$$\text{or } t = \frac{w}{2 g m q d^2} \times \text{arc. tan.} \frac{V-p}{q}, \text{ rejecting}$$

the latter arc as inconsiderable; p and q representing the same as before.

Example 1.—Let it be proposed to find the time in which an iron ball, two inches in diameter, will acquire its greatest height, when projected with a velocity of 2000 feet per second.

Here $\frac{n}{2 m} = 115\frac{1}{2} = p$, and $\frac{w}{m d^2} = p^2 + q^2$, gives $q = \sqrt{37153 - p^2} = 154\frac{1}{2}$; whence $t = \frac{w}{2 g m q d^2} \times \left(\text{arc. tan.} \frac{V-p}{q} \right) = 11 \cdot 81$ seconds.

If we take the second example above to find the time, we shall have $p = 115\frac{1}{2}$ as before, and $q = 299 \cdot 4$; therefore $t = \frac{w}{2 g m q d^2} \times \text{arc. tan.}$

$$\frac{V-p}{q} = 16 \cdot 89 \text{ seconds.}$$

After the investigation of these problems, and some others of a similar nature, Dr. Hutton proceeds to the investigation of his principal one, viz. to determine the circumstances of ranges at different degrees of elevation; which we transcribe.

Rules for the general solution of this problem would be best derived from experiments; and these should be made at all elevations, and with all charges, and with various sizes of balls, observing both the ranges and times of flight in every experiment. Such experiments would give us the relations existing, in all cases, amongst these four terms, viz. the ranges, the times of flight, the velocity or charges, and the size of the balls. Numerous and various as are our experiments, as before related, and fruitful as they are in useful consequences, we have obtained but a small portion of those alluded to; nor do I know of any proper set of such experiments any where to be found. Such must, therefore, still remain a valuable desideratum; the few that we have been able to make afford us but very few and imperfect rules, being chiefly as follows:

1. That the ranges with the one-pound balls, at an elevation of 15° , are nearly proportional to the times of flight. 2. That the ranges with the three-pound balls, at 45° of elevation, are nearly as the times of flight, and also as the projectile velocities. Besides these inferences, it does not appear that the experiments are extensive enough to afford any more useful conclusion.

By trials, however, amongst many of the numbers in art. 24, it appears that in most of them at an elevation between 45° and 30° , the time of flight is nearly equal to one-fourth of the square root of the range in feet, in which respect it nearly agrees with the similar rule for the time of flight in the parabolic theory, at the angle of 45° for the greatest range, which time, it is well known, is equal to one-fourth of the square root of the said range in feet. Whence it is probable that, with the help of a few other ranges at several elevations, some general relations might be evinced between the ranges and the times of flight, with the tangents of the elevation.

But such experiments and enquiries as these, unfortunately, it is no longer in my power either to procure, or by any means to promote; and

we can, therefore, only endeavour to render, without them, what service we can to the state, and to philosophy, by such means as are in our power.

There are some few theoretical principles which it may be useful to notice here, as first mentioned by professor Robison. Thus balls of equal density, discharged at the same elevation with velocities which are proportional to the square roots of their diameters, will describe similar curves; because then the resistances will be in proportion as the momentum or quantity of motion. For the resistance r is $d^2 v^2$ nearly; d being the diameter, and v the velocity. But v being as \sqrt{d} , v^2 will be as d ; consequently $d^2 v^2$ will be as d^3 ; that is, r is as d^3 . But the momentum is as the magnitude or mass, which is as d^3 also, the cube of the diameter. Therefore the resistance is proportional to the momentum, when the velocity is as \sqrt{d} , or the square root of the diameter of the ball. In this case, then, the horizontal velocity at the vertex of the curve will be proportional to the terminal velocity; also the ranges, and heights, and all other similar lines in the curve, will be proportional to d , the diameter of the ball. And this principle may be of considerable use; for thus, by means of a proper series of experiments on one ball, projected with different velocities and elevations, tables may be constructed, by which may be ascertained the motions in all similar cases.²

We shall have occasion to advert again to these valuable contributions of Dr. Hutton.

PART II.

OF THE PRACTICE OF GUNNERY, OR MILITARY PROJECTILES.

Having laid before our readers the substance of the latest and most improved theories of projectiles, we proceed to give them a brief sketch of the most improved modern practice.

Mr. Robins, in his preface to his New Principles of Gunnery, states that he had met with only four authors who had treated experimentally on this subject. The first of these is Collado in 1642, who has given the ranges of a falconet, carrying a three-pound shot, to every point of the gunner's quadrant, each point being the twelfth part, or 7° 30'. But from his numbers it is manifest that the piece was not charged with its usual allotment of powder. The result of his trials shows the ranges at the point-blanc, and the several points of elevations as below.

Elevation at Points.	Deg.	Range in paces.
0 or	0 . . .	268
1	7½ . . .	594
2	15 . . .	794
3	22½ . . .	954
4	30 . . .	1010
5	37½ . . .	1040
6	45 . . .	1053
7	52½ . . .	between the 3d and 4th
8	60 . . .	between the 2d and 3d
9	67½ . . .	between the 1st and 2d
10	75 . . .	between the 0 and 1st
11	82½ . . .	fell very near the piece.

The next was by Wm. Bourne, in 1643, in his Art of Shooting in great Ordnance. His elevations were not regulated by the points of the gunner's quadrant, but by degrees; and he gives the proportions between the ranges at different elevations and the extent of the point-blanc shot, thus: if the extent of the point-blanc shot be represented by one, then the proportions of the ranges at several elevations will be as below viz.--

BOURNE'S PROPORTION OF RANGES.

Elevation.	Range.
0°	1
5	2½
10	3½
15	4½
20	4¾
and the greatest random	5½ ;

which greatest random, he says, in a calm day is at 42° elevation; but according to the strength of the wind, and as it favors or opposes the flight of the shot, the elevation may be from 43° to 36°. He does not say with what piece he made his trials, though from his proportion it seems to have been a small one. This however ought to have been mentioned, as the relation between the extent of different ranges varies extremely according to the velocity and density of the bullet.

After him Eldred and Anderson, both Englishmen, also published treatises on this subject. The former of these was many years gunner of Dover Castle, where most of his experiments were made, the earliest of which are dated 1611, though his book was not published till 1646, and was entitled The Gunner's Glass. His principles were simple, and within certain limits very near the truth, though they were not rigorously so. He has given the actual ranges of different pieces of artillery at small elevations, all under 10°. His experiments are numerous, and appear to be made with great care and caution; and he has honestly set down some which were not reconcilable to his method: upon the whole he seems to have taken more pains, and to have had a juster knowledge of his business than is to be found in most of his practical brethren.

Galileo printed his Dialogues on Motion in the year 1646. In these he pointed out the general laws observed by nature in the production and composition of motion, and was the first who described the actions and effects of gravity on falling bodies: on these principles he determined that the flight of a cannon-shot, or of any other projectile, would be in the curve of a parabola, unless so far as it should be diverted from that track by the resistance of the air. He also proposed the means of examining the inequalities which arise thence, and of discovering what sensible effects that resistance would produce in the motion of a bullet at some given distance from the piece. Notwithstanding these determinations and hints it seems, however, that those who came after Galileo never imagined that it was necessary to consider how far the operations of gunnery were affected by this resistance. Instead of this, they boldly asserted, without making the experiment, that no great variation could

rise from the resistance of the air in the flight of shells or cannon-shot. In this persuasion they supported themselves chiefly by considering the extreme rarity of the air, compared with those dense and ponderous bodies; and at last it became an almost generally established maxim that the flight of these bodies was nearly in the curve of a parabola.

After the publication of Newton's *Principia* it might have been expected that the defects of the theory would be ascribed to their true cause, the great resistance of the air to such swift motions; as in that work he particularly considered the subject of such motions, and related the result of experiments made on slow motions at least; by which it appeared that in such motions the resistance increases as the square of the velocities, and he even hints a suspicion that it will increase above that law in swifter motions, as is now known to be the case. So far, however, were those who treated this subject scientifically from making a proper allowance for the resistance of the atmosphere that they still neglected it, or rather opposed it, and their theories accordingly differed most egregiously from the truth. Huygens alone seems to have attended to this principle; for in the year 1590 he published a treatise on gravity, in which he gave an account of some experiments tending to prove that the track of all projectiles, moving with very swift motions, was widely different from that of a parabola. The rest of the learned generally acquiesced in the justness and sufficiency of Galileo's doctrine. Nor was any farther notice taken of these errors till the year 1716, at which time Mr. Resson, a French officer of artillery, of great merit and experience, gave in a memoir to the Royal Academy, importing that, 'although it was agreed that theory joined with practice did constitute the perfection of every art, yet experience had taught him that theory was of very little service in the use of mortars: that the works of M. Blondell had justly enough described the several parabolic lines according to the different degrees of the elevation of the piece: but that practice had convinced him there was no theory in the effect of gunpowder; for having endeavoured, with the greatest precision, to point a mortar according to these calculations, he had never been able to establish any solid foundation upon them.' One instance only occurs, in which D. Bernoulli applies the doctrine of Newton to the motions of projectiles, in the *Com. Acad. Petrop.* tom. ii. p. 338, &c. Besides which nothing farther was done in this business till the time of Robins, who published a treatise in 1742, intitled *New Principles of Gunnery*, in which he treated particularly not only of the resistance of the atmosphere, but also of the force of gunpowder, the nature and effects of different guns, and almost every thing else relating to the flight of military projectiles; and indeed he carried the theory of gunnery nearly to its utmost perfection.

The first thing considered by Mr. Robins, and which is indeed the foundation of all other particulars relating to gunnery, is the explosive force of gunpowder. M. de la Hire, in his *History of the Academy of Sciences* for the year 1702, supposed that this force may be owing to the in-

creased elasticity of the air contained in and between the grains, in consequence of the heat and fire produced at the time of the explosion: a cause not adequate to the 200th part of the effect. On the other hand, Mr. Robins determined, by irrefragable experiments, that this force was owing to an elastic fluid, similar to our atmosphere, existing in the powder in an extremely condensed state, which being suddenly freed from the powder, by the combustion, expanded with an amazing force, and violently impelled the bullet, or whatever might oppose its expansion.

The intensity of this force of exploded gunpowder Mr. Robins ascertained in different ways, after the example of Mr. Hawksbee, related in the *Philosophical Transactions*, No. 295, and in his *Physico-Mechanical Experiments*, p. 81. One of these is by firing the powder in the air thus:—A small quantity of the powder is placed in the upper part of a glass tube, and the lower part of the tube is immersed in water, the water being made to rise so near the top that only a small portion of air is left in that part where the powder is placed; then in this situation, the communication between the upper part of the tube and the external air being closed, the powder is fired by means of a burning glass, or otherwise; the water descends upon the explosion, and stands lower in the tube than before, by a space proportioned to the quantity of powder fired. Another way was by firing the powder in vacuo, viz. in an exhausted receiver, by dropping the grains of powder upon a hot iron included in the receiver. By this means a permanent elastic fluid was generated from the fired powder, and the quantity of it was always in proportion to the quantity of powder that was used, as was found by the proportional sinking of the mercurial gauge annexed to the air-pump. The result of these experiments was, that the weight of the elastic air thus generated was equal to three-tenths of the compound mass of the gunpowder which yielded it, and that its bulk when cold, and expanded to the rarity of the common air, was about 240 times the bulk of the powder; and consequently in the same proportion would such fluid at first, if it were cold, exceed the force or elasticity of the atmosphere. But as Mr. Robins found, by another ingenious experiment, that air heated to the extreme degree of the white heat of iron has its elasticity quadrupled, or is four times as strong, he thence inferred that the force of the elastic air generated as above, at the moment of the explosion, is at least four times 240, or 960, or, in round numbers, about 1000 times as strong as the elasticity or pressure of the atmosphere on the same space.

Having thus determined the force of the gunpowder, or intensity of the agent by which the projectile is to be urged, Mr. Robins proceeded to determine the effects it will produce, or the velocity with which it will impel a shot of a given weight from a piece of ordnance of given dimensions; which is a problem strictly limited and perfectly soluble by mathematical rules, and is in general this:—Given the first force, and the law of its variation, to determine the velocity with which it will impel a given body, in passing

through a given space, which is the length of the bore of the gun. In the solution of this problem Mr. Robins assumes these two postulates, viz. 1. That the action of the powder on the bullet ceases as soon as the bullet is out of the piece; and 2d. That all the powder of the charge is fired and converted into elastic fluid before the bullet is sensibly moved from its place: assumptions which for good reasons are found to be in many cases very near the truth. It is to be noted also, that the law by which the force of the elastic fluid varies is this, viz. that its intensity is directly as its density, or reciprocally proportional to the space it occupies, being so much the stronger as the space is less: a principle well known, and common to all elastic fluids. Upon these principles, then, Mr. Robins resolves this problem, by means of the thirty-ninth proposition of Newton's Principia, in a direct way, and the result is equivalent to this theorem, when the quantities are expressed by algebraic symbols; viz. the velocity of the ball.

$$v = 27130 \sqrt{\frac{10a}{cd} \times \log. \frac{b}{a}}$$

$$\text{or} = 100 \sqrt{\frac{223 ad^2}{w} \times \log. \frac{b}{a}};$$

where v is the velocity of the ball, a the length of the charge of powder, b the whole length of the bore, c the specific gravity of the ball, or weight of a cubic foot of the same matter in ounces, d the diameter of the bore, w the weight of the ball in ounces.

For example, suppose $a = 2\frac{3}{4}$ inches, $b = 45$ inches, $c = 11345$ ozs. for a ball of lead, and

$$d = \frac{3}{8} \text{ inch; then } v = 27130 \sqrt{\frac{7}{2269} \times \log. \frac{120}{7}}$$

$= 1674$ feet per second, the velocity of the ball.

Or, if the weight of the bullet be $w = 1\frac{23}{32}$ ozs. $= \frac{33}{8}$ ozs. Then $v = 100$

$$\sqrt{\frac{1115 \times 189}{29 \times 32} \times \log. \frac{120}{7}} = 1674 \text{ feet, as before.}$$

'Having in this proposition,' says Mr. Robins, 'shown how the velocity which any bullet acquires from the force of powder may be computed upon the principles of the theory laid down in the preceding propositions, we shall next show that the actual velocities with which bullets of different magnitudes are impelled from different pieces, with different quantities of powder, are really the same with the velocities assigned by these computations, and consequently that this theory of the force of powder, here delivered, does unquestionably ascertain the true action and modification of this enormous power.'

'But, in order to compare the velocities communicated to bullets by the explosion with the velocities resulting from the theory by computation, it is necessary that the actual velocities with which bullets move should be capable of being discovered, which yet is impossible to be done by any methods hitherto made public. The only means hitherto practised by others for that purpose have been either by observing the time of

the flight of the shot through a given space, or by measuring the range of the shot at a given elevation, and thence computing on the parabolic hypothesis what velocity would produce this range. The first method labors under this insurmountable difficulty, that the velocities of these bodies are often so swift, and consequently the time observed is so short, that an imperceptible error in that time may occasion an error in the velocity thus found of 200, 300, 400, 500, or 600 feet in a second. The other method is so fallacious, by reason of the resistance of the air (to which inequality the first is also liable), that the velocities thus assigned may not be perhaps the tenth part of the actual velocities sought.

'To remedy then these inconveniences, I have invented a new method of finding the real velocities of bullets of all kinds; and this to such a degree of exactness (which may be augmented too at pleasure) that in a bullet moving with the velocity of 1700 feet in a second, the error in the estimation of it need never amount to its 500th part; and this without any extraordinary nicety in the construction of the machine.'

Mr. Robins then gives an account of the machine by which he measures the velocities of the balls, which machine is simply this: viz. a pendulous block of wood suspended freely by a horizontal axis, against which block are to be fired the balls whose velocities are to be determined.

'This instrument thus fitted, if the weight of the pendulum be known, and likewise the respective distances of its centre of gravity and of its centre of oscillation from its axis of suspension, it will thence be known what motion will be communicated to this pendulum by the percussion of a body of a known weight moving with a known degree of celerity, and striking it in a given point; that is, if the pendulum be supposed at rest before the percussion it will be known what vibration it ought to make in consequence of such a determined blow; and, on the contrary, if the pendulum, being at rest, is struck by a body of a known weight, and the vibration which the pendulum makes after the blow is known, the velocity of the striking body may thence be determined.

'Hence then, if a bullet of a known weight strikes the pendulum, and the vibration which the pendulum makes in consequence of the stroke be ascertained, the velocity with which the ball moved is thence to be known.'

Our author then explains his method of computing velocities from experiments with this machine; which method is rather troublesome and perplexed, as well as the rules of Euler and Antoni, who followed him in this business; but a much plainer rule is given in Hutton's Tracts, vol. i. p. 119, where such experiments are explained at full length, and this rule is expressed by either of the two following formulas,

$$v = 5.6727cg \times \frac{p+b}{bir} = 614.58cg \times \frac{p+b}{bir},$$

the velocity; where v denotes the velocity of the ball when it strikes the pendulum, p the weight of the pendulum, b the weight of the ball, c the chord of the arc described by the vibration to the

radius, r the distance below the axis of motion to the centre of gravity, o the distance to the centre of oscillation, i the distance to the point of impact, and n the number of oscillations the pendulum will perform in one minute, when made to oscillate in small arcs. The latter of these two theorems is much the easiest, both because it is free of radicals, and because the value of the radical \sqrt{o} , in the former, is to be first computed from the number n , or number of oscillations the pendulum is observed to make. With such machines Mr. Robins made a great number of experiments with musket barrels of different lengths, with balls of various weights, and with different charges or quantities of powder. He has set down the results of sixty-one of these experiments, which nearly agree with the corresponding velocities as computed by his theory of the force of powder, and which therefore establish that theory on a sure foundation.

From these experiments, as well as from the preceding theory, many important conclusions were deduced by Mr. Robins; and indeed, by means of these, it is obvious that every thing may be determined relative both to the true theory of projectiles, and to the practice of artillery; for, by firing a piece of ordnance charged in a similar manner against such a ballistic pendulum from different distances, the velocity lost by passing through such spaces of air will be found, and consequently the resistance of the air, the only circumstance that was wanting to complete the theory of gunnery or military projectiles; and of this kind Dr. Hutton made a great number of experiments with cannon balls, and has thereby obtained the whole series of resistances to such a ball when moving with every degree of velocity, from 0 up to 2000 feet per second of time. In the structure of artillery they may likewise be of the greatest use; for hence may be determined the best lengths of guns; the proportions of the shot and powder to the several lengths; the thickness of a piece, so as it may be able to confine, without bursting, any given charge of powder; as also the effect of wads, chambers, placing of the vent, ramming the powder, &c. For the many other curious circumstances relating to this subject, and the various other improvements in the theory and practise of gunnery made by Mr. Robins, consult the first volume of his Tracts, collected and published by Dr. Wilson in the year 1761, where ample information may be found.

In the year 1755, says Dr. Hutton, in conjunction with several able officers of the royal artillery and other ingenious gentlemen, I undertook a course of experiments with the ballistic pendulum, in which we ventured to extend the machinery to cannon shot of one, two, and three pounds weight. An account of these experiments was published in the Philosophical Transactions for 1778; and for which the Royal Society honored me with the prize of the gold medal. These were the only experiments that I know of which had been made with cannon balls for this purpose, although the conclusions to be deduced from such are of the greatest importance to those parts of natural philosophy which are dependent on the effects of fired gunpowder: nor do I know of any other practical method of ascertaining the

initial velocities within any tolerable degree of truth. The knowledge of this velocity is of the utmost consequence in gunnery; by means of it, together with the law of the resistance of the medium, every thing is determinable relative to that business; for, besides its being an excellent method of trying the strength of different sorts of powder, it gives us the law relative to the different quantities of powder, to the different weights of shot, and to the different lengths and sizes of guns. Besides these, there does not seem to be any thing wanting to answer any enquiry that can be made concerning the flight and ranges of shots except the effects arising from the resistance of the medium. In these experiments the weights of the pendulums employed were from 300 to nearly 600 pounds. In that paper is described the method of constructing the machines, of finding the centres of gravity and oscillation of the pendulum, and of making the experiments, which are all set down in the form of a journal, with all the minute and concomitant circumstances; also the investigation of the new and easy rule set down just above, for computing the velocity of the ball from the experiments. The charges of powder were varied from two to eight ounces, and the shot from one to nearly three pounds. And from the whole were clearly deduced the inferences we have already given.

In the year 1786 was published the first volume of Dr. Hutton's Tracts, in which is detailed, at great length, another very extensive course of experiments which were carried on at Woolwich in the years 1783, 1784, and 1785, by order of the duke of Richmond, master general of the ordnance. The objects of this course we have also enumerated in the theoretic part of this treatise.

These objects were obtained in a very perfect and accurate manner; excepting only the article of ranges, which were not quite so regular and uniform as might be wished. The balls too were most of them of one pound weight; but the powder was increased from one ounce up till the bore was quite full, and the pendulum was from 600 to 800 lbs. weight. The conclusions from the whole were as follow:—

1. That the former law, between the charge and velocity of ball, is again confirmed, viz. that the velocity is directly as the square root of the weight of powder, as far as to about the charge of eight ounces: and so it would continue for all charges, were the guns of an indefinite length. But as the length of the charge is increased, and bears a more considerable proportion to the length of the bore, the velocity falls the more short of that proportion.

2. That the velocity of the ball increases with the charge to a certain point, which is peculiar to each gun, where it is greatest; and that, by farther increasing the charge, the velocity gradually diminishes till the bore is quite full of powder. That this charge for the greatest velocity is greater as the gun is longer, but not greater however in so high a proportion as the length of the gun is; so that the part of the bore filled with powder bears a less proportion to the whole in the long guns, than it does in the short ones;

the part of the whole which is filled being indeed nearly in the reciprocal subduplicate ratio of the length of the empty part. And the other circumstances are as in this table.

TABLE of Charges producing the greatest Velocity.

Gun. num.	Length of the bore.	Length filled.	Part of the whole.	Weight of the powder
	inches.	inches.		oz.
1	28·2	8·2	$\frac{3}{10}$	12
2	38·1	9·5	$\frac{1}{10}$	14
3	57·4	10·7	$\frac{1}{16}$	16
4	79·9	12·1	$\frac{1}{20}$	18

‘3. It appears that the velocity continually increases as the gun is longer, though the increase in velocity is but very small in respect of the increase in length, the velocities being in a ratio somewhat less than that of the square roots of the length of the bore, but somewhat greater than that of the cube roots of the length, and is indeed nearly in the middle ratio between the two.

‘4. The range increases in a much less ratio than the velocity, and indeed is nearly as the square root of the velocity, the gun and elevation being the same. And, when this is compared with the property of the velocity and length of gun in the foregoing paragraph, we perceive that very little is gained in the range by a great increase in the length of the gun, the charge being the same. And indeed the range is nearly as the fifth root of the length of the bore, which is so small an increase as to amount only to about one-seventh part more range for a double length of gun.

‘5. It also appears that the time of the ball’s flight is nearly as the range; the gun and elevation being the same.

‘6. It appears that there is no sensible difference caused in the velocity or range, by varying the weight of the gun, nor by the use of wads, nor by different degrees of ramming, nor by firing the charge of powder in different parts of it.

‘7. But a great difference in the velocity arises from a small degree of windage. Indeed with the usual established windage only, namely, about one-twentieth of the calibre, no less than between one-third and one-fourth of the powder escapes and is lost. And, as the balls are often smaller than that size, it frequently happens that half the powder is lost by unnecessary windage.

‘8. It appears that the resisting force of wood to balls fired into it is not constant. And that the depths penetrated by different velocities or charges are nearly as the logarithms of the charges; instead of being as the charges themselves, or, which is the same thing, as the square of the velocity.

‘9. These and most other experiments show that balls are greatly deflected from the direction they are projected in; and that so much as 300 or 400 yards in a range of a mile, or almost one-fourth of the range, which is nearly a deflection of an angle of 15°.

‘10. Finally, these experiments furnish us with the following concomitant data, to a tolerable degree of accuracy, namely, the dimensions and

elevation of the gun, the weight and dimensions of the powder and shot, with the range and time of flight, and the first velocity of the ball. From which it is to be hoped that the measure of the resistance of the air to projectiles may be determined, and thereby lay the foundation for a true and practical system of gunnery, which may be as well useful in service as in theory.

‘Since the publication of those Tracts,’ says Dr. Hutton, ‘we have prosecuted the experiments still farther from year to year, gradually extending our aim to more objects, and enlarging the guns and machinery, till we have arrived at experiments with the six-pounder guns, and pendulums of 1800 lbs. weight. One of the new objects of enquiry was the resistance the atmosphere makes to military projectiles; to obtain which the guns have been placed at many different distances from the pendulum, against which they are fired, to get the velocity lost in passing through those spaces of air; by which, and the use of the whirling machine, described near the end of the first volume of Robins’s Tracts, for the slower motions, I have investigated the resistance of the air to given balls moving with all degrees of velocity from 0 up to 2000 feet per second; as well as the resistance for many degrees of velocity to planes and figures of other shapes, and inclined to their path in all varieties of angles; from which I have deduced general laws and formulas for all such motions.

‘Mr. Robins made also similar experiments on the resistance of the air, but being only with musket bullets, on account of their smallness and of their change of figure by the explosion of the powder, I find they are very inaccurate, and considerably different from those above mentioned, which were accurately made with pretty considerable cannon balls of iron. For this reason we may omit here the rules and theory deduced from them by Mr. Robins, till others more correct shall have been established. All these experiments indeed agree in evincing the very enormous resistance the air makes to the swift motions of military projectiles, amounting in some cases to twenty or thirty times the weight of the ball itself; on which account the common rules for projectiles deduced from the parabolic theory are of little or no use in real practice; for from these experiments it is clearly proved that the track described by the flight even of the heaviest shot is neither a parabola, nor yet approaching any thing near it, except when they are projected with very small velocities; inso-much that some balls, which in the air range only to the distance of one mile, would in vacuo, when projected with the same velocity, range above ten or twenty times as far.’

Mr. Benjamin Thompson (the late count Rumford) instituted a very considerable course of experiments of the same kind as those of Mr. Robins, with musket barrels, which was published in the Philosophical Transactions, vol. 71, for the year 1781. In these experiments the conclusions of Mr. Robins are generally confirmed, and several other curious circumstances in this business are remarked by Mr. Thompson. This gentleman also pursues a hint thrown out by Mr. Robins, relative to the determining the velocity of

a ball from the recoil of the pendulous gun itself. Mr. Robins, in the eleventh proposition, remarks, that the effect of the exploded powder upon the recoil of a gun is the same whether the gun is charged with or without a ball; and that the chord or velocity of recoil with the powder alone, being subtracted from that of the recoil when charged with both powder and ball, leaves the velocity which is due to the ball alone. Thence Mr. Thompson observes that the inference is obvious, viz. that the momentum thus communicated to the gun by the ball alone, being equal to the momentum of the ball, this becomes known; and therefore, being divided by the known weight of the ball, the quotient will be its velocity. Mr. Thompson sets a great value on this new rule, the velocities by means of which he found to agree nearly with several of those deduced from the motion of the pendulum; and in the other cases, in which they differed greatly from these, he very inconsistently supposes that these latter ones are erroneous. In the experiments, however, contained in Dr. Hutton's Tracts, a great multitude of those cases are compared together, and the inaccuracy of that new rule is fully proved.

Having in the ninth proposition compared together a number of computed and experimented velocities of balls to verify his theory; Mr. Robins, in the tenth proposition, assigns the changes in the force of powder, which arise from the different state of the atmosphere, as to heat and moisture, both which he finds have some effect on it, but especially the latter. In the eleventh proposition he investigates the velocity which the flame of gunpowder acquires by expanding itself, supposing it fired in a given piece of artillery, without either a bullet or any other body before it. This velocity he finds is upwards of 7000 feet per second. But the celebrated Euler, in his commentary on this part of Mr. Robins's book, thinks it may be still much greater, and in this proposition too it is that Mr. Robins declares his opinion above alluded to, viz. that the effect of the powder upon the recoil of the gun is the same in all cases whether fired with a ball or without one. In the twelfth proposition he ascertains the manner in which the flame of powder impels a ball which is laid at a considerable distance from the charge; showing here that the sudden accumulation and density of the fluid against the ball is the reason that the barrel is so often burst in those cases. In the thirteenth proposition he enumerates the various kinds of powder, and describes the properest methods of examining its goodness. He here shows that the best proportion of the ingredients is when the saltpetre is three-fourths of the whole compound mass of the powder, and the sulphur and charcoal the other one-fourth between them, in equal quantities. In this proposition Mr. Robins takes occasion to remark upon the use of *eprouvettes*, or methods of trying powder; condemning the practice of the English in using what is called the vertical *eprouvette*; as well as that of the French, in using a small mortar with a very large ball, and a small charge of powder, and instead of these he strongly recommends the use of his ballistic pendulum for its great accuracy. But for still more despatch, he says, he should use another method, which however he

reserves to himself without giving any particular description of it.

The other, or second chapter of Mr. Robins's work, in eight propositions, treats 'of the resistance of the air, and of the track described by the flight of shot and shells.' And of these, the first proposition describes the general principles of the resistance of fluids to solid bodies moving in them. Here Mr. Robins discriminates between continued and compressed fluids, which immediately rush into the space quitted by a body in them, and whose parts yield to the impulse of the body without condensing and accumulating before it; and such fluids as are imperfectly compressed, rushing into a void space, with a limited velocity, as in the case of our atmosphere, which condenses more and more before the ball as this moves quicker, and also presses the less behind it, by following it always with only a given velocity: hence it happens that the former fluid will resist moving bodies in proportion to the square of the velocity, while the latter resists in a higher proportion. The second proposition is 'to determine the resistance of the air to projectiles by experiments.' One of the methods for this purpose is by the ballistic pendulum, placing the gun at different distances from it, by which he finds the velocity lost in passing through certain spaces of air, and consequently the force of resistance to such velocities as the body moves with in the several parts of its path. And another way was by firing balls with a known given velocity, over a large piece of water, in which the fall and plunge of the ball could be seen, and consequently the space it passed over in a given time. By these means Mr. Robins determined the resistance of the air to several different velocities, all which showed that there was a gradual increase of the resistance, over the law of the square of the velocity, as the body moved quicker. In the remaining propositions of this chapter he proceeds a little farther in this subject of the resistance of the air; in which he lays down a rule for the proportion of the resistance between two assigned velocities; and he shows that when a twenty-four pound ball, fired with its full charge of powder, first issues from the piece, the resistance it meets with from the air is more than twenty times its weight. He farther shows that the track described by the flight of shot or shells is neither a parabola, nor nearly a parabola, unless they are projected with small velocities; and that 'bullets in their flight are not only depressed beneath their original direction, by the action of gravity, but are also frequently driven to the right or left of that direction by the action of some other force:' and, in the eighth or last proposition, he pretends to show that the depths of penetration of balls into firm substances are as the squares of the velocities. But this is a mistake; for neither does it appear that his trials were sufficiently numerous or various, nor were his small leaden balls fit for this purpose; and it has appeared, from a number of trials with iron cannon balls, that the penetrations are in a much lower proportion, and that the resisting force of wood is not uniform. See Dr. Hutton's Tracts.

In the small tracts appended to the principles, in this volume. Mr. Robins prosecutes the sub-

ject of the resistance of the air much farther, and lays down rules for computing ranges made in the air. But these must be far from accurate, as they are founded on the two following principles, which are known, from numerous experiments, to be erroneous: viz. 1st, 'that till the velocity of the projectile surpasses that of 1100 feet in a second, the resistance may be esteemed to be in the duplicate proportion of the velocity. 2d, That if the velocity be greater than that of 1100 or 1200 feet in a second, then the absolute quantity of that resistance in these greater velocities will be near three times as great as it should be by a comparison with the smaller velocities.' For instead of leaping at once from the law of the square of the velocities, and ever after being about three times as much, experiments prove that the increase of the resistance above the law of the square of the velocity takes place at first in the smallest motions, and increases gradually more and more, to a certain point, but never rises so high as to be three times that quantity, after which it decreases again. To render this evident, Dr. Hutton has inserted the following table of the actual quantities of resistances, which are deduced from accurate experiments, and which show also the nature of the law of the variations by means of the columns of differences annexed, reserving the detail of the experiments themselves to another occasion. These resistances are, upon a ball of 19.65 inches in diameter, in avoirdupois ounces, and are for all velocities from 0 up to that of 2000 feet per second of time.

The quantity of the resistance of the air to a ball of 1.965 inches in diameter.

If the terms of any arithmetical series be squared, the second differences will be equal: hence this table proves the truth of the former part of Dr. Hutton's assertion. The additional tracts of Mr. Robins, in the latter part of this volume, which contain many useful and important matters, are numbered and titled as follows, viz. Number 1, 'Of the resistance of the air. Number 2, Of the resistance of the air; together with the method of computing the motions of bodies projected in that medium. Number 3, An Account of the experiments relating to the resistance of the air; exhibited at different times before the Royal Society, in the year 1746. Number 4, Of the force of fired gunpowder, together with the computation of the velocities thereby communicated to military projectiles. Number 5, A comparison of the experimental ranges of cannon and mortars, with the theory contained in the preceding papers. Practical maxims relating to the effects and management of artillery, and the flight of shells and shot. A proposal for increasing the strength of the British navy, by changing all the guns, from the eighteen-pounders downwards, into others of equal weight, but of a greater bore.' With several letters, and other papers, 'On pointing, or the directing of the cannon to strike distant objects; Of the nature and advantage of rifled barrel pieces,' &c.

'I have,' continues Dr. Hutton, 'dwelt thus long on Mr. Robins's New Principles of Gunnery, because it is the first work that can be considered as attempting to establish a practical system of gunnery, and projectiles, on good experiments, on the force of gunpowder, on the resistance of the air, and on the effects of different pieces of artillery. Those experiments are not however sufficiently perfect, both on account of the smallness of the bullets, and for want of good ranges to form a proper theory upon. I have supplied some of the necessary desiderata for this purpose, viz. the resistance of the air to cannon balls moving with all degrees of velocity, and the velocities communicated by given charges of powder, to different balls, and from different pieces of artillery. But there are still wanting good experiments with different pieces of ordnance, giving the ranges and times of flight, with all varieties of charges, and at all different angles of elevation. A few, however, of those I have obtained, as in the following small table, which are derived from experiments made with a medium one-pounder gun, the iron ball being nearly two inches in diameter:—

Powder.	Elevation of gun.	Velocity of ball.	Range.	Time of flight.
oz.		feet.	feet.	"
2	15	860	4100	9
4	15	1230	5100	12
8	15	1640	6600	14½
12	15	1680	6700	15½
2	45	860	5100	21

Dr. Hutton's second set of experiments were made with four brass guns very nicely bored and cast on purpose, of different lengths, but regular in all other respects, viz. of weight and bore.

The lengths of the bores of the guns were,

No. 1,	15 calibres,	length of bore	28·5 inches.
2,	20 calibres	.	38·4
3,	30 calibres	.	57·7
4,	40 calibres	.	80·2

the calibre of each being $2\frac{1}{30}$ inches, and the medium weight of the balls 16 oz. 13 dr.

The mediums of all the experimental velocities of the balls, with which they struck the pendulous block of wood, placed at the distance of thirty-two feet from the muzzle of the gun, for several charges of powder, were as in the following table,

TABLE OF INITIAL VELOCITIES.

Powder.	The guns.			
	No. 1.	No. 2.	No. 3	No. 4
oz.				
2	780	835	920	970
4	1100	1180	1300	1370
6	1340	1445	1590	1680
8	1430	1580	1790	1940
12	1436	1640		
14	.	1660		
16	.	.	2000	
18	.	.	.	2200

placed in the first column, for all the four guns, the numbers denoting so many feet per second. Whence in general it appears how the velocities

increase with the charges of powder for each gun, and also how they increase as the guns are longer, with the same charge, in every instance.

By increasing the quantity of the charges continually, for each gun, it was found that the velocities continued to increase till they arrived at a certain degree, different in each gun; after which they constantly decreased again, till the bore was quite filled with the charge. The charges of powder when the velocities arrived at their maximum or greatest state were various, as might be expected, according to the lengths of the guns; and the weight of powder, with the length it extended in the bore, and the fractional part of the bore it occupied, are shown in the following table, of the charges for the greatest effect:—

Gun.	Length of the bore.	The charge		
		Weight.	Length.	
			Inches.	Part of whole
No.	oz.			
1	28·5	12	8·2	$\frac{3}{10}$
2	38·4	14	9·5	$\frac{1}{3}$
3	57·7	16	10·7	$\frac{2}{15}$
4	80·2	18	12·1	$\frac{3}{20}$

Of the few experiments in this course made to obtain the ranges and times of flight, the mediums are exhibited in the following table:—

Guns.	Powder.	Balls.			Elevat. gun.	Time of flight.	Range.	First velocity.
		Weight.	Diam.					
	oz.	oz.	dr.	inch.	o	secs.	feet.	feet.
No. 2.	2	16	10	1·96	45	21·2	5109	863
ditto.	2	16	5	1·96	15	9·2	4130	868
ditto.	4	16	8	1·96	15	9·2	4660	1234
ditto.	8	16	12	1·96	15	14·4	6066	1644
ditto.	12	16	12	1·95	15	15·5	6700	1676
No. 3.	8	15	8	1·96	15	10·1	5610	1938

In this table are contained the following concomitant data, determined with a tolerable degree of precision; viz. the weight of the powder, the weight and diameter of the ball, the initial or projectile velocity, the angle of elevation of the gun, the time in seconds of the ball's flight through the air, and its range, or the distance where it fell on the horizontal plane. From which it is hoped that some aid may be derived towards ascertaining the resistance of the medium, and its effects on other elevations, &c., and so afford some means of obtaining easy rules for the cases of practical gunnery; though the completion of this enquiry, for want of time at present, must be referred to another work.

Another subject of enquiry, in the foregoing experiments, was, how far the balls would penetrate into solid blocks of elm wood, fired in the direction of the fibres. The following tablet shows the results of a few of the trials that were made with the gun No. 2, with the most frequent

charges of two, four, and eight ounces of powder; and the mediums of the penetrations, as placed in the last line, are found to be seven, fifteen, and twenty inches, with those charges. These penetrations are nearly as the numbers 2, 4, 6, or 1, 2, 3; but the charges of powder are as 2, 4, 8, or 1, 2, 4; so that the penetrations are proportional to the charges as far as to four ounces, but in a less ratio at three ounces; whereas, by the theory of penetrations, the depths ought to be proportional to the charges, or, which is the same thing, as the squares of the velocities. So that it seems the resisting force of the wood is not uniformly or constantly the same, but that it increases a little with the increased velocity of the ball. This may probably be occasioned by the greater quantity of fibres driven before the ball; which may thus increase the spring and resistance of the wood, and prevent the ball from penetrating so deep as it otherwise might do.

It is remarkable that, notwithstanding the decisive manner in which Dr. Hutton recommended the diminution of windage, it should not have been adopted in practice till very lately; and that in consequence principally of the representations of Sir Howard Douglas. This able officer, in part second of his Naval Gunnery, points out the extraordinary anomalies in the previously received system of windage, and expatiates with great good sense upon their prejudicial effects. He satisfactorily refutes the popular objections to any change, and then proceeds thus:—'The preceding remarks on windage having been brought under the consideration of the master general of the ordnance in 1817, his lordship referred the paper to the consideration of a select committee of artillery officers, who stated in their report 'that they were very desirous that experiments should be made with a view to ascertain to what extent the benefits which I had anticipated could be realised.' The committee, therefore, proposed to the master general to be permitted to make a course of experiments on this subject, commencing with field-artillery, and for that purpose recommended that a proportion of shot of various increased magnitudes should be provided. These measures having been approved, a course of experiments was instituted accordingly, 'founded upon the suggestions communicated by' me.

'Having first adopted an opinion (asserted in my Observations, articles 49, 53), that the present mode of apportioning a part of the calibre is not so distinct and advantageous as a fixed quantum expressed in parts of inches for all natures (of ordnance), the committee proceeded to determine what that quantum should be. After repeated trials with a six-pounder, a nine-pounder, and a twelve-pounder, at 300, 600, and 1200 yards, it was proved, 'that with charges of powder one-sixth less than usual, the larger shot and smaller windage produced rather the longest range.' 'Recourse was also had to the ballistic pendulum, to discover the proportional excess of momentum of the larger balls over the smaller; and the result, after a very satisfactory course of experiments, assisted by the scientific research and well known mathematical abilities of Dr. Gregory of the Royal Military Academy, corroborated the trials by ranges, leaving no doubt

of their accuracy. In consequence of these trials the committee fixed the quantity of windage for field-guns at one-tenth of an inch; the same which I had suggested.

'Now it is clear that this improvement may either be applied to save one-sixth part of the quantity of powder provided for field-service, without diminishing the power of range, and consequently to economise, without detriment, the means of transport for ammunition: or the alteration may be applied to produce longer ranges, if this be preferred to the economical consideration. This preference has very properly been given, and the established charges adhered to accordingly. A great collateral advantage has followed from this correction of windage. It was at first apprehended that the increased effects arising from the additional weight of shot and diminished windage would injure brass guns; but it is quite the reverse. With the reduced quantum of windage guns are much less injured, and will last much longer than formerly; and this has been so well ascertained, that in consequence of this correction, it is now proposed to abandon the wooden bottoms to which shot were fixed for the purpose of saving the cylinder, substituting for them the paper cap taken off the end of the cartridge. This being put over the ball is quite sufficient to keep it from rolling or shifting, whilst, by supporting or fixing it thus, the centre of the ball coincides with the axis of the cylinder, and the space for windage is reduced to a complete annulus, which admits of the percussion from the charge being equally received, and which prevents, or very much reduces, that injury or indentation which the cylinder receives when the ball touches it on the lower part only.'—*Naval Gunnery*, p. 82.

An abridged account of the experiments with the ballistic pendulum, to which Sir Howard Douglas refers, is given in *Annales de Chimie et de Physique*, tome ix. p. 289, &c. We shall transcribe the results of one day, May 19th, 1818.

The day was dry, but cloudy; the thermometer stood at 13·3° centigrade (56° Fahrenheit), the barometer at 29·9° inches. The pendulum weighed 7008 pounds avoirdupois. The gun was a twelve-pounder; its weight 2025 pounds; its length 74·25 English inches; its calibre 4·62 inches.

Number of the Experiments.	Weight of the Ball.			Diameter of the Ball.	Windage.	Charge of Powder.			Velocities obtained.
	lbs.	oz.	drs.			inches.	inch.	lbs.	
1	12	12	0	4·545	0·075	3	5	6	1548
2	12	12	7	4·54	0·080	3	5	6	1537
3	12	11	0	4·545	0·075	3	5	6	1588
4	12	10	1	4·54	0·080	3	5	6	1507
5	11	11	8	4·42	0·200	4	0	0	1572
6	11	10	4	4·418	0·202	4	0	0	1537
7	11	12	1	4·418	0·202	4	0	0	1563
8	11	12	1	4·418	0·202	4	0	0	1529

Here it is evident that the velocity corresponding to a windage of 0·75, or $\frac{3}{40}$ ths of an inch, is at a mean 1568 feet, rather exceeding 1550 feet, obtained when the windage was $\cdot 20$, or $\frac{1}{50}$ ths;

though in the former case the charge was less by $\frac{1}{10}$ th part than the latter.

Assuming the correctness of the results, as tabulated above, we are by no means inclined to

agree with Sir Howard, however, in recommending an adherence to the established charges, viz. of a third of the weight of the ball, after the new rate of windage is completely adopted. Supposing that, *cæteris paribus*, the initial velocity varies as the square root of the charge, a four-pound charge with the new windage would propel a twelve-pound ball with an initial velocity of about 1720 feet, a velocity which would be very effective indeed if the ball were moving through a non-resisting medium, but which experiences a most rapid retardation as the projectile passes through the air. The experiments of Dr. Hutton prove, not only that the resistance of the air becomes very enormous when the velocities exceed 1300 feet, but that the law of the resistance no longer accords nearly with the square of the velocity, but, to be correctly exhibited, requires a higher exponent. The reason is very evident. Atmospheric air rushes into a vacuum with a velocity of about 1346 feet per second, and it manifestly cannot make way for a ball moving with a greater velocity than this without being condensed before it. In such cases, the air thus condensed in front of the ball, opposes its motion not only by a simple resistance, but by a force of elasticity proportional to the compression, and therefore rapidly increasing as the velocity of the projectile exceeds 1346 feet. This repulsion soon reduces the higher velocities of 1600 or 1700 feet to the limit of from 1350 to 1400, and consequently renders them of scarcely any use in either increasing the horizontal range, or the effective impetus of the ball, except at comparatively small distances from the mouth of the piece. This accords with the experience of our artillery officers when employed in Spain; they found that balls fired with velocities of 1600 feet had scarcely any advantage over those propelled with velocities of 1400 in the destruction of distant objects.

Theorists have long known that the elastic force exerted by the air against small bodies, moving with considerable velocities, may become so great in proportion to the weight as not merely to destroy the motion communicated, but even to repel the bodies; and this, indeed, is frequently experienced when small shot are thrown from a musket by large charges of powder, the shot being driven back in the contrary direction to that in which they were propelled. The same thing of course does not precisely happen in the practice of artillery; but it is a fact strictly coincident with theory, that a smaller charge of powder, by giving the shot less initial velocity, will cause it to fly further than a greater charge, which would propel the ball with a velocity that exceeds a certain limit.

A military officer of some eminence, but defective, as we should conjecture, in mathematical knowledge, has recently proposed the use of short guns, especially in the service of the navy, strangely fancying that the loss of velocity and range, that would attend the shortening of the gun, would be more than compensated by some suggested peculiarities in the external configuration of the piece. This is utterly repugnant to correct theory, and we believe to correct practice also. The question was put to the test in the

Woolwich experiments of 1817, and the result was uniformly and decidedly against the short guns. That additions to the length of the piece should occasion increased velocity of projection is obviously the joint effect of two causes. 1st, The expansive force of the inflamed gunpowder acts longer upon the ball in a long than in a short gun, and therefore communicates a greater velocity. 2dly, In short guns no small portion of the gun-powder is carried out of the muzzle without being at all inflamed. The lengths, however, must be limited by practical considerations, as well as by the theoretical ones deducible from our quotation a few pages back from Dr. Hutton.

Sir Howard Douglas, who has the happy faculty of confirming his theoretical positions by reference to historical facts, adduces some with a view to this question, which we make no apology for citing.—‘Viewing the matter purely as an artillery question, there is no doubt that preference should be given to long guns. As to its application to naval matters, I do not hesitate to recommend that a frigate which cannot carry eight feet twenty-four pounders, had better be fitted with long eighteen pounders, than with six feet or six feet and a half twenty-four pounders, or with any nature of carronade, exclusively. The very mortifying situation in which the gallant Sir James Yeo found himself in September, 1813, on Lake Ontario, shows the danger of the carronade system of armament. Sir James states, in his letter of the 12th of September, ‘the enemy’s fleet of eleven sail, having a partial wind, succeeded in getting within range of their long twenty-four and thirty-two pounders; and, having obtained the wind of us, I found it impossible to bring them to close action. We remained in this mortifying situation five hours, having only six guns in the fleet that would reach the enemy. Not a carronade was fired. At sun-set a breeze sprang up from the westward, when I manœuvred to oblige the enemy to meet us on equal terms. This, however, he carefully avoided.’

‘Captain Barclay states, in his letter of the 12th of September, 1813:—‘The other brig of the enemy, apparently destined to engage the Queen Charlotte, supported in like manner by two schooners, kept so far to windward as to render the Queen Charlotte’s twenty-four pounder carronades useless, whilst she and the Lady Prevost were exposed to a heavy and destructive fire from the Caledonian and four other schooners, armed with long and heavy guns.’

Sir Howard next describes the action of the *Phœbe* with the American frigate *Essex*, as confirming the theoretical view of the business; and adds:—‘This brilliant affair, together with the preceding facts, cannot fail to dictate the necessity of abandoning a principle of armament exposed to such perils, and to teach the importance of adapting the tactics of an operation to the comparative natures and powers of arms.’—*Naval Gunnery*, p. 116.

On the whole, we trust we shall not be accused of any unworthy feeling, if we remark that all, or nearly all, which is truly valuable in this department of research has been the produce of

Britain. We have no wish to depreciate the labors of Bernoulli, Euler, and others, of whom we have already spoken in terms of commendation; and upon whose genius and attainments we often reflect with pleasure. Yet had it not been for the practical turn given to the investigation by Robins, and so incessantly kept in mind, and so skilfully and elaborately carried out to its professional applications by Dr. Hutton, the principles of gunnery would at this moment have been little better than a collection of barren speculative rules, calculated to mislead, rather than direct, the intelligent engineer.

In the notice we have taken of Robins's experiments, we do not perceive that we have described his celebrated ballistic pendulum. It consists of a large block of wood, annexed to the end of an iron stem, strongly framed, and capable of oscillating freely upon a horizontal axis. This machine being at rest, a piece of ordnance is pointed directly towards the face of the block, at any assigned distance, as twenty, thirty, forty, sixty, &c., feet, and then fired; the ball discharged from the gun strikes and enters the block, communicating to it a velocity, which is to the velocity with which the ball was moving at the moment of impact as the weight of the ball to the sum of the weights of ball and pendulum. Referring this velocity to the centre of oscillation of the pendulum, it will rise through an appreciable arc of vibration till such velocity is extinguished. The measure of that arc will lead to the determination of the velocity, because it is evidently equal to the velocity which a body would acquire by falling freely through the versed sine of the arc shown by the experiment.

Robins's largest ballistic pendulum weighed only ninety-seven pounds; being employed to ascertain the velocities of balls weighing about an ounce each. The smallest pendulum constructed by Dr. Hutton weighed 600 pounds; and, as he pursued his experiments, the new pendulums were made successively larger and larger, till at last they reached the weight of about 2600 pounds. He also made several improvements in their construction, especially in their manner of suspension, and in that of measuring the semi-arc of vibration; employing this curious apparatus in ascertaining the velocities of balls varying in weight from one pound to six, and propelled with nearly all possible modifications of charge. It appears farther, from *Annales de Chimie et de Physique*, tome 5, that in recent experiments at Woolwich, conducted by Dr. Gregory and the select committee of artillery officers, a ballistic pendulum, weighing 7400 pounds, was employed in determining the velocities of six, twelve, eighteen, and twenty-four pounders.

Of Rifled-barrelled Guns.—The greatest irregularities in the motion of bullets are owing to the whirling motion on their axis, acquired by the friction against the sides of the piece. The best method hitherto known of preventing these is by the use of pieces with rifled barrels. These pieces have the insides of their cylinders cut with spiral channels, as a female screw, varying

from the common screws only in this, that its threads or rifles are less deflected, and approach more to a right line; it being usual for the threads with which the rifled barrel is indented to take little more than one turn in its whole length. The numbers of these threads are not determinate.

The usual method of charging these pieces is this:—The proper quantity of powder being put down, a leaden bullet rather larger than the bore of the piece is forcibly driven home to the powder; and in its passage acquires the shape of the inside of the barrel, so that it becomes part of a male screw, exactly answering to the indents of the rifle. The rifled barrels made in Britain are often contrived to admit the charge and shot at the breech; and the ball acquires the same shape in its expulsion that is given to it by the more laborious operation of driving it in at the muzzle. From the whirling motion communicated by the rifles, it happens that, when the piece is fired, that indented zone of the bullet follows the sweep of the rifles, and thereby, besides its progressive motion, acquires a circular motion round the axis of the piece; which circular motion will be continued to the bullet after its separation from the piece; and thus a bullet discharged from a rifled barrel is constantly made to whirl round an axis which is coincident with the line of its flight. By this whirling on its axis, the aberration of the bullet, which proves so prejudicial to all operations in gunnery, is almost totally prevented: and accordingly such pieces are much more to be depended on, and will do execution at a much greater distance, than the other. But as it is in a manner impossible entirely to correct the aberrations arising from the resistance of the atmosphere, even the rifled barrelled pieces cannot be depended upon for more than one-half of their actual range at any considerable elevation. It becomes therefore a problem very difficult of solution, to know, even within a very considerable distance, how far a piece will carry its ball with any probability of hitting its mark, or doing any execution. The best rules hitherto laid down on this subject are those of Robins.

Of Carronades.—Mr. Gascoigne's improved gun, called a carronade, was, in June 1779, by the king in council instituted a standard navy-gun, and ten of them appointed to be added to each ship of war, from a first-rate to a sloop.

The carronade is mounted upon a carriage with a perfectly smooth bottom of strong plank, without trucks; instead of which there is fixed on the bottom of the carriage, perpendicular from the trunnions, a gudgeon of proper strength, with an iron washer and pin at the lower end. This gudgeon is let into a corresponding groove cut in a second carriage, called a slide-carriage; the washer supported by the pin overreaching the under edges of the groove. This slide carriage is made with a smooth upper surface, upon which the gun-carriage is moved, and by the gudgeon always kept in its right station to the port; the groove in the slide-carriage being of a sufficient length to allow the gun to recoil and be loaded within board. The slide-carriage, the groove included, is equally broad with the fore-

PROJECTION OF THE SPHERE.

Fig. 6

part of the gun-carriage, and about four times the length; the fore part of the slide-carriage is fixed by hinge-bolts to the quick-work of the ship below the port, the end lying over the fill, close to the outside plank, and the groove reaching to the fore end; the gudgeon of the gun-carriage, and consequently the trunnions of the gun, are over the fill of the port when the gun is run out; and the port is made of such breadth, with its sides bevelled off within board, that the gun and carriage may range from bow to quarter. The slide-carriage is supported from the deck at the hinder end, by a wedge or step-stool; which being altered at pleasure, and the fore end turning upon the hinge-bolts, the carriage can be constantly kept upon an horizontal plane, for the more easy and quick working of the gun when the ship lies along. But see Sir Howard Douglas's remarks on this piece, already given.

Of Rifled Ordnance.—In 1774 Dr. Lind, and captain Alexander Blair of the sixty-ninth regiment of foot, invented a species of rifled field-

pieces. They are made of cast-iron; and are not bored like the common pieces, but have the rifles moulded on the core, after which they are cleaned out and finished with proper instruments. Guns of this construction, which are intended for the field, ought not to be made to carry a ball of above one or two pounds weight at most; a leaden bullet of that weight being sufficient to destroy either man or horse. A pound-gun, of this construction, of good metal, need not weigh above 100 lbs., nor its carriage above 100 lbs. more. It can therefore be easily transported from place to place, by a few men; and a couple of good horses may transport six of these guns and their carriages, if put into a cart. But this kind of ordnance has never been extensively used, we believe, in the British service. See our article ARTILLERY, for the latest official regulations for the proportion and disposition of the ammunition attached to the field pieces of our army: as also for the guns attached to the brigades of artillery. See also CANNON.

The PROJECTION OF THE SPHERE is a perspective representation of the circles on the surface of the globe; and is variously denominated, according to the different positions of the eye and plane of projection. There are three principal kinds of projection; the stereographic, the orthographic, and gnomonic. In the stereographic projection, the eye is supposed to be placed on the surface of the sphere; in the orthographic it is supposed to be at an infinite distance; and in the gnomonic projection the eye is placed at the centre of the sphere. Other kinds of projection are, the globular, Mercator's development, &c.

The chief application of the doctrine of these projections is to the constructing of maps and dials. In our article MAPS we have, therefore, entered at length into the principal projections; i. e. 1. By development; 2. The orthographic; 3. The stereographic; 4. The globular; and 5. Mercator's.

In that of DIALLING the *gnomonic* is involved. See that article. It may, however, be thus exhibited more formally.

The eye, in this projection, is in the centre of the sphere, and the plane of projection touches the sphere in a given point parallel to a given circle: the plane of projection will represent the plane of a dial, whose centre being the projected pole, the semi-axis of the sphere will be the stile or gnomon of the dial.

PROP. I. THEORY I.—Every great circle is projected into a straight line perpendicular to the line of measures; and whose distance from the centre is equal to the cotangent of its inclination, or to the tangent of its nearest distance from the pole of the projection.

Let BAD , fig. 1, be the given circle, and let the circle $CBE D$ be perpendicular to BAD , and to the plane of projection: whose intersection CF with this last plane will be the line of measures. Now, since the circle $CBE D$ is perpendicular both to the given circle BAD and to the plane of projection, the common section of the two last planes produced will therefore be perpendicular to the plane of the circle $CBE D$

Fig. 1.

produced, and consequently to the line of measures: hence the given circle will be projected into that section; that is, into a straight line passing through d , perpendicular to Cd . Now Cd is the cotangent of the angle CdA , the inclination of the given circle, or the tangent of the arch CD to the radius AC .

COROL. 1. A great circle perpendicular to the plane of projection is projected into a straight line passing through the centre of projection; and any arch is projected into its correspondent tangent.

2. Any point, as D , or the pole of any circle, is projected into a point d , whose distance from the pole of projection is equal to the tangent of that distance.

3. If two great circles be perpendicular to each other, and one of them passes through the pole of projection, they will be projected into two straight lines perpendicular to each other.

4. Hence if a great circle be perpendicular to several other great circles, and its representation pass through the centre of projection; then all these circles will be represented by lines parallel to one another and perpendicular to the line of measures, for representation of that first circle.

PROP. II. THEORY II. If two great circles intersect in the pole of projection, their representations will make an angle at the centre of the

plane of projection, equal to the angle made by these circles on the sphere.

For, since both these circles are perpendicular to the plane of projection, the angle made by their intersections with this plane is the same as the angle made by these circles.

PROP. III. THEOR. III. Any less circle parallel to the plane of projection is projected into a circle whose centre is the pole of projection, and its radius is equal to the tangent of the distance of the circle from the pole of projection.

Let the circle PI (fig. 1) be parallel to the plane GF, then the equal arches PC, CI, are projected into the equal tangents GC, CH; and therefore C, the point of contact and pole of the circle PI and of the projection, is the centre of the representation G, H.

COROL. If a circle be parallel to the plane of projection, and 45° from the pole, it is projected into a circle equal to a great circle of the sphere; and therefore may be considered as the primitive circle, and its radius the radius of projection.

PROP. IV. THEOR. IV. A less circle not parallel to the plane of projection is projected into a conic section, whose transverse axis is in the line of measures; and the distance of its nearest vertex from the centre of the plane of projection is equal to the tangent of its nearest distance from the pole of projection; and the distance of the other vertex is equal to the tangent of the great distance.

Any less circle is the base of a cone whose vertex is at A, fig. 2; and this cone being pro-

duced, its intersection with the plane of projection will be a conic section. Thus the cone DAF, having the circle DF for its base, being produced, will be cut by the plane of projection in an ellipse whose transverse diameter is df ; and Cd is the tangent of the angle CAD, and Cf the tangent of CAF. In like manner, the cone AFE, having the side AE parallel to the line of measures df , being cut by the plane of projection, the section will be a parabola, of which f is the nearest vertex, and the point into which E is projected is at an infinite distance. Also the cone AFG, whose base is the circle FG, being cut by the plane of projection, the section will be a hyperbola; of which f is the nearest vertex; and GA being produced gives d the other vertex.

2. If H be the centre, and K, k , l , the focus of the ellipse, hyperbola, or parabola; then $HK = \frac{Ad - Af}{2}$ for the ellipse; $Hk = \frac{Ad + Af}{2}$ for the hyperbola; and fn being drawn perpendicular to AE, $fl = \frac{nE + Ff}{2}$ for the parabola.

PROP. V. THEOR. V. Let the plane TW, fig. 1, Plate PROJECTION OF THE SPHERE, be perpendicular to the plane of projection TV, and BCD a great circle of the sphere in the plane TW. Let the great circle BED be projected into the straight line bek . CQS perpendicular to bk , and Cm parallel to it and equal to CA, and make QS equal to Qm; then any angle QSt is the measure of the arch Qt of the projected circle.

Join AQ: then, because Cm is equal to CA, the angle Qcm equal to QCA, each being a right angle, and the side QC common to both triangles; therefore Qm, or its equal QS, is equal QA. Again, since the plane ACQ is perpendicular to the plane TV, and bQ to the intersection CQ; therefore bQ is perpendicular both to AQ and QS: hence, since AQ and QS are equal, all the angles at S cut the line bQ in the same points as the equal angles at A. But by the angles at A the circle BED is projected into the line bQ. Therefore the angles at S are the measures of the parts of the projected circle bQ; and S is the dividing centre thereof.

COROL. 1. Any great circle bQt is projected into a line of tangents to the radius SQ.

2. If the circle bC pass through the centre of projection, then the projecting point A is the dividing centre thereof, and Cb is the tangent of its correspondent arch CB to CA, the radius of projection.

PROP. VI. THEOR. VI. Let the parallel circle GLH, fig. 1, be as far from the pole of projection C as the circle FNI is from its pole; and let the distance of the poles CP be bisected by the radius AO; and draw bAD perpendicular to AO; then any straight line bQt drawn through b will cut off the arches h, l, F, n , equal to each other in the representations of these equal circles in the plane of projection.

Let the projections of the less circles be described. Then, because BD is perpendicular to AO, the arches BO, DO, are equal; but, since the less circles are equally distant each from its respective pole, therefore the arches FO, OH, are equal; and hence the arch BF is equal to the arch DH. For the same reason the arches BN, DL, are equal; and the angle FBN is equal to the angle LDH; therefore, on the sphere, the arches FN, HL, are equal. And since the great circle BNLD is projected into the straight line bQnl, &c., therefore n is the projection of N, and l that of L: hence fn, hl , the projections of FN, HL, respectively, are equal.

PROP. VII. THEOR. VII. If Fnk, hlg, fig. 2, be the projections of two equal circles, whereof one is as far from its pole P as the other from its pole C, which is the centre of projection; and if the distance of the projected poles C, p, be di-

Fig. 2.

COROL. 1. A less circle will be projected into an ellipse, a parabola, or hyperbola, accord-

vided in o , so that the degrees in $C o, o p$, be equal, and the perpendicular $o S$ be erected to the line of measures $g h$. Then the line $p n, C l$, drawn from the poles C, p , through any point Q in the line $o S$, will cut off the arches $F n, h l$, equal to each other, and to the angle $Q C p$.

The great circle $A O$ perpendicular to the plane of the primitive is projected into the straight line $o S$ perpendicular to $g h$, by Prop. i. Cor. 3. Let Q be the projection of q ; and since $p Q, C Q$, are straight lines, they are therefore the representations of the arches $P q, C q$, of great circles. Now, since $P q C$ is an isosceles spherical triangle, the angles $P C Q, C P Q$, are therefore equal; and hence the arches $P q, C q$, produced will cut off equal arches from the given circles $F I, G H$, whose representations $F n, h l$, are therefore equal: and, since the angle $Q C p$ is the measure of the arch $h l$, it is also the measure of its equal $F n$.

COROL. Hence, if from the projected pole of any circle a perpendicular be erected to the line of measures, it will cut off a quadrant from the representation of that circle.

PROP. VIII. THEOR. VIII. Let $F n k$, fig. 2, be the projection of any circle $F I$, and p the projection of its pole P : If $C g$ be the cotangent of $C A P$, and $g B$ perpendicular to the line of measures $g C$, let $C A P$ be bisected by $A O$, and the line $o B$ drawn to any point B , and also $p B$, cutting $F n k$ in d ; then the angle $g o B$ is the measure of the arch $F d$.

The arch $P G$ is a quadrant, and the angle $g o A = g P A + o A P = g A C + o A P = g A C + C A o = g A o$; therefore $g A = g o$; consequently o is the dividing centre of $g B$, the representation of $G A$; and hence by Prop. V. the angle $g o B$ is the measure of $g B$. But, since $p g$ represents a quadrant, therefore p is the pole of $g B$; and hence the great circle $p d B$, passing through the pole of the circles $g B$ and $F n$, will cut off equal arches in both, that is, $F d = g B =$ angle $g o B$.

COROL. The angle $g o B$ is the measure of the angle $g p B$. For the triangle $g p B$ represents a triangle on the sphere, wherein the arch which $g B$ represents is equal to the angle which the angle p represents; because $g p$ is a quadrant; therefore $g o B$ is the measure of both.

PROP. IX. PROB. I. To draw a great circle through a given point, and whose distance from the pole of projection is equal to a given quantity.

Let $A D B$, fig. 3, be the projection, C its pole or centre, and P the point through which a great circle is to be drawn: through the points P, C , draw the straight line $P C A$, and draw $C E$ perpendicular to it: make the angle $C A E$ equal to the given distance of the circle from the pole of projection C ; and from the centre C , with the radius $C E$, describe the circle $E F G$: through P draw the straight line $P I K$, touching the circle $E F G$ in I , and it will be the projection of the great circle required.

PROP. X. PROB. II. To draw a great circle perpendicular to a great circle which passes through the pole of projection, and at a given distance from that pole.

Let $A D B$, fig. 3, be the primitive, and $C I$ the given circle: draw $C L$ perpendicular to $C I$,

and make the angle $C L I$ equal to the given distance: then the straight line $C P$, drawn through I parallel to $C L$, will be the required projection.

PROP. XI. PROB. III. At a given point in a projected great circle, to draw another great circle to make a given angle with the former; and, conversely, to measure the angle contained between two great circles.

Let P , fig. 4, be the given point in the given great circle $P B$, and C the centre of the primitive: through the points P, C , draw the straight line $P O G$, and draw the radius of the primitive $C A$ perpendicular thereto; join $P A$; to which draw $A G$ perpendicular: through G draw $B G D$ at right angles to $G P$, meeting $P B$ in B ; bisect the angle $C A P$ by the straight line $A O$; join $B O$, and make the angle $B O D$ equal to that given; then, $D P$ being joined, the angle $B P D$ will be that required.

If the measure of the angle $B P D$ be required, from the points B, D , draw the lines $B O, D O$ and the angle $B O D$ is the measure of $B P D$.

PROP. XII. PROB. IV. To describe the projection of a less circle parallel to the plane of projection, and at a given distance from its pole.

Let $A D B$, fig. 3, be the primitive, and C its centre: set the distance of the circle from its pole, from B to H , and from H to D ; and draw the straight line $A E D$, intersecting $C E$ perpendicular to $B C$, in the point E : with the radius $C E$ describe the circle $E F G$, and it is the projection required.

PROP. XIII. PROB. V. To draw a less circle perpendicular to the plane of projection.

Let C , fig. 5, be the centre of projection, and $T I$ a great circle parallel to the proposed less circle: at C make the angles $I C N, T C O$, each equal to the distance of the less circle from its parallel great circle $T I$; let $C L$ be the radius of projection, and from the extremity L draw $L M$ perpendicular thereto; make $C V$ equal to $L M$, or $C F$ equal to $C M$; then, with the vertex V and asymptotes $C N, C O$, describe the hyperbola $W V K$; or, with the focus F and $C V$, describe the hyperbola, and it will be the perpendicular circle described.

PROP. XIV. PROB. VI. To describe the projection of a less circle inclined to the plane of projection.

Draw the line of measures $d p$, fig. 6, and at C , the centre of projection, draw $C A$ perpendicular to $d p$, and equal to the radius of projection: with the centre A , and the radius $A C$, describe the circle $D C F G$; and draw $R A E$ parallel to $d p$: then take the greatest and least distances of the circle from the pole of projection, and set them from C to D and F respectively; for the circle $D F$; and from A , the projecting point, draw the straight lines $A F f$, and $A D d$; then $d f$ will be the transverse axis of the ellipse: but if D fall beyond the line $R E$, as at G , then from G draw the line $G A D d$, and $d f$ is the transverse axis of an hyperbola: and if the point D fall in the line $R E$, as at E , then the line $A E$ will not meet the line of measures and the circle will be projected into a parabola whose vertex is f : bisect $d f$ in H , the centre, and for the ellipse take half the difference of the lines $A d, A f$, which laid from H will give

K the focus; for the hyperbola, half the sum of $A d, A f$ being laid from H , will give k its focus: then with the transverse axis $d f$, and focus K , or k , describe the ellipse $d M f$, or hyperbola $f m$, which will be the projection of the inclined circle: for the parabola, make $E Q$ equal to $F f$, and draw $f n$ perpendicular to $A Q$, and make $f k$ equal to one half of $n Q$: then with the vertex f , and focus k , describe the parabola $f m$, for the projection of the given circle $F E$.

PROP. XV. PROB. VII. To find the pole of a given projected circle.

Let $D M F$, fig. 7, be the given projected circle, whose line of measures is $D F$, and C the centre of projection; from C draw the radius of projection $C A$, perpendicular to the line of measures, and A will be the projecting point: join $A D, A F$, and bisect the angle $D A F$ by the straight line $A P$; hence P is the pole. If the given projection be an hyperbola, the angle $f A G$, fig. 6, bisected, will give its pole in the line of measures; and, in a parabola, the angle $f A E$ bisected will give its pole.

PROP. XVI. PROB. VIII. To measure any portion of a projected great circle, or to lay off any number of degrees thereon.

Let $E P$, fig. 8, be the great circle, and $I P$ a portion thereof to be measured: draw $I C D$ perpendicular to $I P$; let C be the centre, and $C B$ the radius of projection, with which describe the circle $E B D$; make $I A$ equal to $I B$; then A is the dividing centre of $E P$; hence, $A P$ being joined, the angle $I A P$ is the measure of the arch $I P$. Or, if $I A P$ be made equal to any given angle, then $I P$ is the correspondent arch of the projection.

PROP. XVII. PROB. IX. To measure any arch of a projected less circle, or to lay off any number of degrees on a given projected less circle.

Let $F n$, fig. 9, be the given less circle, and P its pole: from the centre of projection C draw $C A$ perpendicular to the line of measures $G H$, and equal to the radius of projection; join $A P$, and bisect the angle $C A P$ by the straight line $A O$, to which draw $A D$ perpendicular: describe the circle $G I H$, as far distant from the pole of projection C as the given circle is from its pole P ; and through any given point n , in the projected circle $F n$, draw $D n l$, then $H l$ is the measure of the arch $F n$. Or let the measure be laid from H to l , and the line $D l$ joined will cut off $F n$ equal thereto.

PROP. XVIII. PROB. X. To describe the gnomonic projection of a spherical triangle, when three sides are given; and to find the measures of either of its angles.

Let $A B C$, fig. 10, be a spherical triangle whose three sides are given: draw the radius $C D$, fig. 11, perpendicular to the diameter of the primitive $E F$; and at the point D make the angles $C D A, C D G, A D I$, equal respectively to the sides $A C, B C, A B$, of the spherical triangle $A B C$, fig. 10, the lines $D A, D G$, intersecting the diameter $E F$, produced if necessary in the points A and G ; make $D I$ equal to $D G$; then from the centre C , with the radius $C G$, describe an arch; and from A , with the distance $A I$, describe another arch, intersecting the for-

mer in B ; join $A B, C B$, and $A C B$ will be the projection of the spherical triangle, and the rectilineal angle $A C B$ is the measure of the spherical angle $A C B$, fig. 10.

PROP. XIX. PROB. XI. The three angles of a spherical triangle being given, to project it, and to find the measures of the sides.

Let $A B C$, fig. 12, be the spherical triangle of which the angles are given: construct another spherical triangle $E F G$, whose sides are the supplements of the given angles of the triangle $A B C$; and with the sides of this supplemental triangle describe the gnomonic projection, &c., as before. The supplemental triangle $E F G$ has also a supplemental part $E F g$; and when the sides $G E, G F$, which are substituted in place of the angles A, B , are obtuse, their supplements $g E, g F$, are to be used in the gnomonic projection of the triangle.

PROP. XX. PROB. XII. Given two sides, and the included angle of a spherical triangle, to describe the gnomonic projection of that triangle, and to find the measures of the other parts.

Let the sides $A C, C B$, and the angle $A C B$, fig. 10, be given: make the angles $C D A, C D G$, fig. 13, equal respectively to the sides $A C, C B$, fig. 10; also make the angle $A C B$, fig. 13, equal to the spherical angle $A C B$, fig. 10, and $C B$ equal to $C G$, and $A B C$ will be the projection of the spherical triangle.

To find the measure of the side $A B$: from C draw $C L$ perpendicular to $A B$, and $C M$ parallel thereto, meeting the circumference of the primitive in M ; make $L N$ equal to $L M$; join $A N, B N$, and the angle $A B N$ will be the measure of the side $A B$. To find the measure of either of the spherical angles, as $B A C$: from D draw $D K$ perpendicular to $A D$, and make $K H$ equal to $K D$: from K draw $K I$ perpendicular to $C K$, and let $A B$ produced meet $K I$ in I , and join $H I$: then the rectilineal angle $K H I$ is the measure of the spherical angle $B A C$. By proceeding in a similar manner, the measure of the other angle will be found.

PROP. XXI. PROB. XIII. Two angles and the intermediate side given, to describe the gnomonic projection of the triangle; and to find the measures of the remaining parts.

Let the angles $C A B, A C B$, and the side $A C$ of the spherical triangle $C D A$, fig. 10, be given: make the angle $C D A$, fig. 13, equal to the measure of the given side $A C$, fig. 10; and the angle $A C B$, fig. 13, equal to the angle $A C B$, fig. 10, produce $A C$ to H , draw $D K$ perpendicular to $C K$, and make the angle $K H I$ equal to the spherical angle $C A B$: from I , the intersection of $K I, H I$, to A draw $I A$, and let it intersect $C B$ in B , and $A C B$, fig. 10. The unknown parts of this triangle may be measured by last problem.

PROP. XXII. PROB. XIV. Two sides of a spherical triangle, and an angle opposite to one of them given, to describe the projection of the triangle; and to find the measure of the remaining parts.

Let the sides $A C, C B$, and the angle $B A C$ of the spherical triangle $A B C$, fig. 10, be given: make the angles $C D A, C D G$, fig. 13, equal respectively to the measures of the given sides

AC, BC: draw DK perpendicular to AD, make KH equal to DK, and the angle KHI equal to the given spherical angle BAC: draw the perpendicular KI, meeting HI in I; join AI; and from the centre C, with the distance CG, describe the arch GB, meeting AI in B; join CB, and ABC will be the rectilinear projection of the spherical triangle ABC, fig. 10; and the measures of the unknown parts of the triangle may be found as before.

PROP. XXIII. PROB. XV. Given two angles and a side opposite to one of them, to describe the gnomonic projection of the triangle, and to find the measures of the other parts.

Let the angles A, B, and the side BC of the triangle ABC, fig. 12, be given: let the supplemental triangle EFE be formed, in which the angles E, F, G, are the supplements of the sides BC, CA, AB, respectively, and the sides EF, FG, GE, the supplements of the angles C, A, B. Now, at the centre C, fig. 13, make the angles CDA, CDK, equal to the measures of the sides GE, GF, respectively, being the supplements of the angles B and A; and let the lines DA, DK, intersect the diameter of the primitive EF, in the points A and K: draw DG perpendicular to AD, make GH equal to DG, and at the point H make the angle GHI equal to the angle E, or to its supplement; and let EI, perpendicular to CH, meet HI in I, and join AI: then from the centre C, with the distance CG, describe an arch intersecting AI in B; join CB, and ABC will be the gnomonic projection of the given triangle ABC, fig. 12: the supplement of the angle ACB, fig. 13, is the measure of the side AB, fig. 12; the measures of the other parts are found as before.

Although this method of projection has, for the most part, been applied to dialling only, yet, from the preceding propositions, it appears that all the common problems of the sphere may be more easily resolved by this than by the ordinary methods of projection.

PROIN, *v. a.* A corruption of prune. To lop; cut; trim.

I sit and *proin* my wings
After flight, and put new strings
To my shafts.

Ben Jonson.

The country husbandman will not give the *proining* knife to a young plant.

Id.

PROLAPSUS, in surgery, a term used to denote the falling of peculiar parts of the body out of their natural situation, more particularly applied to the uterus, vagina, and rectum. See SURGERY.

PROLATE. Lat. *prolatum*. To pronounce; to utter.

The pressures of war have somewhat cowed their spirits, which they gathered from the accent of their words, which they *prolate* in a whining querulous tone, as if still complaining and crest fallen.

Howel.

Parrots, having been used to be fed at the *prolation* of certain words, may afterwards pronounce the same.

Ray.

As to the *prolate* spheroidal figure, though it be the necessary result of the earth's rotation about its own axis, yet it is also very convenient for us.

Cheyne's Philosophical Principles.

PROLATE, in geometry, is applied to a spheroid produced by the revolution of a semi-ellipse about its larger diameter. See SPHEROID.

PROLEGOMENA, in philology, preparatory discourses fixed to a book, &c., containing something necessary to enable the reader the better to understand the book or science, &c.

PROLEP'SIS, *n. s.* } Fr. *prolepse*; Gr. PROLEP'TICAL. } προληψις. A figure of rhetoric, in which objections are anticipated: in the manner of a prolepsis.

This was contained in my *prolepsis* or prevention of his answer.

Bramhall against Hobbes.

The *proleptical* notions of religion cannot be so well defended by the professed servants of the altar.

Glauville.

Theobald.

This is a *prolepsis* or anachronism.

PROLETA'RIAN, *adj.* Mean; wretched; vile; vulgar. A mean word whose etymology we do not find.

Like speculators should foresee,

From pharos of authority,

Portended mischiefs farther than

Low proletarian tything-men.

Hudibras.

PROLIF'IC, *adj.* } Fr. *prolifique*; Lat. PROLIF'ICAL. } *proles* and *facto*.

Every dispute in religion grew *proliferical*, and in ventilating one question, many new ones were started.

Decay of Piety.

Main ocean flowed; not idle, but with warm

Prolific humour soft'ning all her globe,

Fermented the great mother to conceive,

Satiate with genial moisture.

Milton's Paradise Lost.

Their fruits, proceeding from simpler roots, are not so distinguishable as the offspring of sensible creatures, and *prolifications* descending from double origins.

Broune.

His vital power air, earth, and seas supplies,

And breeds whate'er is bred beneath the skies;

For every kind, by thy *prolific* might,

Springs.

Dryden.

All dogs are of one species, they mingling together in generation, and the breed of such mixtures being *prolific*.

Ray.

From the middle of the world,

The sun's *prolific* rays are hurled;

'Tis from that seat he darts those beams,

Which quicken earth with genial flames.

Prior.

PRO'LIX, *adj.* } Fr. *prolix*; Lat. *prolixus*.

PROLIXIOUS, } Long; tedious; verbose:

PROLIX'ITY, } *prolixious* is a synonyme

PROLIX'LY, *adv.* } coined by Shakspeare: to

prolixity and prolixness, tediousness; tiresome dilatation.

Lay by all nicety and *prolixious* blushes.

Shakspeare.

It is true, without any slips of *prolixity*, or crossing the plain highway of talk, that the good Anthonio hath lost a ship.

Id.

According to the caution we have been so *prolix* in giving, if we aim at right understanding the true nature of it, we must examine what apprehension mankind make of it.

Digby.

In some other passages I may have, to shun *prolixity*, unawares slipped into the contrary extreme.

Boyle.

On these *prolixity* thankful she enlarged.

Dryden.

If the appellat appoints a term too *prolix*, the judge may then assign a competent term.

Ayliffe.

Should I at large repeat

The bead-roll of her vicious tricks,

My poem would be too *prolix*. *Prior.*

Elaborate and studied *prolixity* in proving such points as nobody calls in question. *Waterland.*

PROLOCUTOR, *n. s.* Lat. *prolocutor*. The foreman; the speaker of a convocation.

The convocation the queen prorogued, though at the expence of Dr. Atterbury's displeasure, who was designed their *prolocutor*. *Swift.*

PROLOGUE, *n. s. & v. a.* Fr. *prologue*; Gr. *πρόλογος*; Lat. *prologus*. Preface; introduction to a discourse or performance: to introduce with a preface.

Come, sit, and a song.
—Shall we clap into 't roundly, without hawking, or spitting, or saying we are hoarse, which are the only *prologues* to a bad voice? *Shakespeare.*

If my death might make this island happy,
And prove the period of their tyranny,
I would expend it with all willingness;
But nine is made the *prologue* to their play. *Id.*
He his special nothing ever *prologues*. *Id.*

In her face excuse
Came *prologue*, and apology too prompt. *Milton.*
From him who rears a poem lank and long,

To him who strains his all into a song;
Perhaps some bonny Caledonian air,
All birks and braes, though he was never there;
Or, having whelped a *prologue* with great pains,
Feels himself spent, and fumbles for his brains;
A *prologue* interdash'd with many a stroke—
An art contrived to advertise a joke,

So that the jest is clearly to be seen,
Not in the words—but in the gap between:
Manner is all in all, whate'er is writ,
The substitute for genius, sense, and wit. *Cowper.*

PROLONG', *v. a.* } Fr. *prolonger*; Lat. *prolongation*, *n. s.* } *Fr.* and *longus*. To lengthen out; continue; draw out: hence, corruptly, to put off a long time: prolongation is the act of lengthening or delaying.

To-morrow in my judgment is too sudden;
For I myself am not so well provided,
As else I would be were the day *prolonged*.
Shakespeare.

Nourishment in living creatures is for the *prolongation* of life. *Bacon's Natural History.*

This ambassage concerned only the *prolongation* of days for payment of monies. *Id. Henry VII.*

Henceforth I fly not death, nor would *prolong* life much. *Milton.*

The' unhappy queen with talk *prolonged* the night. *Dryden.*

PROLUSION, *n. s.* Lat. *prolusio*. Entertainment; performance of diversion.

It is memorable, which Famianus Strada, in the first book of his academical *prolusions*, relates of Suarez. *Hakewill.*

PROME, or **PROME**, a city of the Birman empire, is situated on the eastern bank of the Irrawaddy, in a fine fertile plain, and was formerly surrounded by two walls, the exterior of timber, and the interior of brick. It is larger than Rangoon, and carries on a considerable trade in timber, grain, oil, wax, ivory, iron, lead, and flag-stones. It is said to have been once the capital of a dynasty. At present, with the adjoining territory, it forms the estate or appanage of one of the king's sons, called the prince of

Prome; and there is here a royal menagerie of elephants. The ruins of the ancient city extend beyond the modern town, and contain a number of temples dedicated to Boodh. Long. 95° E., lat. 18° 50' N.

PROMETHEUS, the son of Japetus, supposed to have been the first discoverer of the art of striking fire by flint and steel; which gave rise to the fable of his stealing fire from heaven. This fable is variously related by different authors. Prometheus, as most say, being a man of subtle and crafty genius, in order to find out whether Jupiter was really worthy to be reckoned a god, slew two oxen, and stuffed one of the skins with the flesh, and the other with the bones of the victims, the latter of which was chosen by Jupiter. The god, resolved to be revenged upon all mankind for this insult, deprived them of the use of fire; but Prometheus, with the assistance of Minerva, who had already aided him by her advice in forming the body of a man of tempered clay, contrived to ascend up to heaven, and, approaching the chariot of the sun, stole from thence the sacred fire, which he brought down to earth in a ferula. Jupiter, incensed at this strange and audacious enterprize, ordered Mercury to carry him to Mount Caucasus, and chain him to a rock, where an eagle was eternally to prey upon his liver. This part of the history of Prometheus and his subsequent deliverance either by Hercules or Jupiter himself, abounds with fictions, which are supposed to contain some ancient facts under this disguise. M. Bannier supposes that this is merely a continuation of the history of the Titans. Prometheus, as he conjectures, was not exempt from the persecutions which harassed the other Titans. As he returned into Scythia, which he durst not quit so long as Jupiter lived, that god is said to have bound him to Caucasus. This prince, addicted to astrology, frequently retired to Mount Caucasus, as to a kind of observatory, where he contemplated the stars, and was, as it were, preyed upon by continual pining, or rather by vexation, on account of the solitary and melancholy life which he led. This is supposed to have given rise to the fable of the eagle or vulture that incessantly preyed upon his liver. Herodotus, however, alleges, that Prometheus was put in prison for not being able to stop the overflowing of a river, which from its rapidity was called the eagle, or at least that he was obliged to fly with a part of his subjects to the mountains to escape the inundation, till a traveller, represented by Hercules, undertook to dam it up by a mount, and to kill the eagle, as it may be said, by making its course regular and uniform; thus Prometheus was delivered by this hero from his prison, or retreat.

Diodorus Siculus says that Prometheus first discovered combustible materials fit for kindling and maintaining fire. Bannier is of opinion, that the origin of this fiction was, that Jupiter, having ordered all the shops where iron was forged to be shut up, lest the Titans should make use of it against him, Prometheus, who had retired into Scythia, there established good forges; hence came the 'Calybes,' those excellent blacksmiths; and, perhaps Prometheus also, not thinking to find fire in that country, brought

some thither in the stalk of the ferula, in which it may be easily preserved for several days. As for the two oxen which Prometheus is said to have slain, that he might impose upon Jupiter, this part of the fable is said to be founded upon his having been the first who opened victims with a view of drawing omens from the inspection of their entrails. According to Le Clerc, Prometheus is the same with Magog, the former being the son of Japetus, and the latter the son of Japhet, and grandson of Noah. Both Prometheus and Magog settled in Scythia; the latter invented or improved the art of founding metals, and of forging iron, which the poets attributed to Prometheus; and Diodorus too says, that he invented several instruments for making fire. The appellation Magog signifies vexation, as Prometheus was gnawed by a vulture.

PROMETHEUS and DAMASICHTHON, two sons of Codrus, king of Athens, who conducted colonies into Asia Minor.—Paus. i. c. 3.

PROMINENT, *adj.* } Lat. *prominens*.
 PROMINENCE, or } Standing out beyond
 PROMINENCY, *n. s.* } another part; protuberant: the noun substantives both corresponding.

Whales are described with two prominent spouts on their heads, whereas they have but one in the forehead, terminating over the windpipe.

Browne's Vulgar Errors.

She has her eyes so prominent, and placed so that she can see better behind her than before her.

More.

Two goodly bowls of massy silver,
 With figures prominent and richly wrought.

Dryden.

Some have their eyes stand so prominent, as the hare, that they can see as well behind as before them.

Ray.

It shows the nose and eyebrows, with the prominences and fallings in of the features.

Addison.

His evidence, if he were called by law
 To swear to some enormity he saw,
 For want of prominence and just relief,
 Would hang an honest man, and save a thief.

Cowper.

PROMISCUOUS, *adj.* } Lat. *promiscuus*.
 PROMISCUOUSLY, *adv.* } Mingled; confused;
 undistinguished: the adverb corresponding.

We beheld where once stood Ilium, called Troy
promiscuously of Tros. *Sandys's Journey.*

No man, that considers the *promiscuous* dispensations of God's providence in this world, can think it unreasonable to conclude, that after this life good men shall be rewarded, and sinners punished.

Tillotson.

Glory he requires, and glory he receives,
Promiscuous from all nations.

Milton's Paradise Lost.

Promiscuous love by marriage was restrained.

Roscommon.

In rushed at once a rude *promiscuous* crowd;
 The guards, and then each other overbear,
 And in a moment through the theatre.

Dryden.

Here might you see
 Barons and peasants on the embattled field,
 In one huge heap *promiscuously* amast.

Philips.

The earth was formed out of that *promiscuous* mass of sand, earth, shells, subsiding from the water.

Woodward.

That generation, as the sacred writer modestly expresses it, married and gave in marriage without distinction.

cretion or decency, but *promiscuously*, and with no better a guide than the impulses of a brutal appetite.

Id.

Clubs, diamonds, hearts, in wild disorder seen,
 With throngs *promiscuous* strow the level green.

Pope.

A wild, where weeds and flowers *promiscuous* shoot.

Id.

Unawed by precepts human or divine,
 Like birds and beasts *promiscuously* they join.

Id.

PROMISE, *n. s., v. a. & v. n.* } Fr. *promise*,
 PROMISE-BREACH, } *promesse*; Lat.
 PROMISE-BREAKER, } *promissum*. En-
 PROMISER, } gagement to
 PROMISSORY, *adj.* } benefit: decla-
 PROMISSORILY, *adv.* } ration of benefit

to be conferred: hence grant, or hope of something promised; to make such declaration or engagement; assure by promise: the two compounds are sufficiently plain: a promiser is he who makes the engagement to benefit: promissory, of the nature of a promise.

O Lord, let thy *promise* unto David be established.

1 Chronicles.

Now are they ready, looking for a *promise* from thee.

Acts.

While they *promise* them liberty, they themselves are the servants of corruption.

2 Peter ii. 13.

As he *promised* in the law, he will shortly have mercy, and gather us together.

2 Mac. ii. 18.

I eat the air, *promise* crammed; you cannot feed capons so.

Shakspeare.

His *promises* were, as he then was, mighty;
 But his performance, as he now is, nothing.

Id.

Your young prince Mamilius is a gentleman of the greatest *promise*.

Id. Winter's Tale.

Promising is the very air o' the' time: it opens the eyes of expectation: performance is ever the duller for his act.

Shakspeare.

Will not the ladies be afraid of the lion?

—I fear it, I *promise* you.

Id.

Criminal in double violation

Of sacred chastity, and of *promisebreach*.

Id.

He's an hourly *promisebreaker*, the owner of no one good quality worthy your entertainment.

Id.

Who let this *promiser* in? did you, good Diligence?

Give him his bribe again.

Ben Jonson.

As the preceptive part enjoins the most exact virtue, so is it most advantageously enforced by the *promissory*, which is most exquisitely adapted to the same end.

Decay of Piety.

What God commands is good; what he *promises* is infallible.

Bp. Hall.

Whoever seeks the land of *promise*, shall find many lets.

Id.

He that brought us into this field, hath *promised* us victory.

Id. Contemplations.

If he receded from what he had *promised*, it would be such a disobligation to the prince that he would never forget it.

Clarendon.

Nor was he obliged by oath to a strict observation of that which *promissorily* was unlawful.

Browne.

Duty still preceded *promise*, and strict endeavour only founded comfort.

Fell.

I could not expect such an effect as I found, which seldom reaches to the degree that is *promised* by the prescribers of any remedies.

Temple's Miscellanies.

Behold, she said, performed in every part

My *promise* made; and Vulcan's laboured art.

Dryden.

I dare *promise* for this play, that in the roughness of the numbers, which was so designed, you will see

somewhat more masterly than any of my former tragedies. *Id.*

Fear's a large *promiser*; who subject live To that base passion, know not what they give. *Id.*

More than wise men, when the war began, could *promise* to themselves in their most sanguine hopes. *Davenant.*

The *promissory* lyes of great men are known by shouldering, hugging, squeezing, smiling, and bowing. *Arbuthnot.*

Let any man consider how many sorrows he would have escaped had God called him to his rest, and then say whether the *promise* to deliver the just from the evils to come, ought not to be made our daily prayer. *Wake.*

All the pleasure we can take, when we met these *promising* sparks, is in the disappointment. *Felton.*

She bribed my stay, with more than human charms; Nay *promised*, vainly *promised*, to bestow Immortal life. *Pope's Odyssey.*

Thy maidens, grieved themselves at my concern, Oft gave me *promise* of a quick return; What ardently I wished, I long believed, And, disappointed still, was still deceived. *Cowper.*

And round the new discoverer quick they flocked In multitudes, and plucked, and with great haste Devoured; and sometimes in the lips 'twas sweet, And *promised* well; but, in the belly, gall. *Pollak.*

PROMISSORY NOTES are entirely on a par with bills, equally negotiable, and subject to the same duties.

PROMONT, *n. s.* } Fr. *promontoire*; Lat. PROMONTORY. } *promontorium*. 'Promont, I have observed,' says Johnson, 'only in Suckling.' A headland; cape; high peninsula; or part of a peninsula.

Like one that stands upon a *promontory*, And spies a far off shore where he would tread. *Shakspeare.*

The land did shoot out with a great *promontory*. *Abbot.*

The waving sea can with each flood Bathe some high *promont*. *Suckling.*

They, on their heads, Main *promontories* flung, which in the air Came shadowing, and oppress whole legions armed. *Milton.*

Every gust of rugged winds, That blows from off each beaked *promontory*. *Id.*

If you drink tea upon a *promontory* that overhangs the sea, it is preferable to an assembly. *Pope.*

PROMOTE', *v. a.* } Fr. *promouvoir*; Lat. PROMOTER, *n. s.* } *promoveo, promotus*. To PROMOTION, } forward; to advance; PROMOVE', *v. a.* } elevate; prefer: promoter is used in an obsolete sense for informer; approver: promotion is advancement; preferment: promote, an obsolete synonyme of promote.

I will *promote* thee unto very great honour. *Numbers.*

Shall I leave my fatness wherewith they honour God and man, and go to be *promoted* over the trees? *Judges ix. 9.*

Many fair *promotions* Are daily given to enoble those, That scarce, some two days since, were worth a noble. *Shakspeare.*

The high *promotion* of his grace of Canterbury Who holds his state at door 'mongst pursuivants. *Id.*

His eies be *promoters*, some tresspass to spie. *Tusser.*

Next to religion, let your care be to *promote* justice. *Bacon*

Informers and *promoters* oppress and ruin the estates of many of his best subjects. *Drummond.*

Never yet was honest man, That ever drove the tale of love;

It is impossible, nor can Integrity our ends *promove*. *Suckling.*

Nothing lovelier can be found, Than good works in her husband to *promote*. *Milton.*

Did I solicit thee From darkness to *promote* me? *Id.*

My rising is thy fall, And my *promotion* will be thy destruction. *Id.*

Knowledge hath received little improvement from the endeavours of many pretended *promoters*. *Glanville.*

Making useless offers, but *promoting* nothing. *Fell.*

Thou youngest virgin-daughter of the skies, Made in the last *promotion* of the blast; Whose palms, new plucked from paradise, In spreading branches more sublimely rise. *Dryden.*

He that talks deceitfully for truth, must hurt it more by his example than he *promotes* it by his arguments. *Atterbury.*

Our Saviour makes this return, fit to be engraven in the hearts of all *promoters* of charity: Verily, I say unto you, inasmuch as you have done it unto one of the least of these my brethren, ye have done it unto me. *Id.*

Frictions of the extreme parts *promote* the flux of the juices in the joints. *Arbuthnot.*

PROMPT, *adj.* & *v. a.* } Fr. *prompt*; Ital. PROMPTER, *n. s.* } *pronto*; Latin, PROMPTITUDE, } *promptus*. Quick; PROMPTLY, *adv.* } ready; acute; easy; PROMPTNESS, *n. s.* } unobstructed; pert. PROMPTURE. } to assist; make ready or perfect; instigate; incite: a promoter is a suggester; admonisher; reminder: promptitude and prompter, readiness; quickness; aptitude; prompture, suggestion; obsolete.

Sitting in some place, where no man shall *prompt* him, let the child translate his lesson. *Ascham.*

Tell him, I'm *prompt* To lay my crown at's feet, and there to kneel. *Shakspeare.*

My voice shall sound as you do *prompt* mine ear, And I will stoop and humble my intents To your well practised wise directions. *Id.*

Were it my cue to fight, I should have known it Without a *prompter*. *Id. Othello.*

Though he hath fallen by *prompture* of the blood; Yet hath he in him such a mind of honour, That had he twenty heads to tender down On twenty bloody blocks he'd yield them up. *Shakspeare.*

None could hold the book so well to *prompt* and instruct this stage play, as she could. *Bacon.*

The reception of light into the body of the building was very *prompt*, both from without and from within. *Wotton.*

If they *prompt* us to anger, their design makes use of it to a further end, that the mind, being thus disquieted, may not be easily composed to prayer. *Duppa.*

He that does his merchandise chearfully, *promptly*, and readily, and the works of religion slowly, it is a sign that his heart is not right with God. *Taylor.*

Very discerning and *prompt* in giving orders, as occasions required. *Clarendon.*

Prompt eloquence

Flowed from their lips in prose or numerous verse.

Milton.

Rage prompted them at length and found them arms.

Id.

The inconcealable imperfections of ourselves will hourly prompt us of our corruption, and loudly tell us we are sons of earth.

Brown.

He needed not one to prompt him, because he could say the prayers by heart.

Stillingfleet.

I was too hasty to condemn unheard;

And you, perhaps, too prompt in your replies.

Dryden.

We understand our duty without a teacher, and acquit ourselves as we ought to do without a prompter.

L'Estrange.

Had not this stop been given him by that accidental sickness, his great courage and promptness of mind would have carried him directly forward to the enemy, till he had met him in the open plains of Persia.

South.

Every one some time or other dreams he is reading books, in which case the invention prompts so readily that the mind is imposed on.

Addison.

Still arose some rebel slave,

Prompter to sink the state than he to save.

Prior.

Firm and rigid muscles, strong pulse, activity, and promptness in animal actions, are signs of strong fibres.

Arbutnot.

To the stern sanction of the offended sky,

My prompt obedience bows.

Pope.

Kind occasion prompts their warm desires.

Id.

The priestly brotherhood, devout, sincere,

From mean self-interest, and ambition clear,

Their hope in heaven, servility their scorn,

Prompt to persuade, expostulate, and warn.

Cowper.

PROMPTUARY, *n. s.* Fr. *promptuaire*; Lat. *promptuarium*. A storehouse; repository; magazine.

This stratum is still expanded at top, serving as the seminary or *promptuary*, that furnisheth forth matter for the formation of animal and vegetable bodies.

Woodward.

PROMULGATE, or **PROMULGE**, *v. a.* Lat. *promulgo*. To publish; make known
PROMULGATION, *n. s.* } by open declaration:
PROMULGATOR, } promulgation, the de-
PROMULGER. } clarator made; the
 promulgator and promulger, he who makes it.

Those albeit I know he nothing so much hateth as to *promulgate*, yet I hope that this will occasion him to put forth divers other goodly works.

Spenser.

The stream and current of this rule hath gone as far, it hath continued as long as the very *promulgation* of the gospel.

Hooker.

Those to whom he entrusted the *promulgating* of the gospel, had far different instructions.

Decay of Piety.

External *promulgation*, or speaking thereof, did not alter the same, in respect of the inward form or quality.

White.

It is certain laws, by virtue of any sanction they receive from the *promulgated* will of the legislature, reach not a stranger, if by the law of nature every man hath not a power to punish offences against it.

Locke.

The very *promulgation* of the punishment will be part of the punishment, and anticipate the execution.

South.

The chief design of them is, to establish the truth of a new revelation in those countries, where it is first *promulgea* and propagated.

Atterbury.

The *promulgers* of our religion, Jesus Christ and his apostles, raised men and women from the dead, not once only, but often.

Id.

PRONAOS, in the ancient architecture, a porch to a church, a palace, or other spacious building. See **PORCH**.

PRONAPIDES, an ancient Greek poet of Athens, who was preceptor to Homer. He also, it is said, first taught the Greeks to write from the left to the right; as they formerly wrote in the Oriental manner from right to left.

PRONATION, among anatomists. The radius of the arm has two kinds of motion, the one called pronation, the other supination. Pronation is that whereby the palm of the hand is turned downwards; and supination, the opposite motion thereto, is that whereby the back of the hand is turned downwards.

PRONE, *adj.* } Lat. *pronus*. Bending
PRONESS, *n. s.* } downwards; not erect;
PRON'ITY. } precipitous; headlong;
 propense; inclined: proneness and pronity, state of being prone.

The Holy Spirit saw that mankind is unto virtue hardly drawn, and that righteousness is the less accounted of by reason of the *prone*ness of our affections to that which delighteth.

Hooker.

The soul being first from nothing brought, When God's grace fails her, doth to nothing fall;

And this declining *prone*ness unto nought,

Is e'en that sin that we are born withal.

Davies.

Of this mechanic *prone*ity, I do not see any good tendency.

More's Divine Dialogues.

There wanted yet a creature not *prone*, And brute as other creatures, but endued With sanctity of reason, might erect His stature, and upright, with front serene Govern the rest.

Milton's Paradise Lost.

Down thither *prone* in flight

He speeds.

Id.

Upon these three positions in man, wherein the spine can only be at right lines with the thigh, arise those postures, *prone*, supine, and erect.

Brown.

He instituted this worship, because of the carnality of their hearts, and the *prone*ness of the people to idolatry.

Tillotson.

Those who are ready to confess him in judgment and profession, are very *prone* to deny him in their doings.

South.

If we are *prone* to sedition, and delight in change, there is no cure more proper than trade, which supplies business to the active, and wealth to the indigent.

Addison.

How great is the *prone*ness of our nature to comply with this temptation!

Rogers.

Since the floods demand,

For their descent a *prone* and sinking land:

Docs not this due declivity declare,

A wise director's providential care?

Blackmore.

The *prone*ness of good men to commiserate want in whatsoever shape it appears.

Atterbury.

Still *prone* to change, though still the slaves of state.

Pope.

While storms remote but murmur on thy ear, Nor waves in ruinous uproar round thee roll,

Yet, yet a moment check thy *prone* career,

And curb the keen resolve that prompts thy soul.

Beattie.

All else was *prone*, irrational, and mute,

And unaccountable, by instinct led.

Pollak.

PRONG, *n. s.* Belg. *pronghen*, to squeeze. Minsheu.—Goth. *prionn*. A fork.

The cooks make no more ado, but, slicing it into little gobbets, prick it on a *prong* of iron, and hang it in a furnace. *Sandys*.

Whacum his sea-coal *prong* threw by, And basely turned his back to fly. *Hudibras*.

Be mindful,

With iron teeth of rakes and *prongs* to move
The crusted earth. *Dryden's Virgil's Georgicks*.

PRONOUN, *n. s.* Fr. *pronom*; Lat. *pronom*. A part of speech; see the extract.

I, thou, he; we, ye, they, are names given to persons, and used instead of their proper names, from whence they had the name of *pronouns*, as though they were not nouns themselves, but used instead of nouns. *Clarke's Latin Grammar*.

PRONOUNCED, *v. a. & v. n.* } French *pron-*
PRONOUN'CE, *n. s.* } *noncer*; Latin
PRONUNCIATION. } *pronuncio*. To
speak; utter; utter solemnly or confidently;
speak with confidence or authority: pronunciation
is the act, art, or mode of utterance.

He *pronounced* all these words unto me with his mouth. *Jer. xxxvi. 18*.

I have *pronounced* the word, saith the Lord. *Jeremiah*.

She

So good a lady, that no tongue could ever
Pronounce dishonour of her.

Shakspeare. Henry VIII.

How confidently soever men *pronounce* of themselves, and believe that they are then most pious, when they are most eager and unquiet; yet 'tis sure this is far removed from the true genius of religion.

Decay of Piety.

Language of man *pronounced*

By tongue of brute, and human sense expressed. *Milton*.

Sternly he *pronounced* the rigid interdiction. *Id.*

The design of speaking being to communicate our thoughts by ready, easy, and graceful *pronunciation*, all kind of letters have been searched out, that were serviceable for the purpose. *Holler*.

Though diversity of tongues continue, this would render the *pronouncing* them easier. *Id.*

It were easy to produce thousands of his verses, which are lame for want of half a foot, sometimes a whole one, and which no *pronunciation* can make otherwise. *Dryden*.

Absalom *pronounced* a sentence of death against his brother. *Locke*.

Every fool may believe and *pronounce* confidently: but wise men will, in matters of discourse, conclude firmly, and in matters of fact, act surely.

South's Sermons.

The *pronouncer* thereof shall be condemned in expenses. *Ayliffe*.

We do not believe the character which a man gives us of another, unless we have a good opinion of his own: so neither should we believe the verdict which the mind *pronounces*, till we first examine whether it be impartial and unbiassed. *Mason*.

And God, beholding, saw

The fair design, that from eternity
His mind conceived, accomplished; and, well pleased,
His six days finished work most good *pronounced*,
And man declared the sovereign prince of all. *Pollak*.

PRONUNCIATION. Interweaving an English Lexicon with the other portions of our alphabet, we may be expected to say something on this

important part of a living language. It is that part of it, however, we apprehend, upon which instruction is least communicable by books; and what constitutes elegant or even correct pronunciation is so much matter of fashion, and ever-changing modifications, that 'Pronouncing Dictionaries' have, we confess, long given place in our library to many less laborious performances. Dr. Watts is said to have proposed in badinage, as a rule of English spelling and pronunciation, that the one should be as unlike the other as possible.

Mr. Walker, however, is clearly entitled to praise for his researches into this subject: yet he confesses that he was afraid to attempt all that he considered necessary, and in general contented himself with ascertaining, and exhibiting, existing, and what has been called polite usage. Nothing more than this, perhaps, can ever be accomplished; and in this he was certainly successful; so that his Dictionary is regarded as the standard of English pronunciation. But he has evidently, after all, attempted too much. For it cannot surely be necessary to mark the sound of every word in the English language: it must be quite sufficient to mark those in which pronunciation is likely to err. Such words only should be marked by a different spelling, which deviate in any respect from the analogy of the language: the pronunciation of all the rest may be sufficiently indicated by the accent, with the assistance, occasionally, of the marks " and ", the first denoting that a vowel is long—the second, that it is short: as, contemplâte, älb. The reader will find the following particulars respecting English pronunciation and its marks worth consideration.

1. The accent should be understood as falling on the letter immediately preceding the mark or sign: as, ac'cent, *n.* accent', *v. a.*; fa'vor, endeavor.
2. When the letter immediately preceding the accentual mark is a vowel, it is long; but, if a consonant immediately precede the mark, the preceding vowel is short: thus, fa'vor, fab'ric, which is equivalent to fävör, fäb'ric.
3. Final *e* renders the preceding vowel long, except when it is followed by a double consonant: as, mate, mete, mite, mote, nature, rëmöte, &c., pronounced as if marked, mäte, mëte, mïte, möte, müte, nätüre, rëmöte. But, when two or more consonants come between the final *e* and the preceding vowel, it is short: as, battle, babble, badge, &c., pronounced as if marked bättle, bäbble, bädge. In such words as *intëstine*, *fütile*, &c., the vowel preceding the final *e* is made short by Mr. Walker; but in the opinion of the writer it is better to make all such instances conform to the rule; and the long vowel sound is an improvement in all such connexions to the English language; for it is, in general, both harsh to the ear and hard to the mouth, from having too few *open* and too many *shut* vowel sounds.
4. When the accent is not placed on a vowel, and when it is not followed by a final *e* in the same syllable, the vowel is to be always considered short: as, fatt'en, hab'it, &c., pronounced as if marked fättën, häb'it.

5. In monosyllables terminating with all, *a* has the same sound as *aw* or *au*: as, all, ball, call, &c., pronounced awl, bawl, caul. In all cases, when the accent is placed before the *l*, *a* is to be pronounced *aw*; when the accent is put after *l*, *a* is to be pronounced short: as, fa'lse, ma'lt, fa'lter; a'l'b, a'l'titude, ca'l'umny, ca'l'let; pronounced as if marked—fawls, mawlt, fawlter; älb, ä'l'titude, &c.

6. The following diphthongs have uniformly the long sound of *a* (except when one of the vowels is in the italic character), *ay*, *ai*, *ei*, *ey*: as, Maid, pail, say, rein, they, &c., pronounced like made, pale, &c. But, when one of the vowels is silent, the other vowel is short: as, plaid, rai'lry, mountain, &c., pronounced plad', ral'ry, mountin.

7. *Au*, *aw*, are to be uniformly considered as sounding the same as in caul, awl, except when the pronunciation of the words containing them is particularly indicated. For *au* before *n* is pronounced like *a* in far, and in the colloquial, words ca'n't and sha'n't, except when a different sound is particularly indicated: thus, aunt, askaunce, askaunt, haunt, &c., are pronounced like † an't, † can't.

8. *Ea*, *ee*, are generally pronounced like *e* long: as, anne'al, peel, fear, feed. The exceptions, however, are numerous, and are thus marked in some pronouncing dictionaries: bread', head', earl, pronounced bred, hed, erl.

9. *Ew*, *eu*, *ue*, are always pronounced like *u* long, except when a difference is particularly indicated: as, few, feud, due. But after *r*, *ue*, *ew*, are generally pronounced like *oo*: as, true, screw, pronounced troo, scroo.

10. *Oa* and *oe* always sound like long *o*, except when a difference is particularly indicated in the dictionary; as, moat, sloe, pronounced mote, slō.

11. *Oy*, *oi*, have uniformly the compound sound of *o* and *i*, except where a departure from rule is indicated: thus, joy, spoil, &c.

12. *Oo* has generally the same sound as in food, soon, fool, &c.

13. *oo*, *ou*, have uniformly the sound of *oo* shortened, except when a difference is particularly indicated: as, bull, full, handful; the sole difference between full and fool is, that the diphthong in the last is longer than in the first.

14. *Ow*, *ow*, uniformly sound as in our, now, except when *w* or *u* is marked as silent, in which case the pronunciation is the same as long *o*: thus, flow, source, mould, pronounced, möld, sörcē, flō. When *ow* terminates a word of more than one syllable, it is uniformly pronounced like long *o*: as in hollow, sorrow, &c., pronounced hol'lō, sor'rō.

15. In monosyllables *y* and *ie* are always pronounced like long *i*; but in words of more than one syllable they are pronounced like short *e*: as, try, tries, pronounced tri, tries, &c.; carry, carries, pronounced carry, carries, &c.

16. Before *nd*, *i* has uniformly the long sound; as in mind, kind, &c.: but every other vowel before *nd* is uniformly short; as in hand, end, fond, fund.

17. Before *lk*, *a* sounds *aw*, and *l* is silent; as in balk, talk, pronounced bawk, tawk.

18. Before *lm*, *a* has the broad German sound, and *l* is silent; as in calm, balm, &c.

19. Before *ll* and *ld*, *o* is always long: as, poll, old, fold, cold, &c., pronounced pole, öld, föld, &c.

20. Before single *r*, *a* has uniformly what is termed the broad German sound, except in unaccented syllables, where it has the common short sound: as, far, part, partial; ram'pärt, &c.; and before double *r*, *a* has uniformly the short sound; as in carry, tarry, &c.

21. Before *a*, *o*, *u*, *C* is always pronounced like *K*; but before *e*, *i*, *y*, it is pronounced like *S*: as, card, cord, curd, pronounced kard, kord, kurd; cement, city, cynic, pronounced sement, sitty, cinnic. When *c* ends a word or syllable, it always sounds the same as *k*; as, mu'sic, flaccid, siccity, pronounced mu'sik, flak'sed, sik'sity: *k* after *c* is now very properly discarded, except in such words as back, pack: as, music, physic, &c., not musick, physick. It would be well to discontinue the *k* in every case, (i. e. in connexion with *c*), or to substitute it for *c*, which last letter is wholly superfluous in the English alphabet; and, if *k* and *s* were made to supersede this double-sounding character, much inconvenience would be obviated.

22. *Ch* has three sounds, viz. *tsh*, as in chair, child, chin, &c.; *sh*, as in chaise, chagrin, machine, &c.; *k*, as in chaos, character, chorus, anchor, mechanic, epoch, &c. When *ci*, *ti*, *si*, come before *a*, *e*, *o*, they are to be considered as sounding like *sh*, with some exceptions, as, special, occasion, diction, petition, captious, &c. pronounced speshal, okazhun, petishun, capshus: tious, cious, are always pronounced shus; cion, sion, tion—shun; but short, as if put *shn*.

23. *G*, like *C*, has two sounds; before *a*, *o*, *u*, *l*, *r*, or when terminating a syllable, it is hard; as in game, go, gun, fig, fag, &c.; before *e*, *i*, *y*, *G* is pronounced like *J*; as in gem, genus, gin, gibe or gybe, gymnastic, age, eulogy, &c.; exceptions, however, occur, such as get, geld, &c. Such words as the following are not exceptions, because the *g* is properly the last letter of a syllable, and therefore has the hard sound, viz. shaggy, shagged, ragged, rugged, dagger, anger, finger, &c. The intention in doubling the *g* in shaggy, beggar, &c., was to indicate the hard sound. When *gn* begins or terminates a word, *g* is silent; as gnaw, gnat, condign, malign, feign, deign, sign—pronounced naw, nat, condine, maline, fain, dain, sine. The vowel preceding the silent *g* or *gh* is uniformly long; as impugn, right, blight, &c.—pronounced impune rite, blite. Except in ghost, ghastr, and their derivatives (pronounced gost, gast), *gh* is to be considered as uniformly silent: there are a few instances in which it is pronounced *f*, as in cough, &c.—and *k*, as in lough—and *g* hard, as in burgh.

24. When *kn* begins a word, *k* is silent; as, knab, knack, knee, know, &c.—pronounced nab, nak, nee, no.

25. *H* is always sounded at the beginning of words, except in heir, heiress, honest, honesty, honor, honorable, hospital. hostler, hour, humble, humor, humorous, humorsome. It is always silent after *r*; as in rhetoric, rhubarb

nyrrh. When the final letter, and preceded by a vowel, it is always silent; as in ah! oh! sirrah! When *wh* begins words, it is pronounced hoo; as in whale, wheel—pronounced hooel, hooel, in one syllable. In the Saxon vocabulary, such words are more properly spelled hu or hw.

26. The affix *or*, *our*, is uniformly pronounced *ur*; as in candor or candour, favor or favour—pronounced candur, favur. The shut or short vowel sounds in unaccented syllables cannot be distinguished as having any difference; and therefore it seems unnecessary to mark *er* as if it were pronounced *ur* in such words as lover, mother, father, &c.

27. The affix *some* is uniformly pronounced *sum*; as in handsome, delightful—pronounced han'sum, deli'ghtsum. This affix is spelled in Saxon, *som*, *sam*, *sum*; and it would be well to return to *sum*, or at least to discard the final *e*; for, as we have so frequently intimated, spelling and pronunciation should coincide.

28. The affix *ous* is uniformly pronounced *us*; as in covetous, righteous—pronounced cuv'etus, ri'ghtyus; *ous* (like *our* for *or*) is the French mode of expressing the Latin affix *os*.

29. When *w* begins the word, it has the sound of *oo*; as in ware, wet, wile, &c.—pronounced ooare, ooet, ooile, in one syllable: *u* before *e*, *i*, *o*, has generally the same sound; as, languish, banquet, languor, language; pronounced lan'gwish, or langooish, ban'kwet, langwur, langwage.

30. *S* has two sounds, the one sharp and hissing, as in *us*, this; the other precisely like *z*; as in *his*, *was*, *as*, &c. Double *s* has uniformly the sharp hissing sound.

31. *Th* has two sounds; the one as in *thin*, &c.; the other as in *thine*. When not particularly indicated, *th* is always to be considered as having the first sound; but, when followed by final *e* in the same syllable, *th* has uniformly the second sound; as in *breath*, *writh*, &c. When *th* is pronounced as *t*, the *h* is marked as silent; thus, *thyme*, *asthma*, pronounced *time*, *ast'ma*.

32. *F* and *ph* have the same sound; and *f* sometimes that of *v*; double *f* has uniformly the sound of *f*; or *ph*, as in *off*, *staff*, &c.

33. Before *on* and *ous*, *i* generally sounds like *y*, at the beginning of a word or syllable; as in *minion*, *million*, *tedious*, &c., pronounced *minyūn*, *milyūn*, *tedeyūn*.

34. When final *e* comes after *l* and *r*, it is to be pronounced as if put before them; as in *fickle*, *mingle*, *theatre*, *nitre*, pronounced *fikkle*, *mingul*, *theater*, *niter*. This pronunciation is quite familiar to the French (from whom the mode of spelling and pronouncing such words was adopted), and other foreigners must remember that final *e* is never pronounced as a distinct syllable in the English language.

35. *T* is always silent between *s* and *en* or *le*; as in *hasten*, *listen*, *castle*, &c., pronounced *hay-sen*, *lissen*, *kassel*.

36. *X* has two sounds, viz. *ks* and *gs*, except when particularly marked, it is to be understood as having the first sound.

37. *Qu* has always the sound of *koo*.

38. The verbal affix *ed*, is seldom pronounced as a distinct syllable except after *d*; as *feared*,

confessed, pronounced *feard*, *confessd*; but in such words as *branded*, *commanded*, &c., it is a distinct syllable.

The irregular character of English pronunciation has been (like that of English spelling), too often noticed, and is too manifest to require any comment: whether it be more or less anomalous than that of other languages is a question of no importance; but there is evidently much importance, i. e. utility, in rendering it as simple and regular as possible. Influential speakers (who have always least reason to dread petty criticism) should set the example of bringing English pronunciation to English spelling. The latter might be materially reformed (see our article GRAMMAR) without much trouble; and the great desideratum is coincidence between the one and the other. It is in general, however, safer to make the pronunciation conform to the spelling, than to make the spelling conform to the pronunciation; and to make the one correspond to the other ought evidently to be a rule with every sensible speaker and writer.

In all those words which are differently pronounced by respectable speakers, that mode is worthy of preference which is most agreeable to analogy and most conformable to orthography; as, *yea*, pronounced *ye* and *yay*; *wound*, pronounced like *found* and *wood*; *break*, pronounced *breck* and *brake*; *oblige*, pronounced *oblige* and *obleege*; *knowledge*, pronounced *nöledge* and *nöledge*, &c., &c. The first of these modes of pronunciation is evidently that which should be universally adopted. Influential speakers should endeavour to bring the general practice to analogy in all cases. It is unworthy of persons who have any respect for utility, to follow the blind guidance of mere custom, or to comply with the anomalous caprices of fashion. The only chance for simplicity, uniformity, and immutable stability to a living language, is to follow the guidance of reason. When learned or foreign words are adopted, they should be made to conform to the English idiom or manner of spelling and pronouncing. This plain sensible rule is surely better than pedantry or affectation: and in this we might profit by the example of the French, in imitating whose language we have given such a motley character to our own.

PROOF, *n. s.* & *adj.* } From PROVE, which
PROOFLESS. } see. Experiment;
evidence; testimony; hence firm temper; impenetrability; armour hardened in a high degree; the rough draught, or copy of a printed sheet: as an adjective, impenetrable; capable of firm resistance; taking *to* or *against* before the object: proofless is, not to be proved, or destitute of proof.

Though the manner of their trial should be altered, yet the *proof* of every thing must needs be by the testimony of such persons as the parties shall produce.

This has neither evidence of truth, nor *proof* sufficient to give it warrant.

That which I shall report will bear no credit, Were not the *proof* so high.

He Bellona's bridegroom, apt in *proof*,
Confronted him.

Nothing can be more irrational than for a man to

Spenser.

Hooker.

Shakspeare.

Id. Macbeth.

doubt of, or deny the truth of any thing, because it cannot be made out by such kind of *proofs* of which the nature of such a thing is not capable. They ought not to expect either sensible *proof*, or demonstration of such matters as are not capable of such *proofs*, supposing them to be true. *Wilkins.*

One soul in both, whereof good *proof*
This day affords. *Milton.*

Opportunity I here have had
To try thee, sift thee, and confess have found thee
Proof against all temptation, as a rock
Of adamant. *Id. Paradise Regained.*

Some were so manifestly weak and *proofless*, that he must be a very courteous adversary, that can grant them. *Boyle.*

Those intervening ideas, which serve to shew the agreement of any two others, are called *proofs*.
Dryden.

To me the cries of fighting fields are charms,
Keen be thy sabre, and of *proof* my arms;
I ask no other blessing of my stars. *Id.*

He past expression loved,
Proof to disdain, and not to be removed. *Id.*

Guiltless of hate, and *proof* against desire;
That all things weighs, and nothing can admire.
Id.

My paper gives a timorous writer an opportunity
of putting his abilities to the *proof*. *Addison.*

Deep in the snowy alps, a lump of ice
By frost was hardened to a mighty price;
Proof to the sun it now securely lies,

And the warm dog-star's hottest rage defies. *Id.*
When the mind is thoroughly tinctured, the man
will be *proof* against all opposition. *Collier.*

Here for ever must I stay,
Sad *proof* how well a lover can obey. *Pope.*

I've seen yon weary winter-sun
Twice forty times return;

And ev'ry time has added *proofs*,
That man was made to mourn. *Burns.*

PROOF, in law and logic, is that degree of evidence which carries conviction to the mind. It differs from demonstration, which is applicable only to those truths of which the contrary is inconceivable. It differs likewise from probability, which produces for the most part nothing more than opinion, while *proof* produces belief.

PROOF, in printing. See **PRINTING**.

PROOF, in spirituous liquors, is a little white lather which appears on the top of the liquor when poured into a glass. This lather, as it diminishes, forms itself into a circle called by the French the *chaplet*, and by the English the head or bubble.

PROOF OF ARTILLERY AND SMALL ARMS, is a trial whether they stand the quantity of powder allotted for that purpose. Government allows eleven bullets of lead in the pound for the proof of muskets, and twenty-nine in two pounds, for service; seventeen in the pound for the proof of carabines, and twenty for service; twenty-eight in the pound for the proof of pistols, and thirty-four for service. When guns of a new metal, or of lighter construction, are proved, besides the common *proof*, they are fired 200 or 300 times, as quick as they can be, loaded with the common charge given in actual service. *Proof* of cannon is made to ascertain their being well cast, their having no cavities in their metal, and, in a word, their being fit to resist the effort of their charge of powder. In making this *proof*, the piece is laid

upon the ground; supported only by a piece of wood in the middle, of about five or six inches thick, to raise the muzzle a little; and then the piece is fired against a solid butt of earth. The tools used in the *proof* of cannon are these:—The searcher, an iron socket with branches, from four to eight in number, bending outwards a little, with small points at their ends: to this socket is fixed a wooden handle, from eight to twelve feet long, and one inch and a half in diameter. This searcher is introduced into the gun after each firing, and turned gently round to discover the cavities within; if any are found they are marked on the outside with chalk; and then the searcher with one point is introduced: about which point a mixture of wax and tallow is put, to take the impression of the holes; and if they are found of one-fourth of an inch deep, or of any considerable length, the gun is rejected as unserviceable. The reliever is an iron ring fixed to a handle, by means of a socket, so as to be at right angles; it serves to disengage the first searcher, when any of its points are retained in a hole, and cannot otherwise be got out.

A curious instrument for finding the principal defects in pieces of artillery was invented by lieutenant-general Desaguliers. This instrument discovers more particularly the defect of the piece not being truly bored; which is a very important one; for, when a gun is not properly bored, the most expert artillerist will not be able to make a good shot.

Every species of ordnance undergoes different kinds of *proof* before it is received into his majesty's service. They are gauged as to their several dimensions, internal and external, as to the accuracy of the position of the bore, the chamber, the vent, the trunnions, &c. They are fired with a regular charge of powder and shot, and afterwards searched to discover irregularities or holes produced by the firing. By means of engines, an endeavour is made to force water through them. They are examined internally, by means of light reflected from a mirror.

PROOF OF MORTARS AND HOWITZERS is performed by placing them on the ground on wood or bullets, of an elevation of 70°. The mirror is the only instrument to discover their defects. To use it, the sun must shine; the breech must be placed towards the sun, and the glass over against the mouth of the piece; it illuminates the bore and chamber sufficiently to discover the flaws in it.

PROOFS IN ENGRAVING. *Proofs* of prints were formerly a few impressions taken off in different stages of the engraver's process, that he might ascertain how far his labors had been successful, and when they were complete. The excellence of such impressions, worked with care under the artist's eye, occasioning them to be sought after, and liberally paid for, it has been customary, among our modern printers, to take off a number under this name, from every plate of considerable value. On retouching a plate, it has been also usual, among the same conscientious fraternity, to cover the inscription, which was immediately added after the first *proofs* were obtained, with slips of paper, that a number of secondary *proofs* might also be created.

PROP, *v. a. & n. s.* Belg. *proppe, proppen*.
To sustain; support; uphold: a stay; support;
pillar.

Again, if by the body's *prop* we stand,
If on the body's life, her life depend,
As Meleager's on the fatal brand,
The body's good she only would intend.

Davies.

That he might on many *props* repose,
He strengthens his own, and who his part did take.

Daniel.

Like these, earth unsupported keeps its place,
Though no fixt bottom *props* the weighty mass.

Creech.

Fairest unsupported flower
From her best *prop* so far.

Milton.

The current of his vict'ries found no stop,
Till Cromwell came, his party's chiefest *prop*.

Waller.

The *props* return

Into thy house, that bore the burdened vines.

Dryden.

PROPÆDEUTICS, from *προπαίδεω*,
to prepare for instruction: a term used in Germany
to indicate the knowledge which is necessary or
useful for understanding or practising an art or
science, or which unfolds its nature and extent,
and the method of learning it. It is applied,
therefore, not only to special introductions to
particular branches of study, but also to auxiliary
sciences, logic, philology, &c., and the encyclopædic
views of particular branches of science
which facilitate an insight into the relations of
the parts. Such a survey can be presented only
by one who has studied a science in all its rami-
fications. The term *propædeutics* is often, of
course, merely relative; thus philology belongs
to the propædeutics of history, while it is itself
the main study of a certain class of scholars.
The term, however, in its common use, is gene-
rally restricted to the body of knowledge, and
of rules necessary for the study of some par-
ticular science—rules which originate in the ap-
plication of the general laws of science or
art to a particular department. Thus we find in
the catalogues of lectures to be delivered in
German universities, medical propædeutics, &c.,
enumerated.

PROPAGANDA; a name generally given to
those institutions by which Christianity is pro-
pagated in heathen countries, more particularly
to those which were established in the seven-
teenth century, and especially that erected by
the papal court, for the extension of its own
power and the Catholic religion among those
who were not Christians or Catholics. It was
called the *congregatio de propaganda fide* (society
for propagating the faith), and was founded by
Gregory XV. in 1622. It consisted of eighteen
cardinals, and some papal ministers and officers
of the college; and its object was, to arrange
and direct all measures relating to the extension
of the Catholic faith and the extirpation of heret-
ics. Connected with this was the *collegium seu
seminarium de propaganda fide*, instituted by
Urban VIII. 1627, for the education of mis-
sionaries. Each Society meet once a week, in
the presence of the pope, in a palace built for
the purpose. Converts to the Catholic church,
who had come to Rome, were instructed and

supported by them. Bishops, and other clergy
who had been expelled, were also received and
supported. The Roman propaganda had a
press celebrated for the numerous works which
issued from it. Thence breviaries and missals
were sent to all parts. Missionary societies, for
the propagation of the Christian religion, have
been formed in Protestant countries on this
model. (See *Missions*.) In the time of the French
revolution, secret societies, whose object was
the propagation of democratical principles, were
called *propaganda*. *Propaganda* has, therefore,
come to signify any kind of institution for mak-
ing proselytes.

PROPAGATE, *v. a. & n. s.* Lat. *propago*.

PROPAGABLE, *adj.*

PROPAGATION, *n. s.*

PROPAGATOR.

To continue by
generation or
production; to
diffuse; extend; promote; transport; increase;
to have offspring: propagable is, that may be
propagated: propagation, the act of continuing
or diffusing by successive production: propaga-
tor, corresponding in sense.

I have upon a high and pleasant hill

Feigned fortune to be throned: the base o' the
mount

Is ranked with all deserts, all kind of natures,

That labour on the bosom of this spheru

To propagate their states. *Shakspeare. Timon.*

Some have thought the *propagating* of religion by
arms not only lawful, but meritorious.

Decay of Piety.

All that I eat, or drink, or shall beget,

Is propagated curse! *Milton's Paradise Lost.*

No need that thou

Should'st propagate, already infinite,

And through all numbers absolute, though one.

Milton.

Is it an elder brother's duty so

To propagate his family and name;

You would not have yours die and buried with you?

Otway.

From hills and dales the cheerful cries rebound,

For echo hunts along, and propagates the sound,

Dryden.

Old stakes of olive trees in plants revive;

But nobler veins by propagation thrive.

Id.

PROPEL', *v. a.* Lat. *propello*. To drive
forward.

Avicen witnesses the blood to be frothy, that is

propelled out of a vein of the breast.

Harvey.

This motion, in some human creatures, may be
weak in respect to the viscosity of what is taken, so
as not to be able to propel it.

Arbutnot on Aliments.

PROPEND', *v. n.*

PROPENSITY, *n. s.* Lat. *propendeo*, to

hang forwards.

To incline to any part; be disposed in favor of any

thing. Not used.

PROPENSE', *adj.*

PROPENSITY, *n. s.* Lat. *propensus*. In-

clined; disposed; used

PROPENSITY.

propensity is tendency; particularly moral dis-

position; natural tendency.

I have brought scandal

In feeble hearts, propense enough before

To waver, or fall off, and join with idols.

Milton.

It requires a critical nicety to find out the genius or the
propensions of a child.

L'Est-ange.

Let there be but *propensity*, and bent of will to religion, and there will be sedulity and indefatigable industry. *South.*

So forcible are our *propensions* to mutiny, that we equally take occasions from benefits or injuries.

Government of the Tongue.

He assists us with a measure of grace, sufficient to over-balance the corrupt *propensity* of the will.

Rogers.

This great attrition must produce a great *propensity* to the putrescent alkaline condition of the fluids.

Arbutnot.

It is, however, not to be omitted, that he appears always *propense* towards the side of mercy. *Johnson.*

PROPER, *adj.*

PROF'ERNESS, *n. s.*

PROF'ERTY, *n. s. & v. a.*

Fr. *propre*; Lat. *proprius*. Peculiar; natural; fit; adapted; belonging to an individual; one's own; literal; mere; pure; pretty or beautiful; and, in a low sense, tall; stout; the adverb and noun substantive corresponding: property is, peculiar quality; disposition, or right; possession held in one's own right; any thing promised; an appendage; any thing peculiarly new or adapted: to property is, to seize or retain as a right; to invest with qualities or possessions; but neither sense is now in use.

Moses was a *proper* child. *Hebrews xi. 23.*

Men of learning hold it for a slip in judgment, when offer is made to demonstrate that as *proper* to one thing, which reason findeth common unto many.

Hocher.

What special *property* or quality is that, which, being no where found but in sermons, maketh them effectual to save souls? *Id.*

The bloody book of law

You shall yourself read in the bitter letter,

After your own sense; yea, though our *proper* son stood in your action. *Shakspeare. Othello.*

Proper deformity seems not in the fiend

So horrid as in woman. *Id. King Lear.*

At last she concluded with a sigh, thou wast the *properest* man in Italy. *Shakspeare.*

Here I disclaim all my paternal care,

Propinquity, and *property* of blood,

And, as a stranger to my heart and me,

Hold thee. *Id. King Lear.*

I will draw a bill of *properties*, such as our play wants. *Shakspeare.*

His reared arm

Crested the world; his voice was *propertied* As all the tuned spheres.

Id. Antony and Cleopatra.

I am too highborn to be *propertied*,

To be a secondary at controul. *Shakspeare.*

Our poets excel in grandity and gravity, smoothness and *property*, in quickness and briefness.

Camden.

Of nought no creature ever formed ought, For that is *proper* to the Almighty's hand.

Davies.

'Tis conviction, not force, that must induce assent; and sure the logic of a conquering sword has no great *property* that way; silence it may, but convince it cannot.

Decay of Piety.

In our *proper* motion we ascend

Up to our native seat. *Milton.*

What dies but what has life

And sin? the body *properly* hath neither. *Id.*

If we might determine it, our *proper* conceptions would be all voted axioms. *Glanville's Scepis.*

Court the age

With somewhat of your *proper* rage. *Waller.*

Now learn the difference at your *proper* cost, Betwixt true valour and an empty boast.

Dryden.

In Athens all was pleasure, mirth, and play, All *proper* to the spring, and sprightly May. *Id.*

For numerous blessings yearly show'r'd,

And *property* with plenty crowned,

Accept our pious praise. *Id.*

The purple garments raise the lawyer's fees,

High pomp and state are useful *properties*. *Id.*

A *proper* goodly fox was carrying to execution.

L'Estrange.

Outward objects, that are extrinsecal to the mind and its own operations, proceeding from powers intrinsecal and *proper* to itself, which become also objects of its contemplation, are the original of all knowledge. *Locke.*

Property, whose original is from the right a man has to use any of the inferior creatures, for subsistence and comfort, is for the sole advantage of the proprietor, so that he may even destroy the very thing that he has *property* in. *Id.*

They professed themselves servants of Jehovah, their God, in a relation and respect peculiar and *proper* to themselves. *Nelsen.*

Those parts of nature, into which the chaos was divided, they signified by dark names, which we have expressed in their plain and *proper* terms.

Burnet's Theory of the Earth.

There is a sense in which the works of every man, good as well as bad, are *properly* his own.

Rogers.

In debility, from great loss of blood, wine, and all aliment that is easily assimilated or turned into blood, are *proper*; for blood is required to make blood.

Arbutnot.

Greenfield was the name of the *property* man in that time, who furnished implements for the actors.

Pope.

The miseries of life are not *properly* owing to the unequal distribution of things. *Swift.*

No wonder such men are true to a government, where liberty runs so high, where *property* is so well secured. *Id.*

A *proper* name may become common, when given to several beings of the same kind; as Cæsar.

Watts.

A secondary essential mode is any attribute of a thing, which is not of primary consideration, and is called a *property*. *Id.*

PROPERTIUS (Sextus Aurelius), a celebrated Latin poet, born at Mevania, a city of Umbria. He went to Rome after the death of his father, a Roman knight, who had been put to death by order of Augustus, for having followed Antony's party. Propertius acquired great reputation by his abilities, and was patronised by Mæcenas and Cornelius Gallus. He had also Ovid, Tibullus, and other literati of his time, for his friends. He died in Rome 19 B. C. His four books of elegies are printed with almost all the editions of Tibullus and Catullus; the best is the separate edition by J. Brouckhusius at Amsterdam, 1702 and 1714, 4to.

PROPERTY. See LAW.

PROPHECY, *n. s.*

PROPHE'T, } Fr. *prophete*; Ita!.

PROPHE'SY, *v. a. & v. n.* } *profeta*; Span. Port.

PROPHE'TESS, *n. s.* } and Lat. *propheta*.

PROPHE'TIC, *adj.* } Gr. *προφητης*. One

PROPHE'TICAL, } who predicts or fore-

PROPHE'TICALLY, *adv.* } tels future events;

PROPHE'TIZE, *v. n.* } one who teaches or

preacheth: a prophecy

is a prediction; declaration of something future: to prophesy, to foretel; prognosticate; foreshow; utter predictions; preach: prophesize, an obsolete synonyme: prophetess, the feminine of prophet: prophetic and prophetical, of the nature of prophecy; the adverb corresponding.

I hate him, for he doth not *prophesy* good, but evil. *1 Kings.*

The elders of the Jews builded, and prospered through the *prophesying* of Haggai. *Ezra vi. 14.*

He hearkens after *prophecies* and dreams. *Shakspeare.*

Miserable England,
I *prophesy* the fearful'st time to thee,
That ever wretched age hath looked upon. *Id.*
Methought thy very gait did *prophesy*
A royal nobleness. *Id. King Lear.*

His champions are the *prophets* and apostles. *Shakspeare.*

He shall split thy very heart with sorrow,
And say poor Marg'ret was a *prophetess*. *Id.*
He is so *prophetically* proud of an heroidal cudgeling, that he raves in saying nothing. *Id.*
Some perfumes procure *prophetical* dreams. *Bacon.*

The counsel of a wise and then *prophetical* friend was forgotten. *Wotton.*

That it is consonant to the word of God, so in singing to answer, the practice of Miriam the *prophetess*, when she answered the men in her song, will approve. *Peachum.*

It buildeth her faith and religion upon the sacred and canonical scriptures of the holy *prophets* and apostles, as upon her main and prime foundation. *White.*

Nature else hath conference
With profound sleep, and so doth warning send
By *prophetizing* dreams. *Daniel's Civil War.*
This great success among Jews and Gentiles, part of it historically true at the compiling of these articles, and part of it *prophetically* true then, and fulfilled afterward, was a most effectual argument to give authority to this faith. *Hammond.*

O *prophet* of glad tidings! finisher
Of utmost hope! *Milton.*

Till old experience do attain
To something like *prophetic* strain. *Id.*
Poets may boast

Their work shall with the world remain;
Both bound together, live or die,
The verses and the *prophecy*. *Waller.*

Some famous *prophetic* pictures represent the fate of England by a mole, a creature blind and busy, smooth and deceitful, continually working under ground, but now and then to be discerned in the surface. *Stillington.*

He loved so fast,
As if he feared each day would be her last,
Too true a *prophet* to foresee the fate,
That should so soon divide their happy state. *Dryden.*

The more I know, the more my fears augment,
And 'ears are oft *prophetic* of the event. *Id.*
She sighed, and thus *prophetically* spoke. *Id.*
God, when he makes the *prophet*, does not unmake the man. *Locke.*

No arguments made a stronger impression on these Pagan converts, than the predictions relating to our Saviour in those old *prophetic* writings deposited among the hands of the greatest enemies to Christianity, and owned by them to have been extant many ages before his appearance. *Addison.*

If my love at once were crowned,
Fair *prophetess*, my grief would cease. *Prior.*

It was attested by the visible centering of all the old *prophecies* in the person of Christ, and by the completion of these *prophecies* since, which he himself uttered. *Atterbury.*

Received by thee, I *prophesy*, my rhimes,
Mixed with thy works, their life no bounds shall see. *Ticket.*

Pleasure is deaf when told of future pain,
And sounds *prophetic* are too rough to suit
Ears long accustomed to the pleasing lute. *Couper.*

False *prophetess*! the day of change was come;
Behind the shadow of eternity,
He saw his visions set of earthly fame,
For ever set. *Pollok.*

PROPHECY. The prophecies in the Scriptures, upon which, if room permitted, we might enlarge, afford the most decisive evidence of the truth of Christianity, being in fact a kind of standing miracles, that have existed for ages, and still exist, in proof of the veracity of Scripture. We may specify, I. The prophecy of Noah (Gen. ix. 25, 26), respecting the degraded and enslaved state of the posterity of Ham; fulfilled, first by the Jews in the slavery of the Canaanites; afterwards by the Greeks in the destruction of Tyre, and by the Romans in that of Carthage; and, in modern times, in the oppression of their posterity by the Saracens and Turks, and even to the present age by the slave trade. II. The prophecy of the innumerable posterity of Abraham; but more particularly of the wild, predatory, free, and independent state of his posterity by Ishmael (Gen. xvi. 10—12.), fulfilled in all ages, as well as in the present, by the unconquered state of the Arabs. III. The remarkable prophecy of Moses (Deut. xxviii. 64—66) and of Hosea (iii. 4) against the Jews, which have been so literally fulfilled for upwards of 1800 years past; notwithstanding which, while they have been scattered among all the nations on the globe, they continue still a distinct people, firmly and irrevocably attached to their peculiar customs, though persecuted every where on that account. This is a phenomenon unparalleled in the history of mankind, and totally unaccountable upon the ordinary principles of human action; and therefore only accountable upon the principle of their being still preserved a distinct people, till the period when they shall fulfil the remaining part of Hosea's prediction (iii. 26). IV. To these remarkable prophecies, we might add those of Daniel, respecting the four universal monarchies; and those of St. Paul and St. John, which so clearly foretel the various fortunes of the Christian church; with its progress from the age of apostolic purity, to that state of universal corruption under which it sunk for about 1000 years, together with its gradual restoration to purity. But, for further information on all these subjects, we must refer the reader to bishop Newton's Dissertations on the Prophecies; bishop Chandler's Vindication of Christianity; bishop Hurd's Warburtonian Lecture; bishop Sherlock's Discourses on Prophecy, &c. See THEOLOGY.

PROPHETS, among the Jews, were persons commissioned and inspired by God to declare his will and purposes to that people. Previous to the existence of that nation, there were other inspired prophets, particularly Enoch, Lamech,

and Noah. After the deluge, and before the giving of the law, we find Melchizedek, Abraham, Isaac, Jacob, Joseph, Job, Elihu, and Moses. Under the law, we find several eminent prophets; particularly Joshua, Samuel, Gad, Nathan, Ahijah, Elijah, Elisha, Micaiah, and some others whose names are not recorded; and, among the canonical books of the Old Testament, are preserved the writings of sixteen prophets, who are commonly styled the greater and lesser.

THE GREATER PROPHETS, so called from the length and extent of their writings, are four, viz. ISAIAH, JEREMIAH, EZEKIEL, and DANIEL.

THE LESSER PROPHETS, so named from the brevity of their prophecies, are twelve; viz. HOSEA, JOEL, AMOS, OBADIAH, JONAH, MICAH, NAHUM, HABAKKUK, ZEPHANIAH, HAGGAI, ZECHARIAH, and MALACHI. See these articles in their order.

PROPHETS, SONS OF THE, in Scripture history, an appellation given to young men who were educated under a proper master, (who was commonly, if not always, an inspired prophet,) in the knowledge of religion and in sacred music, and thus were qualified to be public teachers. This seems to have been part of the business of the prophets on the Sabbath days and festivals.

PROPHYLACTIC, *adj.* Gr. *προφυλακτικός*, of *προφυλασσω*. Preventive; preservative.

Medicine is distributed into *prophylactic*, or the art of preserving health; and therapeutic, or the art of restoring health. *Watts.*

PROPINQUITY, *n. s.* Lat. *propinquitās*. Nearness; proximity of station, kind, time, or blood.

Here I disclaim all my paternal care,

Propinquity, and property of blood,

And, as a stranger to my heart and me,

Hold thee. *Shakspeare. King Lear.*

Thereby was declared the *propinquity* of their dissolutions, and that their tranquillity was of no longer duration, than those soon decayed fruits of summer. *Browne.*

They draw the retina nearer to the crystalline humour, and by their relaxation suffer it to return to its natural distance according to the exigency of the object, in respect of distance or *propinquity*. *Ray.*

PROPTIATE, *v. a.*

PROPTIABLE, *adj.*

PROPTIATION, *n. s.*

PROPTIATOR,

PROPTIATORY, *adj. & n. s.*

PROPTIOUS,

PROPTIOUSLY, *adv.*

PROPTIOUSNESS, *n. s.*

Lat. *propitio*.

To conciliate;

gain; induce to

favor; appease;

make gracious;

propitiable, ap-

peasable; such

as may be induc-

ed to favor: propitiation is, the act or means of propitiation; atonement made: propitiator, he who makes it: propitiatory, having the power to conciliate; as a noun substantive, a mercy-seat, or throne of mercy: propitious, favorable; kind; gracious; partial: the adverb and noun substantive corresponding.

He is the *propitiation* for the sins of the whole world. *1 John.*

'T' assuage the force of this new flame,

And make thee more *propitious* in my need,

I mean to sing the praises of thy name. *Spenser.*

Let not my words offend thee,

My Maker, be *propitious*, while I speak!

Milton.

So when a muse *propitiously* invites,
Improve her favours, and indulge her flights.

Roscommon.

You, her priest, declare

What off'rings may *propitiate* the fair,
Rich orient pearl, bright stones that ne'er decay,
Or polished lines which longer last than they.

Waller.

Is not this more than giving God thanks for their virtues, when a *propitiatory* sacrifice is offered for their honour? *Stillingfleet.*

All these joined with the *propitiousness* of climate to that sort of tree and the length of age it shall stand and grow, may produce an oak *Temple.*

Vengeance shall pursue the inhuman coast,
Till they *propitiate* thy offended ghost. *Dryden.*

Would but thy sister Marcia be *propitious*

To thy friend's vows. *Addison's Cato.*

Ere Phœbus rose he had implored

Propitious Heaven. *Pope's Rape of the Lock.*

Let fierce Achilles, dreadful in his rage,

The god *propitiate*, and the pest assuage. *Pope.*

In allusion to the ancient worship, the apostle represents Christ as a *propitiatory* or mercy-seat, set forth by God for receiving the worship of men, and dispensing pardon to them. *Macknight.*

PROPTIATION. Among the Jews there were both ordinary and public sacrifices, as holocausts, &c., offered by way of thanksgiving; and extraordinary ones, offered by particular persons guilty of any crime, by way of propitiation. The Roman Catholics believe the mass to be a sacrifice of propitiation for the living and the dead. The reformed churches allow of no propitiation but that one offered by Jesus Christ on the cross.

PROPTIATORY, any thing rendering God propitious; as propitiatory sacrifices, in contradistinction to eucharistical. Among the Jews the propitiatory was the cover or lid of the ark of the covenant; which was lined both within and without with plates of gold, insomuch that there was no wood to be seen. This propitiatory was a type or figure of Christ, whom St. Paul calls the propitiatory ordained from all ages.

PROPLASM, *n. s.* Gr. *προ* and *πλάσμα*. Mould; matrix.

Those shells serving as *proplasm*s or moulds to the matter which so filled them, limited and determined its dimensions and figure. *Woodward.*

PROPONENT, *n. s.* Let. *proponens*. One that makes a proposal, or lays down a position.

For mysterious things of faith rely

On the *proponent*, heaven's authority. *Dryden.*

PROPONTIS, or the Sea of Marmora, a part of the Mediterranean, dividing Europe from Asia; it has the Hellespont or canal of the Dardanelles on the south-west, whereby it communicates with the Archipelago, and the ancient Bosphorus of Thrace, or Straits of Constantinople, on a north-east, communicating with the Black or Euxine Sea. It has two castles; that on the side of Asia is on a cape, where formerly stood a temple of Jupiter; that of Europe is on the opposite cape, and had anciently a temple of Serapis. It is 120 miles long, and in some places upwards of forty miles broad. Lempriere says, 'it is 175 miles long, and sixty-two broad;' and that 'it received its name from its vicinity to Pontus.'—Class. Dict.

PROPORTION, *n. s. & v. a.*
 PROPORTIONABLE, *adj.*
 PROPORTIONABLY, *adv.*
 PROPORTIONAL, *adj.*
 PROPORTIONALITY, *n. s.*
 PROPORTIONALLY, *adv.*
 PROPORTIONATE, *adj. & v. a.*
 PROPORTIONATENESS, *n. s.*

Fr. *proportion*;
 Latin, *proportio*.

Ratio: comparative relation; settled relation or

graduation;

symmetry; harmonic agreement; form; size: to adjust; form symmetrically: proportionable, proportional, and proportionate, mean, having a settled comparative relation; suitable; the adverbs corresponding: proportionality and proportionateness, the state of being proportionate, or comparatively adjusted.

Nature had *proportioned* her without any fault, quickly to be discovered by the senses; yet altogether seemed not to make up that harmony that Cupid delights in. *Sidney.*

Measure is that which perfecteth all things, because every thing is for some end; neither can that thing be available to any end which is not *proportionable* thereunto: and to *proportion* as well excesses as defects are opposite. *Hooker.*

Let any man's wisdom determine by lessening the territory, and increasing the number of inhabitants, what *proportion* is requisite to the peopling of a region in such a manner that the land shall be neither too narrow for those whom it feedeth, nor capable of a greater multitude. *Raleigh.*

It is good discretion not to make too much of any man at the first; because one cannot hold out that *proportion*. *Lord Bacon.*

All things received, do such *proportions* take,

As those things have, wherein they are received;

So little glasses little faces make,

And narrow webs on narrow frames are weaved. *Davies.*

By *proportion* to these rules, we may judge of the obligation that lies upon all sorts of injurious persons. *Taylor.*

His volant touch

Instinct through all *proportions*, low and high,
 Flew, and pursued transverse the resonant fugue. *Milton.*

It must be mutual in *proportion* due
 Given and received. *Id.*

The serpent lives,

Lives, as thou said'st, and gains to live as man

Higher degree of life, inducement strong

To us, as likely tasting to attain

Proportional assent, which cannot be

But to be gods or angels. *Id. Paradise Lost.*

By this congruity of those faculties to their proper objects, and by the fitness and *proportionateness* of these objective impressions upon their respective faculties accommodated to their reception, the sensible nature hath so much of perception, as is necessary for its sensible being. *Hale.*

Four numbers are said to be *proportional*, when the first containeth, or is contained by the second, as often as the third containeth, or is contained by the fourth. *Cocker.*

The parallelism and due *proportionated* inclination of the axis of the earth. *More's Divine Dialogues.*

His commandments are not grievous, because he offers us an assistance *proportionable* to the difficulty. *Tillotson.*

No man of the present age is equal in the strength, *proportion*, and knitting of his limbs, to the Hercules of Farnese. *Dryden.*

Greater visible good does not always raise men's desires, in *proportion* to the greatness it is acknow-

ledged to have, though every little trouble sets us on work to get rid of it. *Locke.*

The mind ought to examine all the grounds of probability, and, upon a due balancing the whole, reject or receive it *proportionably* to the preponderancy of the greater grounds of probability, on one side or the other. *Id.*

The connection between the end and any means is adequate, but between the end and means *proportionate*. *Grew.*

All sense, as grateful, dependeth upon the equality or the *proportionability* of the motion or impression made. *Id.*

In *proportion* as this resolution grew, the terrors before us seemed to vanish. *Tatler.*

The *proportions* are so well observed that nothing appears to an advantage, or distinguishes itself above the rest. *Addison.*

In the loss of an object, we do not *proportion* our grief to the real value it bears, but to the value our fancies set upon it. *Id.*

It was enlivened with an hundred and twenty trumpets, assisted with a *proportionable* number of other instruments. *Id.*

Things nigh equivalent and neighbouring value By lot are parted; but high heaven thy share,
 In equal balance weighed 'gainst earth and hell,
 Flings up the adverse scale, and shuns *proportion*. *Prior.*

If light be swifter in bodies than in vacuo, in the *proportion* the sines of which measure the refraction of the bodies, the forces of the bodies to reflect and refract light, are very nearly *proportional* to the densities of the same bodies. *Newton.*

The parts of a great thing are great, and there are *proportionably* large estates in a large country. *Arbutnot.*

Since every single particle hath an innate gravitation toward all others, *proportionated* by matter and distance, it evidently appears that the outward atoms of the chaos would necessarily tend inwards, and descend from all quarters towards the middle of the whole space. *Bentley's Sermons.*

Harmony, with every grace,
 Plays in the fair *proportions* of her face. *Mrs. Carter.*

Hast thou incurred

His anger, who can waste thee with a word,

Who poises and *proportions* sea and land,

Weighing them in the hollow of his hand,

And in whose sight all nations seem

As grasshoppers, as dust, a drop, & *ditto* ? *Coarper.*

PROPORTION, the identity or similitude of two ratios. Hence quantities that have the same ratio between them are said to be *proportional*; e. gr. if A be to B as C to D, or 8 be to 4 as 30 to 15; A, B, C, D, and 8, 4, 30, and 15, are said to be in *proportion*, or are simply called *proportionals*. *Proportion* is frequently confounded with ratio, yet the two convey in reality very different ideas, which ought by all means to be distinguished. Ratio is properly that relation or habitude of two things which determines the quantity of one from the quantity of another, without the intervention of any third; thus we say the ratio of 5 and 10 is 2, the ratio of 12 and 24 is 2. *Proportion* is the sameness or likeness of two such relations; thus the relations between 5 and 10 and 12 and 24 being the same, or equal, the four terms are said to be in *proportion*. Hence ratio exists between two numbers but *proportion* requires at least three.

PROPOSITION is also used for the relation between unequal things of the same kind, whereby their several parts correspond to each other with an equal augmentation or diminution.

PROPORTION, in architecture, denotes the just magnitude of the members of each part of a building, and the relation of the several parts to the whole; e. gr. of the dimensions of a column, &c., with regard to the ordonnance of a whole building.

PROPOSE', *v. a. & v. n.* } Ital. *proporre* ;
 PROPOSAL, *n. s.* } Span. *proponer* ;
 PROPOSER, } Fr. *proposer* ; Lat.
 PROPOSITION, } *propono*. To submit
 PROPOSITIONAL, *adj.* } to considera-
 tion; offer: as a verb neuter, lay schemes: a proposal is the scheme laid; design proposed; offer to the mind: the proposer, he who forms or offers a proposal or scheme: proposition, one of the three logical parts of an argument; a sentence which affirms or denies any thing; offer: the adjective corresponding.

Run thee into the parlour,
 There shalt thou find my cousin Beatrice,
 Proposing with the prince and Claudio.

Shakspeare.

The first *proposition* of the precedent argument is not necessary.

White.

Chrysippus, labouring how to reconcile these two *propositions*, that all things are done by fate, and yet that something is in our own power, cannot extricate himself.

Hammond.

The enemy sent *propositions*, such as upon delivery of a strong fortified town, after a handsome defence, are usually granted.

Clarendon.

Raphael to Adam's doubt *proposed*,

Benevolent and facile thus replied.

The compounding the representation of things, with an affirmation or negation, makes a *proposition*.

Hale.

Faith is the assent to any *proposition*, not made out by the deductions of reason, but upon the credit of the *proposer*, as coming from God.

Locke.

My design is to treat only of those who have chiefly *proposed* to themselves the principal reward of their labours.

Tatler.

Upon the *proposal* of an agreeable object, a man's choice will rather incline him to accept than refuse it.

South.

The work you mention will sufficiently recommend itself, when your name appears with the *proposals*.

Addison to Pope.

This truth is not likely to be entertained readily upon the first *proposal*.

Atterbury.

He provided a statute, that, whoever *proposed* any alteration to be made, should do it with a rope about his neck: if the matter *proposed* were generally approved, then it should pass into a law; if it went in the negative, the *proposer* to be immediately hanged.

Swift.

In learning any thing there should be as little as possible first *proposed* to the mind at once, and, that being understood, proceed then to the next adjoining part.

Watts.

If it has a singular subject in its *propositional* sense, it is always ranked with universals.

Id.

PROPOSITION, in logic, part of an argument wherein some quality, either negative or positive, is attributed to a subject.

PROPOSITION, in mathematics, is either some truth advanced and shown to be such by demonstration or some operation proposed and its so-

lution shewn. If the proposition be deduced from several theoretical definitions compared together, it is called a theorem; if from a praxis, or series of operations, it is called a problem.

PROPOUND', *v. n.* } Lat. *propono*. To
 PROPOUNDER. } offer to consideration;
 a spirit: he who proposes any thing.

A spirit raised from depth of under-ground,
 That shall make answer to such questions,
 As by your grace shall be *propounded* him.

Shakspeare.

A king, when he presides in council, let him beware how he opens his own inclination too much in that which he *propoundeth*; for else counsellors will but take the wind of him, and, instead of giving free counsel, will sing him a song of placebo.

Bacon.

To leave as little as I may unto fancy, which is wild and irregular, I will *propound* a rule.

Wotton.

The parliament, which now is held, decreed
 Whatever pleased the king but to *propound*.

Daniel.

Dar'st thou to the Son of God *propound*

To worship thee?

Milton.

The existence of the church hath been *propounded* as an object of our faith in every age of Christianity.

Pearson.

The arguments which Christianity *propounds* to us are reasonable encouragements to bear sufferings patiently.

Tillotson.

PROPRETOR, a Roman magistrate, who, having discharged the office of pretor at home, was sent into a province to command there with his former pretorial authority. It was also an appellation given to those who, without having been pretors at Rome, were sent extraordinarily into the provinces to administer justice, with the authority of pretors.

PROPRIETY, *n. s.*

PROPRIETARY, *n. s. & adj.*

PROPRIETOR, *n. s.*

PROPRIETRESS.

Fr. *propriété*,

propriétaire;

Lat. *proprietas*.

Peculiar possession or right; hence accuracy; justness; correctness of behaviour: a proprietary is a possessor in his own right; the adjective means belonging of right to a certain owner: proprietor, an owner; possessor in his own right: proprietress, the feminine of that noun.

You must have promised to yourselves *propriety* in love,
 Know women's hearts like straws do move.

Suckling.

Benefit of peace, and vacation for piety, render it necessary by laws to secure *propriety*.

Hammond.

Hail, wedded love! mysterious law, true source

Of human offspring, sole *propriety*

In Paradise! of all things common else.

Milton.

They secure *propriety* and peace.

Dryden.

A big-bellied bitch borrowed another bitch's kennel to lay her burden in; the proprietress demanded possession, but the other begged her excuse.

L'Estrange.

Man, by being master of himself, and proprietor of his own person, and the actions or labour of it, had still in himself the great foundation of property.

Locke.

Common use, that is the rule of *propriety*, affords some aid to settle the signification of language.

Id.

Though sheep, which are *proprietary*, are seldom marked, yet they are not apt to straggle.

Greer.

'Tis a mistake to think ourselves stewards in some of God's gifts, and *proprietary* in others: they are

all equally to be employed, according to the designation of the donor. *Government of the Tongue.*

PROPUGN' v. a. } Lat. *propugno*. To
PROPUGNATION, n. s. } defend, vindicate:
PROPUGNER. } defence: he who defends.

Thankfulness is our meet tribute to those sacred champions for *propugning* of our faith. *Hammond.*

PROPULSION, n. s. Lat. *propulsus*. The act of driving forward.

Joy worketh by *propulsion* of the moisture of the brain, when the spirits dilate and occupy more room. *Bacon.*

PROPYLÆA (Greek *προπυλαία*); the splendid entrance to a temple among the Greeks, a square before the temple, surrounded with a portico; on the square in the open air stood the altar. The term was employed particularly in speaking of the superb vestibules, or porticoes, conducting to the Acropolis, or citadel of Athens, which formed one of the principal ornaments of the city. This magnificent work, of the Doric order, was constructed by Pericles, after the designs of Mnesicles, one of the most celebrated architects of his age. Pausanias says it was covered with white marble, remarkable for the size of the blocks and the beauty of the workmanship. Stewart, in his Antiquities of Athens, Le Roy, in his ruins of Greece, and the Travels of Anacharsis the Younger, mention the relics of the propylæa.

PROPE, n. s. Lat. *prora*. The prow; the forepart of the ship. A poetical word, used for a rhyme.

There no vessel with vermilion *prore*,
Or bark of traffic, glides from shore to shore. *Pope.*

PROROGUE, v. a. } Fr. *proroger*; Latin
PROROGATION, n. s. } *prorogo*. To protract;
prolong; put off; in a particular sense withhold the sitting of parliament: the noun substantive corresponding.

My life was better ended by their hate,
Than death *prorogued*, wanting of thy love. *Shakspeare.*

By the king's authority alone they are assembled, and by him alone are they *prorogued* and dissolved; but each house may adjourn itself. *Baron.*

He *prorogued* his government, still threatening to dismiss himself from public cares. *Dryden.*

The fulness and effluence of man's enjoyments, in the state of innocence, might seem to leave no place for hope, in respect of any farther addition, but only of the *prorogation* and future continuance of what already he possessed. *South.*

It would seem extraordinary, if an inferior court should take a matter out of the hands of the high court of parliament, during a *prorogation*. *Swift.*

But Savage easily reconciled himself to mankind without imputing any defect to his work, by observing that his poem was unluckily published two days after the *prorogation* of parliament. *Johnson.*

PROROGATION differs from an adjournment of parliament in this, that by prorogation the session is ended, and such bills as passed in either house, or both houses, and had not the royal assent, must at the next assembly begin again.

PRORUPTION, n. s. Lat. *proruptus*, *prorumpo*. The act of bursting out.

Others ground this disruption upon their continued or protracted time of delivery, whereat, excluding

but one a day, the latter brood, impatient, by a forcible *prorruption*, anticipate their period of exclusion.

Broune's Vulgar Errors.

PROSCRIBE, v. a. } Latin *proscribo*. To
PROSCRIBER, n. s. } censure capitably; de-
PROSCRIPTION. } cree to death or de-
struction: the proscriber is he who makes or issues such a decree: proscription, the decree issued.

Robert Vere, earl of Oxford, through the malice of the peers, was banished the realm, and *proscribed*. *Spenser.*

You took his voice who should be prickt to die,
In our black sentence and *proscription*. *Shakspeare.*

For the title of *proscription*, or forfeiture, the emperor hath been judge and party, and justified himself. *Bacon.*

I hid for thee
Thy murder of thy brother, being so bribed,
And writ him in the list of my *proscribed*
After thy fact. *Ben Jonson.*

Sylla's old troops
Are needy and poor; and have but left t' expect
From Catiline new bills and new *proscriptions*. *Id.*

Followed and pointed at by fools and boys,
But dreaded and *proscribed* by men of sense. *Roscommon.*

He shall be found,
And taken or *proscribed* this happy ground. *Dryden.*

The triumvir and *proscriber* had descended to us in a more hideous form, if the emperor had not taken care to make friends of Virgil and Horace. *Id.*

Some utterly *proscribe* the name of chance, as a word of impious and profane signification; and, indeed, if taken by us in that sense in which it was used by the heathens, so as to make any thing casual, in respect of God himself, their exception ought justly to be admitted. *South.*

In the year 325, as is well known, the Arian doctrines were *proscribed* and anathematized in the famous council of Nice, consisting of 318 bishops, very unanimous in their resolutions, excepting a few reclaimants. *Waterland.*

That he who dares, when she forbids, be grave,
Shall stand *proscribed*, a madman or a knave,
A close designer not to be believed,
Or, if excused that charge, at least deceived. *Cowper.*

PROSE, n. s. } Fr. *prose*; Lat. *prosa*. Lan-
PROSAIC, adj. } guage not restrained to har-
monic sounds or numbers; discourse not metrical: prosaic, the corresponding adjectival.

Things unattempted yet in *prose* or rhyme. *Milton.*

The reformation of *prose* was owing to Boccace, who is the standard of purity in the Italian tongue, though many of his phrases are become obsolete. *Dryden.*

A poet lets you into the knowledge of a device better than a *prose* writer, as his descriptions are often more diffuse. *Addison.*

Prose men alone for private ends,
I thought, forsook their ancient friends. *Prior.*

My head and heart thus flowing through my quill,
Verse man and *prose* man, term me which you will. *Pope.*

I will be still your friend in *prose*:
Esteem and friendship to express,
Will not require poetic dress. *Swift.*

PROSECUTE, *v. a.* } Lat. *prosequor*, *pro-*
 PROSECUTION, *n. s.* } *secutus*. To pursue ;
 PROSECUTOR. } persevere in endeavors
 after any thing ; continue ; proceed ; particu-
 larly, to proceed by legal measures : prosecution
 is, pursuit ; continuance of design or effort ;
 legal suit : prosecutor, he who pursues or prose-
 cutes legally or otherwise.

An infinite labour to *prosecute* those things, so far
 as they might be exemplified in religious and civil
 actions. *Hocker.*

I am beloved of *beauteous* *Hermia* ;
 Why should not I then *prosecute* my right ?

Shakspeare.

The same reasons, which induced you to entertain
 this war, will induce you also to *prosecute* the same.

Hayward.

All resolute to *prosecute* their ire,
 Seeking their own and country's cause to free.

Daniel.

That which is morally good is to be desired and
prosecuted ; that which is evil is to be avoided.

Wilkins.

He infested Oxford, which gave them the more
 reason to *prosecute* the fortifications. *Clarendon.*

I must not omit a father's timely care,
 To *prosecute* the means of thy deliverance
 By ransom. *Milton's Agonistes.*

With louder cries

She *prosecutes* her griefs, and thus replies.

Dryden.

He *prosecuted* this purpose with strength of argu-
 ment and close reasoning, without incoherent sallies.

Locke.

Many offer at the effects of friendship, but they
 do not last ; they are promising in the beginning,
 but they fail, jade, and tire in the *prosecution*.

South.

Their jealousy of the British power, as well as
 their *prosecutions* of commerce and pursuits of uni-
 versal monarchy, will fix them in their aversions to-
 wards us. *Addison.*

Addison.

PROSECUTION. See LAW.

PROSELYTE, *n. s.* & *v. a.* Fr. *proselite* ;
 Gr. *προσηλυτος*. A convert ; one brought over
 to a new opinion : to convert.

Ye compass sea and land to make one *proselite*.

Matthew.

Never any Pharisee was so eager to make a *prose-*
lyte, as our late factors of Rome. *Hall.*

He that saw hell in's melancholy dream,
 Scared from his sins, repented in a fright,
 Had he viewed Scotland, and turned *proselite*.

Cleaveland.

Where'er you tread,

Millions of *proselites* behind are led,
 Through crowds of new-made converts still you go.

Granville.

Men become professors and combatants for those
 opinions they were never convinced of, nor *proselites*
 to. *Locke.*

What numbers of *proselites* may we not expect ?

Addison.

Men of this temper cut themselves off from the
 opportunities of *proselitying* others, by averting them
 from their company. *Government of the Tongue.*

PROSELYTE, in theology, is used to denote any
 new convert. The term was frequent in the pri-
 mitive church ; and the Jews likewise had their
 proselytes, who from Gentiles became Jews, fol-
 lowing the precepts of the Mosaic law. It is
 generally believed that among the Hebrews there
 were two kinds of proselytes ; one called prose-

lytes of righteousness, or proselytes of the cove-
 nant, who became complete Jews, by submitting
 to the rite of circumcision, and were in all re-
 spects united to the Jewish church and nation.
 The other called proselytes of the gate, who did
 not embrace the Jewish religion, so as to be
 obliged to receive or observe the ceremonial law,
 and yet were suffered to live among the Jews
 under certain restrictions ; as that they should
 not practice idolatry, nor worship any other god
 beside the God of Israel ; that they should not
 blaspheme the God of Israel ; that they should
 keep the Jewish sabbath, so far at least as to re-
 frain from working on that day. Besides forsak-
 ing idolatry, they were under an obligation to
 observe the seven precepts, which, as the Tal-
 mudists pretend, God gave to Adam, and after-
 wards to Noah, who transmitted them to posterity.
 The first of these precepts forbids idolatry, and
 the worship of the stars in particular ; the second
 recommends the fear of God ; the third forbids
 murder ; the fourth adultery ; the fifth theft ; the
 sixth enjoins respect and veneration for magis-
 trates ; and the seventh condemns eating of flesh
 with the blood.

Dr. Lardner, with whom Dr. Doddridge and
 others also agree, is of opinion that there was
 but one sort of proselytes among the Jews. They
 were circumcised, and thus they became Jews
 by religion, and were permitted to eat the pass-
 over, and to partake of all religious privileges,
 as the Jews by descent did. They were called
 'strangers, or proselytes within the gates, and
 sojourners,' as they were allowed to dwell or
 sojourn among the people of Israel. And they
 were so called, because, according to the law
 of Moses, they could not possess land. This is
 the sense of the word in all the texts of the New
 Testament where it is used. Dr. Lardner thinks
 that the notion of two kinds of Jewish proselytes
 cannot be found in any Christian writer before
 the fourteenth century or later. This learned
 writer pays no regard to what the later Jewish
 rabbins say of the method of initiating proselytes
 by circumcision, baptism, and sacrifice. See
 Lardner's works, and Doddridge on the Acts.

PROSELYTE BAPTISM. The Jews (see our ar-
 ticle BAPTISM) are said from an early period to
 have practised the baptism of all their proselytes
 from the heathen. We have given the ingenious
 parallelism that has been drawn by some writers
 between that supposed custom and Christian
 baptism : the most modern and respectable au-
 thors, we may add, continue to quote the con-
 stant practice, as it has been called, of the Jews
 in this matter 'before our Saviour's time, as the
 foundation of infant baptism.' The editor of the
 last edition of Dr. Gale's Reply to Dr. Wall
 wholly disputes, however, the validity of this
 argument, and insists that no foundation can
 be found for it in authentic history. As we have
 not met elsewhere with so detailed an examina-
 tion of the authorities commonly referred to, we
 subjoin his remarks on those of Dr. Wall's In-
 troduction.

Dr. Wall, as this writer concedes, has rested
 on the authority of some considerable names.
 That is, he has transferred from the pages of
 Ainsworth, Hammond, Lightfoot, &c., what they

state to be found in 'the books of the Jews,' without appearing to have consulted the original authorities; 'partly,' as he states, 'because the quotations for that purpose are to be searched for in books with which I am not so well acquainted; and partly because those few which I shall produce will make it clear enough that there was such a custom.' He repeatedly presses the importance of establishing this custom in the controversy with Antipædobaptists. 'The apostles must know that baptism was usually given to infants.' They would conceive the command to proselyte and baptize all nations to include infants as a matter of course; Christ 'took into his hands baptism,' says he, after Lightfoot, 'such as he found it, adding with this, that he exalted it to a nobler purpose and to a larger use;'—and after Hammond, that 'The whole nation knew well enough that infants were wont to be baptized. There was no need of a precept for that which was always settled by common use. Suppose there should at this time come out a proclamation in these words, Every one on the Lord's Day shall repair to the public assembly in the church: that man would reason weakly who should conclude that there were no prayers, sermons, psalms, &c., in the public assemblies on the Lord's Day, for this reason, because there was no mention of them in this proclamation; for the proclamation ordered the keeping of the Lord's Day in the public assemblies in general; and there was no need that mention should be made of the particular kinds of divine worship there to be used, since they were, both before and at the time of the said proclamation, known to every body, and in common use. Just so the case stood as to baptism. Christ ordered it to be for a sacrament of the New Testament, by which all should be admitted to the profession of the gospel, as they were formerly to proselytism in the Jews' religion. The particular circumstances of it, as the manner of baptizing, the age of receiving it, which sex was capable of it, &c., had no need of being regulated or set down, because they were known to every body by common usage. It was, therefore, necessary, on the other side, that there should have been an express and plain order that infants and little children should not be baptized, if our Saviour had meant that they should not; for, since it was ordinary in all ages before to have infants baptized, if Christ would have had that usage to be abolished, he would have expressly forbidden it; so that his and the Scriptures' silence in this matter does confirm and establish infant baptism for ever.'

I. Dr. Wall's first position is, that it is evident 'the custom of the Jews before our Saviour's time (and as they themselves affirm from the beginning of their law) was to baptize as well as circumcise any proselyte that came over to them from the nations.' 'This custom of theirs, he says, 'is fully and largely set forth by Maimonides, Isura Bia, cap. xiii. and xiv;' from whom a long quotation states that the ancient Israelites entered into covenant with Jehovah by circumcision, dipping, and sacrifice; that in all ages when an Ethnic is desirous of joining himself to Israel, 'and take upon him the

yoke of the law, he must be circumcised, and baptized, and bring a sacrifice; or, if it be a woman, be baptized and bring a sacrifice,' with several particulars respecting the nature of the offering that was to be brought, the time of performing the baptism, the number of witnesses necessary, &c. Maimonides further asserts that the judges received no proselytes in David's days, lest they should have come of fear; nor in Solomon's, lest they should have come because of the great prosperity of Israel. 'Notwithstanding there were many proselytes,' he adds, 'that in David's and Solomon's time joined themselves in the presence of private persons; and the judges of the great sanhedrim had a care of them. They drove them not away after they were baptized out of any place; neither took they them near to them until their after-fruits appeared.'

The Babylonian Talmud says the same thing with regard to receiving proselytes by baptism, according to Dr. Wall, and only differs with the Talmud Hiersosol. Jevamoth as to the number of witnesses that should be present; and here follow three quotations, which the doctor says are taken from the latter (published about A. D. 230), but which in point of fact are all from the former (compiled not earlier than A. D. 500), as Dr. Gill has long ago remarked. They are all from T. BAB Yebamot, fol. xlvi. 2, et Gloss. So that we have not, as yet, any authority earlier than the Babylonian Talmud, or a Collection of Jewish Traditions and Comments on the Law, published at the beginning of the sixth century of the Christian era. Leo Modena is then quoted to show that the modern Jews continue this practice.

The Gemara *Babylon. tit. Cherithoth, and tit. Jabimoth* (portions of this Talmud) are afterwards brought forward to prove that 'the books do speak of this washing or baptism as absolutely necessary; that 'he is no proselyte unless he be circumcised and baptized;' the Talmud Tract Repudii (also a part of the Babylonian Talmud), as quoted by Godwin in his *Moses and Aaron*, states that Jethro, the father-in-law of Moses, was 'made a proselyte by circumcision and immersion in waters;' the comment of Moses Kotsensis, a Jewish writer of the fourteenth century, that 'a purification by water' was necessary; and Drusius, a learned Fleming of the sixteenth century, that 'of a woman proselyte were required only purification by water and oblation.' It is on this collection of authorities (and we have mentioned them all) that Dr. Wall remarks, 'This custom of the Jews continued after Christ's time, and after their expulsion from the Holy Land; and continues, as I showed from Leo Modena, to this day.'

He now cites the testimony of Arrian, who (A. D. 147) calls the Jews *βεβαμμενος*, the dipped; and proceeds to show how the Jewish doctors 'prove the necessity of this washing and baptism from Moses' law;' he says that many of them understand the command, *Exod. xix. 10*, for the people to sanctify themselves, as meaning to wash or baptize themselves; that Aben Ezra, who died A. D. 1174, understands Jacob's injunction to his family on the subject of meeting

God at Bethel, Genesis xxxv. 2, to refer to 'a washing of their whole bodies;' he mentions Selden as showing from several Jewish commentators that when the washing of garments is mentioned, Lev. xi. xiv., and in various other places, the washing of the whole body is intended; and again adverts to Maimonides and the Babylonian Talmud on the subject of the 'three things' required of a proselyte, because they were originally required of the Jews. Of these, says Maimonides, 'Baptism was in the wilderness, just before the giving of the law, as it is written, Sanctify them to-day and to-morrow and let them wash their clothes.' Dr. W. concludes his list of Jewish authorities with the words of R. Solomon, who lived in the twelfth century, 'Our rabbins teach that our fathers entered into covenant by circumcision and baptism, and sprinkling of blood.'

St. Gregory Nazianzen, Cyprian, Basil, and Tertullian, are then brought as early Christian witnesses of this baptism amongst the Jews. St. Gregory speaks of Moses giving a baptism or washing with water only, and that 'before that they were baptized with the cloud and the sea, as St. Paul reasons;' Cyprian of 'the baptism of the law and of Moses;' which Basil compares with that of John and Christ. 'Before them all, however,' observes Dr. Wall, 'Tertullian complains of the devil aping or imitating the things of God,' in the rites of Ceres and Apollo, which were accompanied with baptism; and which 'divine baptism,' so imitated, Dr. Wall says, must intend the Jewish baptism.

Such are the entire authorities of Dr. Wall for his first and most important position, that Jewish proselyte baptism was not only in existence before our Saviour's time, but even from the beginning of the Mosaic dispensation.

II. Dr. Wall secondly proposes to show, that the infants of proselytes born previous to their conversion to Judaism were baptized with their parents, and admitted as proselytes. The Babylonian Talmud is here again his first authority; then follows a passage from the text of the Mishna.

This is a compendium of Jewish traditions collected by R. Jehuda Hakkodesh, in the middle of the second century of the Christian era, and the most authentic depository of the oral law said to be delivered by Jehovah to Moses, together with the written law, during the forty days he was in Sinai. When Moses returned to his tent, according to Maimonides, he was attended by Aaron, to whom he recited the text (which alone was written) and taught the interpretation which he thus received; Eleazar and Ithamar then entered, to whom he repeated the sacred communications; then the seventy elders, to whom he again repeated the whole; afterwards entered the congregation at large, to whom it was once more repeated; and being thus heard by Aaron four times, by his sons three times, by the seventy elders twice, and by the congregation once, it became firmly and proportionally fixed in their memories. Rabbi Moses Kotsensis, quoted by Dr. Wall in a former page, says, 'If the oral law had not been added to the written law, the whole law would have been ob-

scure and unintelligible. For in the first place there are Scriptures contrary to each other; and, in the next place, the written law is imperfect, and comprehends not all that is necessary to be known.' 'He that has learned the Scripture and not the Mishna is a blockhead,' according to one of the maxims of 'he Gemara.

According to the Mishna, on which the Talmuds contain Glosses or Comments, a girl born of heathen parents and made a proselyte after she is three years and a day old, shall not have 'such and such privileges,' as Dr. Wall quotes it. That is, as the whole passage runs, a certain matrimonial dowry. The Babylonian Talmud says, that if she be made a proselyte before that age she shall have it; and the Gemara or Comment of this Talmud that 'they are wont to baptize such a proselyte in infancy upon the profession of the house of judgment; for this is for its good.' The Mishna itself, as quoted by Dr. Wall, has not a word respecting baptism or dipping, or how the proselyte was to be made such, nor the Jerusalem Talmud on the place. 'But they are wont to baptize,' says the above Gloss of the sixth century, 'because none is made a proselyte without circumcision or baptism.' It then speaks of the appointment of three men as a kind of sponsors for the education of the child.

Maimonides quotes this passage, therefore Dr. Wall quotes him again here; and from Selden the rule, originally found in the same Gemara or Gloss, that a male child was not to be considered capable of giving his own consent to become a proselyte until he was thirteen years old and a day; but a female might give her consent, or be proselyted in her own name, at twelve years and a day.

The opinions of several Jewish and Christian doctors are then quoted, as to the power of infants to retract their baptismal vows; and a quotation by Hammond of a 'saying' from Maimonides (who quotes it from the Babylonian Talmud), that 'A heathen woman, if she be made a proselyte when big with child, that child needs not baptism, for the baptism of the mother serves him for baptism.' Children born to proselytes after their parents were baptized, 'they reckoned were clean by their birth.'

And these are all the proofs of Jewish infant-baptism produced by Dr. Wall, beginning with a Jewish Commentary of the sixth century, and confirmed by subsequent writers.

III. Dr. Wall, thirdly, undertakes to prove that gentile infants found exposed, or taken in war, were frequently 'baptized for proselytes.' So says Maimonides; and by Dr. Wall the baptism of such a child is said to be according to the rule of rabbi Hezekiah, set down in the Jerusalem Talmud. This rule, however, which he recites, relates entirely to the dipping for servitude, or otherwise, or a civil designation totally distinct from the baptism of proselytes, as Maimonides himself states, the former being repeated (anabaptistically) in case of the servant ever becoming free; that is, he was then dipped or dipped himself, for the ten thousandth time perhaps, with a different object in view. See Isuri Biah, c. xiii. ss. 11 and 12, &c.

And these are Dr. Wall's authorities for his third conclusion.

IV. His fourth is entirely grounded on the preceding, viz. that the baptism of proselytes was called by the Jews a new birth, a regeneration, or being born again. He quotes the Babylonian Gemara and Maimonides in support of this, the latter of whom applies the same phrase to 'a servant made free.' Dr. Wall thinks that our Lord adopted this phraseology in his conversation with Nicodemus, that St. Paul alludes to it, 2 Cor. v. 16, 17, &c., and that the Fathers continued it in their manner of stating regeneration. This writer afterwards draws a sort of parallel between what he conceives to have been the Jewish and the early Christian modes of baptizing, with regard both to adults and infants; he again quotes the Babylonian Talmud, in reply to Sir Norton Knatchbull, to prove 'the wise men pronounced' that until he were 'both circumcised and baptized no gentile could be a proselyte;' this, however, is the statement of but one side of a dispute; and with rabbi Eliezer (who was on the other side) and who pronounced, even at this date, that a gentile circumcised and not baptized was an honorable proselyte, the decision is always held to rest. This is the entire amount of evidence produced by the doctor.

'A more singular instance of confused quotations,' says this writer, 'passing current with the world for proofs, never perhaps was afforded, than in the authority this Introduction has been allowed in the baptismal controversy. Wall never, it is clear, examined the works on which he ultimately rests this important part of his argument (and upon which so many respectable writers have rested their notions of the matter after him); he does not even seem to have paid the attention of an ordinary compiler to their dates. Thus a writer (Maimonides) of the latter end of the twelfth century, the Babylonian Talmud first published in the sixth century, and the Jerusalem Talmud (which he thinks he is quoting) of the third century, Moses Kotsensis who flourished in the fourteenth, and Drusius, a writer of the sixteenth century, are made to speak in succession as to the existence of a custom disputed in point of date, and evidently as if they were all speaking of the same period. After quoting the last writer he gravely says, 'this custom of the Jews continued after Christ's time, and after their expulsion from the Holy Land.'

PROSEMINATION, *n. s.* Lat. *prosemino*, *proseminatus*. Propagation by seed.

Touching the impossibility of the eternal succession of men, animals, or vegetables, by natural propagation or *prosemination*, the reasons thereof shall be delivered. *Hale*.

PROSERPINACA, in botany, a genus of the trigynia order, and triandria class of plants; natural order fifteenth, inudatæ: CAL. tripartite superior: COR. none: there is one trilocular seed.

PROSERPINE, in fabulous history, the daughter of Jupiter and Ceres, and queen of hell. She was carried off by Pluto while gathering flowers. Ceres, after a tedious search, intreated Jupiter to let her return from hell. To this request Jupiter consented, if she had tasted

nothing in hell; but Ascalaphus informing him that he had seen her eat part of a pomegranate, she was sentenced to continue in Tartarus as Pluto's spouse; but, to mitigate the grief of Ceres, Jupiter ordered her to spend six months on earth, and the other six months in the infernal regions. Some explain this fable to relate to the corn remaining six months in the earth.

PROSEUCHÆ, in antiquity [Gr. *προευχη*, prayer], the places of prayer of the Jews, nearly the same as their synagogues. But the synagogues were originally in the cities, and were covered places; whereas, for the most part, the *proseuchæ* were out of the cities, and on the banks of rivers; having no covering, except perhaps the shade of some trees or covered galleries.

PROSLAMBANOMENE, a musical note in the Greek system. As the two tetrachords of the Greeks were conjunctive, or, in other words, as the highest note of the first served likewise for the lowest note of the second, it is plain that a complete octave could not be formed. To remedy this deficiency, therefore, one note beneath the lowest tetrachord was added, as an octave to the highest of the last tetrachord. Thus, if we suppose the first to have begun on B, the last must have ended upon A, to which one note subjoined immediately beneath the lowest B in the diatonic order must have formed an octave. But it appears from authors who have scrutinised antiquity with some diligence, and perhaps with as much success as the data upon which they proceeded could produce, that the names of the notes in the Greek system, which originally signified their natural station in the scale of ascending or descending sounds, were afterwards applied to their positions in the lyre. Higher or lower, then, according to this application, did not signify their degree of acuteness or gravity, but their higher or lower situation upon this instrument.

PROS'ODY, *n. s.* } Fr. *prosodie*; Gr. *προ-*
PROS'ODIAN. } *σωδια*. That part of grammar which teaches the sound and quantity of syllables, and the measures of verse; one skilled in prosody.

Some have been so bad *prosodians*, as from thence to derive *malum*, because that fruit was the first occasion of evil. *Broune*.

Many of the rules and observations respecting *prosody* are taken from Sheridan's Art of Reading. *Murray*.

PROSODY, in grammar, treats of the quantity of syllables, as well as their accent and sound; it has also been held to include the laws of versification. Its most important and popular application is to quantity, although its Greek etymon, *προσωδια* (*προς, ωδη*) would certainly teach us to include accent, and therefore both pause, and tune. We devote, however, a distinct article to **VERSIFICATION**, to which we refer the reader for much we should otherwise be here disposed to say on the latter topics; and under **QUANTITY** will be found what relates peculiarly to that subject. See **PRONUNCIATION**.

PROSOPIS, in botany, a genus of the monogynia order, and decandria class of plants: CAL. hemispherical and quadridentate: stigma simple; the legume inflated and monospermous.

PROSOPOPOE'IA, *n. s.* Fr. *prosopopée*; Gr. *προσωποποιια*. Personification; a figure of rhetoric by which things are made persons.

These reasons are argued, and raised by the *prosopopeia* of nature speaking to her children.

Dryden.

PROSPECT, *n. s.* } Lat. *prospectus*. View
PROSPECTIVE, *adj.* } of something distant or future; view delineated; place of view; series of objects brought under the eye: the adjective corresponding.

To be king,
 Stands not within the *prospect* of belief,
 No more than to be Cawdor.

Shakespeare. Macbeth.

Man to himself
 Is a large *prospect*, raised above the level
 Of his low creeping thoughts. *Denham.*
 Eden and all the coast in *prospect* lay.

Milton.

The French king and king of Sweden are circum-
 spect, industrious and *prospective* too in this affair.

Child.

Is he a prudent man, as to his temporal estate,
 that lays designs only for a day, without any *prospect*
 to, or provision for the remaining part of his life?

Tillotson.

It is better to marry than to burn, says St. Paul;
 a little burning felt pushes us more powerfully, than
 greater pleasures in *prospect* allure.

Locke.

Against himself his gratitude maintained,
 By favours past, not future *prospects* gained.

Smith.

There is a very noble *prospect* from this place: on
 the one side lies a vast extent of seas, that runs
 abroad further than the eye can reach: just opposite
 stands the green promontory of Suretum, and on
 the other side the whole circuit of the bay of Naples.

Addison.

Present, sad *prospect!* can he ought descry,
 But what affects his melancholy eye;
 The beauties of the ancient fabrick lost
 In chains of craggy hills, or length of dreary coast?

Prior.

To say more of a man than one thinks, with a *pros-*
pect of interest, is dishonest; and without it foolish.

Pope.

Claude Lorrain, on the contrary, was convinced,
 that taking nature as he found it seldom produced
 beauty; his pictures are a composition of the vari-
 ous draughts which he has previously made from
 various beautiful scenes and *prospects*.

Reynolds.

Prospects, however lovely, may be seen

Till half their beauties fade.

Cowper.

PROSPER, *v. a. & v. n.* } Fr. *prosperer*;

PROSPERITY, *n. s.* }

PROSPEROUS, *adj.* }

PROSPEROUSLY, *adv.* }

PROSPEROUSNESS, *n. s.* }

Lat. *prospero*. To
 make happy; fa-
 vor; to be happy
 or successful:

prosperity and prosperousness mean success;
 happiness; good fortune: the adjective and ad-
 verb corresponding.

My word shall not return void, but accomplish
 that which I sent it, and it shall *prosper* in the thing
 whereunto I sent it.

Isaiah.

Prosperity, in regard of our corrupt inclination to
 abuse the blessings of Almighty God, doth prove
 a thing dangerous to the souls of men.

Hooker.

Kind gods, forgive
 Me that, and *prosper* him.

Shakespeare. King Lear.

Prosperously I have attempted, and
 With bloody passage led your wars, even to
 The gates of Rome. *Id. Coriolanus.*
 All things do *prosper* best, when they are advanced
 to the better; a nursery of stocks ought to be in a
 more barren ground, than that whereunto you remove
 them. *Bacon.*

God's justice reaps that glory in our calamities,
 which we robbed him of in our *prosperity*.

King Charles.

Surer to *prosper*, than *prosperity*

Could have assured us.

Milton.

She visits how they *prospered*, bud, and bloom. *Id.*
 That neat kind of acer, whereof violins and mu-
 sical instruments are made, *prosper* well in these
 parts. *Browne's Travels.*

All things concur to *prosper* our design;

All things to *prosper* any love but mine. *Dryden.*

Those, who are *prosperously* unjust, are intitled to
 panegyrick, but afflicted virtue is stabbed with re-
 proaches. *Id.*

Prosperity which depends upon the caprice of
 others is of short duration. *Johnson.*

PROSSNITZ, or **PROSTIEGOW**, a trading town
 of the Austrian States in Moravia, the chief
 place of the district of Hanna, and situated in
 the midst of a very fertile tract. Nine miles
 S. S. W. of Olmutz.

PROSTATÆ GLANDULÆ, prostate glands.
See ANATOMY.

PROSTERNATION, *n. s.* Lat. *prosterno*.
 Dejection; depression; state of being cast
 down; or act of casting down. A word not
 adopted.

Pain interrupts the cure of ulcers, whence are
 stirred up a fever, watching, and *prosternation* of
 spirits. *Wiseman.*

PROSTITUTE, *v. a., adj., & n. s.* } French
PROSTITUTION, *n. s.* } *prostituér*;

Span. and Port. *prostituyr*; Lat. *prostitutio*.
 To sell to wickedness; expose to crimes for a
 reward: bribed or sold to vice: a hiring or
 mercenary so sold. Commonly used of women
 sold to whoredom. Prostitution, the act or habit
 of being prostituted.

Do not prostitute thy daughter, to cause her to be
 a whore. *Leviticus* xix. 29.

Who shall prevail with them to do that themselves
 which they beg of God, to spare his people and his
 heritage, to prostitute them no more to their own
 sinister designs? *Decay of Piety.*

Marrying or prostituting,

Rape or adultery. *Milton's Paradise Lost.*

It were unfit that so excellent and glorious a re-
 ward, as the gospel promises, should stoop down like
 fruit upon a full laden bough, to be plucked by every
 idle and wanton hand, that heaven should be *prostitu-*
tuted to slothful men. *Tillotson.*

At open fulsome bawdry they rejoice,

Base prostitute! thus dost thou gain thy bread.

Dryden.

An infamous woman, having passed her youth in
 a most shameless state of *prostitution*, now gains
 her livelihood by seducing others.

Addison's Spectator.

Affections, consecrated to children, husbands, and
 parents, are vilely *prostituted* and thrown away upon
 a hand at loo. *Addison.*

Their common loves, a lewd abandoned pack
 By sloth corrupted, by disorder fed,
 Made bold by want, and prostitute for bread,

Prior

No hiring she, no prostitute to praise. *Pope.*

PROSTRATE, *adj.* & *v. a.* } *Lat. prostrat-*
 PROSTRATION, *n. s.* } *ius.* Lying at
 length; a posture denoting adoration and humili-
 ation; hence lying at mercy: to lay flat; throw
 down: the noun substantive corresponds, and
 means, also, dejection; depression.

Once I saw with dread oppressed
 Her whom I dread; so that with *prostrate* lying,
 Her length the earth in love's chief cloathing dressed.
Sidney.

A storm that all things doth *prostrate*,
 Finding a tree alone all comfortless,
 Beats on it strongly, it to ruinat. *Spenser.*

The warning sound was no sooner heard, but the
 churches were filled, the pavement covered with
 bodies *prostrate*, and washed with tears of devout
 joy. *Hooker.*

Look gracious on thy *prostrate* thrall.

In the streets many they slew, and fired divers
 places, *prostrating* two parishes almost entirely.
Shakspeare.

He heard the western lords would undermine
 His city's wall, and lay his towers *prostrate*.
Hayward.

Our *prostrate* bosomes forc't with prayers to trie,
 If any hospitable right, or boone
 Of other nature, such as have bin wonne
 By laws of other houses, thou wilt give. *Chapman.*

Your lordships must give me leave to say that the
 poor Church of England humbly *prostrates* herself,
 next after his sacred majesty, at your lordships' feet;
 and humbly craves your compassion and aid.
Fairfar.

Some have *prostrated* themselves an hundred times
 in the day, and as often in the night. *Duppa.*
 Grovelling and *prostrate* on yon lake of fire.
Milton.

Nor is only a resolved *prostration* unto antiquity a
 powerful enemy unto knowledge, but any confident
 adherence unto authority. *Browne.*

Stake and bind up your weakest plants against the
 winds, before they come too fiercely, and in a moment
prostrate a whole year's labour. *Evelyn.*

The truths, they had subscribed to in speculation,
 they reversed by a brutish senseless devotion, man-
 aged with a greater *prostration* of reason than of
 body. *South.*

The drops falling thicker, faster, and with greater
 force, beating down the fruit from the trees, *prostrat-*
ing and laying corn growing in the fields.

A sudden *prostration* of strength, or weakness, at-
 tends this colick. *Arbuthnot.*

While *prostrate* here in humble grief I lie,
 Kind virtuous drops just gathering in my eye.
Pope.

The general idea of showing respect is by making
 yourself less; but the manner, whether by bowing the
 body, kneeling, *prostration*, pulling off the upper part
 of our dress, or taking away the lower, is a matter of
 custom. *Sir J. Reynolds.*

PROSYLLOGISM, *n. s.* Pro and syllogism.

A *prosylogism* is when two or more syllogisms are
 so connected together that the conclusion of the former
 is the major or the minor of the following.
Watts.

PROTAGORAS a celebrated Greek philosopher,
 born at Abdera. Being in his youth employ-
 ed in carrying wood to Abdera, Democritus

met him one day, and, observing the logs packed
 up with mathematical exactness, took him under
 his protection, maintained him, and taught him
 philosophy. He afterwards himself taught with
 reputation at Athens, but was at length banished
 thence for the alleged impiety of his doctrines.
 Of this he was accused by different persons, and
 among others by one of his scholars, viz. Eval-
 thus, who asserted that in one of his books he
 had said, 'concerning the gods I am wholly
 unable to determine whether they have any
 existence or not; for the weakness of the human
 understanding, and the shortness of human life,
 with other causes, prevent us from attaining this
 knowledge.' Similar opinions were also to be
 met with in some of his other writings, and, on
 this account, they were ordered to be collected
 and burnt in the market-place. He had unques-
 tionably an inclination to scepticism. Adopting
 the doctrine of Democritus, that the atoms of
 which bodies are composed are in perpetual
 motion, Protagoras conceived that external ob-
 jects are liable to such continual fluctuation that
 nothing can certainly be known of them; and
 hence he concluded that nothing can be pro-
 nounced to exist, but that which is at any instant
 perceived by the senses; and that since these are
 perpetually varying, things themselves accord-
 ingly vary, so that, upon the same evidence, that
 of the senses, contradictory opinions may be
 advanced. On his banishment from Athens he
 visited the islands in the Mediterranean, where
 it is said that he was the first philosopher that
 lectured for money. He died in a voyage to
 Sicily, in a very advanced age. He commonly
 reasoned by dilemmas, and left the mind in
 suspense with respect to all the questions he
 proposed. Plato wrote a dialogue against him.
 He flourished about A. A. C. 400.

PROTATICK, *adj.* Fr. *protatique*; Gr.
πρωτατικός. Previous.

There are *protatick* persons in the ancients, whom
 they use in their plays to hear or give the relation.
Dryden.

PROTEA, in botany, the silver tree, a genus
 of the monogynia order, and tetrandria class of
 plants; natural order forty-eighth, aggregatæ.
 There is one quadrifid petal surrounding the
 germ: CAL. none; the receptacle is paleaceous.
 There are thirty-six species, all natives of the
 Cape of Good Hope; of which the most re-
 markable are:—

1. *P. argentea*, commonly called silver tree,
 with a strong upright stem, covered with pur-
 plish bark, dividing into several branches which
 grow erect, garnished with broad, shining, silvery
 leaves, which make a fine appearance when in-
 termixed with other exotics. Through the whole
 year it exhibits its glossy white or silvery leaves.
 It has at first a very uncommon and beautiful
 appearance, and sometimes in the course of twelve
 or fifteen years reaches the height of twenty
 feet, which it never exceeds. These trees are
 generally planted near some farms, and very
 seldom grow wild.

2. *P. conifera*, with linear, spear-shaped,
 entire leaves, grows to the height of ten or
 twelve feet, with a straight regular stem. The
 branches naturally form a large regular head

The leaves are long and narrow, of a shining silver color; and, as they remain the whole year, make a fine appearance in the green-house.

3. *P. nitida*, or wageboom, greatly resembles the first sort: the leaves are very silky and white, with erect purple branches. All these plants, being tender exotics, require to be continually kept in the green-house during winter. The second may be propagated by cuttings, which should be cut off in April, just before the plants begin to shoot; the first and third sorts may be propagated by seeds.

PROTECT, *v. a.* } Fr. *protéger, protecteur* ;
PROTECTION, *n. s.* } Lat. *protectus*. To shelter
PROTECTIVE, *adj.* } ter; defend: afford im-
PROTECTOR, *n. s.* } munity from evil; and in
PROTECTOR, *n. s.* } a modern sense (to avoid
calling a spade a spade), to keep as a concu-
bine: protection and protector follow these
senses: protective is defensive; sheltering: pro-
tectress, a woman who protects.

Drive toward Dover, friend, where thou shalt meet
Both welcome and protection.

Shakspeare. King Lear.

The king

Had virtuous uncles to protect his grace.

Shakspeare.

Is it concluded he shall be protector? *Id.*

All things should be guided by her direction, as
the sovereign patroness and protectress of the enter-
prise. *Bacon.*

Leave not the faithful side,
That gave thee being still shades thee and protects.
Milton.

Hither the' oppressed shall henceforth resort,
Justice to crave, and succour at your court;
And then your highness, not for our alone,
But for the world's protector shall be known.

Waller.

The law of the empire is my protection. *Kettlewell.*
Full in the midst of his own strength he stands,
Stretching his brawny arms and leafy hands,
His shade protects the plains. *Dryden's Virgil.*

The obligations of hospitality and protection are
sacred; nothing can absolve us from the discharge
of those duties. *L'Estrange.*

Behold those arts with a propitious eye,
That suppliant to their great protectress fly.

Addison.

The king of Spain, who is protector of the common-
wealth, received information from the great duke.

Id.

If the weak might find protection from the mighty,
they could not with justice lament their condition.

Swift.

The stately sailing swan guards his osier isle,
Protector of his young. *Thomson.*

PROTECTOR is also a title given to the repre-
sentative of a Catholic nation, or religious order,
at the court of Rome, who is often a cardinal.

PROTECTORATE, the office of protector;
applied in British history to the office held by
Oliver Cromwell.

PROTEND, *v. a.* Lat. *protendo*. To hold
out; to stretch forth. Not used.

All stood with their protended spears prepared.
Dryden.

PROTESILAI TURRIS, the sepulchre of Pro-
tesilaus, with a temple, at which Alexander
sacrificed, situated at the south extremity of the
Hellespont, next to the Chersonesus Thracia.

PROTESILAUS, a king of part of Thessaly,
the son of Iphiclus, grandson of Phylacus, and
brother of Alcimede, the mother of Jason. He
was the first Greek who landed on the coast of
Troy, and the first slain by the Trojans. (Homer,
Ovid.) His wife Laodamia, to assuage her
grief, requested of the gods that his shade might
be permitted to visit her, and, obtaining her
request, she expired in his embraces. (Hyginus.)
Protesilaus was also called Phylacides, from
Phylace, a town of Thessaly, or rather from his
grandfather Phylacus.

PROTEST, *v. n., v. a., & n. s.* } Fr. *protes-*
PROTESTANT, *n. s. & adj.* } *ter*; Span.
PROTESTANCY, *n. s.* } and Port.
PROTESTATION, } *protestar* ;
PROTESTER, } Ital. *protes-*

ture; Lat. *protestor*. To make a solemn decla-
ration of one's judgment or resolution; more
commonly used of an adverse judgment: to
prove; show; call as witness: a protest is a
solemn declaration of opinion; particularly the
solemn and expressed dissent of a peer of par-
liament from the opinion of the House of Lords:
protestant, one who in any way solemnly pro-
poses or objects his opinion; but particularly
one who adheres to the objections of the Reformed
against the Church of Rome: protestant, as an
adjective, relating to Protestants: protestancy,
the profession or religion of Protestants: pro-
testation is the dissent or resolution made or ex-
pressed: protester, he who makes or issues it.

He maketh protestation to them of Corinth, that
the gospel did not by other means prevail with them,
than with others the same gospel taught by the rest
of the apostles. *Hooker.*

Here's the twin brother of thy letter; but let thine
inherit first, for, I protest, mine never shall.

Shakspeare.

The peaking cornuto comes in the instant, after
we had protested and spoke the prologue of our
comedy. *Id.*

But to your protestation; let me hear
What you profess. *Id. Winter's Tale.*

Did I use

To stale with ordinary oaths my love
To every new protester? *Id. Julius Cæsar.*

This is the first example of any protestant subjects
that have taken up arms against their king a protes-
tant. *King Charles.*

What miserable subdivisions are there in our pro-
testancy! *Bp. Hall.*

He protests against our votes, and swears

He'll not be tried by any but his peers. *Denham.*

If the lords of the council issued out any order
against them, some nobleman published a protestation
against it. *Clarendon.*

Fiercely they opposed

My journey strange with clamorous uproar,
Protecting fate supreme. *Milton.*

The conscience has power to disapprove and to
protest against the exorbitances of the passions.

South.

Since the spreading of the protestant religion, several
nations are recovered out of their ignorance.

Addison.

I smiled at the solemn protestation of the poet in
the first page, that he believes neither in the fates or
destinies. *Id.*

What if he were one of the latest protesters against
popery? and but one among many that set about
the same work? *Aterbury*

We receive but little advantage from repeated *protestations* of gratitude, but they cost them very much from whom we exact them in return.

Goldsmith.

Each peer has a right, by leave of the house, when a vote passes contrary to his sentiments, to enter his dissent on the journals of the house with the reasons for such dissent, which is usually styled his *protest*. 1 Comm. c. 2. Lord Clarendon relates that the first instances of *protests*, with reasons, in England, were in 1641; before which time they usually only set down their names as dissentient to the vote.

Tomline.

PROTEST, in commerce, is a writing executed by a notary public to secure to the holder of a bill recourse upon the indorsers when the drawer refuses to accept, or the acceptor fails to pay.

PROTEST, in parliament. Any of the lords in parliament have a right to protest their dissent from any bill passed by a majority; which protest is entered in form. This is said to be a very ancient privilege. The commons have no right to protest.

PROTESTANTISM. The emperor Charles V. called a diet at Spire, in 1529, to request aid from the German princes against the Turks, and to devise the most effectual means for allaying the religious disputes which then raged in consequence of Luther's opposition to the established religion. The emperor being at Barcelona, at the meeting of this diet, his brother Ferdinand, archduke of Austria, was appointed to preside. In this diet it was decreed, by Ferdinand and other popish princes, that, in the countries which had embraced the new religion, it should be lawful to continue in it till the meeting of a council; but that no Roman Catholic should be allowed to turn Lutheran; and that the reformers should deliver nothing in their sermons contrary to the received doctrine of the church. This decree was justly considered as iniquitous and intolerable by the elector of Saxony, the langrave of Hesse, and other members of the diet. Nor was any one of them so simple, or so little acquainted with the politics of Rome, as to look upon the promises of assembling speedily a general council in any other light than an artifice to quiet the minds of the people; since it was easy to perceive that a lawful council, free from the despotic influence of Rome, was the very last thing that a pope would grant in such a critical situation of affairs. Against this decree, therefore, six Lutheran princes (John and George, the electors of Saxony and Brandenburg; Ernest and Francis, the two dukes of Lunenburg; the landgrave of Hesse; and the prince of Anhalt), with the deputies of thirteen imperial towns (Strasbourg, Ulm, Nuremberg, Constance, Rottingen, Windsheim, Memmingen, Nortlingen, Lindau, Kempten, Heilbron, Wissemburg, and St. Gall), formally and solemnly *protested*, and declared that they appealed to a general council; and hence the name of PROTESTANTS, which, from this period, has been given to the followers of Luther. Nor was it confined to them; for it soon after included the Calvinists, and has now of a long time been applied indiscriminately to all the churches, sects, and denominations, in whatever country they may be found, which have separated from the see of Rome.

The important period which was distinguished by this reformation of religion, is not, as Protestants contend, to be considered as the period when the principles then embraced first made their appearance. Long, very long, had purity of doctrine and discipline slept beneath the overloaded ornaments and corruptions of the church of Rome; and there was a time when that church herself might have boasted of her primitive purity and freedom from error, with other churches of Christ: never, indeed, was there a time, from the date of her first departure from sound principles, wherein there were not witnesses to the truth; or some, more or less, who withstood the corruptions and depravity of their respective ages, maintained orthodox and primitive doctrine, and exhibited in their lives the genuine fruits of our most holy faith.

We are not to wonder that Protestantism soon exhibited a variety of religious opinion and practice. The active spirit of enquiry, natural to men who had just broken loose from the despotism of popery, operating differently on different intellects and dispositions, almost necessarily produced a variety of sects; and, in some cases, gave birth to extreme wildness and extravagance of unscriptural doctrine and practice. Protestants, therefore, have been far from unanimous in all points of doctrine, worship, church government, or discipline: on the contrary, while they agree only in receiving the Scriptures as the supreme rule of their faith and practice, and in rejecting the distinguishing doctrines of the church of Rome, particularly the authority ascribed by her members to tradition as a rule of faith, in many other respects they still differ not more widely from that church than they do from one another. And, to ascertain their doctrines, it will be necessary to examine their several *libri symbolici*, or the confessions and articles of the different churches, sects, and parties, into which professors of the reformed religion are now subdivided. The learned Chillingworth, addressing himself to a writer in favor of the church of Rome, speaks of the religion of Protestants in the following terms, worthy, as has been well observed, to be inscribed in letters of gold:—'Know then, Sir, that when I say the religion of Protestants is, in prudence, to be preferred before yours; on the one side, I do not understand by your religion the doctrine of Bellarmine, or Baronius, or any other private man amongst you, nor the doctrine of the Sorbonne, or of the Jesuits, or of the Dominicans, or of any other particular company among you, but that wherein you all agree, or profess to agree, 'The doctrine of the council of Trent.' so accordingly, on the other side, by the religion of Protestants I do not understand the doctrine of Luther, or Calvin, or Melancthon, nor the confession of Augsburg, or Geneva, nor the catechism of Heidelberg, nor the articles of the church of England—no, nor the harmony of Protestant confessions; but that wherein they all agree, and which they all subscribe with a greater harmony, as a perfect rule of faith and action, that is, the Bible. The Bible, I say, the Bible only, is the religion of Protestants. whatsoever else they believe besides it, and the plain

irrefragable, indubitable, consequences of it, well may they hold it as a matter of opinion; but, as a matter of faith and religion, neither can they, with coherence to their own grounds, believe it themselves, nor require belief of it of others, without most high and most schismatical presumption. I, for my part, after a long, and (as I verily believe and hope) impartial search of the true way to eternal happiness, do profess plainly, that I cannot find any rest for the sole of my foot, but upon this *rock* only. I see plainly, and with my own eyes, that there are popes against popes, and councils against councils; some fathers against other fathers, the same fathers against themselves; a consent of fathers of one age, against a consent of fathers of another age. Traditive interpretations of Scripture are pretended, but there are few or none to be found: no tradition, but that of Scripture, can derive itself from the fountain, but may be plainly proved either to have been brought in in such an age after Christ, or that in such an age it was not in. In a word, there is no sufficient certainty but of Scripture only, for any considering man to build upon. This, therefore, and this only, I have reason to believe. This I will profess: according to this I will live; and, for this, if there be occasion, I will not only willingly, but even gladly, lose my life; though I should be sorry that Christians should take it from me. Propose me any thing out of this book, and require whether I believe or no, and, seem it never so incomprehensible to human reason, I will subscribe it with hand and heart, as knowing no demonstration can be stronger than this, God hath said so, therefore it is true. In other things, I will take no man's liberty of judging from him; neither shall any man take mine from me.

But though the Bible is, properly speaking, their only *symbolic book*, or the only sure foundation upon which all true Protestants build every article of the faith which they profess, and every point of doctrine, which they teach, whereby they may be said to unite in subscribing to the sixth article of the United Church of England and Ireland; and though all other foundations, whether they be the decisions of councils, the confessions of churches, the rescripts of popes, or the expositions of private men, are considered by them as sandy and unsafe, or as in no wise to be ultimately relied on; yet, on the other hand, they do by no means fastidiously reject them as of no use. For while they admit the Bible, or the Scriptures of the Old and New Testaments, to be the only infallible rule by which we must measure the truth or falsehood of every religious opinion, they are sensible that all men are not equally fitted to apply this rule, considered in all its latitude; and that the wisest men want, on many occasions, all the helps of human learning, to enable them to understand its precise nature, and to define its certain extent. That is, the consistent Protestant must admit that all men are not equal judges of what nature, i. e. the national sense of propriety, taught the Corinthian ladies respecting the wearing of their hair, see 1 Cor. xi. 15, nor of the geographical question, whether the 'river of Egypt,' given as a boundary to Canaan in the

important grant, Gen. xv. 18, were or were not the river Nile: but it is an essential part of consistent Protestantism to maintain, with Chillingworth, not only the fulness, but the plainness, of Scripture, as a rule in all things needful to salvation. 'He that would usurp an absolute lordship over conscience,' says this admirable writer, 'need not put himself to the trouble and difficulty of abrogating and disannulling the laws made to maintain the common liberty; for he may frustrate them entirely, and compass his own design as well, if he can get the power and authority to interpret them as he pleases, and add to them what he pleases.' 'If you will stand to your rule, that Scripture is as perfect a rule of faith and practice as a writing can be, you must then grant it both so complete that it needs no addition, and so evident that it needs no interpretation; for both these properties are requisite to a perfect rule, and a writing is capable of both these properties.' The helps adverted to are great and numerous, having been supplied, in every age of the church, by the united labors of learned men in every country, and, we may add, particularly in Protestant communions.

With regard to church government, it may be here remarked in general, that, however widely Protestants may differ in other respects, they all agree in rejecting a universal, visible, supreme head of the church, together with the infallibility of any church governors or councils whatsoever, from the days of the apostles. They all likewise agree in adopting the principle of the independency of every church, either in its national or congregational character; as subject to no spiritual head but Christ; as conceding no superiority, and claiming no preeminence of jurisdiction; and as authorized to frame its own laws, and to regulate its own government: while, at the same time, a very great proportion of them equally concur in admitting the union of church and state, or the lawfulness of national establishments of religion. 'It is very remarkable,' says dean Comber, 'that a Romanist may turn Protestant without adding any one article to his faith; but a Protestant cannot turn to Rome unless he embrace many new articles: for our doctrines are generally confessed by both sides to be true; but those of the Roman church are rejected by our reformers as novel additions, and such as have no good foundations in Scripture nor genuine antiquity: and therefore the Protestant doctrines are the surer and safer, as in which both sides agree. For example, we and they both hold there are two states after this life, heaven and hell; but they add a third, which is purgatory; and this we deny: we and they both say that sins are to be remitted by the merits of Christ's death; but they add the merits of the saints, and their own satisfactions, with the merit of their own good works, which we deny to be expiatory, or such as can merit remission for us: we hold there be two sacraments, baptism and the eucharist: these they confess are the chief, but add five more, to which we affirm the name of sacraments doth not properly belong: we say that God alone is to be worshipped: they confess he is chiefly to be worshipped; but, then, they say the blessed Virgin Mary, angels, and saints

are to be worshipped also; which additions we deny: we say Christ is our only mediator and advocate: they confess he is principally so, but add that saints and angels are so in an inferior manner; which we utterly deny: we say Christ is really present in the sacrament of the altar: this they confess, but add he is corporally there, by the transubstantiation of the bread, &c.; and this we deny: we say there are twenty-two books of the Old Testament canonical, and they confess these all to be so, but they add divers others, and call them canonical, which we affirm to be apocryphal: we say the Scriptures are the rule of faith; and they will not absolutely deny it, but add their own traditions, which we reject. I could give more instances; but these may suffice to show that the Protestant doctrines look most like the ancientest, as being received by both parties; but the Roman opinions are novel enlargements added to the old Catholic truths.'

PROTEUS, in mythology, a sea deity, the son of Oceanus and Tethys, or, as others say, of Neptune and Phœnice. From Neptune he received the gift of prophecy, and was often consulted on the coast of the Carpathian Sea by mortals. But on these occasions he was sometimes very shy, and shifted his votaries by assuming the shapes of various animals; and, while they held him fast as a sea god, eluded their grasp in the form of a fish or a serpent, unless they previously bound him with fetters. Hercules, Aristeus, and many other heroes, consulted him. Some say he reigned long in Egypt. He had two sons, Telegonus and Polygonus; and three daughters, Cabira, Fidothea, and Rhetia.

PROTEUS, in zoology, a genus of the class reptilia, order batraciens, of Cuvea, discovered in 1789 in the limestone caves of Carniola, and also in Mexico. The first protei described by Laurenti and Scopoli were not procured from the lake of Zirknitz, as has been commonly represented, nor from any of the caverns of Carniola, but were found accidentally by the peasants in small puddles of water near the mouths of certain caverns, a little distant from Sittich, on the road to Newstadt, in Lower Carniola, cast out of the caverns probably by the overflowing of their water after heavy rains. It was not till the year 1797 that these animals were discovered in the caverns of Maddalena. At present, the peasants of Adelsberg, when the season suits, go to fish for them, and preserve them alive, till they sell them to the curious, who visit Carniola, or convey them to Trieste, where they are sold for the small sum of two or three lire each.

Hermann and Schreibers wrote on the proteus, but described only its external parts, and contributed nothing to clear up the many doubts and conjectures respecting it. In this state of uncertainty, Dr. Schreibers first had recourse to anatomy, as the only satisfactory mode of gaining correct information: but unfortunately he possessed only three protei which had been sent to him from Carniola, preserved in spirits; which circumstance precluded him from giving that complete information which might otherwise have been expected from so eminent a naturalist. His description was published in 1801; and, among many excellent ob-

servations, he points out the striking difference of form between the lungs of the sirena lacertina and those of the proteus. Next to Schreibers we have to notice two zoologists of the highest celebrity, MM. Cuvier and Rudolphi, both of whom examined the internal structure of this animal. The former first discovered, and accurately described, the organs of generation in the female, and established, on a solid foundation, that the proteus was not a larva, as many had supposed, but a perfect animal; an opinion now generally followed, and confirmed by the recent observations of Rudolphi, who has described the generative system in the male.

The sirena lacertina occupies the same class and order, and is another genus consisting only of one species. It is said, like the proteus, to retain through its whole life three gills on each side the neck, and to possess, at the same time, lungs internally. A most ample description of this curious reptile was furnished to the Edinburgh Philosophical Journal, by professor Confiagliachi, and Dr. Rusconi, to the fourth volume of which we must refer the reader for more ample information.

PROTHONOTARY, *n. s.* Fr. *protonotaire* - Lat. *protonotarius*. The head register.

Salignaeus, the pope's *prothonotary*, denies the Nubians professing of obedience to the bishop of Rome. *Brerewood.*

He had the *prothonotariship* of the chancery. *Carew.*

PROTHONOTARY [from *πρωτος* Gr. first, and *notarius*, Lat.] properly signifies first notary, and was anciently the title of the principle notaries of the emperors of Constantinople.

PROTHONOTARY is used in England for an officer in the court of king's bench and common pleas; the former of which courts has one, and the latter three. The prothonotary of the king's bench records all civil actions sued in that court, as the clerk of the crown-office does all criminal causes. The prothonotaries of the common pleas enter and enrol all declarations, pleadings, assizes, judgments, and actions; they also make out all judicial writs, except writs of habeas corpus and *distringas jurator*, for which there is a particular office, called the habeas corpus office; they likewise enter recognizances acknowledged, and all common recoveries; make amplifications of records, &c.

PROTHONOTARY, in the courts of Rome. There is a college of twelve prelates, called apostolical prothonotaries, empowered to receive the last wills of cardinals, to make all informations and proceedings necessary for the canonisation of saints, and all such acts as are of great consequence to the papacy; for which purpose they have the right of admission into all consistories. They also attend on the pope, whenever he performs any extraordinary ceremony out of Rome.

PROTOCOL, *n. s.* Belg. *protokol*; Fr. *protocole*; Gr. *πρωτοκολλον*, from *πρωτος* and *κολληη*. The original copy of a writing; the rough memorandum of a diplomatic conference.

An original is stiled the *protocol*, or *scriptura matrix*; and if the *protocol*, which is the root and foundation of the instrument, does not appear, the instrument is not valid. *Ayliffe.*

PROTOGENES, a celebrated ancient painter, born at Carnas, a city of Caria, subject to the Rhodians, who flourished about A. A. C. 300. He was at first employed in painting ships, &c., but soon acquired the highest fame for historical pieces. His most celebrated piece was Jalyesus, the founder of Jalyesus, a city of Rhodes. Apelles gave him fifty talents (about £10,000) for one picture, which the Rhodians purchased back from him at a still higher price. He lived very abstemiously.

PROTOPLAST, *n. s.* Gr. *πρωτος* and *πλαστος*. Original; thing first formed as a copy.

The consumption was the primitive disease, which put a period to our *protoplasts*, Adam and Eve. *Harvey.*

PROTOTYPE, *n. s.* Fr. *prototype*; Greek *πρωτοτυπον*. The original of a copy; archetype; exemplar.

Man is the *prototype* of all exact symmetry.

The image and *prototype* were two distinct things; and therefore what belonged to the exemplar could not be attributed to the image. *Wotton.*
Stillingfleet.

PROTRACT, *v. a. & n. s.* } Lat. *protractus*.
PROTRACTOR, *n. s.* } To draw out; to
PROTRACTION, } delay; to length-
PROTRACTIVE, *adj.* } en; to spin to
length: the derivations all corresponding.

Since I did leave the presence of my love,
Many long weary days I have out-worn,

And many nights, that slowly seemed to move
Their sad *protract* from evening until morn. *Spenser.*
Where can they get victuals to support such a
multitude, if we do but *protract* the war? *Knolles.*

Our works are nought else
But the *protractive* tryals of great Jove,
To find persisive constancy in men. *Shakespeare.*

Those delays
And long *protraction*, which he must endure,
Betray the opportunity. *Daniel.*
As to the fabulous *protractions* of the age of the
world by the Egyptians, they are uncertain idle tra-
ditions. *Hale.*

He suffered their *protractive* arts,
And strove by mildness to reduce their hearts.

PROTRACTOR, an instrument for laying down
and measuring angles upon paper with accuracy
and despatch; and by which the use of the line
of chords is superseded.

The **CIRCULAR PROTRACTOR** is a complete
circle, and is superior by far to either the right-
angled or semicircular, both in point of accuracy
and despatch, especially when several angles are
to be formed at the same point. The limb of
this instrument is divided into 36°, and each
degree in some protractors is halved; it has a
subdividing scale or vernier, by which an angle
may be laid down or measured to a single mi-
nute. In the centre of the protractor is a mark,
which, when an angle is to be protracted or
measured, is to be laid upon the angular point,
and O, or zero on the limb, upon the given line
forming one side of the angle.

The **RECTANGULAR PROTRACTOR** is con-
structed in form of a right-angled parallelogram,
which, when applied to a case of mathematical
instruments, is substituted in place of the semi-
circular protractor and scale of equal parts.

PROTREPICAL, *adj.* Gr. *προτρεπικος*.
Hortatory; suatory.

The means used are partly didactical and *protrep-
tical*; demonstrating the truths of the gospel, and
then urging the professors to be steadfast in the faith,
and beware of infidelity. *Ward on Infidelity.*

PROTRUDE, *v. a. & v. n.* } Lat. *protrudo*.
PROTRUSION, *n. s.* } To thrust for-
ward; thrust itself forward: the act of thrusting
forward.

If the spirits be not merely detained, but *protrude*
a little, and that motion be confused, there followeth
putrefaction. *Bacon.*

When the stomach has performed its office upon
the food, it *protrudes* it into the guts, by whose pe-
ristaltic motion it is gently conveyed along. *Locke.*

One can have the idea of one body moved, whilst
others are at rest; then the place it deserted gives
us the idea of purer space without solidity, whereinto
another body may enter without either resistance or
protrusion of any thing. *Id.*

They were not left, upon the sea's being *protruded*
forwards, and constrained to fall off from certain
coasts by the mud or earth, which is discharged into
it by rivers. *Woodward.*

His left arm extended, and fore finger *protruded*.
Garlick.

PROTUBERANCE, *n. s.* } Lat. *protuberantia*.
PROTUBERANT, *adj.* } Something swell-
ing out; prominence; tumour; the adjective cor-
responding.

If the world were eternal, by the continual fall
and wearing of waters, all the *protuberances* of the
earth would infinite ages since have been levelled,
and the superficies of the earth rendered plain.

Mountains seem but so many wens and unna-
tural *protuberances* upon the face of the earth. *Hale.*

One man's eyes are more *protuberant* and swell-
ing out, another's more sunk and depressed. *More.*

If the navel *protuberates*, make a small puncture
with a lancet through the skin, and the waters will
be voided without any danger of a hernia succeeding.
Sharp's Surgery.

PROUD, *adj.* } Sax. *þruðe*, *þruæ*; Goth.
PROUDLY, *adv.* } and Swed. *prud*. See **PRIDE**.
Arrogant; self-exalted; haughty; elated, taking
of before the object of pride; daring; presumptu-
ous; ostentatious; salacious; exuberant;
swelling (as 'proud flesh'); lofty of mien or
manner; grand; splendid: the adverb follows
these senses.

By his understanding he smiteth through the
proud. *Job.*

The patient in spirit is better than the proud in
spirit. *Eccles.*

The blood foretold the giant's fall,
By this *proud* palmer's hand. *Drayton.*

I better brook the loss of brittle life,
Than those *proud* titles thou hast won of me.
Shakespeare.

He bears himself more *proudly*
Even to my person, than I thought he would. *Id.*
So much is true, that the said country of Atlan-
tis, as well as that of Peru, then called Coya, as
that of Mexico, then named Tyrambel, were mighty
and *proud* kingdoms in arms, shipping, and riches.
Bacon's New Atlantis.

A man is certainly *proud* of that knowledge he
despises others for the want of. *Mason*

The proud attempt thou hast repelled.

Milton.

He like a proud steed reined, went haughty on. *Id.*

The swan

Between her white wings mantling proudly rows.

Id.

Scaliger gave it (camphor) unto a bitch that was proud.

Broune's Vulgar Errors.

Fortune, that, with malicious joy,

Does man her slave oppress,

Proud of her office to destroy,

Is seldom pleased to bless. *Dryden's Horace.*

Storms of stones from the proud temple's height
Pour down, and on our battered helmets alight.

Dryden.

Ancus follows with a fawning air ;

But vain within, and proudly popular. *Id.*

If thou beest proud, be most instant in praying
for humility.

Duty of Man.

Proudly he marches on, and void of fear ;

Vain insolence. *Addison.*

When the vessels are too lax, and do not sufficiently resist the influx of the liquid, that begets a fungus or proud flesh.

Arbuthnot.

Proud Sparta with their wheels resounds.

Pope.

The proudest admirer of his own parts might find it useful to consult with others, though of inferior capacity.

Watts.

If it were a virtue in a woman to be proud and vain in herself, we could hardly take better means to raise this passion in her, than those that are now used in their education.

Law.

What is all righteousness that men devise !

What—but a sordid bargain for the skies ?

But Christ as soon would abdicate his own,

As stoop from heaven to sell the proud a throne.

Couper.

PROVE, *v. a. & v. n.* } Fr. *prover* ; Ital.

PROVEABLE, *adj.* } *provare* ; Spanish *probar* ; Lat. *probo*. To evince ; to show or attest by argument or testimony ; to try ; experience ; endure : as a verb neuter to make true ; be found experimentally ; succeed : proveable is, demonstrable ; that may be proved.

For the dai of the Lord schal declare, for it schal be schewid in fier, the fier schal prue the werk of ech man, what maner of werk it is.

Wiclif. 1 Cor. 3.

Who so delyteth to prouen and assay,

Of waveryng fortune the vncertayne lot,

If that the answeere please you not alway,

Blame ye not me. *Sir T. More.*

Wilt thou thy idle rage by reason prove ?

Or speak those thoughts which have no power to move ?

Sandys.

Let the trumpet sound :

If none appear to prove upon thy person

Thy heinous, manifest, and many treasons,

There is my pledge : I'll prove it on thy heart.

Shakspeare.

Delay not the present, but

Filling the air with swords advanced, and darts,

We prove this very hour. *Id. Coriolanus.*

Children prove, whether they can rub upon the breast with one hand, and pat upon the forehead with another.

Bacon.

If the experiment proved not, it might be pretended that the beasts were not killed in the due time.

Id.

Could sense make Marius sit unbound, and prove

The cruel lancing of the knotty gout ?

Davies.

In a set copy every fault is important, and may prove a rule of error.

Bp. Hall.

So both their deeds compar'd this day shall prove

Milton.

Thy overpraising leaves in doubt

The virtue of that fruit, in thee first proved. *Id.*

Smile on me, and I will prove

Wonder is shorter lived than love. *Waller.*

Well I deserved Evadne's scorn to prove,

That to ambition sacrificed my love. *Id.*

Let him in arms the power of Turnus prove,

And learn to fear whom he disclaims to love.

Dryden.

The sons prepare,

Meeting like winds broke loose upon the main,

To prove by arms whose fate it was to reign. *Id.*

If it prove any thing, it can only prove against our author, that the assignment of dominion to the eldest is not by divine institution.

Locke.

In spite of Luther's declaration, he will prove the tenet upon him.

Atterbury.

When the inflammation ends in a gangrene, the case proves mortal.

Arbuthnot.

Property, you see it alter,

Or in a mortgage prove a lawyer's share,

Or in a jointure vanish from the heir. *Pope.*

PROVEDITOR, or } Ital. *proveditore*. One
PROVEDORE', *n. s.* } who undertakes to procure military supplies.

The Jews, in those ages, had the office of *provedore*.

Friend.

PROVENDER, *n. s.* Fr. *provende* ; Ital. *provenda* ; Belg. *provande*. Dry food for brutes ; hay and corn.

Good provender labouring horses would have.

Tusser.

I do appoint him store of provender ;

It is a creature that I teach to fight. *Shakspeare.*
For a fortnight before you kill them, feed them with hay or other provender.

Mortimer.

When'er he chanced his hands to lay

On magazines of corn or hay,

Gold ready coined appeared, instead

Of paltry provender and bread.

Swift's Miscellanies.

PROVENCE, a ci-devant province of France, bounded by Dauphine on the north, by the late Piedmontese on the east, by the Mediterranean on the south, and by the Rhone, which separated it from Languedoc, on the west, being 138 miles long and 100 broad. The air is cold near the Alps, hot on the coast, and temperate in the middle. Since the revolution it has been divided into the following departments :—

	Sq. Miles.	Population.
The Lower Alps . . .	2845	146,000
The Var	2820	284,000
The Mouths of the Rhone 2272		320,000
Total	7937	750,000

To these is to be added a portion of the department of the Vaucluse. The principal towns are Marseilles, Toulon, Aix, Arles, and Grasse. It was divided into the Upper and Lower Provence.

PROVERB, *n. s. & v. a.* } Fr. *proverbe* ;
PROVERBIAL, *adj.* } Ital. *proverbio* ;
PROVERBIALLY, *adv.* } Lat. *proverbium*.

A pithy saying ; a saw ; an adage : the verb, to mention in, or provide with, a proverb, has been very properly disused : the adjective and adverb correspond with the noun substantive.

Thou hast delivered us for a spoil, and a proverb of reproach. *Tob. iii. 4.*

Let wants, light of heart,

Tickle the senseless rushes with their heels :

For I am *proved* with a grandsire phrase ;

I'll be a candle-holder and look on. *Shakespeare.*

It is in praise and commendation of men, as it is in gettings and gains ; for the *proverb* is true, that light gains make heavy purses ; for light gains come thick, whereas great come but now and then.

Bacon's Essays.

The sum of his whole book of *proverbs* is an exhortation to the study of this practick wisdom.

Decay of Piety.

The *proverbs* of several nations were much studied by Bishop Andrews, and the reason he gave, was, because by them he knew the minds of several nations, which is a brave thing. *Selden.*

Am I not sung and *proved* for a fool

In every street ; do they not say, how well

Are come upon him his deserts ? *Milton.*

He (Solomon), did wonderfully excel in ethics ; concerning which he spake three thousand *proverbs*, or moral aphorisms. *Barrow.*

It is *proverbially* said, formicæ sua bilis inest, habet et musca splenem ; whereas these parts anatomy hath not discovered in insects. *Browne.*

In case of excesses, I take the German *proverbial* cure, by a hair of the same beast, to be the worst in the world ; and the best, the monks diet, to eat till you are sick, and fast till you are well again.

Temple's Miscellanies.

The *proverb* says of the Genoese, that they have a sea without fish, land without trees, and men without faith. *Addison.*

Moral sentences and *proverbial* speeches are numerous in this poet. *Pope.*

People will, in a great degree, and not without reason, form their opinion of you, upon that which they have of your friends ; and there is a Spanish *proverb* which says, very justly, ' Tell me with whom you live, and I will tell you who you are.' *Chesterfield.*

PROVERBS, BOOK OF, a canonical book of the Old Testament, containing a part of the proverbs of Solomon. The first twenty-four chapters are the work of that prince ; the next five are a collection made by order of king Hezekiah ; and the authors of the two last are Agur, the son of Jakeh, and king Lemuel.

PROVIDE', *v. a.*

PROVIDENCE, *n. s.*

PROVIDENT, *adj.*

PROVIDENTIAL,

PROVIDENTIALLY, *adv.*

PROVIDENTLY,

PROVIDER, *n. s.*

Lat. *provideo.* To

procure, or supply,

beforehand ; furnish ;

get ready, taking

of or with before

the object : ' to provide

against' is to

take measures to counteract or escape ; ' provide for,' to take care of ; maintain : ' provided that' means, conditioned that : providence is, forecast ; forethought ; timely care ; prudence ; frugality ; act of providing ; in a theological sense, God's care of all his creatures : providential and providentially are generally used in this last sense : provident is, prudent ; forecasting : providently corresponding : provider, he who provides.

God will *provide* himself a lamb for a burnt offering. *Genesis.*

The only people which, as by their justice and *providence*, give neither cause nor hope to their neighbours to annoy them, so are they not stirred with false praise to trouble others' quiet. *Sidney.*

Eternal *providence* exceeding thought,

Where none appears can make himself a way. *Spenser.*

States, which will continue, are above all things to uphold their reverend regard of religion, and to *provide* for the same by all means. *Hooker.*

This appointeth unto them their kinds of working, the disposition whereof, in the purity of God's own knowledge, is rightly termed *providence.* *Id.*

He hath intent, his wanted floggers

Shall all be very well *provided* for. *Shakespeare.*

I take your offer, and will live with you ;

Provided that you do no outrages. *Id.*

I saw your brother,

Most *provident* in peril, bind himself

To a strong mast that lived upon the sea. *Id.*

Here's money for my meal,

As I had made my meal, and parted thence

With prayers for the *provider.* *Id.*

A *provident* man *provides* for the future. *Raleigh.*

Providence is an intellectual knowledge, both foreseeing, caring for, and ordering all things, and doth not only behold all past, all present, and all to come ; but is the cause of their so being, which prescience is not. *Id.*

To make experiments of gold, be *provided* of a conservatory of snow, a good large vault under ground, and a deep well. *Bacon.*

Providence for war is the best prevention of it. *Id.*

The king forthwith *provides* him of a guard,

A thousand archers daily to attend. *Daniel.*

He happier seat *provides* for us. *Milton.*

The world was all before them, where to chuse

Their place of rest, and *providence* their guide. *Id.*

First crept

The parsimonious emmet, *provident*

Of future. *Id.*

Sagacity of brutes in defending themselves, *providing* against the inclemency of the weather, and care for their young. *Hale.*

Though the *providence* of God doth suffer many particular churches to cease, yet the promise of the same God will never permit that all of them at once shall perish. *Pearson.*

Orange with youth, experience has,

In action young, in council old ;

Orange is what Augustus was,

Brave, wary, *provident*, and bold. *Waller.*

They could not move me from my settled faith in God and his *providence.* *More's Divine Dialogues.*

Nature having designed water fowls to fly in the air, and live in the water, she *providently* makes their feathers of such a texture that they do not admit the water. *Boyle.*

He went,

With large expence and with a pompous train

Provided. *Dryden.*

Some men, instructed by the labouring ant,

Provide against the' extremities of want. *Id.*

By thrift my sinking fortune to repair,

Though late, yet is at last become my care ;

My heart shall be my own, my vast expence

Reduced to bounds, by timely *providence.* *Id.*

Provided that he set up his resolution not to let himself down below the dignity of a wise man. *L'Estrange.*

Every animal is *providentially* directed to the use of its proper weapons. *Ray on the Creation.*

An earth well *provided* of all requisite things for an habitable world. *Burnet's Theory.*

The lilies grow and the ravens are fed according to the course of nature, and yet they are made arguments of providence, nor are these things less *providential*, because regular. *Burnet.*

My arbitrary bounties undenied ;

I give reversions, and for heirs *provide.* *Garth.*

He will have many dependents, whose wants he cannot provide for. *Addison.*

It happened, very providentially to the honour of the Christian religion, that it did not take its rise in the dark illiterate ages of the world, but at a time when arts and sciences were at their height. *Id.*

This thin, this soft contexture of the air, Shows the wise author's providential care. *Blachmore.*

An established character spreads the influence of such as move in a high sphere, on all around; it reaches farther than their own care and providence can do. *Atterbury.*

A very prosperous people, flushed with great successes, are seldom so pious, so humble, so just, or so provident, as to perpetuate their happiness. *Id.*

Rome, by the care of the magistrates, was well provided with corn. *Arbutnot on Coins.*

Fraudulent practices were provided against by laws. *Arbutnot.*

When the monasteries were granted away, the parishes were left destitute, or very meanly provided of any maintenance for a pastor. *Swift's Miscellanies.*

They were of good birth, and such who, although inheriting good estates, yet happened to be well educated, and provided with learning. *Swift.*

PROVIDENCE. That there exists a divine providence, or, in other words, that the Deity attends to the affairs of this world, and directs their course, has been an opinion generally received among mankind, in all ages, and in all countries of the world. It has not, however, passed without opposition from philosophers in various ages, as well as the present. The most ancient of these were Democritus, Leucippus, and Epicurus. We think it totally unnecessary, however, to state the arguments on either side, as they would lead into a discussion of the much disputed doctrines about the origin of evil, liberty, and necessity, free-will, predestination, &c., which have been sufficiently noticed elsewhere. The weight of the argument indeed lies on the side of the affirmative, both for a general and particular Providence. Every argument that has been advanced in favor of the eternal self-existence, infinite power, wisdom, and goodness of God, is equally decisive in favor of his superintending care over all his works. See THEOLOGY.

PROVIDENCE, an island near the coast of Honduras, eleven miles long and four wide, and celebrated in the history of the buccaneers, who fortified it for some years. Its western extremity, called the island of Santa Catalina, is separated from the rest of the island by a narrow channel, over which was thrown a bridge. It has been considered one of the best of the West India islands for fertility, and the salubrity of its climate; to which may be added the facility of its fortification and defence, and the abundance of its fine water.

PROVIDENCE, a post-town, port of entry, and semi-metropolis of Rhode Island, in a county of the same name; fifteen miles N. N. W. of Bristol, thirty north by west of Newport, forty S. S. W. of Boston, and fifty-nine north-east of New London, is situated on both sides of Providence River, just above the mouth of the Seekhonk, or Pawtucket, and thirty-five miles from the ocean. It is a pleasant, well-built, and very thriving

town, well situated for trade, and has a flourishing commerce, and extensive manufactures. The shipping owned here in 1810, amounted to 14,465 tons. The river is navigable as far as the town for vessels of 900 tons. The two parts of the town are connected by an elegant bridge, ninety feet in breadth. In point of population, it is the first town in Rhode Island, and the third in New-England. It contains a court-house, a jail, a university, a public library of about 2000 volumes, a Friends' boarding-school and five public schools, seven banks, including a branch of the United States bank, and eight houses of public worship: three for Congregationalists, two for Baptists, one for Episcopalians, one for Friends, and one for Methodists. Two of the Congregational, and one of the Baptist meeting-houses, and the Episcopal church, are among the handsomest edifices of the kind in the United States. Many of the private houses are elegant, and some of them very finely situated. Among the manufacturing establishments are four cotton manufactories, a large woollen manufactory, a paper-mill, a bleaching, dyeing, and calendering company. These manufactories are aided by three steam engines. Three newspapers are published here, one twice a-week, and two once a-week. A little to the east of the town there are two handsome bridges across the Seekhonk.

This town was originally settled, in 1636, by Roger Williams, to whom is ascribed the honor of having established the first political community in which perfect religious toleration was admitted. Brown University was originally founded at Warren in 1764, and removed to Providence in 1770. It received its present name in 1804 from Nicholas Brown, esq., one of its principal benefactors. It is a respectable and flourishing seminary. Its funds are not large, having arisen solely from individual liberality. The college building is a spacious and elegant brick edifice, four stories high, 150 feet long, forty-six broad, with a projection of twenty-feet on each side; and it contains forty-eight rooms for students, and six rooms for public purposes. It is delightfully situated on an eminence on the east side of the town, commanding a fine prospect. The library contains about 3000 volumes, and the philosophical apparatus is respectable.

The board of trustees is composed of thirty-six members; of whom twenty-two must be Baptists, five Friends, five Episcopalians, and four Congregationalists. The number of fellows, or learned faculty, is twelve; of these eight, including the president must be Baptists; the other four may be of any denomination; as also may be the professors and tutors. The executive government consists of the president, seven professors, and two tutors.

PROVIDENCE, NEW, an island of the West Indies, nearly in the centre of the great Bahama Bank, is twenty-five miles long and nine broad. The harbour of Nassau is on the north side, and is sheltered to the north by Hog Island; it is fit for vessels of thirteen feet. The town of Nassau is the seat of government of the Bahamas, and one of the best planned towns of the West Indies; the streets being wide and airy, and the houses well built. The trade here, particularly

with the United States, was at a late period very considerable. Its chief objects were live stock, and salt and fresh provisions; which latter have been chiefly obtained from the more southern of the states. A considerable intercourse has likewise occasionally taken place between New Providence and the Island of Cuba; particularly to the Havannah, where there was a brisk market for British manufactures, prize goods, &c., through the facilities rendered by the licence trade. In May, 1803, there had been granted in this island, by the crown, no less than 23,079 acres of patented estates, for the purpose of cultivation. The population, in 1801, amounted to 1599 whites, 752 free people of color, and 3861 slaves, making a total of 6212; and in 1803 to 1758 whites, 817 people of color, and 2515 slaves, the total being 5090.

At Nassau, there are two parish churches, and an old fort near the west entrance of the harbour. The government house (built in 1804) is one of the best in the West Indies, and is finely situated on a hill that commands the town and harbour. Here also is Fort Fincastle, and a small light-house. The public buildings, courts of justice, &c., are handsome and commodious. The barracks situated in Fort Charlotte, a little to the west of Nassau, were erected at a great expense by the earl of Dunmore, a late governor of the Bahamas. There is a very good road, extending for a considerable way along the coast of New Providence, and likewise one across the island from Nassau to the south. The island is situated between long. 77° 10' and 77° 38' W., lat. 25° 3' N.

PROVIDENCE, NORTH, a town of Providence county, Rhode Island, on the west side of the Pawtucket. It lies on the north side of Providence, and contains several cotton manufactories, two banks, and an air furnace. Pawtucket village is in this township.

Also a town of Saratoga county, New York.

PROVIDENCE RIVER, a river of Rhode Island, formed by the Wanasquatucket and Moshasick, which unite just above Providence. It flows into Narraganset Bay, at Bullock's Point, five or six miles below Providence.

PROVINCE, *n. s.* } Fr. *province* ;
 PROVIN'CIAL, *adj.* & *n. s.* } Ital. Span., Port.,
 PROVIN'CIATE, *v. a.* } and Lat. *provincia*.

A conquered region or tract of country; a country governed by delegated authority; hence any one's proper sphere or business: provincial is, relating or belonging to a province; unpolished; rude; not oecumenical: and, as a noun substantive, a spiritual delegate among the Jesuits and other religious orders: to provinciate; to make into a province. Not used.

Those *provinces* these arms of mine did conquer.
Shakspeare.

The duke dare not more stretch
 This finger of mine, than he dare rack his own;
 His subject am I not, nor here *provincial*. *Id.*
 When there was a design to *provinciate* the whole
 kingdom, Druina, though offered a canton, would not
 accept of it. *Howel.*

Over many a tract
 Of heaven they marched, and many a *province* wide.
Milton.

Some have delivered the polity of spirits, and left an
 account even to their *provincial* dominions. *Brown.*

I am fit for honours's toughest task;
 Nor ever yet found fooling was my *province*.

Otway.
 Nor can I alone sustain this day's *province*.

More.
 Valignanus was *provincial* of the Jesuits in the
 Indies. *Stillingfleet.*

Greece, Italy, and Sicily, were divided into common-
 wealths, till swallowed up and made *provinces*
 by Rome. *Temple.*

'Tis thine, whate'er is pleasant, good, or fair;
 All nature is thy *province*, life thy care. *Dryden.*

They build and treat with such magnificence,
 That, like the ambitious monarchs of the age,
 They give the law to our *provincial* stage. *Id.*

The woman's *province* is to be careful in her occo-
 nomy, and chaste in her affection. *Tatler.*

He has caused fortified towns and large *provinces*
 to be restored, which had been conquered long be-
 fore. *Davenant.*

A law made in a *provincial* synod is properly
 termed a *provincial* constitution. *Ayliffe's Parergon.*

See them broke with toils, or sunk in ease,
 Or infamous for plundered *provinces*. *Pope.*

A country squire having only the *provincial* accent
 upon his tongue, which is neither a fault, nor in his
 power to remedy, must marry a cast wench. *Swift.*

Their understandings are cooped up in narrow
 bounds; so that they never look abroad into other
provinces of the intellectual world. *Watts.*

His mien was awkward; graces he had none;
Provincial were his notions and his tone. *Harte.*

PROVINCE, in Roman antiquity, was a country
 of considerable extent, which, upon being en-
 tirely reduced under the Roman dominion, was
 new-modelled according to the pleasure of the
 conquerors, and subjected to the command of
 annual governors, sent from Rome, being obliged
 to pay such taxes and contributions as the senate
 thought fit to demand. Of these countries, that
 part of France next the Alps was one, and re-
 tained the name of Provence till the Revolution.
 Nicod derives the word a *procul vivendo*, living
 afar off; but it is better derived from *pro* and
vinco, I overcome.

PROVINCE, in geography, is a division of a
 kingdom or state, comprising several cities, towns,
 &c., all under the same government, and usually
 distinguished by the extent either of the civil or
 ecclesiastical jurisdiction. The church distin-
 guishes its provinces by archbishoprics; in which
 sense, England is divided into two provinces,
 Canterbury and York.

PROVINCE ISLAND, a fertile island in the De-
 laware, six miles below Philadelphia.

PROVINCETOWN, a post town of Barnstable
 county, Massachusetts, near Cape Cod; forty-
 four miles north-east of Barnstable, and 116
 south-east of Boston. It is situated on the hook
 of Cape Cod, three miles south-east of Race
 Point. The harbour, which is one of the best
 in the state, opens to the southward, and has suf-
 ficient depth of water for any vessels. The
 houses are of one story, and, in order to prevent
 their being buried in the sand, are set on piles,
 that the driving sands may pass under them.
 The inhabitants depend almost wholly on the
 fisheries for subsistence; raise nothing on their
 lands, and are dependent on Boston and the

neighbouring towns, for every vegetable production. They keep a few cows, which obtain a scanty subsistence from the beach grass and marshes.

PROVINS, a post-town of the department of the Seine-et-Marne, France, and the chief place of a sub-prefecture of the same name, containing 5600 inhabitants, and having a lower court of judicature, a chamber of commerce, an agricultural society, and a communal college. This town is situated on the declivity and at the foot of a lofty hill, watered by the little rivers of Durtein and Vouzie, which turn about sixty flour-mills in the neighbourhood. It is well built, and divided into the Upper and Lower Town; most of the streets are wide, clean, and airy; but it is not peopled in proportion to its size. It was fortified in ancient times, and there are still to be seen in the Upper Town the remains of a strong castle. Both parts of the town are encompassed with walls in a pretty good state of preservation. It is also almost encircled with boulevards, which form majestic bowers over a fountain of mineral-water, of a ferruginous quality. In 1780 a canal was commenced, for the purpose of rendering the little river Vouzie navigable; the accomplishment of this enterprise, as the canal would communicate with the Seine near Bray, would be of the highest importance to this town.

Here are manufactures of linsey-woolsey, earthenware, and conserve of roses; there are also numerous flour-mills, tan-yards, and bark mills, tile and lime-kilns. The trade consists in corn and flour for the Paris market, Provins roses for medicinal purposes, cultivated in this neighbourhood for centuries; wool, leather, and mineral-waters. The most remarkable public places are, the mineral-spring, the walks, and the extremity of the hill, on which the town is built, the ruins of an ancient fort, supposed to be of Roman construction, from which there is a very extensive prospect. Provins is thirty-seven miles east of Melun, thirteen north-west of Nogent, and sixty-three south-east of Paris.

PROVISION, *n. s.* } Fr. *provision*; Lat. }
 PROVISIONAL, *adj.* } *provisio, provisio.* The }
 PROVISIONALLY, *adv.* } act of providing; }
 PROVIS'IO, *n. s.* } care; things provided }
 or measures taken beforehand; stock, particularly of food; terms settled: provisional means provided for the present only; temporary: the adverb corresponding: proviso, stipulation; expressed condition; caution or care taken.

Kalander knew that *provision* is the foundation of hospitality, and thrift the fewel of magnificence.

Sidney.

This *provisio* is needful, that the sheriff may not have the like power of life as the marshal hath.

Spenser.

Mendoza advertised, that he would valiantly defend the city, so long as he had any *provision* of vicuals.

Knolles.

He doth deny his prisoners,

But with *provisio* and exception,

That we, at our own charge, shall ransom strait

His brother-in-law. *Shakspeare. Henry IV.*

Five days we do allot thee for *provision*,

To shield thee from disasters of the world.

Shakspeare.

He preserved all points of humanity, in taking

order and making *provision* for the relief of strangers distressed.

Bacon.

This law was only to reform the degenerate English, but there was no care taken for the reformation of the mere Irish, no ordinance, no *provision* made for the abolishing of their barbarous customs.

Davies on Ireland.

Under whose chin nature hath fastened a little bag, which she hath also taught him to use as a store-house; for in this, having filled his belly, he preserveth the remnant of his *provision*.

Heylin.

He caused *provisions* to be brought in. *Clarendon.*

Provisions laid in large for man or beast. *Milton.*

In such abundance lies our choice,

As leaves a greater store of fruit untouched,

Still hanging incorruptible, till men

Grow up to their *provision*.

Id.

Religion lays the strictest obligations upon men, to make the best *provision* for their comfortable subsistence in this world, and their salvation in the next.

Tillotson.

The prudent part is to propose remedies for the present evils, and *provisions* against future events.

Temple.

The abbot of St. Martin was born, was baptised, and declared a man *provisionally*, till time should show what he would prove, nature had moulded him so untowardly.

Locke.

David, after he had made such vast *provision* of materials for the temple, yet, because he had dipt his hands in blood, was not permitted to lay a stone in that sacred pile.

South.

Some will allow the church no further power than only to exhort, and this but with a *provisio*, too, that it extends not to such as think themselves too wise to be advised.

Id.

The commenda semestris grew out of a natural equity, that, in the time of the patron's respite given him to present, the church should not be without a *provisional* pastor.

Ayliffe.

PROVOKE', *v. a. & v. n.* } Fr. *provoquer* ;
 PROVOCATION, *n. s.* } Spanish *provocar* ;

PROVOCATIVE, } Lat. *provocare, pro-*
 PROVOKER, } *voco.* To excite ;

PROVOKINGLY, *adv.* } rouse to energy ;

rouse or excite to anger; enrage; offend; challenge; induce; promote; move: as a verb neuter, to produce anger; and (a Latinism) to appeal: provocation is, the act or cause which excites to anger; excitement; appeal: provocative, that which operates as an excitement of the appetite, in particular: provoker, one who excites anger or displeasure; promoter: provokingly, in a way to excite anger.

The Lord abhorred them, because of the *provoking* of his sons. *Deuteronomy xxxii. 19.*

Ye *provoke* me unto wrath, burning incense unto other Gods. *Jeremiah xlv. 8.*

To *provoke* unto love and to good works. *Hebrews.*

The like effects may grow in all towards their pastor, and in their pastor towards every of them, between whom there daily and interchangeably pass in the hearing of God himself, and in the presence of his holy angels, so many heavenly acclamations, exultations, *provocations*, and petitions.

Hooker.

Drink is a great *provoker*; it *provokes* and unprovokes.

Shakspeare.

It is a fundamental law, in the Turkish empire, that they may, without any other *provocation*, make war upon Christendom for the propagation of their law.

Bacon.

When we see a man that yesterday kept a humiliation, to-day invading the possessions of his bre-

then, we need no other proof how hypocritically and *provokingly* he confessed his pride.

Decay of Piety.
If we consider man in such a loathsome and *provoking* condition, was it not love enough that he was permitted to enjoy a being?
Taylor.

Though often *provoked*, by the insolence of some of the bishops, to a dislike of their overmuch fervour, his integrity to the king was without blemish.
Clarendon.

Neither to *provoke*, nor dread
New war *provoked*.
Milton.

A practice which, to the shame of our age, is now so much in fashion, and with some men in vogue; the invoking God's name, appealing to his testimony, and *provoking* his judgment, upon any slight occasion, in common talk, with vain incogitancy, or profane boldness.
Barrow.

Arius and Pelagius durst *provoke*
To what the centuries preceding spoke.
I neither fear, nor will *provoke* the war.
Dryden.

He now *provokes* the sea-gods from the shore:
With envy Triton heard the martial sound,
And the bold champion for his challenge drowned.
Id.

Tempt not my swelling rage
With black reproaches, scorn and *provocation*.
Smith.

We may not be startled at the breaking of the exterior earth; for the face of nature hath *provoked* men to think of, and observe such a thing.
Burnet.
As, in all civil insurrections, the ringleader is looked on with a peculiar severity, so, in this case, the first *provoker* has double portion of the guilt.

Government of the Tongue.
There would be no variety of taste to solicit his palate and occasion excess, nor any artificial *provocatives* to relieve satiety.
Addison.

A *provocation* is every act, whereby the office of the judge or his assistants is asked; a *provocation* including both a judicial and an extrajudicial appeal.
Ayliffe.

One Petro covered up his patient with warm cloaths, and when the fever began a little to decline, gave him cold water to drink till he *provoked* sweat.
Arbutnot.

Agamemnon *provokes* Apollo against them, whom he was willing to appease afterwards.
Pope.

If the performance of a writer thus distressed is not perfect, its faults ought surely to be imputed to a cause very different from want of genius, and must rather excite pity than *provoke* censure.
Johnson.

When gifts perverted, or not duly prized,
Pleasure o'ervalued, and his grace despised
Provoke the vengeance of his righteous hand,
To pour down wrath upon a thankless land;
He will be found impartially severe,
Too just to wink, or speak the guilty clear.
Cowper.

Garrulity, attended with immoderate fits of laughing, is no uncommon case, when the *provocation* thereunto springs from jokes of a man's own making.
Cumberland.

PROVOST, *n. s.* } Sax. *þræfarr*; Fr. *pro-*
PROVOSTSHIP. } *vost*; Ital. *provosto*; Lat. *præpositus*. The chief of any body, civil or military: the office of a provost.

Kingston, *provost* marshal of the king's army, was deemed not only cruel, but inhuman in his executions.
Hayward.

C. Piso first rose, and was afterwards advanced to the *provostship* of Rome by Tiberius.
Hakewill.
He had particular intimacy with Dr. Potter, *provost* of Queen's College.
Fell.

The *PROVOST* of a city or town is the chief municipal magistrate in several trading cities, particularly Edinburgh, Paris, &c., being much the same with mayor in other places. He presides in city courts, and, together with the bailies, who are his deputies, determines in all differences that arise among citizens. The provost of Edinburgh is called lord; and the same title is claimed by the provosts of Perth and Glasgow. The former calls yearly conventions of the royal boroughs to Edinburgh by his missives, and is, *ex officio*, president of the convention when met.

PROVOST GENERAL of the marines; a ci-devant French officer, whose duty it was to prosecute the marines when guilty of any crime, and to make report thereof to the council of war; besides a marine provost in every vessel, who was a kind of jailor, and took the prisoners into his care, and kept the vessel clean.

PROVOST MARTIAL OF AN ARMY is an officer appointed to seize and secure deserters, and all other criminals. He is to hinder soldiers from pillaging, to indict offenders, and see the sentence passed on them executed. He also regulates the weights and measures, and the price of provisions, &c., in the army. For the discharge of his office, he has a lieutenant, a clerk, and a troop of marshalmen on horseback, as also an executioner.

PROVOST OF THE MARSHALS was a kind of lieutenant of the marshals of France: of these there were 180 seats in France; their chief jurisdiction regarded highwaymen, footpads, house-breakers, &c.

PROVOST OF A UNIVERSITY OR COLLEGE, a title given to the head of King's College, Cambridge, and of Trinity College, Dublin, and also to the president of a college in the United States.

PROW, *n. s.* Fr. *proue*; Span. *proa*; Lat. *prora*. The head or forepart of a ship.

The sea-victory of Vespasian was a lady holding a palm in her hand, at her foot the *proa* of a ship.

Peacham on Drawing.
Straight to the Dutch he turns his dreadful *proa*,
More fierce th' important quarrel to decide.
Dryden.

PROWESS, *n. s.* } Fr. *prouesse*; Ital. *pro-*
PROWESS, *adj.* } *dezza*; Span. *proeza*. Bravery; military valor: prowtest, bravest; valiant: an obsolete barbarism.

Men of such *prowess*, as not to know fear in themselves, and yet to teach it in others that should deal with them; for they had often made their lives triumph over most terrible dangers, never dismayed, and ever fortunate.
Sidney.

I hope
That your wisdom will direct my thought,
Or that your *prowess* can me yield relief.
Spenser

They be two of the *provest* knights on ground,
And oft approv'd in many a hard assay,
And eke of surest steel, that can be found,
Do arm yourself against that day them to confound.
Id.

Nor should thy *prouess* want praise and esteem.
But that 'tis shewn in treason.

Shakspeare. Hen-3. VI.
Those are they
First seen in acts of *prouess* eminent,
And great exploits, but of true virtue void.
Milton.

The fairest of her sex, Angelica,
His daughter, sought by many *provest* knight. *Id.*

These were the entertainments of the softer nations, that fell under the virtue and *proveness* of the two last empires. *Temple.*

The vigour of this arm was never vain,
And that my wonted *proveness* I retain,
Witness these heaps of slaughter on the plain.

Dryden.

PROWL, *v. a. & v. n.* } The old dictionaries
PROWL'ER, *n. s.* } write *prole*, which
Casaubon derives from *προαλης*, ready, quick.
Skinner, from *proslar*, a diminutive formed by
himself from *proier* to prey, French; 'perhaps,'
says Johnson, 'it may be formed, by accidental
corruption, from *patrol*.' Thomson, Fr. *proioler*,
to rove over.

The champion robeth by night,
And *proweleth* and filcheth by daie. *Tusser.*

He *provs* each place, still in new colours deck't,
Sucking one's ill, another to infect. *Sidney.*

Nor do they bear so quietly the loss of some par-
cels confiscated abroad, as the great detriment which
they suffer by some *prowing* vice-admiral or public
minister. *Raleigh.*

As when a *prowing* wolf,
Whom hunger drives to seek new haunt for prey.

Milton.

On church-yards drear,
The disappointed *prowl*ers fall, and dig
The shrouded body from the grave. *Thomson.*

PROXIMATE, *adj.* } Lat. *proximus*. Next
PROXIMATELY, *adv.* } in the series of ratioci-
PROXIME, *adj.* } nation; near and im-
PROXIMITY, *n. s.* } mediate: this is the sig-
nification of both adjectives; the adverb and
noun-substantive corresponding.

When kingdoms have customably been carried by
right of succession, according to *proximity* of blood,
the violation of this course hath always been danger-
ous. *Hayward.*

If he plead *proximity* of blood,
That empty title is with ease withstood. *Dryden.*

Add the convenience of the situation of the eye,
in respect of its *proximity* to the brain, the seat of
common sense. *Ray.*

Writing a theory of the deluge, we were to shew
the *proximate* natural causes of it. *Burne.*

I can call to my assistance
Proximity, mark that! and distance. *Prior.*

The consideration of our mind, which is incorpo-
real, and the contemplation of our bodies, which
have all the characters of excellent contrivance; these
alone easily and *proximately* guide us to the wise au-
thor of all things. *Bentley.*

Must we send to stab or poison all the popish
princes, who have any pretended title to our crown by
the *proximity* of blood? *Swift.*

A syllogism is made up of three propositions,
and these of three terms variously joined: the three
terms are called the remote matter of a syllogism,
the three propositions the *proxime*, or immediate matter
of it. *Watts's Logic.*

PROXY, *n. s.* Contracted from *procuracy*.
Agency of another; the substitution of another:
hence the appearance of a representative, or per-
son substituted.

We must not think that we, who act only as their
proxies and representatives, may do it for them.

Kettlenell.

A wise man will commit no business of import-
ance to a *proxy*, where he may do it himself.

L'Estrange.

None acts a friend by a deputy, or can be f
by *proxy*. *South.*

Had Hyde thus sat by *proxy* too,
As Venus once was said to do,
The painter must have searched the skies,
To match the lustre of her eyes. *Granville.*

PRUCE, *n. s.* From Prussia or Pruzzi. See
PRUSSIA. Prussian leather.

Some leathern buckles use
Of folded hides, and leathern shields of *pruce*.
Dryden.

PRUDE, *n. s.* } Fr. *prude*; Lat. *prudential*.
PRUDISH, *adj.* } A woman affectedly nice
and scrupulous: affectedly grave or nice.

The graver *prude* sinks downward to a gnome,
In search of mischief, still on earth to roam. *Pope*

Not one careless thought intrudes,
Less modest than the speech of *prudes*. *Swift.*

I know you all expect, from seeing me,
Some formal lecture, spoke with *prudish* face.
Garrick.

PRUDENCE, *n. s.* } Fr. *prudence*; Lat.
PRUDENT, *adj.* } *prudential*. Wisdom in
PRUDENTIAL, *adj.* } practice; discretion:
PRUDENTIALLY, *adv.* } prudent is the corre-
PRUDENTIALS, *n. s.* } sponding adjective:
PRUDENTLY, *adv.* } prudent is, accord-
ing to rules of prudence, the adverb, and noun-
substantive corresponding: prudentials, max-
ims or principles of prudence: prudently, dis-
creetly; judiciously.

I have seen a son of Jesse, that is a man of war,
and *prudent* in matters. I Samuel xvi. 18.

I wisdom dwell with *prudence*. *Proverbs.*

These laws were so *prudently* framed, as they are
found fit for all succeeding times. *Bacon.*

Under *prudence* is comprehended that discreet,
apt, suiting, and disposing as well of actions as
words, in their due place, time, and manner.

Peachment.

If the probabilities on the one hand should some-
what preponderate the other, yet if there be no con-
siderable hazard on that side, which has the least
probability, and a very great apparent danger in a
mistake about the other: in this case, *prudence* will
oblige a man to do that which may make most for
his own safety. *Wilkins.*

So steers the *prudent* crane

Her annual voyage. *Milton.*

Prudence is principally in reference to actions to
be done, and due means, order, season, and method
of doing or not doing. *Hate.*

Being incapable rightly to judge the *prudentiality*
of affairs, they only gaze upon the visible success,
and thereafter condemn or cry up the whole progres-
sion. *Broune.*

Motives are only *prudential*, and not demonstra-
tive. *Tillotson.*

Such deep designs of empire does he lay
O'er them, whose cause he seems to take in hand;
And *prudently* would make them lords at sea,
To whom with ease he can give laws by land.

Dryden.

He acts upon the surest and most *prudential*
grounds, who, whether principles which he acts
upon prove true or false, yet secures a happy issue
to his actions. *South.*

If he acts piously, soberly, and temperately, he
acts *prudentially* and safely. *Id.*

These virtues, though of excellent use, some *pru-
dential* rules it is necessary to take with them in
practice. *Rogers.*

Many stanzas, in poetick measures, contain rules relating to common *prudentials*, as well as to religion.

Watts.

Prudent men lock up their motives; letting familiars have a key to their heart as to their garden.

Shenstone.

Adieu, dear amiable youth!

Your heart can ne'er be wanting:

May *prudence*, fortitude, and truth,

Erect your brow undaunting. Byron.

PRUDENCE, in ethics, may be defined an ability of judging what is best, in the choice both of ends and means. According to the definition of Cicero, *De Officiis*, lib. i. c. 43, *prudence* is the knowledge of what is to be desired or avoided. Accordingly, he makes *prudencia* (*De Legibus*, lib. i.) to be a contraction of *providentia*, or foresight. Plato calls this the leading virtue; and Juvenal *Stat. x.* observes, *Nullum nunquam abest si sit prudentia.*

PRUDENTIUS, or **AURELIUS PRUDENTIUS CLEMENS**, a celebrated Christian poet, under Theodosius the Great, born in Spain, A. D. 348. He was first an advocate, and afterwards a judge; he then became a soldier, and at length obtained an honorable employment at court. We have a great number of his poems, which, from the choice of his subjects, may be termed Christian Poems; but the style is barbarous, and very different from the purity of the Augustan age. The best editions of his works are those of Amsterdam, in 1667, with Heinsius's notes, and Paris in 1687, in usum Delphini.

PRUNE, *v. a., v. n., &* Of unknown derivation. — Johnson.
PRUNER, [*n. s.*]
PRUNINGHOOK, Fr. *provin*, of Latin
PRUNINGKNIFE, *propago*, an exuberant shoot.—Thomson. To lop; divest trees of their superfluities; dress; prink: a dried plum; one who crops trees: pruning-hook and pruning-knife are instruments of his art.

His royal bird

Prunes the immortal wing, and cloy's his beak.

Shakspeare.

Many birds *prune* their feathers; and crows seem to call upon rain, which is but the comfort they receive in the retenting of the air.

Bacon.

In drying of pears and *prunes* in the oven, and removing of them, there is a like operation. *Id.*
 So lopped and *pruned* trees do flourish fair. Davies.

Some sitting on the beach to *prune* their painted breasts.

Drayton.

Lest thy redundant juice

Should fading leaves, instead of fruits, produce,
 The *pruner's* hand with letting blood must quench
 Thy heat, and thy exub'rant parts retrench.

Denham.

What we by day

Lop overgrown, or *prune*, or prop, or bind,

One night with wanton growth derides,

Tending to wild. Milton's *Paradise Lost*.

Horace will our superfluous branches *prune*,

Give us new rules, and set our harp in tune.

Waller.

Every scribbling man

Grows a fop as fast as ere he can,

Prunes up, and asks his oracle the glass,

If pink or purple best become his face. Dryden.

Let thy hand supply the *pruningknife*,

And crop luxuriant stragglers. *Id.*

No plough shall hurt the glebe, no *pruninghook*

the vine. *Id.*

Vol. XVIII.

The cyder land obsequious still to thrones,
 Her *pruninghooks* extended into swords. Philips.
 You have no less right to correct me than the same hand that raised a tree has to *prune* it. Pope.

PRUNELLA, in botany, self-heal, a genus of the gymnospermia order, and didymnacia class of plants; natural order *fortieuh*, verticillate. The filaments are bifurcated, with an anthera only on one point; the stigma is bifid. The chief species is

P. vulgaris, the herb self-heal. The stem is erect, and eight or ten inches high. The leaves grow on foot-stalks, are ovato-oblong, slightly indented and somewhat hairy. The bractea are heart-shaped, opposite, and fringed. The flowers are white and purplish, grow in dense spikes, and are terminal. The plant is perennial; grows wild in meadows and pasture grounds, and flowers in June and July. It is recommended as a mild astringent and vulnerary, in spitting of blood and other hæmorrhagies and fluxes; and in gargles against aphthæ and inflammations of the fauces. Its taste is slightly austere and bitterish; and this is more perceptible in the flowery tops than in the leaves, though the latter are chiefly prescribed.

PRUNEL'LO, *n. s.* Barb. Lat. *prunella*. A kind of stuff of which clergymen's gowns are made.

Worth makes the man, and want of it the fellow,
 The rest is all but leather or *prunello*. Pope.

PRUNING, in gardening and agriculture, is the lopping off the superfluous branches of trees. Pruning, or the amputation of part of a plant with the knife or other instrument, says Mr. Loudon, is practised for various purposes, but chiefly on trees of the fruit-bearing kinds. Of two adjoining and equal sized branches of the same tree, if the one be cut off, that remaining will profit by the sap which would have nourished the other, and both the leaves and the fruits which it may produce will exceed their natural size. If part of a branch be cut off which would have carried a number of fruits, those which remain will fix better, and become larger. The objects of pruning may be reduced to the following: promoting growth and bulk; lessening bulk; adjusting the stem and branches to the roots; renewal of decayed plants or trees; and removal or cure of diseases.

Pruning, for promoting the growth and bulk of a tree, is the simplest object of pruning, and is that chiefly which is employed by nurserymen with young trees of every description. The art is to cut off all the weak lateral shoots, that the portion of sap destined for their nourishment may be thrown into the strong ones. In some cases, besides cutting off the weak shoots, the strong ones are shortened, in order to produce three or four shoots instead of one. In general, mere bulk being the object, upright shoots are encouraged rather than lateral ones; excepting in the case of trained trees, where shoots are encouraged.

Pruning for lessening the bulk of the tree is also chiefly confined to nursery practice, as necessary to keep unsold trees portable. It consists in little more than what is technically called heading down; that is, cutting off the leading

shoots within an inch or two of the main stem, leaving, in some cases, some of the lower lateral shoots. Care is taken to cut to a leaf bud, and to choose such from among the side, upper, or under buds of the shoot, according as the succeeding year's shoots may be wanted, in radiated lines from the stem, or in oblique lines in some places to fill up vacancies. It is evident that this unnatural operation persisted in for a few years must render the tree knotty and unsightly, and in stone-fruits, at least, it is apt to generate canker and gum.

In rearing trees planted for timber, it is desirable to throw the timber produced, as much as possible, into long compact masses; and hence pruning is employed to remove the side branches, and encourage the growth of the bole or stem. Where this operation is begun when the trees are young, it is easily performed every two or three years, and the progress of the trees under it is most satisfactory; when, however, it is delayed till they have attained a size, it will sometimes prove injurious. It is safer in such cases to shorten or lessen the size of lateral branches, rather than to cut them off close by the stem, as the large wounds produced by the latter practice either do not heal at all, or not till the central part is rotten, and has contaminated the timber of the trunk. Where timber-trees are planted for shelter or shade, it is evident, pruning must be directed to clothing them from the summit to the ground, with side branches; but in avenues, and hedge-row trees, it is generally desirable that the lowest branches should be a considerable distance from the ground. In all cases, the superfluous parts are to be cut off with a clean section, near a bud or shoot if a branch is shortened, or close to the trunk if it is entirely removed, in order that it may more easily heal.

Pruning for adjusting the stem and branches to the roots is almost solely applicable to transplanted trees, in which it is an essential operation; and should be performed in general in the interval between removal and replanting, when the plant is entirely out of the ground; if the roots have been broken or bruised, in any of their main branches or ramifications, the pruner, estimating the quantity of root of which the plant is deprived by the sections of fracture and other circumstances, peculiar and general, will be able to form a notion of what was the bulk of the whole roots before the tree was undisturbed. Then he may state the question of lessening the top to adjust it to the roots, thus:— as the whole quantity of roots which the tree had before removal is to the whole quantity of branches which it now has, so is the quantity of roots which it now has to the quantity of top which it ought to have. In general, bearing-wood and weak shoots should be removed, and the stronger lateral and upright shoots, with leaf or shoot-eyes, left.

Pruning for renewal of the head is performed by cutting over the stem a little way, say its own thickness above the collar, or the surface of the ground. This practice applies to old osier-beds, coppice woods, and to young forest-trees. Sometimes also it is performed on old, or ill-

thriving fruit-trees which are headed down to the top of their stems. This operation is performed with the saw, and better after scarification, as in cutting off the broken limb of an animal. The live section should be smoothed with the chisel or knife, covered with the bark, and coated over with grafting-clay, or any convenient composition, which will resist drought and rain for a year. Those who are advocates for pruning when the sap is dormant, will not of course be able to perform the operation of scarification, and covering the section with bark.

Pruning for curing diseases has acquired much celebrity since the time of Forsyth, whose amputations and scarifications for the canker, together with the plaster or composition which he employed to protect the wounds from air, are treated of at large in his Treatise on Fruit-Trees. Almost all vegetable diseases either have their origin in the weakness of the individual, or induce a degree of weakness; hence to amputate a part of a diseased tree is to strengthen the remaining part, because, the roots remaining of the same force, the same quantity of sap will be thrown upwards as when the head and branches were entire. If the disease is constitutional, or in the system, this practice may probably, in some cases, communicate to the tree so much strength as to enable it to throw it off; if it be local, the amputation of the part will at once remove the disease, and strengthen the tree.

PRUNUS, in botany, a genus of the monogynia order, and icosandria class of plants; natural order thirty-sixth, pomaceæ: CAL. quinquefid, inferior; there are five petals; the fruit is a plum, having a kernel with prominent sutures. There are thirty-three species, of which six are cultivated in Britain: they are originally natives of America and Siberia.

1. *P. armeniaca*, or apricot tree, grows twenty feet high, with a large spreading head, having reddish shoots, large nearly heart-shaped leaves, and close-sitting pale red flowers rising all along the sides of the young branches; succeeded by large roundish fruit of a yellow and reddish color in different varieties. The fruit and kernels excite when eaten a continued head-ache: the kernels, infused in brandy, communicate an agreeable flavor.

2. *P. avium*, the great wild cherry-tree, grows forty or fifty feet high, having oval spear-shaped leaves, downy underneath, with umbellate sessile clusters of white flowers, succeeded by small round fruit of different properties in the varieties.

3. *P. Canadensis*, the Canada dwarf bird cherry, grows but four or five feet high, branching horizontally near the ground with smooth branches; broad, spear-shaped, rough, downy leaves, without glands; and long clusters of white flowers, succeeded by small, round, berry-like, black fruit, ripe in autumn.

4. *P. cerasus*, the common cherry-tree, grows twenty feet or more in height, garnished with oval clusters of lanceolate, smooth leaves, umbellate flowers, succeeded by clusters of red roundish fruit of different sizes and properties in the varieties. The cherry trees afford an almost endless variety; all differing in some re-

Longitude East 16 from Greenwich 18 20 22 24

spect in the manner of shooting, leaves, flowers, or fruit : two in particular demand admission into the pleasure-garden ; the double-blossomed and the red-flowering. The pleasing show the common cherry-tree makes when in blow is known to all ; but that of the double-blossomed is much more beautiful. It blossoms like the other in May ; the flowers are produced in large and noble clusters ; for each separate flower is as double as a rose, is very large, and placed on long and slender foot-stalks, so as to occasion the branches to have an air of ease and freedom. They are of a pure white ; and the trees are so profusely covered with them, that when viewed at a distance they have been compared to balls of snow. But by the multiplicity of the petals the organs of generation are destroyed ; so that those flowers which are really full are never succeeded by any fruit. The red-flowering cherry tree differs in no respect from the common cherry tree, only that the flowers are of a pale red color, and by many are esteemed on that account. Besides the ornament and utility afforded by the flowers and fruit of the cherry, its timber is a further inducement for propagating it ; more especially that of the small black wilding sort ; which will grow, in a soil and situation it affects, to be a large tree ; which, if taken in its prime, will yield perhaps not less than a ton of valuable materials ; peculiarly adapted to the purposes of furniture. The grain is fine, and the color nearly approaching to that of mahogany.

5. *P. domestica*, the common plum tree, grows twenty or thirty feet high, garnished with oval, spear-shaped leaves, and with the pedunculi for the most part, single, terminated by flowers, succeeded by plums of many different colors, sizes, and shapes in the varieties.

6. *P. insititia*, wild plum, or bullace tree, grows twelve or fifteen feet high ; the branches somewhat spinous ; the leaves oval, hairy underneath ; and the pedunculi by pairs, terminated by white flowers, succeeded by small, round, plum-like, fruit of different colors in the varieties.

7. *P. padus*, the common bird-cherry tree, grows fifteen or twenty feet high, of a shrub-like growth, with a spreading head, large, oblong, rough, serrated leaves, having two glands at the back of the base like the other, and with shorter, more compact clusters of flowers, succeeded by large red fruit. This grows wild in hedges in the north parts of England.

8. *P. spinosa*, black thorn, or sloe tree, grows ten or twelve feet high, very branchy and bushy quite from bottom, armed with strong, sharp spines, small, spear-shaped, smooth leaves, pe-

dunculi growing singly, terminated by flowers, succeeded by small round cherries in autumn. It grows wild every where in hedges and woods ; and is very proper for planting field hedges, being of very quick and close growth.

9. *P. Virginiana*, the Virginian bird-cherry, grows thirty feet high, dividing into a very branchy head, having a dark purple bark, oval, slightly serrated, shining green leaves, having two glands at the fore part of the base, and long clusters of white flowers, succeeded by small, round, berry-like, black fruit. All the different varieties of plums have at first been raised from the stones, and are afterwards preserved by budding and grafting on any plum-stock. The same method is applicable to cherries ; only these are grafted to most advantage upon stocks of the wild black and red cherry raised from the stones of the fruit. The apricot-trees are propagated by budding on any kind of plum-stocks.

PRURIENCE, *n. s.* } Latin *prurio*. An
PRURIENCY. } itching or great desire
or appetite to any thing.

There is a *prurience* in the speech of some, Wrath stays him, or else God would strike him dumb : His wise forbearance has their end in view, They fill their measure, and receive their due.

Cowper.

PRUSA, in ancient geography, a town situated at Mount Olympus in Mysia, built by Prusias, who waged war with Cræsus and Cyrus. It was the capital of Bithynia, in Asia Minor.

PRUSIAS II., king of Bithynia, made an alliance with the Romans, but afterwards receiving Hannibal kindly, by his advice, made war on Eumenes, king of Pergamus, whom he defeated. Eumenes complained to the Romans, on which queen Flaminia was sent against him ; whereupon Prusias rendered himself for ever infamous by offering to deliver up Hannibal, which that hero prevented by a voluntary death. Prusias then restored Eumenes his provinces ; but became such a servile flatterer of the Romans that his subjects dethroned him, made his son Nicomedes king ; and, on his flight to Nicomedia, assassinated him, A. A. C. 149.

PRUSIAS, in geography, a town of Bithynia, anciently called Cios, from a cognominal river, and giving name to the Sinus Cianus of the Propontis ; rebuilt by Prusias the son of Zela after having been destroyed by Philip the son of Demetrius. It stood on the Sinus Cianus, at the foot of Mount Arganthonius. Of this place was Asclepiades, surnamed Prusicus, the famous physician.

P R U S S I A .

PRUSSIA, an extensive kingdom of modern Europe, is by some writers said to have derived that name (through Prussia proper) from the Pruzzi, a tribe of the ancient Scythians or Sarmatians. Others suppose it derived from the word Russia, united with the Slavonic word *po*, signifying near. Po-Russia, easily modified into

Prussia, would thus imply the people or country near Russia. This kingdom occupies a great part of northern Germany, bordering on the south of the Baltic ; and extends, with little interruption, from the confines of Lithuania to those of the Netherlands : being washed at one extremity by the Neimen, and at the other by

the Rhine and the Moselle. Or it is bounded by Russia and the Baltic on the north; Poland on the east; the Austrian empire and the kingdom of Saxony on the south; the Netherlands on the west; and the kingdom of Hanover, with the duchy of Mecklenburg, on the north-west. From north-east to south-west it measures about 750 miles. Its breadth is very unequal, and in some places it does not exceed 100 miles: in others it is 300. In one place it reaches from the Baltic to the southern point of Silesia, below 50° of latitude. The extremity of the grand duchy of the Lower Rhine, which now forms a part of the kingdom, also stretches nearly to the 49°.

According to Hoffmann, the whole extent of the Prussian dominions includes an area of

115,795 English square miles, or 74,108,800 British statute acres. The population, in 1817, was 10,536,570; which is about ninety-one persons for each square mile. The following statement shows the rapid increase of this population:—In 1688 it was stated at 1,500,000; in 1713 it was 1,620,000; at the death of Frederick William, in 1740, it had increased to 2,200,000; and in 1786 it was 5,800,000. On the accession of his present majesty, in 1797, the population of his dominions was 8,700,000.

Part of the Prussian monarchy, situated within the confines of Germany, forms a portion of the Germanic confederation. The other part is entirely independent of that body. The whole is now divided into ten provinces, i, e.

I. GERMAN PROVINCES.

Provinces.	Extent in Eng. sq. miles.	Population.	Chief towns.	No. of inhabitants.
1. Brandenburg	17,227	1,297,795	Berlin	236,830
2. Pomerania	13,018	700,766	Stettin	20,000
3. Silesia	16,560	1,992,598	Breslau	90,090
4. Duchy of Saxony	10,411	1,214,219	Magdeburg	44,049
5. Westphalia	8,648	1,074,079	Munster	13,000
6. Duchy of Juliers, Cleves, and Berg	3,634	935,040	Cleves	5,000
7. Grand duchy of the Lower Rhine	6312	972,724	Cologne	64,099

II. PROVINCES OUT OF GERMANY

Provinces.	Extent in Eng. sq. miles.	Population.	Chief towns.	No. of inhabitants.
8. Eastern Prussia	16,146	919,580	Konigsberg	67,941
9. Western Prussia	10,695	581,971	Dantzic	61,902
10. Grand duchy of Posen	12,374	847,800	Posen	15,000

Total (exclusive of lakes and waters) 115,025 10,536,572

A level and rather low surface is the predominant character of this country; but Silesia, which is divided from Moravia and Bohemia by the Carpathians, is frequently diversified by the rapid interchange of hill and valley. The eastern side, however, participates with the grand duchy of Posen in all the properties of an extensive plain, which, with the other regions between it and the Baltic, constitute the grand basin of the Oder. According to Busching, the principal detached hills in Silesia are Spiltzberg and Gratzberg. The countries approaching the Baltic are level and marshy. Many parts of the Prussian landscape, particularly Prussia Proper, abound with forests, and in the districts of Silesia bordering on Hungary noble woods clothe the range of hills that forms the barrier. The south-western regions, in the vicinity of the Rhine, also contain many forests, and morasses and pools abound in various parts.

Most of the large rivers which intersect these dominions originate in foreign sources. The Oder and the Pregel, indeed, may be considered as Prussian rivers: the former, rising in the mountains in the northern part of Moravia, soon after enters the southern parts of Silesia, flows through the middle of that province, and crosses Brandenburg and Pomerania, falling into the Grass-Haff, after a course of nearly 400 miles. The Pregel originates near the south-east extremity of Prussia, and passes by Konigsberg into the northern end of the Frische-Haff. The Spree, rising in Saxony, flows through Berlin, and enters the Elbe. The Vistula and the Memel

likewise complete their course by flowing through this kingdom; the former into the Frische-Haff, and the latter into the Curische-Haff. The Netze and the Warta are two considerable rivers running from east to west, through the grand duchy of Posen, till they unite above Landsberg, and afterwards pour their waters into the Oder. The Weser, the Rhine, and the Moselle, with some of their tributary streams, intersect Western Prussia. The Netze and the Vistula are united by a canal, which enters the latter river near Bromberg. Smaller canals intersect some parts of the kingdom: as one which connects the capital with the Oder on the east, and another with the Elbe on the west.

The lakes and pools of Prussia are so numerous as to add considerably to the insalubrity of the climate. These are chiefly in the eastern regions, and are supposed to exceed 400 in number: many are also spread over the surface of Pomerania, Brandenburg, and the western regions. One of the largest of these is the Spelding-See, in the south-east of Prussia Proper; and, including its several creeks, spreads more than twenty English miles. Besides these, the kingdom of Prussia presents many singular Haffs or sheets of water, at the estuaries of some of its principal rivers. One of these, denominated the Grass-Haff, is situated in the north-west point of Pomerania, at the mouth of the Oder. A second, the Frische-Haff, extends from Elbing to Konigsberg, and is only separated from the Baltic, to which it is nearly parallel, by a narrow slip of land. It is about

seventy English miles in length, and from three to ten in breadth; but not of sufficient depth to admit ships of large burden. The bank which separates it from the Baltic is said to have been thrown up by storms about the end of the twelfth century. Another of these gulfs commences a few miles north-east of the last, stretches northward, and enters the sea opposite Memel. This is the Curische-Haff, and is broadest at its southern extremity, but very narrow towards the opposite end. Its length is nearly sixty English miles, and its greatest breadth about thirty. The space between it and the sea is likewise very narrow. It is subject to frequent storms.

Prussia, amidst great variety of climate, must be considered as on the whole a cold and damp country. The lakes, forests, and marshes, render some places particularly unhealthy; as, for instance, Prussia Proper, where the autumn is often deluged with rain, and the winter is very long. Silesia is the most pleasant and healthy province, but in the south-western parts, which border on the Carpathians, the winters are severe. Some of the most favored districts produce the grape, but not in perfection. Brandenburg and Pomerania are principally sandy and marshy plains. The south-western regions enjoy a more favorable temperature.

Silesia is one of the most fertile of the old provinces, and portions of the lately acquired territory on the Rhine possess a genial soil as well as climate, requiring skilful culture to render them very productive. But in Brandenburg the soil is sandy and very barren: and other central parts of the country are marshy and totally unfit for culture.

We have not met with so able a sketch of the general agricultural state of Prussia as is furnished by Mr. Jacob in the course of his first Report on the Foreign Trade in Corn. He carefully examined the maritime, which are also the principal agricultural provinces of Prussia, i. e. East and West Prussia and Pomerania.

They appear by the official accounts, which he quotes, to have exported 447,183 quarters of wheat, and 1,218,916 quarters of rye, barley, and oats, beyond their own growth, in the last nine years, up to the end of 1824; exclusive of the year 1818, the returns of which, for East Prussia, are wanting, but which probably were 350,000 quarters of wheat, and 340,000 quarters of the other grains. It is possible, however, that some portion of this quantity may have been produced in the internal contiguous provinces of Posen, Silesia, and Brandenburg.

Before the year 1807 the landed estates in Prussia, as in most other parts of Europe, were in the possession of large proprietors. Many of them could only be held by such as were of noble birth; and the merchant, the manufacturer, or the artisan, however much money he might have accumulated, could not invest it in such land until he had obtained a patent of nobility. These restrictions were removed by the king, about the year 1807, when the French had overrun the country. A tenantry in our sense of the term was then, as it still is, almost unknown. The land was worked by a class of persons in some respects slaves; and in most respects but

little removed from that condition. In many cases they had an hereditary kind of right to some use of the land, such as to grow one crop of corn according to a prescribed course, whilst the lord had the right of pasture between the crops. These peasants were sold with the land, or descended to the heir, and were bound to perform certain labor or services for the lord. They could not, on the other hand, be dismissed from their holdings, nor had their superior any power over the property they might happen to be able to accumulate.

The conditions upon which the peasants held their portions of land were very various, some having a greater, and others a less share of the use of them; some doing greater, and others less service for them. By a series of legislative measures, which were enacted from 1807 to 1811, the whole of the enslaved peasants have become converted into freemen and freeholders. In some cases the holdings have been equally divided, and the peasant has his moiety in perpetuity. In cases where the lord's claims for personal services were more extensive, the peasant had a smaller share in the land. In some instances, compensations in money were settled by compact between the lords and the peasants, sometimes by the payment of a fixed sum, or by a security on the land allotted in perpetuity to the peasant, for the payment of such sum. Sometimes the peasant retained the whole of the land he had before used, paying to the lord the value of that portion which might otherwise have been given up to him. The successive measures by which the peasants were raised to the rank of freemen were not received by all with equal readiness. The lords were compelled, but the peasants were allowed to decline compliance; and, even to the present day, some few prefer the ancient mode of their holdings to that which the laws have allowed.

Although the foundation is laid for a new and better order of things, yet its effects on the agriculture of the country have not hitherto been fully realised. The abolition of personal services, and of hereditary ownership of such services, has been too recent for the full operation of the change of the parties from the relation of master and slave, to that of employer and employed, to produce the effect which is its natural tendency. It is obvious that all the operations of agriculture are still performed by the laborers with a listlessness and slovenly indolence which was natural to their former character, and which their new condition has not yet had time to remove.

The land in the three maritime provinces, as indeed in almost the whole of Prussia, may be considered as either in very large portions belonging to the nobility, or to the new class of proprietors; or as very small portions, such as under the ancient system were deemed sufficient for half the maintenance of the family of a peasant. There are but very few of that middle class of capitalists, resembling our farmers, who can hire land to that extent, which one able man can most advantageously manage, and, after stocking and working it, pay for the hire to the proprietor.

With some few exceptions, and those very few,

no rent is paid; but each occupier, whether a large or a small one, is his own landlord. The deviations from this general view are to be found, for the most part, on the banks of the great rivers, where meadows, either for the purpose of fattening cattle, or of saving hay, for the supply of large towns near the mouths of these rivers, are let to tenants for money rents.

The value of land generally is low, as may be inferred from the low price of produce, and of rents for what little is rented.

According to official documents it appears that the three maritime provinces of East Persia, West Prussia, and Pomerania, including in the latter the late Swedish territory, contains about 25,500,000 acres, or more than half the extent of England. By an official account, made up in 1821, the stock of cattle appeared to be as follows, at the latter end of the year 1819; viz.

556,839 horses and colts.
1,171,434 oxen, cows, and calves.
2,049,801 sheep and lambs,—and
617,310 swine.

The lowest estimate of the stock of cattle in England gives three times this number of horses, and more than four times the number of cows and sheep, to the same extent of land; and most of those who have calculated on the subject have carried the proportion of cattle to surface in England much higher.

From this deficient stock of the animals, from which manure is derived, it will naturally be inferred that the increase of grain must be very small. Mr. Jacob was satisfied, from his observations, confirmed by the opinion of intelligent natives, that much of the land in cultivation could not yield on an average more than three times as much corn as the seed that had been sown. The calculations made by the most intelligent statistical enquirers, and the most observing calculators, have not estimated the average increase of the four kinds of grain, viz. wheat, rye, barley, and oats, taken together, to be more than four times the seed.

Course of cultivation.—The general course of cultivation is to fallow every third year, by ploughing three times, when designed for rye, or five times if intended for wheat, and allowing the land to rest without any crop during the whole of the year, from one autumn to the next. Most of the land is deemed to be unfit for the growth of wheat under any circumstances. Where it is deemed adapted to that grain, as much as can be manured from their scanty supply of that article is sown with wheat, and the remainder of the fallow ground with rye. The portion which is destined for wheat, even in the best farms, is thus very small; and, as on many none is sown, the whole of the land devoted to wheat does not amount to one-tenth of that on which rye is grown. Of late years the proportion of rye to wheat has been increasing. The first is an article of domestic consumption and of universal demand; the far greater number of the inhabitants eat only bread made from it from necessity, and those who can afford wheaten bread eat commonly that of rye from choice. At the tables of the first families, both in Germany and Poland,

though wheaten bread was always to be seen, Mr. Jacob remarked that the natives scarcely ever tasted it.

‘From the time,’ says this gentleman, ‘I left the Netherlands, through Saxony, Prussia, Poland, Austria, Bavaria, and Wurtemberg, till I entered France, I never saw, either in the bakers’ shops, in the hotels, or private houses, a loaf of wheaten bread. In every large town, small rolls, made of wheaten flour, could be purchased, and they were to be seen at the tables at which foreigners were seated. In the small towns and villages only rye bread can be obtained; and travellers commonly take in their carriages sufficient wheaten rolls to supply them from one large town to the next. Wheat is only used by the natives for making what our English bakers would call fancy bread, or in pastry and confectionary.’

Although the increase of wheat is greater than that of rye, yet, as it absorbs all the manure of the farm, and requires the land to be ploughed twice more, it is now deemed to be the least profitable of the two crops by many of the farmers. As the rye receives the full benefit of the fallow, its increase is greater than that of the spring crops which follow it.

Barley and oats are sown in the spring which follows the harvesting the wheat and rye, and these complete the course, which is again followed by a whole year’s fallow. By this rotation of crops, the land bears corn only two years out of three; and the crop of the last year scarcely produces three times the quantity of the seed that was sown.

‘Like others,’ says our able reporter, ‘I was prevailed upon to pay the closest attention to the details and face of the land of the most skilful, the most affluent, and most productive proprietors. I visited several noblemen, whose knowledge of and attention to agriculture was fully equal to that of any men in this or any other country; and, if the produce of the land was not equal to that raised by our best farmers, the difference must be attributed rather to the soil and climate than to any deficiency either of capital, of skill, or of assiduity. On such property the wheat sown was very insignificant, and the proportion of that grain to rye had gradually declined of late years. One nobleman, who farmed his estate of 26,000 acres, of which two-thirds was tillage, and one-third woodland, grew but a few acres of wheat, and of late had sold no corn of any kind. From the ports of England being shut against corn, he had turned his attention to the production of fine wool. On this estate there is a flock of 15,000 merino sheep, yielding on an average two pounds and a half of fine wool, the annual sales of which amount to one-half more than the value of the sheep. Through the five winter months the sheep are fed with corn, chiefly rye, at the rate of one pound per day, which is estimated to be equal to three pounds of hay. The proprietor calculated that sheep thus kept yielded nearly as much more wool as, added to the benefit which the manure of the animals received from that kind of food, was equal to the price he should have received for the corn, if he had sold it; and

that the profit on this system was the value of the whole of the hay, which would have been otherwise consumed. Instead of selling, he finds it more profitable to buy corn. On the same property, the extent of land planted with potatoes was upwards of 1500 morgens, or about 1000 acres, the chief part of which were used in the distillery, which seems an indispensable adjunct to every well-managed farm. The calculation made there was that two bushels of potatoes yielded as much ardent spirit as one of barley; and that the residuum, after extracting the spirit, was equal in alimentary power, for the draft bullocks, which are fed with it, to two-thirds of its value before the wort was extracted from it. By the process on this estate nine bushels of potatoes are mixed with one of malt, to draw the wort, which is afterwards distilled, so as to produce a spirit containing eighty per cent. of alcohol, in which state it pays a duty, much complained of, of sixpence per gallon. It is reduced, before it is sold, till it retains fifty per cent. of alcohol; and the price charged to the retailers is about fourteen-pence per gallon.

Another person, of the same rank, who had turned his attention to the improvement of his property, boasted that his corn land already yielded nearly six fold for the seed that was sown, and could be further increased. He, too, cultivated potatoes very extensively, and, by converting them into starch and treacle, made that land yield a profit which, had it been devoted to corn, would have produced a loss. He had tried to make sugar from potatoes, and found it not advantageous; but he assured me that treacle paid him well, and he could afford to sell it 18s. per cwt., whilst that from the West Indies cost 24s. I could perceive no difference between the sweetness of this treacle and that from the tropics, but it has less consistency. A nobleman whom I had before known, to whose hospitality I am much indebted, and whose estate I viewed in detail, took the trouble to furnish me with the course of cultivation he pursued on the property on which he resides. Though cultivated with care, and though fairly productive, I readily give credit to what he assured me,—that the whole benefit which he derived from the estate of 6300 acres, in his joint capacity of landlord and cultivator, had not exceeded the amount for which he had sold the annual clip of the wool of his flock of 4000 sheep.

On the several other estates that I viewed, the recurrence of corn crops was equally distant; the superior portion of land devoted to green crops, and pasture, the same; and the stock of cattle bore nearly a like proportion. These, however, were exceptions, few in number and confined in extent, when compared with the general condition of the estates of the three provinces.

The new proprietors, he afterwards states, who have been raised to that condition by the abolition of the ancient feudal tenures, though they can scarcely ever want the bare necessities of life, have very little beyond them. If they happen to be both industrious and economical, their own labor, on the small portion of land which they possess, will supply them with potatoes and

some little bread corn, as well as provision for their two oxen. They all grow a small patch of flax, and some contrive to keep five or six sheep. If disposed to labor beyond the time required for their own land, there is a difficulty in obtaining employment; and in the winter months, which are long and severely cold, no agricultural work can be performed. The flax and the wool spun in their cottages must supply the clothing of the family; and the fat of the animals they kill must be converted into soap and candles. Meat of any kind can be rarely afforded to be eaten by such families; and only the few who are more prosperous than their neighbours can keep a cow to supply them with milk. They consume nearly all they produce, and are considered happy if they have a sufficient surplus for sale to meet the demands of a few shillings annually for the payment of their trifling taxes and local assessments. It was the universal opinion of all with whom I had any conversation on the topic that this description of peasants were hitherto in a worse condition than under the old tenures; and as this was attributed to the depression of agriculture, and the want of capital, and of incitement to the large occupiers to employ their spare time, it was not considered to be an impeachment of the wisdom which had planned and executed their emancipation.

Low state of agriculture.—In general the soil of the maritime provinces of Prussia is so light that it may be easily ploughed with two oxen, and those of diminished size and no great strength. On the smaller portions of land a single cow is not unfrequently seen drawing the plough; the latter guided by the owner, while the cow is led by his wife. The more tenacious soils, on the banks of the streams, are commonly but of small extent. There is indeed a large portion of land on the Delta, formed by the separation of the Nogat from the Fistula, between Derschau and Marienburg, which, under a good system of management, would be highly productive, and which requires greater strength to plough. Some others, especially near Tilsit, are of less extent; but the whole of them, if compared with the great extent of the surface of the country, are merely sufficient to form exceptions to the general classification which may be made of the soil. The various implements of husbandry are quite of as low a description as the working cattle. The ploughs are ill constructed, with very little iron in them. The harrows are made of wood, without any iron, even for the tines or teeth. The waggons are mere planks, laid on the frame loose, and resting against upright stakes, fixed into its sides. The cattle are attached to these implements by ropes, without leather in any part of the harness. The use of the roller is scarcely known; and the clods, in preparing the fallow ground, are commonly broken to pieces by hand with wooden mallets. In sowing, the seed is carried in the apron, or the skirts of the frock of the man who scatters it on the ground.

The monied value of the live stock on the farms is low. The best flocks of Merino sheep, exclusive of the wool, are averaged to be worth about 6s. or 6s. 8d. per head. Cows are worth from 30s. to 65s. A dairy which Mr. Jacob saw.

of the best description, was let to a dairyman at 36s. per year. The owner told him he valued them at 75s. per head, and thought the average weight of the butter from each, the calf being taken from the mother when ten days old, was about 120 lbs. each year. The variation in the price of cows is much greater than in that of sheep, according to their race, to the soil on which they are pastured, and to the distance from large towns requiring supplies of milk and butter. The price of hay varies, according to the situation and quality, from 14s. to 20s. the ton.

Taxes.—The general burdens of the state in Prussia are the subject of complaints among all classes; and although they may appear to us to amount to a very small sum, rated by the number of persons, they must be considered heavy in a country so destitute of little other capital than that of land, now vastly depreciated in value. The whole taxes in Prussia amount to about 10s. per head; but the effective value of money, in exchange for commodities, may be considered to be double what it is with us.

The land is divided into six classes, the rent of the lowest of which is estimated to be about 7d. per acre, and that of the highest about 4s. an acre. On this amount the grund steuer or land tax is twenty-five per cent., and averages in the three maritime provinces somewhat less than 3d. per acre. The gross amount collected in the three provinces annually, according to Hassel, is about £265,000 sterling. The local taxes do not fall wholly on the land. That for the disabled soldiers, and the families of such as fell in the conflicts, is in part borne by the cities and towns, though the chief weight falls on the land. The same, in some measure, is the case respecting the tax for roads, bridges, schools, and the poor. These are various in different districts, so that it is impossible to form any general estimate of their amount. In some parts of the country they appear to be equal to the grund steuer; in others higher; and in others they do not amount to one-tenth. Among the cultivators there is much complaint of the heavy tax on the distilleries.

The *military service* is extremely onerous throughout Prussia, as every young man is compelled to serve three years, from the age of twenty to twenty-four, as a soldier. This, though not precisely a tax, and not peculiar to the agricultural class, is a burden which perhaps presses as much on the productive industry of the country as the heavier taxes that are collected in other countries. To this must be added the quartering of the troops, who are billeted on private houses; and, however well discipline may be maintained amongst them, must be a great annoyance, and in most cases an expense, which, though apparently trifling in amount, becomes weighty to those whose means of supporting it are small. In a country where four-fifths of the inhabitants subsist wholly by producing food, and depend for the conveniences besides bare food on the price which they can obtain for their surplus, the low rate at which that surplus can be disposed of must be felt and observed in every rank of society.

The *scale of living* in the country we are con-

sidering corresponds with the low prices of the objects in which their labor is employed. The working class of the inhabitants, amounting in the maritime provinces to upwards of 1,000,000, including both those who work for daily wages and those who cultivate their own little portions of land, cannot be compared to any class of persons in England. This large description of the inhabitants live in dwellings provided with few conveniences, on the lowest and coarsest food; potatoes, or rye, or buck wheat, are their chief, and frequently their only food; linen, with flax of their own growth, and wool, spun by their own hands, both coarse and both worn as long as they will hold together, furnish their dress; whilst an earthen pot that will bear fire forms one of the most valuable articles of their furniture. As fuel is abundant they are warmed more by close stoves than by the shelter of their wooden or mud houses covered by shingles, which admit the piercing cold of the severe weather through abundant crevices. If they have bees and a plot of chicory, their produce serves as a substitute for sugar and coffee; but too often these must be sent to market to raise the scanty pittance which the tax-gatherer demands. Though the price of whiskey is low, yet the farm produce is still lower; and neither that, nor the bad beer which is commonly brewed, can be afforded by the peasantry as a usual drink. In common seasons this description of people suffer much in the winter; but in times of scarcity, such as followed the disastrous harvest of 1816, their distress and their consequent mortality is increased.

Since the acquisition of the Rhenish provinces, wine is one of the most important of the Prussian products. They yield various kinds of a good quality; and the average quantity is estimated at 100,000 hogsheads.

The Prussian horses differ little from those of the adjacent districts, but are generally considered as inferior to the Polish: for the Prussian cavalry are chiefly supplied from that country. The domestic cattle are likewise the same as in the other parts of Northern Germany. Silesia, Saxony, and the provinces near the Rhine, are the best adapted for supporting a superior breed of sheep; and the increase of Merinos has greatly augmented both the quantity and quality of the wool yielded by these districts. M. Krug has lately given the following estimate of the live stock in the entire Prussian States; viz.—

Horses	1,661,800
Cattle	5,252,820
Sheep and Lambs	11,230,000
Swine	2,640,000
Goats	181,000
Asses and Mules	9,680
Bee-hives	521,000

The *minerals* of Prussia are found chiefly in the high ground of the Westphalian and Rhenish provinces, particularly in the mountainous district of the Harz. Iron, copper, lead, vitriol, alum, saltpetre, are all found here, and, in a smaller degree, silver. Salt from brine springs, and coal, are abundant in some parts of Prussia

Saxony; but the expense of conveyance prevents the use of the latter for fuel. Amber is found in several parts of Prussia Proper. The whole annual value of mineral produce in the states is about £2,000,000.

Timber can be exported only from the vicinity of rivers or canals. Hops, in like manner, are confined to particular districts. Westphalia has long been noted for its hams; Pomerania for its poultry. Game is abundant in many parts. The fisheries are confined to the shores of the Baltic, the lakes, and the mouths of the great rivers. The general use of coffee, and the notion that the import of large quantities of it from abroad was a disadvantage, induced certain individuals, so far back as the year 1780, to attempt to find a substitute for it. Several plants were tried; among which the root of succory was most successful, and is now cultivated to a great extent to mix with coffee.

Weaving is the general employment of the lower orders in Silesia and Westphalia, long noted for their linens, also in no small degree, in Pomerania. Woollens are made, more or less, in almost every town or large village: in some parts of Silesia, and of the province of the Lower Rhine, they are manufactured in great quantities. Cotton manufactures are of recent introduction, and are found chiefly near the Rhine, at Berlin, at Erfurt, at Elberfeld, and in particular quarters of Silesia. These and hardware are the only fabrics carried on in collective establishments; the Prussian linens and woollens being both made by individuals in their cottages. Next in importance is the leather manufacture, then earthenware, glass, paper, tobacco, starch, potash, and vitriol. Brewing is also a pursuit of considerable importance.

Possessing on the Baltic the ports of Dantzic, Königsberg, Memel, and Stralsund, the commerce of Prussia has kept fully pace with her interior cultivation; and the maintenance of neutrality during so many years of war between Britain and France (from 1795 to 1806) was highly favorable to it. Subsequently, however, it suffered greatly, particularly in 1810, 1811, 1812, and has recovered but slowly. The last century was in Prussia the era of monopolies: one company had the exclusive right of manufacturing and selling tobacco; another were the sole importers of salt; while a third had a contract to supply Potsdam with firewood. Another abuse, remedied only since 1818, was the tax levied on the introduction of merchandise from one province of the kingdom to another. A third, and one not within the control of the government, is the heavy transit duty levied by the Dutch and Hanoverian governments on foreign goods imported by the Rhine, on the Ems and the Weser. The result is, that the commerce of Prussia, though conducted under many advantages, both maritime and inland, is in an early stage. The value of goods annually exported differs under different circumstances, but the great article of linen is steady in amount. The whole may probably be averaged between £7,000,000 and £8,000,000 sterling, or about a seventh of the exports of England. They consist, in addition to linen, of woollens and hard-

ware, corn, wool, timber, pitch, tar, potash, lintseed, tobacco, wax; horses, horned cattle, hogs, salt meat, and, from a few maritime towns, the produce of the fisheries. Distilled spirits are also, like corn, an article of export from the eastern part of the kingdom. The imports comprise coffee, cotton, sugar, tea, and other produce of the colonies; the wines, silk, fruit, and bay-salt of the south of Europe, printed cotton, and the finer hardware, tin, furs, and dye-stuffs. The chief trade takes place with Great Britain, whither Prussia sends her corn, and takes in return manufactures and colonial goods.

The *religion* of the royal family, and of the majority of the population of Prussia, is the Calvinist; but Christians of all denominations are admitted, on an equal footing, to public employments. The year 1817, the 300th anniversary of the reformation, was remarkable for the union of the Calvinists and Lutherans of the Prussian dominions, and of some other parts of Germany, into one religious community, under the name of Evangelical Christians. The relative number of the different creeds is thus stated,

Calvinists and Lutherans	6,600,000
Catholics	3,600,000
Jews	75,000
Baptists	14,000
Moravian brethren	7,000
Unitarians, Pietists, and members of the Greek church	4,000

The elementary *schools* in Brandenburg, Saxony, and part of Prussia Proper, are numerous, and well conducted. Silesia has also much improved in the means of education since the middle of last century; but in other parts of the kingdom, particularly where the majority are Catholics, the government has as yet been unable to introduce much reform. The universities are those of Berlin, Halle, Breslau, Königsberg; and here, and at Dantzic, Magdeburg, and a number of other towns, are academies (under the name of gymnasia, colleges, or high schools), in which are taught the classics and mathematics, the modern languages, drawing, &c. There are also, in the large towns, schools of surgery and midwifery distinct from the universities; but for the study of medicine, in a comprehensive sense, Vienna is the great resort of all Germany. Frederick II. established an academy of sciences at Berlin, and associations of a similar nature, but on a smaller scale, are established in most of the great towns.

Frederick II. also introduced the liberty of the press to that degree which led to the production of a number of books disfigured by declamation and extravagance. Others were, however, of a different character, and full of useful information. The result was the formation of that spirit of freedom which has for some time back caused great disquietude to the executive, and produced, in 1819, the restrictive enactments of the congress of Carlsbad. It is said that some of the best writers in the Prussian dominions have been Jews.

Several of the kings of Prussia have been economists. The father of Frederick II., with a revenue of only £1,200,000, found means to leave at

his death, in 1740, a well replenished treasury and a large army. His successor, notwithstanding expensive wars and improvements, left in 1785 a treasure of £7,000,000. This disappeared in the reign of his successor, and prior to the year 1785. In the twelve succeeding years of peace, the standing army was numerous and expensive, and the misfortunes of 1806, and the great exertions made in 1813, 1814, and 1815, have all borne so hard on the Prussian finances, as to have led to the creation of a debt amounting to above £45,000,000 sterling. After all her late acquisitions, the revenue of Prussia is not above £7 500,000 : but there is no paper currency. Mr. Jacob, in his *View of Germany*, gives the following state of the revenue, and the proportions contributed by the different provinces of the monarchy, in 1819, viz.—

East Prussia	8,100,000
West Prussia	3,750,000
Posen	3,100,000
Brandenburg	9,000,000
Pomerania	3,000,000
Silesia	13,500,000
Saxony	10,417,000
Westphalia	8,431,000
Juliers, Cleves, and Berg	8,670,000
Lower Rhine	7,000,000

Guldens, or 74,968,000

Sterling £7,528,003

The Prussian army was a subject of admiration to all foreigners, during great part of the eighteenth century. On the termination of his dreadful struggle, in 1763, Frederick II. determined to cultivate peace, and to trust to the gradual operation of time for the reinstatement of his finances and army. Such, with little deviation, was the policy of Prussia during forty years; and the number of disciplined men belonging to the army during this period was carried to more than 200,000, without involving a permanent expense of more than half the number. The battle of Jena was followed by the surrender of successive corps and garrisons, to the number of more than 100,000; and the loss of the financial resources of the kingdom reduced for a time the Prussian military establishment to utter insignificance. The humiliating peace of Tilsit restricted the means of its reinstatement; but, in 1813, the national ardor burst forth, and the old soldiers repaired to their standards, in a manner that excited universal admiration. They soon asserted in Silesia, their superiority over the raw levies of the French, and maintained their character in a more advanced stage of operations in Saxony and Champagne. At Ligny, in 1815, the army was 80,000 strong: the total number of Prussian troops under arms that year exceeded 200,000. Since then, the confirmation of peace, the complaint of heavy taxation, and the reductions of neighbouring powers, have led to a partial diminution of the military establishment; but it still exceeds 150,000. At Berlin, Breslau, Königsberg, and at Stolpe in Pomerania are military schools: where every branch of the service, whether

cavalry, artillery, or infantry, is diligently attended to.

Prussia had formerly a representative body, under the name of states. While the powers and privileges of the nobility were also very extensive, comprising, until lately, the local administration of justice. By degrees, the power of the crown reduced that of the aristocracy; and the sovereign found means to conduct the public business independent of the states. Such was the state of political affairs during the eighteenth century. But the diffusion of knowledge awakened the attention of the middling ranks to the existence of a number of abuses, and to the necessity of electing a representative body: this feeling and hope prompted the memorable exertions in 1813, 1814, and 1815, for the overthrow of Buonaparte; and great disappointment has been experienced by the better classes of society at the successive delays and evasions of the court, which as yet has done little more than new model the executive departments. Each circle or district has its council for the transaction of public business, viz. the collection of the direct taxes, regulation of local traffic, and superintendance of police. In the second place, each government has an administrative board, charged with a similar superintendance; while, at the head of each of the ten provinces, is a high president, who, like the préfet of a French department, serves as a medium or connecting link between the province and the ministers. These are nearly on the same footing as in England and France. The orders of knighthood are four. The noblesse or gentry, comprising 20,000 families, were formerly exempt from part of the taxes, and considered as entitled to a preference in public appointments; but the disasters of 1806 taught government the folly of these preferences, and led also to the abolition of exclusive privileges in regard to trades, &c.

The first proceedings of the law take place before justices, or courts of limited jurisdiction, nominated chiefly by the king, but in certain districts by the mediatised princes, or ecclesiastical dignitaries of the quarter; the second stage of jurisdiction is the *Oberlandes gerichte*, or courts in each government; and the final appeal is to the supreme courts at Berlin, consisting of a high tribunal and commission. Ecclesiastical affairs are managed by provincial consistories or commissions: and medical police is, in like manner, subject to a provincial commission. Commercial affairs are superintended by a board of merchants in several of the towns, particularly at Berlin, Königsberg, and Swinemunde. The highest court for fiscal questions is the *exchequer*, or high chamber of reckoning at Berlin.

The Prussians are generally allowed to be a brave and industrious people. They have more military parade, more show, and higher pretensions, than any other people of northern Germany. Berlin is considered as the Paris of that part of the continent; but, in other parts of old Prussia, the people have a tinge of gloom in their character. Some writers have ascribed this feature to the nature of their government, the strict and unceasing vigilance of which, and the constant and uniform obedience of the people,

have, doubtless, done much towards superinducing such a disposition in the inhabitants.

HISTORY.—On the expulsion of the Christians from the Holy Land, by Saladin, a settlement was given to the Teutonic knights in Prussia by Conrade duke of Masovia, the competitor of Boleslaus V. for the crown of Poland. Their first residence in this country was Culm; to which territory they were confined by the conditions of the donation, excepting what they could conquer from their pagan neighbours, all of which the emperor granted to them in perpetuity. Encouraged by this grant, the knights conquered the greatest part of the country which now goes by the name of Prussia; and became very troublesome to POLAND: see that article. The Teutonic order continued in Prussia till 1531. Their last grand-master was Albert marquis of Brandenburg, nephew to Sigismund I., king of Poland. He was preferred to this dignity in hopes that his affinity to Sigismund might procure a restitution of some of the places which had been taken from the order during the former unsuccessful wars with Poland; but Albert, instead of endeavouring to obtain any favor from his uncle, refused to do homage to him, began to assert his independence, and to recover the whole of Prussia and Pomerania by force of arms. But, being foiled in every attempt, he was forced to resign the grand-mastership, instead of which his uncle gave him Ducal Prussia. It was now the interest of the house of Brandenburg to assist in the expulsion of the fraternity; and accordingly, being at last driven out of Prussia and Pomerania, they transferred their chapter to Mariendal in Franconia; but in that, and other provinces of the empire where they settled, little more than the name of the order once so famous now remains.

The other most considerable part of his Prussian majesty's dominions is the electorate of Brandenburg. Like other parts of Germany, it was anciently possessed by barbarians, of whom no history can be given. These were subdued by Charlemagne; but, being on every occasion ready to revolt, in 927 Henry the Fowler established margraves, or governors of the frontiers. The first margrave of Brandenburg was Sigefroy, brother-in-law to Henry, under whose administration the bishoprics of Brandenburg and Havelberg were established by Otho I. From this Sigefroy, to the succession of the house of Hohenzollern, from whom the present elector is descended, there are reckoned eight different families, who have been margraves of Brandenburg; namely, the family of the Saxons, of Walbeck, Staden, Plenck, Anhalt, Bavaria, Luxemburg, and Misnia. The margraves of the four first races had continual wars with the Vandals and other barbarous people; nor could their ravages be stopped till the reign of Albert, surnamed the Bear, the first prince of the house of Anhalt. He was made margrave by the emperor Conrad III., and afterwards elector by Frederick Barbarossa, about A. D. 1100. Afterwards the king of the Vandals dying, without issue, left the Middle Marche to the elector, who was possessed of the old Marche, Upper Saxony, the country of Anhalt, and part of Lusace. In 1332 this line

became extinct, and the electorate devolved to the empire. It was then given by the emperor Lewis of Bavaria to his son Lewis, who was the first of the sixth race. Lewis the Roman succeeded his brother; and, as he also died without children, he was succeeded by Otho, his third brother, who sold the electorate to the emperor Charles IV. for 200,000 florins of gold. Charles IV. gave the Marche to his son Wenceslaus, to whom Sigismund succeeded. This elector, being embarrassed in his circumstances, sold the new Marche to the knights of the Teutonic order. Josse succeeded Sigismund; but, aspiring to the empire, sold the electorate to William duke of Misnia; who, next year sold it again to the emperor Sigismund. In 1417 Frederick VI., of Nuremberg, received the investiture of Brandenburg at Constance from the emperor Sigismund; who, in 1415, had made him elector, and arch-chamberlain of the empire.

This prince, the first of the family of Hohenzollern, found himself possessed of the Old and Middle Marches, but the dukes of Pomerania had usurped the Marche Ukraine. Against them, therefore, the elector immediately declared war, and soon recovered the province. As the New Marche still continued in the hands of the Teutonic knights, the elector took possession of Saxony, then vacant by the death of Albert the last elector of the Anhalt line. But the emperor gave the investiture of Saxony to the duke of Misnia; upon which Frederick voluntarily resigned his acquisitions. This elector made a division of his possessions by will. His eldest son, because he had attempted to search for the philosopher's stone, was left only Vogtland. The electorate was given to his second son Frederick; Albert, surnamed Achilles, had Franconia; and Frederick the fat had the old Marche; but by his death it returned to the electorate. Frederick I. was succeeded by his son Frederick, surnamed Iron-tooth. He might have been surnamed the Magnanimous, for he refused two crowns, viz. that of Bohemia, offered him by the pope, and that of Poland by the people; but Frederick declared he would not accept of it unless Casimir, brother to Ladislaus the late king, refused it. This induced the states of Lower Lusatia to make a voluntary surrender of their country to him. But, Lusatia being a fief of Bohemia, the king of that country made war on the elector to recover it. But by a treaty, in 1462, he was obliged to yield the sovereignty of Corbus, Peits, Sommerfeld, &c. Frederick then, having redeemed the New Marche from the Teutonic order for 100,000 florins, and still further enlarged his dominions, resigned the sovereignty in 1469, to his brother Albert, surnamed Achilles. Albert was at this time fifty-seven years old. Most of the exploits, for which he had the surname of Achilles, had been performed while he was burgrave of Nuremberg. He had defeated and taken prisoner Lewis duke of Bavaria. He had gained eight battles against the Nurembergers, in one of which he fought singly against sixteen men. He had taken Greissenburg, as Alexander took the capital of the Oxydracæ, and Frederick III. gave him the direction of almost the whole empire. He had also gained the prize at seventeen tourna-

ments. From this period nothing important occurred till 1594, when, John Sigismund of Brandenburg, having married Anne the only daughter of Albert duke of Prussia, that duchy was joined to the electorate, with which it has continued united ever since; and gave pretensions to the countries of Juliers, Berg, Cleves, Marck, Ravensburg, and Ravenstein, to the succession of which Anne was heiress.

Sigismund died in 1619, and was succeeded by his son George William; during whose government the electorate suffered the most miserable calamities. At this time a war commenced between the Protestants and Catholics, which lasted thirty years. The former, although leagued together, were on the point of being utterly destroyed by the Imperialists under Tilly and Wallenstein, when Gustavus Adolphus turned the scale in their favor, and threatened the Catholic party with utter destruction. But by his death, at the battle of Lutzen, the fortune of war was once more changed. At last, however, peace was concluded; and, in 1640, the elector died, and was succeeded by his son Frederick William. This young prince, though only twenty years of age at his succession, applied himself to repair the losses and devastations occasioned by the dreadful wars which had preceded. He received the investiture of Prussia personally from the king of Poland, on condition of paying 100,000 florins annually, and not making truce or peace with the enemies of that crown. His envoy likewise received the investiture of the electorate from Ferdinand III. The elector now concluded a truce for twenty years with the Swedes, who evacuated the greatest part of his estates, concluded a treaty with the Hessians, who delivered up a part of the duchy of Cleves; and obtained of the Hollanders the evacuation of other cities. In the mean time the powers of Europe began to be weary of a war which had continued for so long a time with such unrelenting fury. The conferences were opened at Osnaburg and Munster, in 1645. France demanded that Pomerania should be ceded to Sweden, as an indemnification for the expenses which the war had cost Gustavus Adolphus; but, though the empire and the elector refused to give up Pomerania, it was at last agreed to give up to the Swedes Hither Pomerania, with the isles of Rugen and Wollin, and some other cities; in return for which, the bishoprics of Halberstadt, Minden, and Camin, were secularised in favor of the elector, and ceded to him, with the lordships of Hohenstein and Richenstein, and the reversion of the archbishopric of Magdeburg. Thus was the treaty of Westphalia concluded in 1648, which so long served as a basis for all the possessions and rights of the German princes. The elector then concluded a new treaty with the Swedes, for the regulation of limits, and for the acquittal of some debts; and next year the electorate, Pomerania, and the duchy of Cleves, were evacuated by the Swedes. Notwithstanding these treaties, however, the Swedes soon after invaded Pomerania, but were entirely defeated by the elector near Fehrbellin; with the loss of 3000 killed, and many prisoners. He pursued his victory, gained many advantages over the

Swedes, and took the cities of Stralsund and Gripswald. On this the Swedes, to oblige the elector to evacuate Pomerania, which he had almost totally subdued, invaded Prussia, from Livonia, with 16,000 men; burnt the suburbs of Memel, and took Tilse and Insterburg. The elector, to oppose the invaders, left Berlin on the 10th of January, 1679, at the head of 9000 men. The Swedes retired at his approach, and were very much harassed by his troops. So successful indeed was Frederick on this occasion, that the Swedes lost almost one-half of their army. At last, having crossed the bay of Frischehoff and Courland on the ice, he arrived on the 19th of January, with his infantry, within three miles of Tilse, the head quarters of the Swedes. The same day his general, Trefenfeldt, defeated two Swedish regiments near Splitter; and the Swedes abandoned Tilse. They were pursued into Courland by general Gortz, and defeated with such slaughter that scarce 3000 of them returned to Livonia. Yet, notwithstanding these victories, the elector, pressed by the victorious generals of France, Turenne and Conde, was obliged to make peace with the Swedes. The conditions were, that the treaty of Westphalia should serve for a basis; that the elector should have the property of the customs in all the ports of Further Pomerania, with the cities of Camin, Gortz, Griessenburg, and Wildenbruck; while he gave up to the Swedes all that he had conquered from them. Frederick William passed his last years in peace. His great qualities had rendered him respected by all Europe, and had even reached Tartary, whence he received an embassy courting his friendship. From 1684 to 1686 he received into his dominions 20,000 Protestants who fled out of France, after the revocation of the edict of Nantz, and who introduced new arts and manufactures, that were of the utmost benefit to the country. By this, however, he disobliged Louis XIV., for which reason he concluded an alliance with the emperor; and, having furnished him with 8000 troops against the Turks in Hungary, the emperor ceded to him the circle of Schwibus in Silesia. In 1688 the elector Frederick William died, and was succeeded by his son Frederick III.

This elector was remarkably fond of show and ceremony; and the great object of his ambition seemed to be the regal dignity. To obtain this, he joined with the emperor in the alliance against France in which he was engaged by our William III. He also yielded up the circle of Schwibus, which had been given to his predecessor; and, in 1700, obtained from the emperor that dignity which he had so earnestly desired. The chief terms on which it was obtained were, that he should never separate from the empire those provinces of his dominions which depended on it; that he should not, in the emperor's presence, demand any other marks of honor than those which he had hitherto enjoyed; and that he should maintain 6000 men in Italy at his own expense, in case the emperor should be obliged to make war on account of the house of Bourbon's claim to the crown of Spain. Frederick I. continued all his life in strict alliance with the emperor

Frederick I. died in the beginning of 1713, and was succeeded by Frederick William I., in almost every thing the reverse of his father. His dispositions were altogether martial; so that he applied himself entirely to the augmentation of the army. His whim was to have it composed of men above the ordinary size, and his officers made no scruple of picking up such men wherever they could find them. However he was never engaged in any martial enterprise of consequence; but having put his army on the most respectable footing, and filled his coffers, he put it in the power of his son to perform those exploits which astonished all Europe. Frequent bickerings took place between the prince and the emperor, for which the persecution of the Protestants by some of the Catholic states of the empire afforded a pretence. But when Frederick William died, in 1740, this enmity broke out in full force.

Frederick II., immediately on his accession, seized upon Silesia, of which his ancestors, he said, had been unjustly deprived. But it cost him dear; for the empress queen, having overcome her momentary difficulties, formed against him the most formidable combination that had hitherto been known in Europe. The treaty was hardly concluded, by which she reluctantly yielded up Silesia, with a revenue of £800,000 a year, before she entered into another with Russia. This treaty, called the treaty of Petersburg, was apparently only defensive; but six secret articles were appended, one of which was, that if the king of Prussia should attack the empress queen, or Russia, or Poland, it should be held as a breach of the treaty of Dresden: another contained a plan for a partition of Prussia. The empress queen concluded also a treaty with France, on the 1st of May, 1756. Frederick, hearing of these machinations, resolved to be before-hand with his enemies, and, entering Saxony with a considerable army, demanded a free passage for his troops, on the principle of the king of Poland's professed neutrality; which being refused, he blockaded the Saxon camp at Pirna. To oppose the two Saxon armies, then in Bohemia, he placed one army under M. Schwerin and another under the celebrated M. Keith; and soon after joined the latter: on the first of December, 1756, he attacked and defeated the Austrian general. On this the king of Poland quitted his German dominions, and the Prussians took up their quarters in Saxony, where they seized the revenues and raised recruits: in the archives of Dresden Frederick discovered the originals of the secret articles above-mentioned. Mean time he was put to the ban of the empire; the circles were ordered to furnish their contingents: the French sent a large body of troops under prince de Soubise; the Austrians raised 100,000 men under prince Charles of Lorraine and M. Brown; and the Czarina sent 60,000 under M. Apraxin into Ducal Prussia, with a strong fleet to co-operate with them in the Baltic. The king of Sweden and the duke of Mecklenburgh also joined the combination; while Prussia had not a single ally, except about 35,000 Hanoverians under the duke of Cumberland; who were soon forced to yield to a superior army

of the French. In spring 1757 the Prussians entered Bohemia in three divisions; one under the king; another under general Schwerin; and the third under the prince of Bevern, from Lusatia, where he defeated an army of 28,000 Austrians. The Austrians then detached another body of 20,000 men from their main army; whereupon Frederick cut off all communication between that detachment and the main body, and, having quickly joined his two generals, attacked the Austrians near Prague and totally defeated them, but lost the brave general Schwerin. The Austrian general, also, was mortally wounded; and about 40,000 of his troops took refuge in Prague, which was immediately invested by the king. The garrison made a sally; but were repulsed, as were also 12,000 of the inhabitants, who wished to quit it. In this desperate situation, Leopold count Daun took the command of the remains of Brown's army, and having collected 60,000 of them retired to a strong post near the town. Frederick sent against them only 32,000 men, who were defeated at Colin on the 18th of June, after a bloody battle. The king then raised the siege of Prague, left Bohemia, and retired into Saxony.

Meantime the Russians, under Apraxin and Pormor, were committing the greatest cruelties in Ducal Prussia. The Austrians entered Silesia, penetrated to Breslau, and besieged Schweidnitz. Another body of them took Zittau. An army of 22,000 Swedes also entered Prussian Pomerania, took Anclam and Demmein, and plundered the country: while the French devastated Halberstadt and the Old Marche of Brandenburg. General Haddick laid Berlin itself under contribution. The Prussian general, Lehwald, with 30,000 men, attacked 30,000 Russians, who were strongly intrenched at Norkitten, but, though they performed prodigies of valor, were obliged to retire. At last, on the 5th of November 1757, the king of Prussia met, at Rasbach, with the united army of his enemies under prince Saxe-Hilburghausen and general Soubise, amounting to 50,000 men. His army did not amount to above half that number of men, but inspired with the most enthusiastic patriotism, and encouraged by the presence of their king, they completely defeated the Austrians, with the loss of 3000 men killed; eight generals, 250 officers, and 6000 men, prisoners, while night alone prevented their total destruction. But in Silesia the Austrians, after a siege of sixteen days, reduced Schweidnitz, and took the Prussian garrison of 4000 men prisoners. They next attacked the army under the prince of Bevern, encamped at Breslau, on the 22d of November; but were repulsed with dreadful slaughter. Yet the Prussians, soon after, rashly deserted their strong post, and in two days the prince of Bevern, reconnoitering carelessly, was taken prisoner; Breslau of course surrendered, and all was going to wreck, when the king, by a rapid march, passing through Thuringia, Misnia, and Lusatia, entered Silesia on the 2d of December, and was joined by the prince of Bevern's corps and the garrison of Schweidnitz. He now approached Breslau, where the Austrians, trusting to their numbers (amounting to 70,000) while the Prus-

sians were scarcely 36,000 men, left their strong camp and advanced to battle. The two armies met on the 5th of December near Luthen. Count Daun occupied a plain with some small eminences, and caused his troops to scatter a great number of trees in the road of the Prussians. But Frederick overcame all these difficulties: attacked the enemy with the utmost impetuosity, took the post, and a total rout ensued, wherein the Austrians lost 6000 killed, 15,000 prisoners, and 200 cannons. The consequences were great; Breslau surrendered on the 29th of December with a garrison of 13,000 men: the Russians retreated out of Ducal Prussia: general Lehwald expelled the Swedes out of Prussian Pomerania, and took part of Swedish Pomerania; and the king took ample vengeance on Mecklenburg. To add to his good fortune, the French were now so successfully opposed by the Hanoverians, under prince Ferdinand, that he had no more trouble from them.

On the 3d of April, 1758, Frederick laid siege to Schweidnitz, which surrendered on the 16th. He then disposed his forces in the best manner for the defence of his dominions, placing one army under count Dohna on the side of Pomerania; another between Wohlan and Glogau, to cover Silesia; and a third in Saxony under his brother prince Henry, consisting of thirty battalions and forty-five squadrons, to make head against the empire. All these armies were connected by posts. Frederick next, making a feint of invading Bohemia, suddenly burst into Moravia, over-run the whole country, and laid siege to Olmutz on the 27th of May. But general Daun, seizing a strong hold where he could not be attacked, obliged the king to raise the siege; which he did very unexpectedly, on the 1st of July, and marched in two columns into Bohemia. After laying Konigsgratz and the adjacent districts under contribution, he marched rapidly against the Russians, who had been employed in besieging Custrin, since the 15th of August. Frederick arrived on the 25th within sight of the Russians, after fifty-six days march: when they raised the siege and retired to Zorndorff. The battle of Zorndorff began at 9 A. M., and continued till 7 P. M., with various success and dreadful slaughter. At one period the Prussians had given way and fled before an army half defeated; but the king, by a rapid and masterly movement, brought his cavalry to the centre, and, falling on the Russian foot, put them into such confusion that they fired on each other, plundered their own baggage, and got so much intoxicated that the fire of the Prussians had dreadful effect. In a word, their loss, besides a vast train of artillery, amounted to 21,529 men, the military chest, &c., while that of the Prussians did not exceed 2000. The remains of the Russian army retreated to Landsperg; and the king marched to the relief of prince Henry. Here he met with a severe check. Marshal Daun had his camp advantageously situated at Stolpen, while the right wing of the king extended to Hochkirchen, by which he had a communication with prince Henry and protected Brandenburg. In this critical situation Daun surprised the Prussian camp at 5 A. M. on the 14th of Octo-

ber. The brave marshal Keith, and prince Francis of Brunswick, were killed on the spot; and though the king did his utmost to encourage his troops, and the victory was long doubtful, the king at last ordered a retreat, which he conducted in good order: but this bloody battle cost him 7000 men, with a great number of cannon. The Austrians lost 5000. Frederick next reinforced his army from that of prince Henry, and hastened to raise the siege of Neiss, which had been invested on the 4th of October. On the 24th he came to Gorlitz, where he defeated a party of Austrians, with the loss of 800 men; and soon after relieved Cosel. The king then hastened to the relief of Dresden, which was badly fortified and garrisoned by only 12,000 men. It had large suburbs, but these had been burnt by Schmettau, the governor, on the 10th of November, to prevent their being taken by the Austrians under Daun, as then all defence of the city would have been vain. Upon the king's approach all the Austrian armies retired into Bohemia. He now took up his winter quarters in Saxony, where he levied the most exorbitant contributions. On the 23d of February, 1759, general Wobersow marched with a body of Prussians into Poland, where he destroyed several large Russian magazines. The successes of prince Henry, in the interim, cleared Franconia of their enemies; but now the Russians once more approached. The king disgraced count Dohna, for not opposing them with sufficient zeal, and appointed general Wedel in his place; who, on the 23d of July, with an army of not quite 30,000 men, attacked 70,000 Russians most advantageously posted at Zulichau. The Prussians fought with their usual bravery, but were defeated with the loss of 4700 killed or taken, and 3000 wounded. The consequences were that the Russians took Crossen and Frankfurt on the Oder; on which the king joined Wedel with a large body of troops, leaving the rest of his army in Saxony, under prince Henry. But as Daun had sent 12,000 horse and 8000 foot, under Laudohn, to assist the Russians, the king was unwilling to venture a battle. This, however, became unavoidable; he therefore, on the 12th of August, attacked the enemy in their strong entrenchments with a heavy cannonade, forced the entrenchments with great slaughter, and took seventy-two cannon. The Russians made a stand at Cunnersdorf, but were driven from it, and from post to post to the last redoubts. For above six hours the Prussians were wholly successful; and victory was completely in their power, if the king had not lost it by his impetuosity. General Saltikoff assembled the remains of the Russian army at an advantageous post where prudence and policy would have allowed them to remain. But, the king attempting to drive them from it, his fatigued troops were overpowered, and the Austrians, who had not been much engaged all day, assisting them, the fortune of the day was turned so completely that nothing but the night coming on saved the Prussians from total destruction. Their loss amounted to 20,000 men. After this defeat Frederick exerted himself to procure artillery from Berlin; he recalled general Kleist with

5000 men from Pomerania; detached 6000 from his own army to defend Saxony; and with the remainder put himself between the Russians and Great Glogan; thus obliging them to return to Poland, notwithstanding their victory. New misfortunes, however, attended the Prussian arms. General Finch, who had been sent with 12,000 Prussians to oppose Daun, having advanced too far, was surrounded and obliged to surrender. General Durceke, and another body of Prussians, were posted at the Elbe, opposite Meissen; but were suddenly attacked by the Austrians, and lost 3000 men.

The year 1760 began with very unfavorable auspices. Since October 1756 forty generals had been killed in the Prussian service, exclusive of those wounded or taken: and most of Frederick's veteran soldiers had fallen in battle, and their places were filled up by raw inexperienced troops. At this time Laudohn drew general Fouquet and a body of above 11,000 Prussians into a situation from which they could not escape; and on the 23rd of June attacked them at midnight, near Landshut, when, though they made a brave defence, 4000 were killed, 7000 taken, with fifty-eight cannon, and not above 300 escaped. The victory, however, cost the Austrians 12,000 men in killed and wounded. Laudohn immediately followed it up by the capture of Glatz. Thence he marched against Breslau, and invested it; but, the king of Prussia having laid siege to the town on the 13th of July, Daun appeared within three miles on the 19th, and on the 21st had supplied it with sixteen battalions, which obliged the king to raise the siege. Breslau was also bombarded by Laudohn, but the approach of prince Henry obliged him to retire on the 5th of August. Meantime the king advanced into Silesia with his usual rapidity. This, however, did not prevent the junction of the armies under Laudohn, Daun, and Lacy, which formed a line of encampments, extending no less than thirty miles. They now laid a plan to attack and surround the king's army in the night; but Frederick, having heard or suspected their intention, quitted his camp privately, and took an advantageous post on the road through which Laudohn was to pass. A thick fog in the morning hid the Prussians till Laudohn saw them with surprise regularly drawn up for battle. An obstinate conflict ensued, wherein Laudohn was completely defeated, with the loss of 10,000 killed, wounded, and prisoners; eighty-two cannon, and twenty-three colors. This victory compelled count Czernichev, who was advancing with 24,000 Russians to join Daun, to repossess the Oder; and soon after the king joined prince Henry at New Marche, and, attacking a corps under general Breck, took two battalions of Croats prisoners. About this time too general Hulsen defeated the imperial army in Saxony. But a body of 15,000 Austrians, under generals Lacy and Brentano, with the whole of the imperialists in Saxony, began their march in concert with the Russians towards Berlin. These armies amounted to 40,000 men. The Prussian generals Hulsen and Werner could not raise above 16,000. Berlin was therefore abandoned to its fate; which, by the powerful mediation of several

foreign ministers, was better than could have been expected. The city, however, was obliged to pay the sums of 800,000 guilders, and 1,900,000 crowns: the magazines, arsenals, and foundries were destroyed; all the military stores, cannon, and other arms seized, and the king's palace plundered. The combined armies left Berlin in four days, dreading the vengeance of Frederick; and on their return took Leipsic, Torgau, Meissen, and Wirtemberg. A detachment of French under M. Stainville laid Halberstadt under contribution. In East Pomerania the Russians besieged Colberg; in West Pomerania the Swedes advanced, while Laudohn besieged Cosel; and Daun watched the king with a superior army. The Prussians did not amount to 50,000: the Austrians exceeded 86,000. The king therefore resolved to make a desperate effort. On the 3rd of November, 1760, he divided his forces into three columns, with one of which general Hulsen took post in a wood. With the other two columns, under himself and general Ziethen, the king attacked general Daun about 2 P. M., who received him with the fire of 200 cannon. The Prussians were thrice led on to the attack, but as often repulsed with dreadful slaughter; till, at length, general Zeithen with the right wing attacked the enemy in the rear, repulsed them, and got possession of some eminences. Encouraged by this success, the Prussians advanced, mastered the Austrian entrenchments, and made way for their cavalry, which broke in with irresistible fury and threw the Austrians into irreparable confusion. It was now about 9 P. M., both armies were in darkness, yet the firing continued, till M. Daun was wounded; and the command devolved on count O'Donnel, who ordered a retreat. This important victory cost the Prussians 10,000 killed and wounded, and 3000 prisoners. The loss of the Austrians in killed and wounded is unknown; but 8000 were taken prisoners, among whom were four generals and 212 other officers. The consequences of this victory were that the king recovered all Saxony, except Dresden; the Russians raised the siege of Colberg, and retired into Poland; Werner defeated the Swedes, and drove them totally out of West Pomerania; Laudohn raised the blockade of Cosel, and retired into Austrian Silesia; Daun placed his army in Dresden, and other strong posts south and west of it; and the imperial army retired into Franconia. But, though these successes retrieved the king's affairs, they exhausted his strength; and in 1761 he was unable to make any vigorous efforts. He continued strongly encamped at Schweidnitz, but was closely watched by Daun and Laudohn. He however defeated the designs of the Russians against Breslau, by sending general Platen to destroy their magazines, who at the same time cut off 4000 of their troops. But they retook Colberg on the 3rd of December; and, the king having drawn 4000 men out of Schweidnitz, Laudohn took it by a coup de main. In the midst of these adverse circumstances, the empress Elizabeth, Frederick's inveterate enemy, died on the 2d of January 1762, and was succeeded by Peter III. his warm friend. The consequences were a suspen-

sion of hostilities on the 16th of March, and a treaty of peace and alliance on the 5th of May. Sweden made peace too on the 22d of May. The arms of Prussia were now attended every where with success. Prince Henry drove the imperialists from several important posts in Saxony, which secured all the Prussian possessions there. The king was joined by the Russians in the end of June; after which he drove M. Daun to the extremity of Silesia. He then penetrated deep into Bohemia, where the Russians committed the same cruelties on their late allies, the Austrians, that they had long practised on the Prussians. But the deposition and murder of Peter III. occasioned a new change. Catharine II. was prejudiced against Frederick; but his private letters to Peter, wherein he had advised him to treat her well, being discovered, excited her gratitude; and, though she ordered her troops home, she adhered to the peace, and restored all the places taken during the war. The success of Frederick, however, continued: he totally defeated Laudohn; retook Schweidnitz, with a garrison of 8000 men; and, on the 29th of October, entirely routed the Austrians at Freyberg, vast numbers being killed, and 6000 taken prisoners. This decisive victory produced the peace of Hubertsburg, whereby every thing was settled in statu quo. After this Frederick turned his attention to the arts of peace; which was hardly interrupted in 1778 by a difference with Austria, about Bavaria. No other remarkable events occurred during his life, but what are already mentioned in our article **FREDERICK**. He died August 17th, 1786, and was succeeded by his nephew, Frederick William II.

Frederick the Great had bequeathed the most effectual securities to his successor for the preservation of his dominions, that human wisdom could provide or devise; and the new monarch, with these advantages, was not wanting to himself. But his uncle's predilection for the French language and French literature was not grateful to his subjects. Frederick-William began his reign with declaring in council, Germans we are, and Germans I mean we shall continue; giving directions at the same time, that their native language should resume its natural rank and station. This was a very popular measure, and it was followed by another still more so. Observing that he had marked with great concern the progress of impiety and profaneness on the one hand, and of enthusiasm on the other, he declared, that he would not have his subjects corrupted either by fanatics or atheists, and strictly prohibited all publications tending to excite a contempt or indifference for religion. An opportunity soon occurred, in which he was also thought to have displayed such talents in negotiation and in military arrangements, as proclaimed him in every respect a worthy successor of his uncle. The States of Holland, who had long been jealous of the power of the Stadtholder, and inclined to a republican government without any permanent chief, had gained such ascendancy in the states general, that in 1786 and 1787 they divested the prince of Orange of all his prerogatives. They proceeded even to the seizure and imprisonment of the princess, sister to the king of Prussia; and, de-

pending upon support from France, treated with insolence every power connected with them in Europe. The court of Berlin did not witness these proceedings without indignation; and the king formed his plan for restoring the power of the Stadtholder with such secrecy and prudence, that, in the space of one month, the duke of Brunswick led 18,000 Prussians to Amsterdam. The monarch's subsequent conduct was not such as the beginning of his reign gave reason to expect. See the article **POLAND**. He was, on the whole, a weak voluptuous character, who dissipated his treasures, and, in the part which he took against the French republic, by no means added to the reputation of the Prussian arms.

Frederick William III. came to the crown in 1797, and acted for several years in concurrence with France. In 1806, however, his eyes were opened to the usurpations of Buonaparte; war was determined on, and the army led to the western frontier, with as much confidence as if the French troops had been those of Louis XV. The result was the fatal battle of Jena; and the capture, in succession, of almost every corps of the Prussian army; the loss of Berlin, and soon after of every province of the kingdom, except Prussia Proper. The peace of Tilsit restored little more than half the states of the monarchy; and during six years all the calamities of foreign occupation and exaction were accumulated on this ill fated country. Hence the ardor with which the Prussians rushed to arms in 1813; their courage under the first reverses of the campaign, and their perseverance in its prosecution. The peace of Paris in 1814, confirmed by that of 1815, gave them their reward; for, while the Prussian monarch did not obtain the restoration of the same extent of territory in Poland, he had an ample equivalent in Saxony and on the Lower Rhine. Since that period the closest ties of the Prussian court have been with Russia and the Netherlands.

PRUSSIA PROPER is a division of the Prussian dominions, having on the one side the northern frontier of Poland, on the other the Baltic. Its form, though irregular, approaches to an oblong, extending from east to west; its superficial extent is nearly equal to that of Scotland. It is in a great measure agricultural, and is composed of the provinces of East and West Prussia, divided formerly by the Vistula, but now by a line a few miles to the east of that river.

East or Ducal Prussia lies between 19° 20' and 24° 15' of E. long., and 52° 32' and 56° 3' of N. lat. It has a superficial extent of 15,000 square miles, with 856,000 inhabitants, of whom about a third are of Polish or Lithuanian origin.

It is divided into the governments of Königsberg and Gumbinnen, the latter being the part of Lithuania allotted to Prussia on the partition of Poland. Two-thirds of the population are descendants of Swiss, French, or German protestants. The soil is tolerably productive, but the climate severe, and the spring and autumn changeable and foggy. A great degree of moisture is produced by the lakes, marshes, and vast forests; yet the winds that brush the surface of this country almost without interruption purify the air. The forests are said to cover nearly

8,400,000 acres. They contain bears, elks, and other wild animals common in Poland; they also produce kermes, or, as it is here termed, Russian cochineal. The lakes, great and small, are said to be fully 300 in number. All these abound in fish. Corn of all kinds, as well as flax and hemp, are largely cultivated; hops and madder are reared in particular districts; and potatoes are much used. Hogs are also reared in great numbers, and bees, in a domestic as well as wild state, are in great abundance. The horses are both numerous and of good breeds. The royal studs are now united at the town of Stallupohen, and are said to form the largest establishment of the kind in Europe. Iron ore is found in many of the marshes. Linen, woollen, and in a small degree leather and glass, are the manufactures. The commercial towns are Königsberg and Memel. But the most singular article in this country is amber, currently sold for about three or four shillings the 1 cwt. The district in which it is obtained from the sea is about twenty-five miles in length. It is thrown on the coast or fished like coral, after strong

north and north-west winds. It is manufactured at Dantzic, Königsberg, and Stolpe, and serves to make trinkets, scented powder, a spirituous acid, and a fine varnishing oil. Part of it is exported to Denmark and Italy, whence, after undergoing a farther process of manufacture, it is sent to Turkey. The quantity annually collected in Prussia is about 200 tons.

West Prussia has an area of about 10,000 square miles; its population is 560,000. The foreign settlers here are far less numerous than in East Prussia. It is divided into the governments of Dantzic and Marienwerder. The small part to the right of the Vistula is full of lakes; but along the banks of that river the soil is fertile; in other parts it is sandy and barren.

The agricultural products are similar to those of East Prussia; but the number of cattle is larger. Manufactures, with the exception of linen, are backward; but this province contains the well known commercial towns of Dantzic and Elbing, and possesses in the Vistula a grand channel of communication between Poland and the sea.

PRUSSIC, CYANIC, or HYDROCYANIC, ACID, in chemistry, was first discovered in the pigment commonly called Prussian blue, by Bergman, and first obtained separate by Scheele. The compound formed by this acid with iron was long known and used before its nature was understood. Macquer first found that alkalis would decompose Prussian blue, by separating the iron from the principle with which it was combined, and which he supposed to be phlogiston. Hence the prussiate of potash was long called phlogisticated alkali. Bergman, however, ranked it among the acids; and, as early as 1772, Sage announced that this animal acid, as he called it, formed with the alkalis neutral salts. About the same time Scheele instituted a series of experiments to obtain the acid separate, and to ascertain its constituent principles. These, according to him, are ammonia and carbon; and Berthollet showed that its triple base contains hydrogen and azote, nearly, if not precisely, in the proportions that form ammonia. Berthollet could find no oxygen in any of his experiments for decomposing this acid.

Scheele's method of preparing this acid is this:—Mix four ounces of Prussian blue with two of red oxide of mercury prepared by nitric acid, and boil them in twelve ounces by weight of water, till the whole becomes colorless; then filter and add to it one ounce of clean iron filings, and six or seven drachms of sulphuric acid. Draw off by distillation about a fourth of the liquor, which will be prussic acid, contaminated with a portion of sulphuric; to render it pure, it may be rectified by redistilling it from carbonate of lime.

This prussic acid has a strong smell of peach blossoms, or bitter almonds; its taste is at first sweetish, then acrid, hot, and virulent, and excites coughing; it has a strong tendency to assume the form of gas; it has been decomposed in a high temperature, and by the contact of

light, into carbonic acid, ammonia, and carburetted hydrogen. It does not completely neutralise alkalis, and is displaced even by the carbonic acid: it has no action upon metals, but unites with their oxides, and forms salts for the most part insoluble; it likewise unites into triple salts with these oxides and alkalis.

The peculiar smell of the prussic acid could scarcely fail to suggest its affinity with the poison of the leaves of the lauro-cerasus; and M. Schrader of Berlin has ascertained the fact, that these do contain a principle capable of forming a blue precipitate with iron; and that with lime they afford a test of the presence of iron equal to the prussiate of that earth. Dr. Buchholz of Weimar, and Mr. Roloff of Magdeburg, confirm this fact. The prussic acid appears to come over in the distilled oil.

The following communication to the Royal Society, by Dr. Madden, of Dublin, contains the first proofs of the deleterious effects of this poison upon mankind:—'A very extraordinary accident,' says the Dr., 'has discovered to us a most dangerous poison, which was never before known to be so, though it has been in frequent use among us. This is a simple water, distilled from the leaves of the lauro-cerasus; the water is at first milky, but the oil which comes over, being in a good measure separated from the phlegm, by passing it through a flannel bag, it becomes as clear as common water. It happened that a servant, who lived with a person who sold great quantities of this water, got a bottle of it from her mistress, and gave it to a shop-keeper in town, who she thought might oblige her customers with it. Accordingly, in a few days, she gave about two ounces to a woman called Mary Whaley, who drank about two-thirds and went away. In a quarter of an hour after Mary Whaley had drunk the water, she complained of a violent disorder in her stomach, soon after lost her speech, and died in about an

hour, without vomiting or purging, or any convulsion. The shop-keeper sent word to her sister of what had happened, who came to her upon the message, and affirmed that it was not possible the cordial could have occasioned the death of the woman; and, to convince her of it, she filled out about three ounces and drank it. She continued talking, about two minutes longer, and was so earnest to persuade her of the liquor's being inoffensive, that she drank about two spoonfuls more, but was hardly seated in her chair when she died without the least groan or convulsion. A similar instance, fresh in the memory of every one, is that of Mr. Montgomery, who took one ounce and a half of this acid in Newgate, the night previous to his intended execution for forgery.

The following is the method usually adopted by M. Vauquelin to obtain this acid pure:—To a quantity of powdered Prussian blue diffused in boiling water, let red nitric oxide of mercury be added till the blue color is destroyed. Filter the liquid, and concentrate by evaporation till a pellicle appears. On cooling, crystals of prussiate of mercury will be formed. Dry these, and put them into a tubulated glass retort, to the beak of which is adapted a horizontal tube about two feet long, and half an inch wide at its middle part. The first third part of the tube next the retort is filled with small pieces of white marble, the two other thirds with fused muriate of lime. To the end of this tube is adapted a small receiver, which should be artificially refrigerated. Pour on the crystals muriatic acid, in rather less quantity than is sufficient to saturate the oxide of mercury which formed them. Apply a very gentle heat to the retort. Prussic acid, named *hydrocyanic* by M. Gay Lussac, will be evolved in vapor, and will condense in the tube. Whatever muriatic acid may pass over with it will be abstracted by the marble, while the water will be absorbed by the muriate of lime. By means of a moderate heat applied to the tube, the prussic acid may be made to pass successively along; and, after being left some time in contact with the muriate of lime, it may be finally driven into the receiver. As the carbonic acid evolved from marble by the muriatic is apt to carry off some of the prussic acid, care should be taken to conduct the heat so as to prevent the distillation of this mineral acid.

Prussic acid thus obtained has the following properties:—It is a colorless liquid, possessing a strong odor; and the exhalation, if incautiously snuffed up the nostrils, may produce sickness or fainting. Its taste is cooling at first, then hot, asthenic in a high degree, and it is a most deadly poison. Its specific gravity at $44\frac{1}{2}^{\circ}$ is 0.7058; at 64° it is 0.6969. It boils at $81\frac{1}{2}^{\circ}$, and congeals at about 3° . It then crystallises regularly, and affects sometimes the fibrous form of nitrate of ammonia. The cold which it produces, when reduced into vapor, even at the temperature of 68° , is sufficient to congeal it.

M. Gay Lussac analysed this acid by introducing its vapor at the temperature of 86° into a jar, two-thirds filled with oxygen, over warm mercury. When the temperature of the mer-

cury was reduced to that of the surrounding atmosphere, a determinate volume of the gaseous mixture was taken and washed in a solution of potash, which abstracts the prussic acid, and leaves the oxygen. A known volume was introduced into a Volta's eudiometer, with platinum wires, and an electric spark was passed across the gaseous mixture. The combustion is lively, and of a bluish-white color. A white prussic vapor is seen, and a diminution of volume takes place, which is ascertained by measuring the residue in a graduated tube. This, being washed with a solution of potash or barytes, suffers a new diminution from the absorption of carbonic acid formed. Lastly, the gas which the alkali has left is analysed over water by hydrogen, and it is ascertained to be a mixture of nitrogen and oxygen.

The following are the results referred to prussic acid vapor:—

Vapor	100
Diminution after combustion	78.5
Carbonic acid gas produced	101.0
Nitrogen	46.0
Hydrogen	55.0

During the combustion a quantity of oxygen disappears, equal to about one and a quarter of the vapor employed.

M. Gay Lussac also analysed prussic acid by passing its vapor through an ignited porcelain tube containing a coil of fine iron wire, which facilitates the decomposition of this vapor, as it does with ammonia. No trace of oxygen could be found in prussic acid. And again, by transmitting the acid in vapor over ignited peroxide of copper in a porcelain tube, he came to the same conclusion:—

One volume of the vapor of carbon,	
Half a volume of hydrogen,	
Half a volume of nitrogen,	
condensed into one volume; or in weight,	
Carbon	44.39
Nitrogen	51.71
Hydrogen	3.90
	<hr/>
	100.00

This acid, when compared with the other animal products, is distinguished by the great quantity of nitrogen it contains, by its small quantity of hydrogen, and especially by the absence of oxygen.

When this acid is kept in well-closed vessels, even though no air be present, it is sometimes decomposed in less than an hour; though it has been occasionally kept for fifteen days without alteration. It begins by assuming a reddish-brown color, which becomes deeper and deeper, and it gradually deposits a considerable carbonaceous matter, which gives a deep color to both water and acids, and emits a strong smell of ammonia. If the bottle containing the prussic acid be not hermetically sealed nothing remains but a dry charry mass, which gives no color to water. Thus a prussiate of ammonia is formed at the expense of a part of the acid, and an azoturet of carbon. When potassium is heated in prussic acid vapor mixed with hydrogen or

nitrogen, there is absorption without inflammation, and the metal is converted into a gray spongy substance, which melts, and assumes a yellow color.

Supposing the quantity of potassium employed capable of disengaging from water a volume of hydrogen equal to fifty parts, we find after the action of the potassium, 1. That the gaseous mixture has experienced a diminution of volume amounting to fifty parts: 2. On treating this mixture with potash, and analysing the residue by oxygen, that fifty parts of hydrogen have been produced: 3. And consequently that the potassium has absorbed 100 parts of prussic vapor; for there is a diminution of fifty parts, which would obviously have been twice as great, had not fifty parts of hydrogen been disengaged. The yellow matter is prussiate of potash; properly a prusside of potassium, analogous in its formation to the chloride and iodide, when muriatic and hydriodic gases are made to act on potassium.

The base of prussic acid, thus divested of its acidifying hydrogen, should be called, agreeably to the same chemical analogy, prussine. M. Gay Lussac styles it cyanogen, because it is the principle which generates blue.

The prusside or cyanide of potassium gives a very alkaline solution in water, even when a great excess of hydrocyanic vapor has been present at its formation. In this respect it differs from the chlorides and iodides of that metal, which are perfectly neutral.

On subjecting prussic acid to the action of a galvanic battery, much hydrogen is disengaged at the negative pole; and prussine or cyanogen at the positive, which remains dissolved in the acid. This compound should be regarded as a hypoprussic or prussous acid. Since potash by heat separates the hydrogen of the prussic acid, we see that in exposing a mixture of potash and animal matters to a high temperature, a true prusside or cyanide of potash is obtained, formerly called the Prussian or phlogisticated alkali. When prusside of potassium is dissolved in water, prussiate of potash is produced, which is decomposed by the acids without generating ammonia or carbonic acid; but, when prusside of potash dissolves in water, no change takes place; and neither ammonia, carbonic acid, nor hydrocyanic vapor is given out, unless an acid be added. These are the characters which distinguish a metallic prusside or cyanide from the cyanide of an oxide.

From the experiments of M. Magendie it appears that the pure prussic acid is the most violent of all poisons. When a rod dipped into it is brought in contact with the tongue of an animal, death ensues before the rod can be withdrawn. If a bird be held a moment over the mouth of a phial containing this acid, it dies. A French professor of chemistry left by accident, on a table, a flask containing alcohol impregnated with prussic acid; the servant, enticed by the agreeable flavor of the liquid, swallowed a small glass of it. In two minutes she dropt down dead, as if struck with apoplexy.

'Scharinger, a professor at Vienna,' says Orfila, 'prepared a pure and concentrated prus-

sic acid; he spread a certain quantity of it on his naked arm, and died a little time thereafter.'

Dr. Magendie has, however, ventured to introduce its employment into medicine. He found it beneficial against phthisis and chronic catarrhs. His formula is the following:—

Mix one part of the pure prussic or hydrocyanic acid of M. Gay Lussac with eight and a half of water by weight. To this mixture he gives the name of medicinal prussic acid.

Of this he takes	1 gros. or	59 gr. Troy.
Distilled water	1 lb. or	7560 grs.
Pure sugar	1½ ox. or	708½ grs.

And, mixing the ingredients well together, he administers a table-spoonful every morning and evening. A well written report of the use of the prussic acid in certain diseases, by Dr. Magendie, was communicated by Dr. Granville to Mr. Brande, and is inserted in the fourth volume of the Journal of Science.

For the following ingenious and accurate process, for preparing prussic acid for medicinal uses, we are indebted to Dr. Nimmo of Glasgow:—

'Take of the ferroproussiate of potash 100 grains, of the protosulphate of iron eighty-four grains and a half; dissolve them separately in four ounces of water, and mingle them. After allowing the precipitate of the protoproussiate of iron to settle, pour off the clear part, and add water to wash the sulphate of potash completely away. To the protoproussiate of iron, mixed with four ounces of pure water, add 135 grains of the peroxide of mercury, and boil the whole till the oxide is dissolved. With the above proportions of peroxide of mercury, the protoproussiate of iron is completely decomposed. The vessel being kept warm, the oxide of iron will fall to the bottom; the clear part may be poured off to be filtered through paper, taking care to keep the funnel covered, so that crystals may not form in it by refrigeration. The residuum may be treated with more water, and thrown upon the filter, upon which warm water ought to be poured, until all the soluble part is washed away. By evaporation, and subsequent rest in a cool place, 145 grains of crystals of the prusside or cyanide of mercury will be procured in quadrangular prisms.

'The following is a new process for obtaining the prussic acid:—Take of the prusside of mercury in fine powder one ounce, diffuse it in two ounces of water, and to it, by slow degrees, add a solution of hydrosulphuret of barytes, made by decomposing sulphate of barytes with charcoal in the common way. Of the sulphuret of barytes take an ounce, boil it with six ounces of water, and filter it as hot as possible. Add this in small portions to the prusside of mercury, agitating the whole very well, and allowing sufficient time for the prusside to dissolve, while the decomposition is going on between it and the hydrosulphuret as it is added. Continue the addition of the hydrosulphuret so long as a dark precipitate of sulphuret of mercury falls down, and even allowing a small excess. Let the whole be thrown upon a filter, and kept warm till the fluid drops through; add more water to wash the

sulphuret of mercury, until eight ounces of fluid have passed through the filter, and it has become tasteless. To this fluid, which contains the prussiate of barytes, with a small excess of hydrosulphuret of barytes, add sulphuric acid, diluted with an equal weight of water, and allowed to become cold, so long as sulphate of barytes falls down. The excess of sulphureted hydrogen will be removed by adding a sufficient portion of carbonate of lead, and agitating very well. The whole may now be put upon a filter, which must be closely covered; the fluid which passes is the hydrocyanic or prussic acid, of what is called the medical standard strength.

Dr. Nimmo finds that prussiae of mercury is capable of dissolving the mercurial peroxide. Hence the above proportions must be strictly observed, if we wish to obtain this powerful medicine of uniform strength. He conceives, therefore, that the ferropussiate of potash should be taken for the basis of the calculation.

Scheele found that prussic acid occasioned precipitates with only the following three metallic solutions; nitrates of silver, and mercury, and carbonate of silver. The first is white, the second black, the third green, becoming blue.

The prussiates or hydrocyanates are all alkaline, even when a great excess of acid is employed in their formation; and they are decomposed by the weakest acids.

The hydrocyanate of ammonia crystallises in cubes, in small prisms crossing each other, or in feathery crystals, like the leaves of a fern. Its volatility is such that at the temperature of $71\frac{1}{2}^{\circ}$ it is capable of bearing a pressure of 17.72 inches of mercury; and at 97° its elasticity is equal to that of the atmosphere. Its great volatility prevented M. Gay Lussac from determining the proportion of its constituents. M. Gay Lussac considers Prussian blue as a hydrated prusside of iron, or a cyanide having water in combination; and M. Vauquelin, in a memoir lately read before the Academy of Sciences, regards Prussian blue as a simple hydrocyanate of iron. He finds that water impregnated with prussine can dissolve iron without changing it into Prussian blue, and without the disengagement of any hydrogen gas, while Prussian blue was left in the undissolved portion. But prussic acid converts iron or its oxide into Prussian blue without the help either of alkalis or acids. He farther lays it down as a general rule, that those metals which, like iron, decompose water at the ordinary temperature of the atmosphere, form hydrocyanates; and that those metals which do not possess this power, as silver and quicksilver, form only cyanides.

Prussic acid is easily separated from potash by carbonic acid, but, when oxide of iron is added to the compound, a triple salt is formed, usually called ferropussiate of potash. The method of preparing this salt practised by Klaproth is one of the best. It is as follows:—Prepare pure potash, by gradually projecting into a large crucible, heated to whiteness, a mixture of equal parts of purified nitre and crystals of tartar; when the whole is injected, let it be kept at a white heat for half an hour, to burn off the coal. Detach the alkali thus obtained from the

crucible, reduce it to powder, spread it on a muffle, and expose it to a white heat for half an hour. Dissolve it in six times its weight of water, and filter the solution while warm. Pour this solution into a glass receiver, placed in a sand furnace, heated to 170° or 180° , and then gradually add the best Prussian blue in powder, injecting new portions of it as the former becomes gray, and supplying water as fast as it evaporates; continue until the added portions are no longer discolored; then increase the heat to 212° , and continue for half an hour. Filter the ley thus obtained, and saturate it with sulphuric acid moderately diluted; a precipitate will appear: when this ceases, filter off the whole, and wash the precipitate. Evaporate the filtered liquor to about one quarter and set it by to crystallise: after a few days, yellowish crystals of a cubic or quadrangular form will be found mixed with some sulphate of potash and oxide of iron; pick out the yellowish crystals, lay them on blotting paper, and redissolve them in four times their weight of cold water, to exclude the sulphate of potash. Essay a few drops of this solution with a solution of barytes, to see whether it contains any sulphuric acid: filter off the solution from the sulphat of barytes, which will have precipitated, and set it by to crystallise for a few days, that the barytes, if any should remain, may be precipitated. If the crystals now obtained be of a pale yellow color, and discover no bluish streaks, when sprinkled over with muriatic acid, they are fit for use, and should be kept in a well stopped bottle, which, to preserve them from the air, should be filled with alcohol, as they are insoluble in it.

M. Gay Lussac prepared a hydrocyanate of potash and silver, which was quite neutral, and which crystallised in hexagonal plates. The solution of these crystals precipitates salts of iron and copper, white. Muriate of ammonia does not render it turbid; but muriatic acid, by disengaging hydrocyanic acid, precipitates chloride of silver. Sulphureted hydrogen produces in it an analogous change. This compound, says M. Gay Lussac, is evidently the triple prussiate of potash and silver; and its formation ought to be analogous to that of the other triple hydrocyanates. 'And as we cannot doubt,' adds he, 'that hydrocyanate of potash and silver is in reality, from the mode of its formation, a compound of cyanide of silver and hydrocyanate of potash, I conceive that the hydrocyanate of potash and iron is likewise a compound of neutral hydrocyanate of potash, and subcyanide of iron, which I believe to be combined with hydrocyanic acid in the white precipitate. We may obtain it perfectly neutral, and then it does not decompose alum; but the hydrocyanate of potash, which is always alkaline, produces in it a light and flocculent precipitate of alumina. To the same excess of alkali we must ascribe the ochry color of the precipitates which hydrocyanate of potash forms with the persalts of iron.'

M. Vauquelin has given the following very elegant process for obtaining pure hydrocyanic or prussic acid, from the cyanide or prusside of mercury:—

Considering that mercury has a strong attrac-

tion for sulphur, and that prussine unites easily to hydrogen, when presented in the proper state, he thought that sulphureted hydrogen might be employed for decomposing dry cyanide (prusside) of mercury. He operated in the following way:—He made a current of sulphureted hydrogen gas, disengaged slowly from a mixture of sulphuret of iron, and very dilute sulphuric acid, pass slowly through a glass tube slightly heated, filled with the mercurial prusside, and communicating with a receiver, cooled by a mixture of salt and snow.

As soon as the sulphureted hydrogen came in contact with the mercurial salt, this last substance blackened, and this effect gradually extended to the farthest extremity of the apparatus. During this time no trace of sulphureted hydrogen could be perceived at the mouth of a tube proceeding from the receiver: As soon as the odor of this gas began to be perceived, the process was stopped; and the tube was heated in order to drive over the acid which might still remain in it. The apparatus being unluted, he found in the receiver a colorless fluid, which possessed all the known properties of prussic acid. It amounted to nearly the fifth part of the prusside of mercury employed.

This process is easier, and furnishes more acid, than M. Gay Lussac's, by means of muriatic acid. He repeated it several times, and always successfully. It is necessary merely to take care to stop the process before the odor of the sulphureted hydrogen begins to be perceived, otherwise the hydrocyanic acid will be mixed with it. However, we may avoid this inconvenience by placing a little carbonate of lead at the extremity of the tube. As absolute hydrocyanic acid is required only for chemical researches, and as it cannot be employed in medicine, it may be worth while, says M. Vauquelin, to bring to the recollection of apothecaries a process of M. Proust, which has perhaps escaped their attention. It consists in passing a current of sulphureted hydrogen gas through a cold saturated solution of prussiate of mercury in water, till the liquid contains an excess of it; to put the mixture into a bottle, in order to agitate it from time to time; and finally, to filter it.

If this prussic acid, as almost always happens, contains traces of sulphureted hydrogen, agitate it with a little carbonate of lead, and filter it again. By this process we may obtain hydrocyanic acid in a much greater degree of concentration than is necessary for medicine. It has the advantage over the dry prussic acid, of being capable of being preserved a long time, always taking care to keep it as much as possible from the contact of air and heat. Dr. Nimmo's directions for preparing the prusside of mercury ought to be attended to.

PRUSSINE, or PRUSSIC GAS, in chemistry, the cyanogen of M. Gay Lussac, is a peculiar gas obtained by decomposing prusside of mercury by heat. The term cyanogen signifies the produce of blue; but as the production of blue is never the result of the direct action of this substance on any other single body, but an indirect and unexplained operation of it in conjunction with iron, hydrogen, and oxygen, the

same reason which leads to the term cyanogen, would warrant us in calling it leucogen, erythro- gen, or chlorogen; for it produces, white, red, or green, with other metals, as it produces blue with iron.

By digesting red oxide of mercury with prussian blue and hot water, we obtain a prusside perfectly neutral, which crystallises in long four-sided prisms, truncated obliquely. By repeated solutions and crystallisations, we may free it from a small portion of adhering iron. But M. Gay Lussac prefers boiling it with red oxide of mercury, which completely precipitates the oxide of iron, and he then saturates the excess of oxide of mercury with a little prussic acid, or a little muriatic acid. The prusside thus formed is decomposed by heat to obtain the radical. For common experiments we may dispense with these precautions.

When this cyanide is boiled, with red oxide of mercury, it dissolves a considerable quantity of the oxide, becomes alkaline, crystallises no longer in prisms, but in small scales, and its solubility in water appears a little increased. When evaporated to dryness, it is very easily charred, which obliges us to employ a water bath. This compound was observed by M. Proust. When decomposed by heat, it gives abundance of prussine, but mixed with carbonic acid gas. Proust says that it yields ammonia, oil in considerable abundance, carbonic acid, azote, and oxide of carbon. He employed a moist prusside. Had it been dry, the discovery of prussine could hardly have escaped him. The prusside of mercury, when neutral and quite dry, gives nothing but prussine; when moist, it furnishes only carbonic acid, ammonia, and a great deal of prussic acid vapor. When we employ the prusside made with excess of peroxide, the same products are obtained, but in different proportions, along with azote, and a brown liquid, which Proust took for an oil, though it is not one in reality. Hence, to obtain pure prussine, we must employ the neutral prusside in a state of perfect dryness. The other mercurial compound is not, however, simply a sub-prusside. It is a compound of oxide of mercury and the prusside.

When the simple mercurial prusside is exposed to heat in a small glass retort, or tube, shut at one extremity, it soon begins to blacken. It appears to melt like an animal matter, and then the prussine is disengaged in abundance. This gas is pure from the beginning of the process to the end, provided always that the heat be not very high; for, if it were sufficiently intense to melt the glass, a little azote would be evolved. Mercury is volatilised with a considerable quantity of prusside, and there remains a chary matter of the color of soot, and as light as lampblack. The prusside of silver gives out likewise prussine when heated; but the mercurial prusside is preferable to every other.

Prussine or cyanogen is a permanently elastic fluid. Its smell, which it is impossible to describe, is very strong and penetrating. Its solution in water has a very sharp taste. The gas burns with a bluish flame mixed with purple. Its specific gravity, compared to that of air, is 1.8064. M. Gay Lussac obtained it by weigh-

ing at the same temperature, and under the same pressure, a balloon of about two litres and a half (152·56 cubic inches), in which the vacuum was made to the same degree, and alternately full of air and prussine. 100 cubic inches weigh therefore 55·1295 grains.

Prussine is capable of sustaining a pretty high heat, without being decomposed. Water, with which M. Gay Lussac agitated it for some minutes, at the temperature of 68°, absorbed about four times and a half its volume. Pure alcohol absorbs twenty-three times its volume. Sulphuric ether and oil of turpentine dissolve at least as much as water. Tincture of litmus is reddened by prussine. On heating the solution the gas is disengaged, mixed with a little carbonic acid, and the blue color of the litmus is restored. The carbonic acid proceeds no doubt from the decomposition of a small quantity of prussine and water. It deprives the red sulphate of manganese of its color, a property which prussic acid does not possess. This is a proof that its elements have more mobility than those of the acid. In the dry way it separates the carbonic acid from the carbonates.

Phosphorus, sulphur, and iodine, may be sublimed by the heat of a spirit-lamp in prussine, without occasioning any change on it. Its mixture with hydrogen was not altered by the same temperature, or by passing electrical sparks through it. Copper and gold do not combine with it; but iron, when heated almost to whiteness, decomposes it in part. The metal is covered with a slight coating of charcoal, and becomes brittle. The undecomposed portion of the gas is mixed with azote (contains free azote). In one trial the azote constituted 0·44 of the mixture, but in general it was less. Platinum, which had been placed beside the iron, did not undergo any alteration. Neither its surface, nor that of the tube, was covered with charcoal like the iron.

In the cold, potassium acts but slowly on prussine, because a crust is formed on its surface, which presents an obstacle to the mutual action. On applying the spirit-lamp, the potassium becomes speedily incandescent; the absorption of the gas begins, the inflamed disc gradually diminishes, and when it disappears entirely, which takes place in a few seconds, the absorption is likewise at an end. Supposing we employ a quantity of potassium that would disengage fifty parts of hydrogen from water, we find that from forty-eight to fifty parts of gas have disappeared. On treating the residue with potash, there usually remains four or five parts of hydrogen, sometimes ten or twelve. M. Gay Lussac made a great number of experiments to discover the origin of this gas. He thinks that it is derived from the water which the prusside of mercury contains when it has not been sufficiently dried. Prussic acid vapor is then produced, which, when decomposed by the potassium, leaves half its volume of hydrogen. Potassium, therefore, absorbs a volume of pure prussine, equal to that of the hydrogen which it would disengage from water.

The compound of prussine and potassium is yellowish. It dissolves in water without effer-

escence, and the solution is strongly alkaline. Its taste is the same as that of hydrocyanate or simple prussiate of potash, of which it possesses all the properties.

The gas being very inflammable, M. Gay Lussac exploded it in Volta's eudiometer, with about twice and a half its volume of oxygen. The detonation is very strong; and the flame is bluish, like that of sulphur burning in oxygen.

It is now obvious that the action of potassium on prussine agrees with its action on prussic acid. We have seen that it absorbs fifty parts of the first, and likewise that it absorbs 100 parts of the second, from which it separates fifty parts of hydrogen. But 100 parts of prussic acid vapor, minus fifty parts of hydrogen, amount exactly to fifty parts prussine. Hence the two results agree perfectly, and the two compounds obtained ought to be identical, which agrees precisely with experiment.

The analysis of prussine being of great importance, M. Gay Lussac attempted it likewise by other methods. Having put prusside of mercury into the bottom of a glass tube, he covered it with brown oxide of copper, and then raised the heat to a dull red. On heating gradually the part of the tube containing the prusside, the prussine was gradually disengaged, and passed through the oxide, which it reduced completely to the metallic state. On washing the gaseous products with aqueous potash, at different parts of the process, he obtained only from 0·19 to 0·30 of azote, instead of 0·33, which ought to have remained according to the preceding analysis. Presuming that some nitrous compound had been formed, he repeated the experiment, covering the oxide with a column of copper filings, which he kept at the same temperature as the oxide. With this new arrangement, the results were very singular; for the smallest quantity of azote which he obtained during the whole course of the experiment was 32·7 for 100 of gas, and the greatest was 34·4. The mean of all the trials was,—

Azote	33·6 or nearly 1
Carbonic acid	66·4 2

A result which shows clearly that prussine contains two volumes of the vapor of carbon, and one volume of azote.

In another experiment, instead of passing the prussine through the oxide of copper, he made a mixture of one part of the prusside of mercury, and ten parts of the red oxide, and after introducing it into a glass tube, close at one end, he covered it with copper filings, which he raised first to a red heat. On heating the mixture successively, the decomposition went on with the greatest facility. The proportions of the gaseous mixture were less regular than in the preceding experiment. Their mean was,—

Azote	34·6 instead of 33·3
Carbonic acid	65·4 66·6

In another experiment he obtained,—

Azote	32·2
Carbonic acid	67·8

Now the mean of these results gives,—

Azote	33·4
Carbonic acid	66·6

No sensible quantity of water seemed to be formed during these analyses. This shows farther that what has been called a prussiate of mercury is really a prusside of that metal.

When a pure solution of potash is introduced into this gas, the absorption is rapid. If the alkali be not too concentrated, and be not quite saturated, it is scarcely tinged of a lemon-yellow color. But, if the prussine be in excess, we obtain a brown solution, apparently carbonaceous. On pouring potash combined with prussine into a saline solution of black oxide of iron, and adding an acid, we obtain prussian blue. It would appear from this phenomenon that the prussine is decomposed the instant that it combines with the potash: but this conclusion is premature; for, when this body is really decomposed by means of an alkaline solution, carbonic acid is always produced, together with prussic acid and ammonia. But on pouring barytes into a solution of prussine in potash, no precipitate takes place, which shows that no carbonic acid gas is present. On adding an excess of quicklime, no trace of ammonia is perceptible. Since, then, no carbonic acid and ammonia have been formed, water has not been decomposed, and consequently no prussic acid evolved. How then comes the solution of prussine in potash to produce prussian blue, with a solution of iron and acid? The following is M. Gay Lussac's ingenious solution of this difficulty:—

The instant an acid is poured into the solution of prussine in potash, a strong effervescence of carbonic acid is produced, and at the same time a strong smell of prussic acid becomes perceptible. Ammonia is likewise formed, which remains combined with the acid employed, and which may be rendered very sensible to the smell by the addition of quicklime. Since, therefore, we are obliged to add an acid in order to form prussian blue, its formation occasions no farther difficulty.

Prussine rapidly decomposes the carbonates at a dull red heat, and prussides of the oxides are obtained. When passed through sulphuret of barytes, it combines without disengaging the sulphur, and renders it very fusible, and of a brownish black color. When put into water we obtain a colorless solution, but which gives a deep brown (maroon) color to muriate of iron. What does not dissolve contains a good deal of sulphate, which is doubtless formed during the preparation of the sulphuret of barytes.

On dissolving prussine in the sulphureted hydrosulphuret of barytes, sulphur is precipitated, which is again dissolved when the liquid is saturated with prussine, and we obtain a solution having a very deep brown maroon color. This gas does not decompose sulphuret of silver, nor of potash.

Prussine and sulphureted hydrogen combine slowly with each other. A yellow substance is obtained in fine needles, which dissolves in water, does not precipitate nitrate of lead, produces no prussian blue, and is composed of one volume prussine (cyanogen), and one volume and a half of sulphureted hydrogen.

Ammoniacal gas and prussine begin to act on each other whenever they come in contact; but

some hours are requisite to render the effect complete. We perceive at first a white thick vapor, which soon disappears. The diminution of volume is considerable, and the glass in which the mixture is made becomes opaque, its inside being covered with a solid brown matter. On mixing ninety parts of prussine, and 227 ammonia, they combined nearly in the proportion of one to one and a half. This compound gives a dark orange-brown color to water, but dissolves only in a very small proportion. The liquid produces no prussian blue with the salts of iron.

When prussic acid is exposed to the action of a voltaic battery of twenty pairs of plates, much hydrogen gas is disengaged at the negative pole, while nothing appears at the positive pole. It is because there is evolved at that pole prussine, which remains dissolved in the acid.

A portion of pure cyanide of mercury was heated by Faraday till perfectly dry, and then enclosed in a green glass tube, and, being collected to one end, was decomposed by heat, whilst the other end was cooled. The cyanogen soon appeared as a liquid, limpid, colorless, and very fluid; not altering its state at 0° Fahr. A tube containing it being opened in the air, the expansion within did not seem to be very great; and the liquid passed with comparative slowness into the state of vapor, producing great cold. The vapor collected over mercury proved to be pure cyanogen. Liquid cyanogen, evolved in contact with moisture, does not mix with the water, but floats over it. In a few days the water and cyanogen react on each other, and carbonaceous matter is evolved. Faraday, Phil. Trans. 1823.

In the first volume of the Journal of Science and the Arts, Sir H. Davy has stated some interesting particulars relative to prussine. By heating prusside of mercury in muriatic acid gas, he obtained pure liquid prussic acid, and corrosive sublimate. By heating iodine, sulphur and phosphorus, in contact with prusside of mercury, compounds of these bodies with prussine or cyanogen may be formed. That of iodine is a very curious body. It is volatile at a very moderate heat, and on cooling collects in flocculi, adhering together like oxide of zinc formed by combustion. It has a pungent smell, and very acid taste.

PRUTH, a considerable river of Europe, which rises in the palatinate of Marmarosch, Hungary, and forms the boundary between the Russian and Turkish dominions in Moldavia, falling into the Danube below Galatz. It is remarkable for the perilous situation of the Russian army under Peter I. in 1712, from which it was extricated by a treaty with the Turkish vizier.

PRY, *v. n.* Perhaps of Span. *perojar*, to observe. To peep narrowly; inspect curiously or impertinently.

He that *prieth* in at her windows, shall also *hearken* at her doors. *Ecclus. xiv. 23.*

I can counterfeit the deep tragedian,
Speak, and look back, and *pry* on every side,
Intending deep suspicion.

Shakspeare. Richard III.

Nor need we with a *prying* eye survey
The distant skies to find the milky way. *Creech.*

I waked, and, looking round the bow'r,
Searched ev'ry tree, and pry'd on every flow'r,
If any where by chance I might espy
The rural poet of the melody.

Dryden.

We have naturally a curiosity to be prying and
searching into forbidden secrets.

L'Estrange.

All these I frankly own without denying;

But where has this Praxiteles been prying?

Addison.

PRYNNE (William), an English lawyer, who greatly distinguished himself in the civil commotions under Charles I., was born at Swainswick, in Somersetshire, in 1600. His *Histriomastix*, written against stage plays in 1632, containing some reflections that offended the court, he was sentenced by the star-chamber to pay a fine of £5000, to stand in the pillory, to lose his ears, and to perpetual imprisonment. During his confinement, he wrote several more books; particularly, in 1637, one entitled *News from Ipswich*, which reflecting severely on the bishops, he was again sentenced by the star-chamber to another fine of £5000, to lose the remainder of his ears in the pillory, to be branded on both cheeks with S: L. for seditious libeller, and to be perpetually imprisoned in Caernarvon castle. Nothing however could intimidate the stubborn spirit of Prynne, he continued to write, and in 1640, being set at liberty by the house of commons, he entered London in a kind of triumph, was elected into parliament for Newport in Cornwall, and opposed the bishops with great vigor, being the chief manager of archbishop Laud's trial. In the long parliament he was zealous in the Presbyterian cause; but, when the Independents gained the ascendancy, he opposed them warmly, and promoted an agreement with the king. When the army divided the house, and refused him entrance, he became a bitter enemy to them and their leader Cromwell, and attacked them with his pen so severely that he was again imprisoned; but he pleaded the liberty of the subject so successfully that he was enlarged. Being restored to his seat after Cromwell's death, with the other secluded members, he assisted in promoting the restoration, and was appointed keeper of the Tower records; where he was very useful by the collections he published from them. He presented forty volumes of his works, in folio and 4to., to Lincoln's Inn library, of which society he was a member; and, dying in 1669, was buried under the chapel.

PRYTANES, in Grecian antiquity, were the presidents of the senate, whose authority consisted chiefly in assembling the senate; which, for the most part, was done once every day. The senate consisted of 500, fifty senators being elected out of each tribe: after which lots were cast, to determine in what order the senators of each tribe should preside; which they did by turns, and during their presidentship were called prytanes. However, all the fifty prytanes of the tribes did not govern at once, but one at a time, viz. for seven days; and, after thirty-five days, another tribe presided for other five weeks; and so of the rest.

PRZEMYSL, a circle and town of Austrian Poland, in the centre of that country, to the west of the circle of Lemberg. Its area is 1420

square miles, population of the circle about 212,000, of the town 7500; the former consists of a vast plain, traversed nearly throughout its extent by the river San; and watered by a number of other minor streams. The surface is occasionally diversified by gentle elevations and woods. The only manufacture is a coarse linen and leather. The town is the see both of a Greek and Catholic bishop.

PRZIBRAM, a town in the west of Bohemia, near silver and lead mines, nineteen miles south of Beraun, and thirty-three S. S. W. of Prague. Population 2300.

PRZIPICA, the greatest river in the east of Poland, is joined partly by a canal, partly by the stream of the Muchawica, to the Bug and Vistula, the great rivers of the central part of that kingdom, and after flowing west falls into the Dnieper forty miles above Kiev.

PRZIPCOWIUS (Samuel), a learned Socinian writer, born in 1590, who was driven from Poland with many others of that sect in 1658. He took refuge in Prussia, where he died in 1670, aged eighty. His works are inserted in the collection of Socinian writers published in 1656, in 9 vols. folio.

PSALM, *n. s.* } Fr. *psalme, pseume*; Gr. }
PSALM'IST, } *ψαλμοσ*. A holy song: psalm-
PSAL'TER, } ist is the author of such a
PSAL'TERY. } song: psalms, a collection of psalms: psaltery, a harp on which they are played.

Praise with trumpets, pierce the skies,
Praise with harps and psalteries.

Sandys's Paraph.

The choice and flower of all things profitable in other books, the psalms do both more briefly contain and more movingly express, by reason of that poetical form wherewith they are written.

Hooker.

The trumpets, sacbut, psalteries, and fife,
Make the sun dance. *Shakspeare. Coriolanus.*
Sternhold was made groom of the chamber, for turning certain of David's psalms into verse.

Peacham.

The sweet singer of Israel with his psaltery, loudly resounded the benefits of the Almighty Creator.

Id.

Those just spirits that wear victorious palms,
Hymns devote and holy psalms
Singing continually

Milton

In another psalm he speaks of the wisdom and power of God in the creation.

Burnet.

How much more rational is this system of the psalmist, than the Pagan's scheme in Virgil, where one deity is represented as raising a storm, and another as laying it!

Addison.

Nought shall the psaltery and the harp avail,
When the quick spirits their warm march forbear,
And numbing coldness has unbraced the ear.

Prior.

She, her daughters, and her maids, meet together at all the hours of prayer in the day, and chaunt psalms, and other devotions, and spend the rest of their time in such good works, and innocent diversions, as render them fit to return to their psalms and prayers.

Law.

PSALMS, BOOK OF, a canonical book of the Old Testament. Most of the psalms have particular titles, signifying either the name of the author, the person who was to set it to music or sing it, the instrument that was to be used, or

the subject and occasion of it. Many of the psalms are inscribed with the names Korah, Jeduthun, &c., from the persons who were to sing them.

PSALMANAZAR (George), the name assumed by a very extraordinary character, born in France and educated in a Jesuit's College: upon leaving which, he led the life of a pilgrim. At Liege he entered into the Dutch service, and afterwards into that of Cologne. In the habit of a pilgrim he begged through several countries, in elegant Latin, and, accosting only gentlemen and clergymen, received liberal supplies, which he spent as freely. In Germany he passed for a native of Formosa, a convert to Christianity, and a sufferer for it. At Sluys he fell in with brigadier Lauder, a Scots colonel, who introduced him to the chaplain; who, to recommend himself to the bishop of London, took him over to that city. The bishop patronised him with credulous humanity, and a large circle of his great friends patronised him as a prodigy. He published a History of Formosa, and invented a character and language for that island, and translated the church catechism into it, which was examined by learned critics and approved. Some of the learned, however, doubted him, particularly Drs. Halléy, Mead, and Woodward. He was allowed the use of the Oxford library, and employed in compiling the Universal History. Some errors in his History of Formosa first led him to be suspected as an impostor. He died in 1753, and in his last will confessed the imposture.

PSALMODY. The act or practice of singing holy songs was always esteemed a considerable part of devotion. The plain song was early used, being a gentle inflection of the voice, not much different from reading, like the chant in cathedrals; at other times more artificial compositions, like our anthems. Sometimes a single person sung alone; sometimes the whole assembly joined together, which was the most ancient and general practice. At other times, as in those of king David, the psalms were sung alternately, the congregation dividing themselves into parts, and singing verses in turns. There was a fourth way of singing, pretty common in the fourth century, which was, when a single person began the verse, and the people joined with him in the close; this was often used for variety in the same service with alternate psalmody. The use of musical instruments, in the singing of psalms, seems to be as ancient as psalmody itself; the first psalm we read of being sung to the timbrel, viz. that of Moses and Miriam, after the deliverance of the Israelites from Egypt: and afterwards musical instruments were in constant use in the temple of Jerusalem. See **ORGAN**.

In the early ages of Christianity much was done by the priests to mystify the principles of the various branches of psalmody, and the arts and sciences in general, in order more effectually to keep the common people in ignorance, and consequently in superstition. To create the greater reverence for the church and its priests, who were alone supposed capable of understanding its sacred mysteries, psalmody was carefully cultivated in the minds of youth as of divine

origin, and thoroughly to be understood only by actual inspiration. Ecclesiastical modes of accentuation were adopted in the reading of the gospels, epistles, &c.; and, for the performance of those parts of the divine worship which were sung rather than thus musically or artificially declaimed (see article **MUSIC**, p. 280), the authentic, and, 300 years afterwards, the plagal modes of the ancient Greeks were introduced into the church by Gregory VIII. He declared that, to ensure the perfect development of his principles of psalmody, he was duly inspired by God. These difficulties, together with the syllabic nature of their music, to suit the rythmical structure of the words, the exact performance of which required the utmost attention to acquire, excluded all participation on the part of the people in praising their Maker, but through the medium of the priests: a principle which, for ages, proved a most powerful engine of priestcraft. Of these ecclesiastical accentuations an idea may be formed, though but a faint one, for they are but mere shadows of them, by attending our cathedral service; they were formerly expressed by a number of signs, termed *pes flexus*, *pes sinuosus*, *pes gutturalis*, *quassus*, *resupinus*, *quillissimi*, &c., each of which designated a peculiar inflexion of the human voice.

With the exception of the Metzian hymns, which, from their popularity, are supposed to have partaken much of the principles of natural melody, and written by Benoit, who established himself at Metz soon after the return of Charlemagne from Rome (a specimen of which style we have inserted in our article **MUSIC**), the principles appertaining to syllabic music were maintained unimpaired, in the church of Rome, up to the eighteenth century, to the total exclusion of musical rhythm: and, notwithstanding the rapid progress of the arts and sciences after the extinction of the Bards and Druids, it was not before the first dawnings of the reformation that melody, independently of absolute prosodial quantity and accentuation, was generally introduced into the divine service, when, as may be expected, the grand distinction took place between the Protestant and Catholic modes of psalmody. The *fauxbourdons* of the Roman church are however still adopted by the Protestants of Germany and Switzerland, both in the modern as well as in the ancient modes; a species of music brought to the highest pitch of excellence in the pontificate of Marcellus, by Palestrina and others; though of late, even amongst the Catholics themselves, such have been the mutations of their ideas relative to ecclesiastical music, these compositions have been allowed to be superseded by others totally of an opposite description, as the performance of the works of Haydn, Mozart, Rhigini, &c., has abundantly testified; thus completing a revolution which, but fifty years ago, would not have been anticipated without feelings of horror and disgust.

In the church of England the system of psalmody in four parts has been of late generally superseded by adhering to one, in which all classes may with facility join. It is nevertheless susceptible of great improvement, as we shall endeavour presently to show. But.

as the understanding of the principles of music, like those of painting, depends more upon example than precept, one good specimen of either conveying more to the mind, the eye, or ear, than volumes, we have but little more to offer upon this subject than what has been stated in substance in our article *Music*.

With respect to the proper mode of singing, that is to be preferred which best tends to induce the people assembled for the purpose of praising their Maker to join with the greatest ease, devotion, and dignity: singing in parts constituting a system, which, whilst it precludes the possibility of congregational psalmody, can only be effected with tolerable decency, by the hiring of persons to do that which we are in fact commanded to do for ourselves. The first point to be attended to is propriety of articulation; this is effected by warbling steadily on the vowel, and quickly pronouncing the consonant: singing being only a lengthening of the mode of speech. The necessity of this observation will immediately be felt in the singing of the following lines from Dr. Watts,

'Their captive sons, exposed to scorn,' &c.,

When, if we endeavour to warble upon the consonant, no tone can be produced, neither can any sense be given to the melody or words; dwelling, on the contrary, upon the vowels, and quickly pronouncing the consonants, the air is set in motion, a tune is formed, and the words thoroughly understood and felt, more especially when the congregation joins in the manner commended by the ritual, which the reader will pardon us if we observe, consists neither in the boisterous vociferation, as if in glorification of our noisy powers, too often observed in dissenting meetings, nor in the gross indifference so prevalent in the church of England.

Of the two modes upon which all modern music is composed, the major one, being the simplest to understand, is to be preferred; but great advantages will be obtained in the formation of psalm-tunes upon the other modes of the ancient Greeks, the adoption of which added greatly to the celebrity of their extraordinary, most powerful, and varied music, as compared with our own; for the truth of this remark we need only refer the reader to our article *Music*, where the powers of the different Grecian modes are made evident in our practical illustration of the principles of Scottish music. The mixt Lydian mode, comprising the notes from G to G of our diatonic scale of C, making the half-tones fall between the third and fourth, and sixth and seventh intervals, instead of the third and fourth, and seventh and eighth, intervals of the octave, mingles well with the harmonic powers of the organ, though it is best felt when employed in the construction only of melody. The Lydian mode or measure, which has been supposed by many writers to have been lost to us, is precisely our scale of F major; the same may be said of the Ionian, transposed a fourth lower than the Lydian measure. Excepting the Æolian mode, which is our descending minor scale, these are the only modes capable of receiving the principles of harmonic support. The Dorian mode,

and the melodious Phrygian, are formed of materials entirely different from all others; and, being remarkable as rejecting all harmonic support, are peculiarly serviceable for places of worship where there are no organs, or where the mode of worship rejects the use of musical instruments to accompany the singing of the psalms and hymns.

As the musical staff and clef were inserted to express the different compasses of the human voice, and as all appreciable musical sound is expressed within the limits of the octave, and one note, termed the ninth (the replication of the second of the scale), it follows that melody suitable for psalmody must, of all species of music, be the easiest to comprehend. The principal points of attention, in the Lydian and Ionian measures, are the situations of the two half-tones denominated in solmisation *mi fa*, and, in the disjoined tetrachord order, C sound, forming the modern major scale, *mi fa* and *si do*, thus: C D E f G A B c (the capitals denoting tones, and the Romans half-tones). This scale, so simple in its construction, and so strictly conformable to the feelings of every one possessing a musical ear, is sufficient to explain the whole mysteries of modern psalmody: the alteration of one or the other of the half-tones constituting the means whereby modulation is effected into the dominant, sub-dominant, and relative minor of the primitive key, which are the utmost limits assigned for the composition of psalmody. The principles also of any well regulated melody in others of the Grecian modes are to be acquired with equal facility; the being habituated to the major and minor systems of sound causing the ancient modes in general to be only momentarily difficult to adopt. To prove this assertion we notice the known secular, for want of a sacred, melody, 'Scots wha hae,' which is written in the mixt Lydian mode of the ancient Greeks.

On the variety of opinions published about the latter end of the sixteenth century upon the use and abuse of psalmody in churches, and of the efforts of many writers to prove the impropriety of its introduction in the reformed church, as a relic only of monkish superstition, we need not offer a comment. According to the Scriptures it has always formed, together with instrumental accompaniments, a part of the divine service: and, sanctioned by the most enlightened men of the age, it prevails universally. Upon the subject of interludes, voluntaries, &c., 'interruptions of the divine service,' as they have often been fairly designated, we would observe that they were adopted in the church as early as the time of St. Ambrose, and that in cases where the organist confines himself to the performance of the sacred compositions of Handel, Graun, Mozart, Marcello, &c., and, in the composition of his interludes, strictly regulates his melody according to the style of the psalm tune, improper associations of ideas could not be raised in the minds even of the most fastidious; on the contrary, they are known to create a tone of feeling highly proper for the occasion. Having, in our article *ORGAN*, sufficiently explained our sentiments on the abuses of extemporaneous perfor-

stances, and of the immoral tendency of introducing secular music into the church, we cannot better conclude this article, than by recommending to the heads of our ecclesiastical affairs, the establishment of one collection of psalm tunes to be sung throughout the established church: such a regulation would surely prove not less useful than one form of prayer; at least the parishioners of one church would then have the advantage of joining in this part of the divine service with facility at another, which, from the strange mixture of musical styles observed at the different churches, is now become impossible.

The PSALTERY was a musical instrument much in use among the ancient Hebrews, who called it nebel; but we know little or nothing of the precise form of the ancient psalter. See MUSIC.

PSAMMETICUS, or PSAMMETICHUS, a renowned conqueror, who subduing eleven other petty kings of Egypt became the founder of a new dynasty in the kingdom of Egypt, about 670 B. C. He is memorable likewise for taking the city of Azot, after a siege of twenty-nine years.

PSATYRIANS, a sect of Arians, who, in the council of Antioch, held in the year 360, maintained that the Son was not like the Father as to will; that he was taken from nothing, or made of nothing; and that in God generation was not to be distinguished from creation.

PSELLUS (Michael Constantine), a learned Christian of the eleventh century, was, by birth, a Constantinopolitan of consular rank, and flourished under the emperor Constantine Monomachus. He was the chief instructor of the Constantinopolitan youth, and at the same time the companion and the preceptor of the emperor. Towards the close of his life, Psellus retired into a monastery, and soon afterwards died. His works, which have been much celebrated, are, Commentaries upon Aristotle's Logic and Physics; a Compendium of Questions and Answers; and an Explanation of the Chaldean Oracles.

PSEUDO, *n. s.* From Gr. ψευδος. A prefix, which signifies false or counterfeit: as pseudo-apostle, a counterfeit apostle.

I will not pursue the many *pseudographies* in use, but show of how great concern the emphasis were, if rightly used.

It is not according to the sound rules of *pseudology*, to report of a pious prince, that he neglects his devotion, but you may report of a merciful prince, that he has pardoned a criminal who did not deserve it.

Arbuthnot.

PSHAU, *interj.* An expression of contempt. A peevish fellow has some reason for being out of humour, or has a natural incapacity for delight, and therefore disturbs all with pishes and *pskaus*.

Spectator.

PSIDIUM, the guava, or bay plum, a genus of the monogynia order, and icosandria class of plants; natural order nineteenth, hesperideæ: CAL. quinquefid, superior; there are five petals; the berry is unilocular and monospermous. There are two species:

1. *P. pomiferum*, the red guava; and 2. *P. pyriferum*, the white guava. The red guava

rises to twenty feet, and is covered with a smooth bark; the branches are angular, covered with oval leaves, having a strong midrib, and many veins running towards the sides, of a light green color, standing opposite upon very short foot-stalks. From the wings of the leaves the flowers come out upon foot-stalks an inch and a half long: they are composed of five large roundish concave petals, within which are a great number of stamina shorter than the petals, and tipped with pale yellow tops. After the flower is past, the germen becomes a large oval fruit, shaped like a pomegranate. A decoction of the roots of guava is employed with success in dysenteries: a bath of a decoction of the leaves is said to cure the itch and other cutaneous eruptions. Guayava, or guava, is distinguished from the color of the pulp into the two species above-mentioned, the white and the red; and, from the figure of the fruit, into the round and the pear-fashioned or perfumed guava. The latter has a thicker rind, and a more delicate taste than the other. The fruit is about the bigness of a large tennis ball; the rind or skin generally of a russet stained with red. The pulp within the thick rind is of an agreeable flavor, and interspersed with a number of small white seeds. The rind, when stewed, is eaten with milk, and preferred to any other stewed fruit. From the same part is made marmalade; and from the whole fruit is prepared the finest jelly in the world. The fruit is very astringent, and nearly of the same quality with the pomegranate; so should be avoided by all who are subject to costiveness. The seeds are so hard as not to be affected by the fermentation in the stomachs of animals; so that when voided with the excrements they take root, germinate, and produce thriving trees. Whole meadows in the West Indies are covered with guavas which have been propagated in this manner. The buds of guava, boiled with barley and liquorice, produce an excellent pisan for diarrhoeas, and even the bloody flux, when not too inveterate. The wood of the tree, employed as fuel, makes a lively, ardent, and lasting fire.

PSITTACUS, the parrot, in ornithology, a genus belonging to the order pica. The bill is hooked from the base; the upper mandible is moveable: the nostrils are round, placed in the base of the bill, which in some species is furnished with a kind of cere: the tongue is broad, and blunt at one end: the head is large, and the crown flat: the legs are short, the toes placed two before and two behind. It might seem surprising why this animal, which is not naturally a bird of prey, but feeds on fruits and vegetables, should have the crooked beak allotted to the hawk and other carnivorous birds: the reason seems to be that the parrot being a heavy bird, and its legs not very fit for service, it climbs up and down trees by the help of this sharp and hooked bill, with which it lays hold of any thing and secures itself before it stirs a foot; and helps itself forward very much, by pulling its body on with this hold. Of all animals, the parrot and crocodile are the only ones which move the upper jaw; all creatures else moving the lower only. The parrot loves nothing so much as the seeds of the carthamus, or bastard saffron. Parrots

are found almost every where within the tropics; and in their natural state they live on fruits and seeds, though, when tame, they will eat flesh, and even fish. In the East and West Indies they are very common, and in such warm climates are very brisk and lively; here, however, they lose much of their vigor. They seldom make nests, but breed like owls in hollow trees: they lay two eggs. At particular times they fly in very large troops, but still they keep two and two together. This genus consists of infinite variety, not so much owing to mixture of species. Mr. Latham increased the genus from forty-seven to 163; and, since the time he wrote his Index, at least thirty more have been discovered. They are very generally divided into three kinds: 1. The larger, which are as big as a moderate fowl, called macaos and cocketoons; these have very long tails. 2. The middle-sized ones, commonly called parrots, which have short tails, and are a little larger than a pigeon. And, 3. The small ones, which are called paroquets, and have long tails, and are not larger than a lark or blackbird.

1. *P. araruna*, the blue and yellow macaw, is blue above, and yellow below, and the cheeks are naked, with feathery lines. It is about the same size with the last, and inhabits Jamaica, Guiana, Brasil, and Surinam.

2. *P. aurora*, the yellow amazon, is about twelve inches long, of a green color, with blue wing quills, and a white front; its orbits are snowy. It inhabits Mexico or Brasil, but in all probability the latter, from the one which Salerne saw, and which pronounced Portuguese words.

3. *P. Guineensis*, the yellow lory, is about ten inches long, and is an inhabitant of Guinea. The bill is of a black color; the cere, the throat, and space about the eyes, are white; above the eye there is a patch of yellow, and the rest of the head and neck is crimson. The breast is yellow, wing coverts green, and the quills are blue, edged with yellow. Under the wings, belly, thighs, vent, and to the under part of the tail, the color is white, which last is tipped with red; the legs are dusky, and the claws black.

4. *P. macao*, the red and blue macao, is red, except the wing quills, which above are blue, below red: the particular feathers are variegated with blue and green: the cheeks are naked and wrinkled. It is about two feet seven inches and a half long, and about the size of a capon. It inhabits Brasil, Guiana, and other parts of South America. It was formerly very common in St. Domingo, but is now rarely found there. It generally lives in moist woods, does not in general learn to speak, and its voice is particularly rough and disagreeable. The flesh is hard, black, and unsavory, but makes good soup, and is much used by the inhabitants of Cayenne and other places. This species, in common with other parrots, is subject to fits when tamed.

5. *P. pullarius*, red-headed Guinea paroquet, or Guinea sparrow, is about five inches and a half long. It inhabits Guinea, and is found in Ethiopia, the East Indies, and the island of Java, and sometimes in Surinam. It is green, with a red front, fulvous tail, black bar, and

cinereous orbits. The male of this species is peculiarly affectionate to the female.

6. *P. severus*, the Brazilian green macaw, is black, with a greenish splendor: the bill and eyes are reddish, and the legs are yellow. It is about one foot and five inches long, and is common in Jamaica, Guiana, and Brasil. It is, however, comparatively rare; but is extremely beautiful, and of a very amiable and sociable temper when familiar and acquainted; but it can neither bear strangers nor rivals; its voice is not strong, nor does it articulate very distinctly the word *ara*.

PSOAS MUSCLE, in anatomy. See ANATOMY.

PSOKV, a government of European Russia, between those of Livonia and Smolensko. Its superficial extent is about 22,000 square miles; and the population about 700,000, almost all of Russ origin, and members of the Greek church. It is divided into eight circles or districts. The surface is level, and clayey or sandy, but tolerably fertile, producing flax and hemp, which, along with the timber of its forests, are exported to Narva and St. Petersburg. The manufactures are limited to the weaving of linen, and the preparation of leather. The climate is healthy, but cold. Pskov is watered by several rivers, and contains a large lake called the lake of Pskov.

PSKOV, or PLESKOV, a considerable trading town and archbishop's see of European Russia, the capital of the above government, is situated at the confluence of the Pskov River and the Velikaja. It is small, but contains a kremlin or citadel; a middle town and greater town; all distinct and surrounded by an earthen mound. Inhabitants 7000. Leather is the only manufacture.

PSOPHIA, in ornithology, a genus belonging to the order of gallinæ. The bill is moderate; the upper mandible convex; the nostrils oblong, sunk, and pervious; the tongue cartilaginous, flat, and fringed at the end; and the legs are naked a little above the knees. The toes are three before and one behind; the last of which is small with a round protuberance beneath it, which is at a little distance from the ground. Latham only enumerates two species.

1. *P. crepitans*, the gold-breasted trumpeter. Its head and breast are smooth and shining green. By the Spaniards of Maynas it is called *trompetero*, and by the French at Cayenne *agami*, under which last Buffon describes it. It inhabits various parts of South America, Brasil, Guiana, Surinam, &c., but it is most plentiful in the Amazons country. It is about twenty inches long, being about the size of a large fowl, and lays eggs rather larger, of a blue green color. It is met with in the Caribee islands, where it is called a pheasant, and its flesh is reckoned as good as that of a pheasant. The most characteristic and remarkable property of these birds consists in the wonderful noise they make, particularly when urged by the keepers of the menagerie. Another very remarkable circumstance is, that they follow people through the streets, though perfect strangers. It is difficult to get rid of them; for, if you enter a house, they will wait your return, and again join you,

though often after an interval of three hours. 'I have sometimes,' says M. de la Borde, 'betaken myself to my heels, but they ran faster, and always got before me; and, when I stopped, they stopped also. I know one,' continues he, 'which invariably follows all the strangers who enter his master's house, accompanies them into the garden, takes as many turns as they do, and attends them back again.'

2. *P. undulata*, the undulated trumpeter, is about the size of a goose. The upper part of the body is of a pale reddish brown color, beautifully undulated with black. The head is adorned with a dependent crest. On each side of the neck, beneath the ears, begins a list of black, widening as it descends, and meeting on the lower part before, where the feathers become greatly elongated, and hang loosely down. The under parts are generally white, the legs are of a dusky blue color like the bill. It is a native of Africa; Latham's specimen came from Tripoli.

PSORALEA, in botany, a genus of the decandria order, and diadelphia class of plants; natural order thirty-second, papilionaceæ: *CAL.* powdered, with callous points, and as long as the monospermous legumen. The most remarkable species are:—

1. *P. aculeata*, the aculeated prickly psoralea, which rises with a shrubby branching stem three or four feet high, with ternate leaves, having wedge-shaped lobes terminating in a recurved sharp point, and the branches terminated by roundish heads of blue flowers; it grows in Ethiopia. These plants flower here every summer; the first sort greatest part of that season, and the others in July and August; all of which are succeeded by seeds in autumn. Keep them in pots in order for removing into the greenhouse in winter. They are propagated by seeds, sown in a hot-bed in the spring; and, when the plants are two or three inches high, prick them in separate small pots, and gradually harden them to the open air, so as to bear it fully by the end of May or beginning of June. They may also be propagated by cuttings any time in summer, planted in pots, and plunged in a little heat, or covered close with hand-glasses, shaded from the sun and watered.

2. *P. bituminosa*, the bituminous trifoliolate psoralea, rises with a shrubby stalk, branching sparingly about two or three feet high, with ternate or three lobed leaves of bituminous scent, and blue flowers in close heads; it grows in Italy and France.

3. *P. primata*, the pinnated psoralea, rises with a woody soft stem, branching five or six feet high, pinnated leaves of three or four pairs of narrow lobes terminated by an odd one, and at the axillas close-sitting blue flowers with white keels. It is a native of Ethiopia.

PSYCHE, a nymph whom Cupid married, and carried into a place of bliss, where he long enjoyed her society. Venus put her to death, because she had robbed the world of her son; but Jupiter, at the request of Cupid, granted immortality to Psyche. The same Greek word, *ψυχη*, signifies a butterfly and the soul. Hence the former was used by the Greek artists as an emblem of the latter; and Cupid fondling or

burning a butterfly is the same as his caressing or paining Psyche or the human spirit. Indeed for almost all the ways in which Cupid is seen playing with butterflies, some parallel may be found in the representations of Cupid and Psyche. Thus, in an antique, the god of love is drawn in a triumphal car by two *Psyches*; in another by two butterflies. By this might be shadowed forth his power over the beings of the air, of which the car is an emblem.

PSYCHOTRIA, in botany, a genus of the monogynia order and pentandria class of plants; natural order forty-seventh, stellatæ: *CAL.* quinque-dentate, persisting, and crowning the fruit: *COR.* tubulated; berry globose, with two hemispherical sulcated seeds. The species are four, viz.:—1. *P. aspatica*. 2. *P. emetica*. 3. *P. herbacea*: and 4. *P. serpens*. They are all natives of Jamaica.

PSYLLI, a people in the south of Cyrenaica, so called from king Psyllus (Agathargides, quoted by Pliny); almost all overwhelmed by sand driven by a south wind (Herodotus). According to Pliny, Lucan, &c., they had something in their bodies fatal to serpents, and their very smell proved a charm against them.

PTARMIGAN, in ornithology. See *TETRAO*.

PTELEA, shrub-trefoil, a genus of the monogynia order and tetrandria class of plants: *COR.* tetrapetalous: *CAL.* quadripartite inferior; fruit monospermous, with a roundish membrane in the middle. There are two species:—

1. *P. trifoliata*, the Carolina shrub trefoil, has a shrubby upright stem, dividing into a branchy head eight or ten feet high, covered with a smooth purplish bark, trifoliolate leaves, formed of oval spear-shaped folioles, and the branches terminated by large bunches of greenish-white flowers, succeeded by roundish bordered capsules. This is a hardy deciduous shrub, and a proper plant for the shrubbery and other ornamental plantations to increase the variety. It is propagated by seeds, layers, or cuttings.

2. *P. viscosa*, the viscous Indian ptelea, rises with several strong shrubby stems, branching erectly twelve or fifteen feet high, having a light brown bark, spear-shaped, stiff, simple leaves, and the branches terminated by clusters of greenish flowers. It is a stove plant, and is propagated commonly by seeds.

PTERIS, in botany, brakes or female fern, a genus of the order filices, and cryptogamia class of plants; natural order fifty-fifth, filices. The fructifications are in lines under the margin. There are numerous species; the most remarkable is the

P. aquilina, or common female fern. The root of this is viscid, nauseous and bitterish; and, like all the rest of the fern tribe, has a salt, mucilaginous taste. It creeps under the ground in some rich soils to the depth of five or six feet, and is very difficult to be destroyed. Frequent mowings in pasture grounds, plentiful dunging in arable lands, but, above all, pouring urine upon it, are the most approved methods of killing it. It has, however, many good qualities to counterbalance the few bad ones. Fern cut while green, and left to rot upon the ground, is a good improver of land; for its ashes, if burnt,

will yield double the quantity of salt that most other vegetables will. Fern is also an excellent manure for potatoes; for, if buried beneath their roots, it never fails to produce a good crop. Its astringency is so great that it is used in many places abroad, in dressing and preparing kid and chamois leather. In several places in the north the inhabitants mow it green, and, burning it to ashes, make those ashes up into balls, with a little water, which they dry in the sun, and make use of them to wash their linen with instead of soap. In many of the Western Isles the people gain a very considerable profit from the sale of the ashes to soap and glass makers. In Glenelg in Inverness-shire, and other places, the people thatch their houses with the stalks of this fern, and fasten them down with ropes made either of birch-bark or heath. Sometimes they use the whole plant for the same purpose, but that does not make so durable a covering. Swine are fond of the roots, especially if boiled in their wash. In some parts of Normandy the poor have been reduced to the miserable necessity of mixing them with their bread. And in Siberia, and some other northern countries, the inhabitants brew them in their ale, mixing one-third of the roots to two-thirds of malt. The ancients used the root of this fern, and the whole plant, in decoctions, and diet-drinks, in chronic disorders of all kinds, arising from obstructions of the viscera and the spleen. The country people still continue to retain some of its ancient uses; for they give the powder of it to destroy worms, and look upon a bed of the green plant as a sovereign cure for the rickets in children.

PTEROCARPUS, in botany, a genus of the decandria order, and diadelphia class of plants; natural order thirty-second, papilionaceæ: CAL. quinquepartite: CAPS. sulcated, filiceous, varicose. The seeds are few and solitary. There are four species, viz. :—

1. *P. draco*. 2. *P. ecastaphyllum*. 3. *P. lunatus*: and 4. *P. santalinus*. The last is by some referred to the genus *santalum*. It is called red saunders; and the wood is brought from the East Indies in large billets, of a compact texture, a dull red, almost blackish color on the outside, and a deep bright red within. This wood has no manifest smell, and little or no taste. The principal use of red saunders is as a coloring drug; with which intention it is employed in some formulæ, particularly in the compound of tincture of lavender. It communicates a deep red to rectified spirit, but gives no tinge to aqueous liquors; a small quantity of the resin, extracted by means of spirit, tinges a large one of fresh spirit, of an elegant blood-red. There is scarcely any oil, that of lavender excepted, to which it communicates its color.

PTERONIA, in botany, a genus of the polygama æqualis order, and syngenesia class of plants; natural order forty-ninth, compositæ: receptacle full of multipartite bristles; pappus a little plummy: CAL. imbricated.

PTEROSPERMUM, in botany, a genus of the polyandria order and monadelphia class of plants; natural order thirty-seventh, columnifera: CAL. quinquepartite: COR. consists of five oblong spreading petals. The filaments are about

fifteen, which unite towards the base into a tube. The style cylindrical: CAPS. oval, woody, and quinquelocular, each bivalved, containing many oblong, compressed, and winged seeds. There is only one species, viz. :—

P. pentapetes, a native of the East Indies, the wood of which is very hard, and very like that of the holly tree.

PTINUS, a genus of insects belonging to the order of coleoptera. The antennæ are filiform: the last or exterior articulations are longer than the others; the thorax is nearly round, without a margin, into which the head is drawn back or received; the feet are made for leaping. The most remarkable species are,—

1. *P. pectinicornis*. This is produced from a worm that lodges in wood and the trunks of trees, such as the willow, where it makes deep round holes, turns to a winged insect, takes flight and roosts upon flowers. It is distinguished by its antennæ pectinated on one side, whence it has the name of feathered. The elytra and thorax are of a deep clay-colored brown, the antennæ and legs are of a pale brown.

2. *P. pertinax*. The form of this insect resembles the preceding one, saving that its antennæ are filiform. It is all over of a deep blackish-brown color resembling soot. It attacks household furniture, clothes, furs, and especially animals dried and preserved in collections of natural history, where it makes great havoc. When caught, this insect bends its legs, draws back its head, and lies as if it was dead till it thinks itself out of danger. It cannot be forced out of this state of inaction either by pricking or tearing; nothing but a strong degree of heat can oblige it to resume its motion and run away. There are many beautiful varieties of this genus; but they in general escape our attention by their minuteness, and living among hay, dried leaves, and divers other dusty matters, where they undergo their metamorphoses. The larvæ of some are found in trunks of decayed trees, in old tables, chairs, &c.

PTISAN, *n. s.* Fr. *ptisane*; Gr. *πιτσανη*. A medical drink, made of barley decocted with raisins and liquorice.

Thrice happy were those golden days of old,
When dear as burgundy the *ptisans* sold;
When patients chose to die with better will,
Than breathe and pay the apothecary's bill. *Garth.*

In fevers the aliments prescribed by Hippocrates were *ptisans* and cream of barley. *Arbuthnot.*

PTISAN is properly barley decorticated, or deprived of its husk, by beating in a mortar, as was the ancient practice; though the cooling potion obtained by boiling such barley in water, and afterwards sweetening the liquor with liquorice root, is what at present goes by the name of ptisan; and to render it laxative some add a little senna, or other simi ar ingredient.

PTOLEMAIS, in ancient geography, the largest and most considerable town of Thebais, or Higher Egypt, and equal to Memphis. It was governed in the manner of a Greek republic, and situated on the west side of the Nile, almost opposite to Coptos. Strabo. This town, which was built by Ptolemy Philadelphus, is now called Ptolometa. The walls and gates

are still entire, and there are a vast number of Greek inscriptions, but only a few columns of the portico remain. There is likewise an Ionic temple, in the most ancient style of executing that order, of which Mr. Bruce took a drawing, which is preserved in the king's collection.

PTOLEMAIS, the port of Arsinoë, situated on the west branch of the Nile, which concurs to form the island called Nomos Heracleotes, to the south of the vertex of the Delta.

PTOLEMY (Claudius), a celebrated mathematician and astrologer, born at Pelusium, and surnamed by the Greeks most divine and most wise. He flourished at Alexandria in the second century, under Adrian and Marcus Aurelius, about A. D. 138. There are still extant his Geography, and several learned works on astronomy. The principal of which are 1. The *Almagest*. 2. *De Judiciis Astrologicis*. 3. *Planisphærium*. His system of the world was for many centuries adopted by the philosophers and astronomers. See *ASTRONOMY*.

PTOLEMY, a son of Pyrrhus, king of Epirus, by Antigone, who was left governor of Epirus, while his father was absent in Italy, fighting against the Romans. He governed with great prudence, and was killed some time after in Pyrrhus's expedition against Sparta and Argos.

PTOLEMY CERAUNUS, the eldest brother of Ptolemy Philadelphus, who fled to Seleucus king of Macedonia, who received him hospitably; in return for which he assassinated him, and usurped his crown. He then invited Arsinoë, who was his widow and his own sister, to share the government with him; but, as soon as he had her in his power, he murdered her and her children. He was at length defeated, killed, and torn limb from limb by the Gauls, A. A. C. 279.

PTOLEMY LAGUS, or SOTER, king of Egypt, a renowned warrior, who established the academy at Alexandria. He was the first of the Macedonian race of Egyptian monarchs, being a natural son of Philip II. of Macedon, by Arsinoë, who married Lagus while she was pregnant of him. He was one of Alexander's generals, and killed an Indian king in single combat; and to his courage Alexander owed the reduction of Aornus. He conquered Cælosyria, Phœnicia, and part of Syria, and carried 100,000 prisoners to Egypt, whom he attached to him by liberal privileges. He wrote a History of Alexander, which was much admired, but is lost. He died A. A. C. 284, aged ninety-two.

PTOLEMY PHILADELPHUS, the second son of Ptolemy Soter. He was renowned as a conqueror, but more revered for his great virtues and political abilities. He established and augmented the famous Alexandrian library, which had been begun by his father. He greatly increased the commerce of Egypt, and granted considerable privileges to the Jews, from whom he obtained a copy of the Old Testament, which he caused to be translated into Greek, and deposited in his library. See *SEPTUAGINT*. He died 246 years B. C. aged sixty-four.

Ptolemy was also the name of eleven other kings of Egypt, of whose reigns we here only add the following brief chronological table, down to queen Cleopatra, the last of the race:—

	Years.	A. M.
1. Ptolemy Soter reigned	39	and died 372C
2. Ptolemy Philadelphus	39	3758
3. Ptolemy Euergetes	25	3783

PUBERTY, *n. s.* } Fr. *puberté*; Lat. *pubescentia*, *adj.* } *bertas*. The time of life in which the two sexes begin to be acquainted: pubescence is the state of puberty; pubescent, the corresponding adjective.

The cause of changing the voice at the years of *puberty* seemeth to be, for that when much of the moisture of the body, which did before irrigate the parts, is drawn down to the spermatical vessels, it leaveth the body more hot than it was, whence cometh the dilatation of the pipes. Bacon.

Solon divided it into ten septenaries: in the first is dentition or falling of teeth, in the second *pubescence*. Browne.

That the women are menstruant, and the men *pubescent* at the year of twice seven, is accounted a punctual truth. Id.

All the carnivorous animals would have multiplied exceedingly, before these children that escaped could come to the age of *puberty*. Bentley's *Sermons*.

PUBERTY, in law, is fixed at the age of twelve in females, and fourteen in males; after which they are reckoned to be fit for marriage.

PUBES, in botany, the hair or down on the leaves of some plants. See *HAIR*.

PUBES, in anatomy. See *ANATOMY*.

PUBLIC, *adj. & n. s.* } Fr. *publique*; Ital. }
 PUBLICAN, *n. s.* } and Span. *publico*;
 PUBLICATION, } Port. *publico*; Lat. }
 PUBLIC-HOUSE, } *publico, publicus*. Ge- }
 PUBLICLY, *adv.* } neral; universal; }
 PUBLICNESS, *n. s.* } open: belonging to }
 PUBLIC-SPIRITED, *adj.* } a state or nation; }
 PUBLISH, *v. a.* } open: the great body }
 PUBLISHER, *n. s.* } of a people or of }
 mankind; open view or notice; exposure: publicly and publicness corresponding: publican is, in an ancient sense, a toll or tax-gatherer; in a modern one, the landlord of a house of public entertainment, or public-house: publication is the act of publishing a thing, particularly a book published; also an edition of a book: public-spirited is, having regard to the general good; patriotic: to publish is, to make generally known; make public; proclaim; send forth a book into the world: publisher, follows both the general and particular sense.

As Jesus sat at meat, many *publicans* and sinners came and sat down with him. Matt. ix. 10.

Joseph being a just man, and not willing to make her a *public* example, was minded to put her away privily. Matthew.

By following the law of private reason, where the law of *public* should take place they breed disturbance. Hooker

For the instruction of all men to eternal life, it is necessary that the sacred and saving truth of God be openly *published* unto them, which open *publication* of heavenly mysteries is by an excellency termed *preaching*. *Id.*

How will this grieve you,
When you shall come to clearer knowledge, that
You thus have *published* me! *Shakspeare.*
Love of you

Hath made me *publisher* of this pretence. *Id.*
Sometimes also it may be private, communicating
to the judges some things, not fit to be *publicly* delivered. *Bacon.*

And for traducing such
That are above us, *publishing* to the world
Their secret crimes, we are as innocent
As such as are born dumb. *Messenger.*
His commission from God and his doctrine tend to
the impressing the necessity of that reformation
which he came to *publish*. *Hammond.*

If I had not unwarily too far engaged myself for
the present *publishing* it, I should have kept it by me.
Digby.

They were *public* hearted men; as they paid all
taxes, so they gave up all their time to their country's
service, without any reward *Clarendon.*

A dismal universal hiss, the sound
Of *public* scorn. *Milton.*

Suppose he should relent,
And *publish* grace to all. *Id.*
O f royal maids how wretched is the fate,
Born only to be victims of the state;
Our hopes, our wishes, all our passions tried
For *public* use, the slaves of others pride.
Granville.

The multitude of partners does detract nothing
from each private share, nor does the *publickness* of it
lessen propriety in it. *Boyle.*

The apostle doth not speak as the *publisher* of a
new law, but only as a teacher and monitor of what
his lord and master had taught before. *Kettlewell.*

These were the *public-spirited* men of their age,
that is, patriots of their own interest. *Dryden.*

Philosophy, though it likes not a gaudy dress, yet,
when it appears in *public*, must have so much com-
placency as to be clothed in the ordinary fashion.
Locke.

They have with bitter clamours defaced the *public*
service of our church. *White.*

I am called off from *public* dissertations by a do-
mestic affair of great importance, which is no less
than the disposal of my sister Jenny for life.
Tatler, No. 75.

Those nations are most liable to be over-run and
conquered, where the people are rich, and where, for
want of good conduct, the *public* is poor. *Davenant.*

All nations that grew great out of little or nothing,
did so merely by the *public* mindedness of particular
persons. *South.*

The *public* is more disposed to censure than to
praise. *Addison.*

The income of the commonwealth is raised on such
as have money to spend at taverns and *public-houses*.
Id.

This has been so sensibly known by trading na-
tions, that great rewards are *publicly* offered for its
supply. *Id.*

Another *public-spirited* project, which the common
enemy could not foresee, might set king Charles on
the throne. *Id.*

The unwearied sun, from day to day,
Does his Creator's power display,
And *publishes* to every land
The work of an almighty hand. *Id. Spectator.*
A collection of poems appeared, in which the *pub-*

lisher has given me some things that did not belong
to me. *Prior.*

A good magistrate must be endued with a *public*
spirit, that is, with such an excellent temper as sets
him loose from all selfish views, and makes him en-
deavour towards promoting the common good.
Atterbury.

In *public* 'tis they hide,
Where none distinguish. *Pope.*

An imperfect copy having been offered to a book-
seller, you consented to the *publication* of one more
correct. *Id.*

The *publication* of these papers was not owing to
our folly, but that of others. *Swift.*

Have we not able counsellors hourly watching over
the *public* weal? *Id.*

It was generous and *public-spirited* in you to be
of the kingdom's side in this dispute, by shewing,
without reserve, your disapprobation of Wood's de-
sign. *Id.*

Then each, in its peculiar honours clad,
Shall *publish* even to the distant eye
Its family and tribe. *Cowper.*

PUBLIUS, a prænomen very common among
the ancient Romans. It was the prænomen of
the Scipios, Ovid, and many other eminent men.

PUCERON, in entomology, a common name
given to several genera of animalcules or insects,
most of which live on the young branches of
trees, particularly the peach tree, and feed on the
sap. The various genera and species of pucerons
have each their favorite plant, on which
they live and feed on its juices.

Earth pucerons differ from most of the other
genera, by residing in the earth. In the month
of March, if the turf be raised in several places
in any dry pasture, there will be found, under
some parts of it, clusters of ants; and, on a far-
ther search, it will be usually found that these
ants are gathered about some pucerons of a pec-
uliar species. These pucerons are large, and
of a grayish color, and are usually found in the
midst of clusters of ants. As the common abode
of the other kinds of puceron is on the young
branches or leaves of trees, and as their only
food is the sap of these trees, these earth kinds
are supposed to extract their food from the
roots of grasses, and other plants, in the same
manner that the others do from the leaves and
branches. The ants follow these and the other
species, for the sake of the saccharine juices
which they extract from plants, and which they
evacuate very little altered from their original
state in the vegetable.

Oak pucerons, a name given by naturalists to
a very remarkable species of animal of the
puceron kind. They bury themselves in the
clefts of the oak and some other trees, and get
into the crevices, where the bark is a little sepa-
rated from the wood. They are larger than the
other pucerons, the winged ones being nearly as
large as a common house fly; those without wings
are also larger than any other species of the same
genus. The winged ones are black, and, the
others of a coffee color. Their trunk is twice
the length of their bodies, and, when walking, it
is carried straight along the belly, trailing behind
it with the point up. When the puceron wishes
to suck a part of a tree that is just before it, it
draws up, and shortens the trunk, till it brings

it to a proper length and direction; but, when it sucks in the common way, it crawls upon the inner surface of the bark, and the turned up end of the trunk, which resembles a tail, fixes itself against the wood that is behind it, and sucks there. The extremity of this trunk holds so fast by the wood, that, when it is pulled away, it frequently brings a small piece of the wood away with it. The ants are as fond of these as of the other species of pucerons, not feeding upon them, but on their dung, which is a liquid matter of a sweet taste. These creatures are the surest guides where to find this species of puceron; for, if we at any time see a number of these crawling up an oak and creeping into the clefts of the bark, we may be assured that in that place there are quantities of these oak pucerons. The ants are so extremely fond of the juices of the tree, when prepared by passing through the body of this animal, that when the puceron has a drop not yet evacuated, but hanging only in part out at the passage, an ant will often seize on it there.

PUCK, *n. s.* } Scot. *puck*; Goth. *puke*. A
PUCKER. } sprite among the fairies; an
imp, who seems chargeable with mischievous
disarrangements of ladies' work, dress, &c.:
hence pucker, a disorderly fold: or from *POKE*,
a bag, which see.

O gentle *puck*, take this transformed scalp
From off the head of this Athenian swain.

Shakspeare.

Turn your cloaks,

Quoth he, for *puck* is busy in these oaks,
And this is fairy ground.

Corbet.

I saw an hideous spectre; his eyes were sunk into
his head, his face pale and withered, and his skin
puckered up in wrinkles.

Spectator.

A ligature above the part wounded is pernicious,
as it *puckers* up the intestines and disorders its
situation.

Sharp.

PUCKHOLI, or PAXALI, a district to the
north of the province of Lahore, situated about
34° of N. lat., and bounded on the west by
the Indus. It is very little known beyond the
description given of it in the sixteenth century by
Abul Fazel. The common but hazardous road
from Cashmere to the Indus lies through this
district, which is chiefly held by predatory
Afghaun tribes.

PUD'DER, *n. s., v. n., & v. a.* Commonly
written *POTHER*, which see. A tumult; turbu-
lent and irregular bustle: to make such a bustle:
to perplex; confound.

Let the great gods,
That keep this dreadful *pudder* o'er our heads,
Find out their enemies.

Shakspeare. King Lear.

What a *pudder* is made about essences, and how
much is all knowledge pestered by the careless use
of words!

Locke.

Mathematicians, abstracting their thoughts from
names, and setting before their minds the ideas
themselves, have avoided a great part of that per-
plexity, *puddering* and confusion, which has so much
hindered knowledge.

Id.

He that will improve every matter of fact into a
maxim will abound in contrary observations, that
can be of no other use but to perplex and *pudder*
him.

Id.

PUD'DING, *n. s.* } Fr. *boudin*; Welsh *pot-*
PUD'DINGPIES, } *ten* (an intestine) Swed.
PUD'DINGTIME. } *pudding*; Span. *puddin*. A
kind of food variously compounded, but made
commonly of mealy and suitable admixtures: it
seems to owe its name to being originally cooked
in the integuments of animals: a pudding pie
is a pudding containing meat: pudding time,
dinner time: hence, by a construction natural
enough, any critical time.

He'll yield the crow a *pudding* one of these days;
the king has killed his heart. *Shakspeare. Henry V.*
As sure as his guts are made of *puddings*.

Shakspeare.

Some cry the covenant, instead
Of *puddingpies* and gingerbread.

Hudibras.

Mars that still protects the stout,
In *puddingtime* came to his aid.

Id.

Salads, and eggs, and lighter fare
Tune the Italian sparg's guitar;

And, if I take Dan Congreve right,
Pudding and beef make Britons fight.

Prior.

Mind neither good nor bad, nor right nor wrong,
But eat your *pudding*, slave, and hold your tongue.

Prior.

PUD'DLE, *n. s. & v. a.* } Latin *puteolus*.
PUD'DLY, *adv.* } Skinner; from old
Bavarian *poil*, dirt, Junius; Ital. *padula*. A
small muddy lake; a dirty plash: to plash; be
mired; the adverb corresponding.

As if I saw my sun-shine in a *puddled* water, I
cried out of nothing but Mopsa.

Sidney.

Thou didst drink

The stale of horses, and the gilded *puddle*
Which beasts would cough at.

Shakspeare.

His beard they singed off with brand of fire,
And, ever as it blazed, they threw on him

Great pails of *puddled* mire to quench the hair. *Id.*
Limy, or thick *puddly* water killeth them.

Carew.

The Hebrews drink of the well-head, the Greeks
of the stream, and the Latins of the *puddle*. *Hall.*

Treading where the treacherous *puddle* lay,
His heels flew up; and on the grassy floor

He fell, besmeared with filth. *Dryden's Virgil.*

The noblest blood of Africk

Runs in my veins, a purer stream than thine;
For, though derived from the same source, thy cur-
rent

Is *puddled* and defiled with tyranny. *Dryden.*

A physician cured madmen thus: they were tied
to a stake, and then set in a *puddle*, till brought to
their wits. *L'Estrange.*

Happy was the man, who was sent on an errand
to the most remote street, which he performed with
the greatest alacrity, ran through every *puddle*, and
took care to return covered with dirt. *Addison.*

PUD'DENCY, *n. s.* Lat. *puđens*. Modesty;
shamefacedness.

A *puđency* so rosy, the sweet view on't
Might well have warm'd old Saturn.

Shakspeare.

PUEBLA, or PUEBLA DE LOS ANGELOS (be-
cause, as we shall see, the angels were materially
concerned in the erection of the capital), is one
of the twelve intendencies into which Mexico or
the former 'New Spain' is divided. It has a
coast of about seventy-eight miles towards the
Pacific; and, as it extends from 16° 57' to 20°
40' of N. lat., is wholly situated within the tropics.
It is bounded on the north-east by Vera

R

Cruz, on the east by the intendency of Oaxaca, on the south by the Ocean, and on the west by Mexico. Its greatest length from the mouth of the small river Tecoyame to near Mexitlan is 118 leagues, and its greatest breadth from Techuacan to Mecameca is 150 miles. The greater part of this province is traversed by the high cordilleras of Anahuac. Beyond 18° of latitude the whole country is a plain, eminently fertile in wheat, maize, agave, and fruits, and from 5900 to 6560 feet above the level of the sea. Here is the most elevated mountain of New Spain, the Popocatepetl. The volcano, first measured by Humboldt, is continually burning; but for these several centuries it has thrown nothing up from its crater but smoke and ashes. It is nearly 2000 feet higher than the most elevated summit of the old continent; and there is only one higher mountain in the American continent. The population is unequally distributed, being concentrated on the plain which extends from the eastern declivity of the snowy Andes to the environs of Perote, especially between Cholula, La Puebla, and Tlascal. Almost the whole country, from the central table-land towards San Luis and Ygualapa, near the South Sea coast, is desert; but not ill adapted for sugar, cotton, and other productions of the tropics. The table-land of La Puebla exhibits vestiges of ancient Mexican civilisation. The great pyramid of Cholula is a curious monument.

‘We left La Puebla on the 22d of March, and slept at San Martin,’ says Mr. Ward, the latest traveller in these regions, ‘taking the road through Cholula to that place, in order to obtain a better view of the old Mexican Teocalli, or pyramid, of which Humboldt’s work contains so detailed a description. The base of this pyramid comprises a square of about 1773 feet; the height is fifty-four metres, or 177 feet. It is truncated, and, on the spacious platform in which it terminates, the conquerors have erected a chapel as if to mark the substitution of another creed, and another race, for the nation by whose united exertions this stupendous monument must have been raised. The whole mass is formed of alternate layers of unburnt bricks and clay, and is now overgrown with thick shrubs, amongst which clouds of tortolas (a small wood pigeon) are found. Its structure is said by baron Humboldt to present a curious analogy with that of the temple of Belus at Babylon, and of the pyramids of Egypt. Its object was undoubtedly religious, but as its construction is ascribed to the Toltecs, a nation which preceded the Aztecs in their emigration towards the south, the exact nature of the rites to which it was dedicated can only be conjectured. It may have served for the performance of human sacrifices in the sight of the assembled tribe; or as a place of defence in the event of an unexpected attack:—perhaps the two objects were combined, for, in the siege of Mexico, the most obstinate resistance was made in the vicinity of the great temple (which resembled in form, though not in size, the Teocallis of Cholula and Teotihuacan), from the summit of which the priests are said to have encouraged the war-

riors by whom the great staircase and platform were defended.

‘The view from the pyramid of Cholula embraces the three great volcanoes, and the Malinche, with a finely cultivated country covering the intervening space. The town of Cholula lies immediately below the platform, reduced, like the rival state of Tlascal, which is separated from it by the Malinche, to a mere shadow of its former greatness; but still indicating, by the size of its plaza, the extent of ground which the city formerly covered. The fertility of the plain around is very great, as from the vicinity of the two great mountains, Popocatepetl and Istaccihuatl, a constant supply of water for irrigation can be obtained; it abounds in haciendas de trigo (corn estates), many of which, in good years, are said to produce wheat in the proportion of eighty to one to the seed. This fertility terminates a little beyond San Martin, where the passage of the mountains, that separate La Puebla from Mexico, commences.’

The progress of commerce has in this province been extremely slow. The flour trade, formerly very flourishing, has suffered from the enormous price of carriage from the Mexican table-land to the Havannah, and especially from the want of beasts of burden. That which Puebla carried on till 1710 with Peru, in hats and delf-ware, has entirely ceased. The intendency has considerable salt-works near Chila, Xicotlan, and Ocotlan, in the district of Chiautla, as also near Zapotitlan. The beautiful marble known by the name of the Puebla marble is procured in the quarries of Totamehuacan and Tecali, at two and seven leagues distance from the capital. The indigenous inhabitants speak three languages, very different from each other, i. e. the Mexican, Totonac, and Tlapanec. Their industry is not much directed to the working of the mines, many of which are either abandoned or very partially worked. The population of Puebla was estimated, in 1803, at 813,300 inhabitants. The extent of surface is 2696 square leagues, which allows 301 inhabitants to each square league.

PUEBLA, LA, DE LOS ANGELOS, a city of Mexico, the capital of the intendency of this name, is one of the number of American towns founded by European colonists; for, in the plain of Acaxete or Cuilaxcoapan, on the spot where this capital now stands, there were only, in the beginning of the sixteenth century, a few huts inhabited by the Indians of Cholula. The privilege of the town of Puebla is dated 28th September, 1531.

La Puebla stands on a plain 7381 feet above the level of the sea, and is, after Mexico, Guanajuato, and the Havannah, the most considerable city of the former Spanish colonies. Its temples are sumptuous; and its streets wide, and drawn in a straight line from east to west, and from north to south. The public squares are large and handsome, and the edifices in a suitable style of architecture. The principal square is adorned on three sides with uniform porticoes, and shops filled with all kinds of commodities; on the other is the cathedral, which has a very beautiful front, and two lofty towers.

‘We remained,’ says Mr. Ward, ‘during the

whole of the 22d at La Puebla, as the governor, whose hospitality and friendly disposition towards every Englishman of respectability who visits the town I have ever found the same, would not hear of our passing a shorter time with him than we had done at Jalapa with general Barragan. The delay afforded us an opportunity of seeing the cathedral, a magnificent building, in the construction of which the *angels themselves* are said to have taken a very active part. It is regarded by the Indians, and by a large proportion of the female Spanish population, as a well authenticated fact, that, during the time that the walls of the edifice were constructing, two messengers from heaven descended every night, and added to their height exactly as much as had been raised, by the united efforts of the laborers, during the day. With such assistance the work advanced at a prodigious rate, and was brought to a conclusion in a much shorter space of time than could have been effected by human exertions alone. It is in grateful commemoration of this event that the name of the town, 'La Puebla de los Angeles,' was assumed; and as all the details of it are recorded with singular care in the convents, which have since been built upon this favored spot, there is little danger of their not being handed down to posterity, in all the purity in which they are now preserved.

But, whether of divine or human origin, the cathedral is a very fine building, and the riches of the interior are worthy of a country that has produced, during the last two centuries, nearly two-thirds of the whole of the silver raised annually in the world. The lofty candlesticks, the balustrade, the lamps, and all the ornaments of the principal altar, are of massy silver; and the effect produced by such magnificence, in conjunction with the beauty of the columns of native marble by which the roof is supported, is very striking. We were not, however, allowed to admire them long in peace, for, notwithstanding the presence of Madame Calderon, and two or three aides-de-camp of the governor, the curiosity excited by the first appearance of an English woman was so ungovernable that the great market-place, through which the carriage had passed, transferred in a moment by far the largest portion of its inmates to the cathedral, where the crowd soon became so great that, although no incivility was intended, it was quite impossible for us to remain. La Puebla contained, at that time, a Lazzaroni population nearly as numerous as that of the capital; a naked and offensive race, whom you cannot approach without pollution, or even behold without disgust. I do not know any thing in nature more hideous than an old Indian woman, with all the deformities of her person displayed, as they usually are, by a dress which hardly covers a tenth part of her body; and in La Puebla, in consequence of the numerous convents in which alms were distributed, these objects were particularly numerous. We were too happy to escape by a different door from that by which we had entered, and to take refuge in the carriage.

Besides the cathedral, there are other churches

and convents, well built and adorned. There are also several colleges and charity schools, both for male and female pupils. Puebla was formerly celebrated for its fine manufactories of delf-ware and pots. At present the delf manufactories have declined, on account of the low price of the stone-ware and porcelain imported at Vera Cruz. Hard soap is still a considerable manufacture and object of commerce: it is also famous for its manufactures of iron and steel, particularly swords and bayonets.

Mr. Ward says 'La Puebla was formerly a town inferior only to the capital in extent and population. It contains at present about 50,000 inhabitants, and is an important place, as being the seat both of the richest bishopric in the country, and of the most extensive manufactures of cotton, earthenware, and wool. The streets, like those of Mexico, are rectangular, spacious, and airy. The houses low, but roomy, and the apartments mostly paved with porcelain, and adorned with Fresco paintings on the stuccoed walls. The country around is rich, but naked, being totally devoid of trees, with the exception of the Pinal, a pine forest (as the name implies), which extends from within a league and a half of Nopaluca, to about five leagues from the gates of La Puebla, where cultivation re-commences. The whole distance is about twelve leagues. The road through the Pinal is extremely bad, and dangerous in unsettled times, the forest being the favorite haunt of banditti, who sometimes assemble there in considerable numbers for a coup de main.' Seventy miles E. S. E. of Mexico, and 150 W. N. W. of Vera Cruz. Inhabitants 67,800.

PUNENTE DEL ARCOBISPO, or ARCHBISHOP'S BRIDGE, a town in the west of Spain, on the Tagus, fifty-eight miles W. S. W. of Toledo. Population 1200. The name is derived from an old bridge over the river.

PUNENTE DE DON GONZALO, a town of Cordova, Spain, belonging in part to the duke of Medina Celi. Population 4800. Fifteen miles west of Lucena.

PUERILE, *adj.* } Fr. *puerile*; Lat. *puer-*
PUERILITY, *n. s.* } *lis*. Childish; boyish: state or time of boyhood; childishness.

A reserve of *puerility* not shaken off from school.

Broune.

Some men, imagining themselves possessed with a divine fury, often fall into toys and trifles, which are only *puerilities*.

Dryden.

I looked upon the mansion with a veneration mixed with a pleasure that represented her to me in those *puerile* amusements.

Pope.

PUERPERAL FEVER. See MIDWIFERY.

PUERTO DEL BAYLIO BUCARELI, a bay on the west coast of the Prince of Wales's archipelago, discovered by Quadra in 1775, and containing a great number of small islands. Long. 226° 12' to 227° 5' E., lat. 55° 14' to 55° 40' N.

PUERTO DE BAZAN, a bay on the south-west coast, of the above archipelago. Long. 227° 16' E., lat. 54° 49' N.

PUERTO CORDOVA, a bay on the east coast of Prince William's Sound, between Hawkins's Island and the north-west coast of America. Long. 214° 13' E., lat. 60° 37' N.

PUERTO CORDOVA Y CORDOVA, a large bay of the North Pacific, on the south side of the Prince of Wales's archipelago. Long. 227° 28' to 228° E., lat. 54° 42' to 55° 6' N.

PUERTO GRAVINA, an inlet on the north-western coast of America, in Prince William's Sound. For four miles it runs parallel to the neighbouring inlet of Port Fidalgo, and the intervening land is not more than four miles across. It then suddenly turns to the N. N. E. for about four miles and a half, when it terminates in a shallow flat in long. 214° 45' E., lat. 60° 44' N. At its entrance it is from four to six miles wide.

PUERTO REAL, an increasing town in the south-west of Spain, in Seville, five miles east of Cadiz, on the bay. The streets are airy, clean, and straight. At the beginning of last century it had not more than 1500 inhabitants: it now contains more than 10,000. This is the great depôt of the salt made in the tanks that of the isle of Leon and bay of Cadiz.

PUERTO DE SANTA MARIA, of ST. MARY'S, the Portus Menesthei of the ancients, a sea-port of Spain, in Seville, five miles north-east of Cadiz, at the mouth of the Guadalete. The climate is excellent, having little either of the severity of cold in winter, or the scorching heat of summer, and the town is well built, well paved, and kept very clean. The Calle Ancha is about a mile in length, and resembles a superior English street in the number of shops and bustle. On the west side of the town there is a very fine prospect of the bay and town of Cadiz, and the surrounding country. The church and monasteries are chiefly remarkable for a profusion of ornaments. The public walk is fine; and there is a beautiful public garden on the bank of the Guadalete. The quay is also well contrived, but large ships cannot come up, on account of sand-banks at the mouth of the river. The only manufacture of consequence is linen and printed cotton, but the inhabitants are still more in preparing the bay-salt of the adjoining salt-pans. Here is also a traffic in the conveyance of water from one of the fountains to Cadiz, for the supply of the town and ships. St. Mary's is the residence of the captain-general and vicar-general of Andalusia, and of an official of the archbishop of Castile. Inhabitants 12,000.

PU'ET, *n. s.*, or PEW'ET, which see. A kind of water fowl.

Among the first sort are coots, sanderlings and *pewets*. *Carew.*

The fish have enemies enough; as otters, the cormorant, and the *puet*. *Walton's Angler.*

PUFF, *n. s.*, *v. n.* & *v. a.* } *Belg. pof*; Span. }
PUFFINGLY, *adv.* } *poufo, bufo*; French }
PUFFY, *adj.* } *bouffe*; Scot. *buffie* }

and there is an oriental *puf* (Pers.), and Sans. *pu*, wind; all clearly words derived from the sound of wind blown from the mouth. A blast of wind through the lips; a small blast of wind; any thing light or porous; or any thing used to sprinkle light dust with, as hair-powder, &c.: to puff is to blow in the way described: hence to swell the cheeks with wind; breathe thick or hard; swell with wind or air; move with hurry or tumult (which produces puffing); sneer at; treat with scorn, or as light and trifling: as a verb

active to inflate; drive or agitate; swell or elate with pride; the adjective and adverb follow these senses.

Think not of men above that which is written, that no one of you be *puffed up* one against another. *1 Corinthians iv. 6.*

His looke like a coxcomb *up puffed* with pride. *Tusser.*

Wherefore do you follow her,
Like foggy South *puffing* with wind and rain? *Shakspeare.*

Seldshown flammings
Do press among the popular throngs, and *puff*
To win a vulgar station. *Id. Coriolanus.*

Have I not heard the sea, *puffed up* with winds,
Rage like an angry boar chafed with sweat? *Shakspeare.*

This army, led by a tender prince,
Whose spirit, with divine ambition *puff'd*,
Makes mouths at the invisible event. *Id.*
The Rosemary, in the days of Henry VII. with a sudden *puff* of wind stooped her side, and took in water at her ports in such abundance, as that she instantly sunk. *Raleigh.*

The attendants of courts engage them in quarrels of jurisdiction, being truly parasiti curiæ, in *puffing* a court *up* beyond her bounds for their own advantage. *Bacon.*

Then came brave glory *puffing* by
In silks that whistled, who but he?
He scarce allowed me half an eye. *Herbert*
Let him fall by his own greatness,
And *puff* him *up* with glory, till it swell
And break him. *Denham's Sophy.*

The naked breathless body lies,
To every *puff* of wind a slave,
At the beck of every wave,
That once perhaps was fair, rich, stout, and wise. *Flatman.*

A new coal is not to be cast on the nitre, till the detonation be quite ended; unless the *puffing* matter blow the coal out of the crucible. *Boyle.*

A true son of the church
Came *puffing* with his greasy bald-pate choir,
And fumbling o'er his beads. *Dryden.*
The unerring sun by certain signs declares
When the South projects a stormy day,
And when the clearing North will *puff* the clouds
away. *Dryden's Virgil's Georgics.*

I can enjoy her while she's kind,
But when she dances in the wind,
And shakes her wings, and will not stay,
I *puff* the prostitute away. *Dryden.*
An injudicious poet, who aims at loftiness, runs into the swelling *puffy* stile, because it looks like greatness. *Id.*

A *puff* of wind blows off cap and wig. *L'Estrange.*
The ass comes back again, *puffing* and blowing from the chase. *Id.*

Flattering of others, and boasting of ourselves, may be referred to lying; the one to please others, and *puff* them *up* with self-conceit; the other to gain more honour than is due to ourselves. *Ray.*

In garret vile, he with a warming *puff*
Regales chill fingers. *Philips.*
Some *puff* at these instances, as being such as were under a different economy of religion, and consequently not directly pertinent to ours. *South.*

Why must the winds all hold their tongue?
If they a little breath should raise;
Would that have spoiled the poet's song,
Or *puffed* away the monarch's praise? *Prior.*
Emphysema is a light *puffy* tumour, and easily yielding to the pressure of your fingers, and riseth again in the instant you take them off. *Wiseman.*

I have been endeavouring very busily to raise a friendship, which the first breath of any ill-natured by-stander could puff away.

Pope.

Who stands safest? tell me, is it he That spreads and swells in puffed prosperity? *Id.*

The Phœacians were so puffed up with their constant felicity, that they thought nothing impossible.

Broome.

Honor's a puff of noisy breath.

Watts.

The pipe, with solemn interposing puff,
Makes half a sentence at a time enough;
The dozing sages drop the drowsy strain,
Then pause, and puff—and speak, and pause again.

Cowper.

PUFFENDORF (Samuel de), an eminent German lawyer, born in 1631 at Fleh, a village of Misnia, in Upper Saxony. He was son of Elias Puffendorf, minister of that place. After acquiring the sciences at Leipsic, he studied the public law, but refused to take the degree of doctor. He accepted the place of governor to the son of Mr. Coyot, then ambassador from Sweden to the court of Denmark. For this purpose he went to Copenhagen, but, the war being renewed soon after between Denmark and Sweden, he was seized with the ambassador's family. During his confinement, which lasted eight months, as he had no books, he amused himself by meditating on what he had read in Grotius's Treatise De Jure Belli et Pacis, and on Hobbes's political writings. Out of these he drew up a short system, with thoughts of his own, and published it at the Hague in 1660, under the title of *Elementa Jurisprudentiæ Universalis*. The elector Palatine invited him to the university of Heidelberg, where he founded in his favor a professorship of the law of nature and nations, the first of that kind established in Germany. Puffendorf remained at Heidelberg till 1673, when Charles XI. of Sweden invited him to be professor of the law of nature and nations at Lunden; which he accepted. Some years after the king sent for him to Stockholm, and made him his historiographer, and a counsellor. In 1688 the elector of Brandenburg obtained the king's consent that he should come to Berlin, to write the history of the elector, William the Great; and in 1694 made him a baron. He died in 1694, aged sixty-three, of an inflammation in his feet. Of his works, which are numerous, the following are the principal:—
1. A Treatise on the Law of Nature and Nations. 2. An Introduction to the History of the principal States in Europe. Both these were written in German, and have been translated into English. The former with Barbeyrac's Notes. 3. The History of Sweden, from Gustavus Adolphus's Expedition into Germany to the Abdication of Queen Christina. 4. The History of Charles Gustavus, 2 vols. folio.

PUFFIN, *n. s.* Ital *puffino*. A water fowl.

Among the first sort we reckon the dipchick, murr, creysers, curlews and *puffins*.

Carew.

PUG, *n. s.* Sax. *puga*, a girl. Skinner. A kind name of a monkey, or any thing tenderly loved.

Upon setting him down, and calling him *pug*, I found him to be her favourite monkey.

Addison.

PUGANTZ, or Baka Banya, a free town, at the foot of a hill, on the north-west of Hungary,

twenty-nine miles east of Neutra, and seventy-three E. N. E. of Presburg. Population 2400. It is the seat of a mine-office, connected with mines of gold and silver, inferior only to those of Cremitz.

PUGET (Peter Paul), one of the greatest painters and sculptors France ever produced, was born at Marseilles in 1623. He was the disciple of Roman, an able sculptor; and went afterwards to Italy, where he studied painting and architecture. In 1657 a dangerous disorder obliged him to renounce the pencil, and devote himself to sculpture; and, being invited to Paris, he obtained a pension of 1200 crowns, as naval sculptor and director of the works: He died at Marseilles in 1695, and left a number of admirable statues both in France and Italy.

PUGGERED, *adj.* For puckered. Crowded; complicated.

Nor are we to cavil at the red *pugged* attire of the turkey, and the long excrescency that hangs down over his bill, when he swells with pride.

More against Atheism.

PUGIL, *n. s.* Fr, *pugille*. What is taken up between the thumb and two first fingers.

Take violets, and infuse a good *pugil* of them in a quart of vinegar.

Bacon's Natural History.

PUGLIA, the ancient Apulia, a large tract on the coast of the Adriatic, Naples, now forming the provinces of CAPITANATA, BARI, and OTRANTO, which see.

PUGNA'CIOUS, *adj.* } Lat. *pugnax*. In-
PUGNA'CIOUSLY, *adv.* } clinable to fight; quar-
relsome. We find no instance of the use of this word in our standard writers; but our pugilistic gentlemen, and most of the monkey tribes, furnish illustrations of it.

PUIKA, or *POYK*, a river of Austrian Illyria, in Carniola, remarkable for the length of its course under ground. Entering a subterraneous cavern at Adelsberg, it finds its way beneath the surface of the earth eight miles to Planina, where it loses itself again almost immediately, and re-appears at a distance of five miles, under the name of the Laybach. The entrance at Adelsburg is in the form of a Gothic vault, and the appearance extremely grand. The noise of the water ceases for some time, as the traveller advances by a glimmering light; and, when he hears it again, the guides are accustomed to light up a straw fire, which shows that he is now arrived at almost impassable precipices, and that he stands on a natural bridge, while the river rolls below at a great distance. The travellers Valvasor and Keyser penetrated to a second bridge, about four miles from the mouth of the cavern, and saw the water eighty or 100 feet below them.

PUISNE, *adj.* French *puis né*. Commonly spoken and written *PUNY*, which see. Younger; later in time; inferior; subordinate; small.

A *puisne* tilter, that spurs his horse but on one side, breaks his staff like a noble goose.

Shakspeare.

When the place of a chief judge becomes vacant, a *puisne* judge who hath approved himself deserving, should be preferred.

Bacon.

If he undergo any alteration 't must be in time, or of a *puisne* date to eternity.

Hab.

PUISSANCE, *n. s.* } Fr. *puissance*. Power;
 PUIS'SANT, *adj.* } strength; force: powerful;
 forcible.

PUKE, *n. s. & v. n.* } Teut. *spucker*. Vo-
 PU'KER, *n. s.* } mit: hence an emetic;
 to vomit: a puker also means an emetic.

The infant

Mewling and *puling* in the nurse's arms. *Shakspeare*.
 PULAWSKI, count Joseph; a distinguished
 Pole, who, after attempting in vain to restore
 the independence of his own country, entered
 the American service. Pulawski had followed
 the profession of the law, and, in 1768, was at
 the head of the patriots who formed the con-
 federation of Bar. Eight noblemen only con-
 stituted the first assembly of that confederation,
 and of these, three were the sons and one the
 nephew of Pulawski. In 1771, at the head of
 a few accomplices, he seized the person of the
 king, but the latter having procured his liberation,
 Pulawski was condemned to death, and obliged
 to save himself by flight. He soon after came
 to America, and offered his services to the
 United States of America against the mother
 country. Being appointed brigadier-general in
 the American service, he served both in the
 northern and the southern army. October 9,
 1779, he was mortally wounded in the attack on
 Savannah, and died two days afterwards.

PUL, or PHUL, the first king of Assyria,
 upon the division of the empire after the death
 of Sardanapalus.

PULARUM ISLE, one of the smallest of the
 Banda Isles, named by early navigators Polaroon,
 in long. 129° 45' E., and lat. 5° 35' N. The English
 East India Company obtained possession of it
 in 1617, but were repeatedly expelled by the
 Dutch; and it was not until March 1665 that
 it was formally delivered up by the Dutch.

PULCHERIA, a daughter of the emperor Ar-
 cadius, eminent for her virtues. She was mother
 of Valentinian III., and governed the empire for
 many years. She died A. D. 452, and was in-
 terred at Ravenna, where her tomb is still visi-
 ble.

PULCHRITUDE, *n. s.* Lat. *pulchritudo*.
 Beauty; grace; handsomeness; quality oppo-
 site to deformity.

Neither will it agree unto the beauty of animals,
 wherein there is an approved *pulchritude*. *Browne*.

Pulchritude is conveyed by the outward senses unto
 the soul, but a more intellectual faculty is that which
 relishes it. *More*.

That there is a great *pulchritude* and comeliness of
 proportion in the leaves, flowers, and fruits of plants,
 is attested by the general verdict of mankind.

Ray on the Creation.

By their virtuous behaviour they compensate the
 hardness of their favour, and by the *pulchritude* of
 their souls make up what is wanting in the beauty
 of their bodies. *South*.

PULCI (Lewis), an eminent Italian poet,
 born in Florence in 1431. He wrote a celebra-
 ted poem on a tournament held at Florence,
 in which Lorenzo de Medicis was victor, en-
 titled Giostra de Lorenzo de Medicis. He had
 two brothers equally devoted to the Muses; one
 of whom wrote an elegy, entitled Bernardo, on
 the death of the great Cosmo de Medicis. Lewis
 died about 1487.

PULE, *v. n.* Fr. *piauler*; Ital. *pipilure*, of Lat.
pipilo. To cry like a chicken; whine.

To have a wretched *puling* fool,
 A whining mammet in her fortune's tender,
 To answer, I'll not wed.

Shakspeare. Romeo and Juliet.

Let the songs be loud and cheerful, and not chirp-
 ings or *pulings*; let the musick likewise be sharp and
 loud. *Bacon*.

Weak *puling* things unable to sustain
 Their share of labour, and their bread to gain.

Dryden.

When ice covered the water, the child bathed his
 legs; and when he began this custom was *puling* and
 tender. *Locke*.

This *puling* whining harlot rules his reason,
 And prompts his zeal for Edward's bastard brood.

Rouee.

While yet thou wast a grovelling *puling* chit,
 Thy bones not fashioned, and thy joints not knit,
 The Roman taught thy stubborn knee to bow,
 Though twice a Cæsar could not bend thee now.

Cowper.

PULEX, the flea, in entomology, a genus of in-
 sects belonging to the order of aptera. It has
 two eyes, and six feet fitted for leaping; the
 feelers are like threads; the rostrum is inflected,
 setaceous, and armed with a sting; and the belly
 is compressed. Fleas bring forth eggs, which
 they deposit on animals that afford them a proper
 food. Of these eggs are hatched white worms of
 a shining pearl color, which feed on the scurfy
 substance of the cuticle, the downy matter
 gathered in the piles of clothes, or other similar
 substances. In a fortnight they come to a tolerable
 size, and are very lively and active; and, if at
 any time disturbed, they suddenly roll themselves
 into a kind of ball. Soon after this they begin
 to creep, after the manner of silk worms, with a
 very swift motion. When arrived at their size,
 they hide themselves, and spin a silken thread
 out of their mouth, wherewith they form them-
 selves a small round bag or case. Here, after a
 fortnight's rest, the animalcule bursts out, trans-
 formed into a perfect flea; leaving its exuvia in
 the bag. While it remains in the bag it is
 milk-white, till the second day before its erup-
 tion; when it becomes colored, grows hard, and
 gets strength; so that upon its first delivery it
 springs nimbly away. The flea is covered all
 over with black, hard, and shelly scales or plates,
 which are curiously jointed, and folded over one
 another in such a manner as to comply with all
 the nimble motions of the creature. These scales
 are finely polished, and beset about the edges
 with short spikes, in a very beautiful and regular
 order. Its neck is finely arched, and resembles
 the tail of a lobster: the head also is very extra-
 ordinary; for, from the snout part of it, proceed
 the two fore legs, and between these is placed
 the piercer or sucker, with which it penetrates
 the skin to get its food. Its eyes are very large
 and beautiful, and it has two short horns or
 feelers. It has four other legs joined all at the
 breast. These, when it leaps, fold short, one
 within another; and then, exerting their spring
 all at the same instant, they carry the creature to
 a surprising distance. The legs have several
 joints, and are very hairy, and terminate in two
 long and hooked sharp claws. The piercer or

sucker of the flea is lodged between its fore legs, and includes a couple of darts or lancets; which, after the piercer has made an entrance, are thrust farther into the flesh, to make the blood flow from the adjacent parts, and occasion that round red spot, with a hole in the centre of it, vulgarly called a flea-bite. This piercer, its sheath opening sidewise, and the two lancets within it, are very difficult to be seen; unless the two fore legs, between which they are hid, be cut off close to the head: for the flea rarely puts out its piercer, except at the time of feeding, but keeps it folded inwards; and the best way of seeing it is by cutting off first the head and then the fore-legs, and then it is usually seen thrust out in convulsions. By keeping fleas in a glass tube corked up at both ends, but so as to admit of fresh air, their several actions may be observed. They may also be thus seen to lay their eggs, not all at once, but ten or twelve in a day, for several days successively; which eggs will be afterwards found to hatch successively in the same order. The flea may easily be dissected in a drop of water; and thus the stomach and bowels, with their peristaltic motion, may be discovered very plainly, as also their testes and penis, with the veins and arteries. This blood-thirsty insect, which fattens at the expense of the human species, prefers the more delicate skin of women; but preys neither upon epileptic persons, nor upon the dead or dying. It loves to nestle in the fur of dogs, cats, and rats. The nests of river swallows are sometimes plentifully stored with them. Fleas are apterous; walk but little, but leap to a height equal to 200 times that of their own body. This amazing motion is performed by means of the elasticity of their feet, the articulations of which are so many springs. Thus it eludes, with surprising agility, the pursuit of the person on whom it riots. See ENTOMOLOGY.

PULEX AQUATICUS of some authors, the monocus pullex of Linnæus, in entomology, is a species of the genus monocus. See ENTOMOLOGY.

PULL, *v. a. & n. s.* } Sax. pullhan; Belg. }
PULLER, *n. s.* } *op paolen.* To draw towards one; opposed to push; tear; rend; pluck; draw forcibly; taking on, off, down, up, &c., before the object: the act of pulling; contest; struggle.

He put forth his hand, and *pulled* the dove in.
Genesis viii. 9.

Pull them out like sheep for the slaughter, and prepare them for the day of slaughter. *Jer.* vii. 11.
 He hath turned aside my ways, and *pulled* me in pieces; he hath made me desolate. *Lam.* iii. 2.

What they seem to offer us with the one hand, the same with the other they *pull* back. *Hooker.*

Duke of Glo'ster, scarce himself;

That bears so shrewd a main; two *pulls* at once;
 His lady banished, and a limb lopt off. *Shakspeare.*
 Shameless Warwick, peace!

Proud setter up and *puller* down of kings. *Id.*

Although it was judged in form of a statute that he should be banished, and his whole estate confiscated, and his houses *pulled* down, yet his case even then had no great blot of ignominy. *Bacon.*

He was not so desirous of wars, as without just cause of his own to *pull* them upon him. *Hayward.*

All fortune never crushed that man, whom good fortune deceived not; I therefore have counselled my friends to place all things she gave them so as she might take them from them, not *pull* them.

Ben Jonson's Discoveries.

This wrestling *pull* between Corineus and Gogmagog is reported to have befallen at Dover. *Carew.*

In political affairs, as well as mechanical, it is far easier to *pull* down than build up; for that structure, which was above ten summers a building, and that by no mean artists, was destroyed in a moment.

Howel's Vocal Forest.

He begs the gods to turn blind fortune's wheel,
 To raise the wretched, and *pull* down the proud.

Roscommon.

When bounteous Autumn rears his head,

He joys to *pull* the ripen'd pear. *Dryden.*

What censure, doubting thus of innate principles,
 I may deserve from men, who will be apt to call it *pulling* up the old foundations of knowledge, I cannot tell; I persuade myself that the way I have pursued, being conformable to truth, lays these foundations surer. *Locke.*

Flax *pulled* in the bloom will be whiter and stronger than if let stand till the seed is ripe.

Mortimer.

They may be afraid to *pull* down ministers and favourites grown formidable.

Davenant.

When God is said to build or *pull* down, 'tis not to be understood of an house; God builds and unbuilds worlds. *Burnet.*

I awaked with a violent *pull* upon the ring, which was fastened at the top of my box. *Gulliver.*

A boy came in great hurry to *pull* off my boots.

Swift.

PULLET, *n. s.* French *poulet*. A young hen.

Brew me a pottle of sack finely.

—With eggs, Sir?

—Simple of itself; I'll no *pullet* sperm in my brewage. *Shakspeare.*

They died, not because the *pullets* would not feed; but because the devil foresaw their death, he contrived that abstinence in them. *Brown.*

I felt a hard tumour on the right side, the bigness of a *pullet's* egg. *Wiseman's Surgery.*

PULLEY, *n. s.* Fr. *poulie*; Ital. *polea*; Gr. *πολεω*? A small grooved wheel turning on a pivot or line.

Here *pullies* make the ponderous oak ascend. *Gay.*

Nine hundred of the strongest men were employed to draw up these cords by many *pulleys* fastened on the poles, and in three hours I was raised and slung into the engine. *Swift.*

PULLEY, in mechanics, one of the five mechanical powers. See MECHANICS.

PULICAT, or **VALIACATA**, a sea-port on the coast of the Carnatic, twenty-five miles north from Madras. The lake of Pullicat, on which it stands, appears to owe its existence to the sea's breaking through a low sandy beach, and overflowing the lands. Its communications with the sea are extremely narrow. This lake is in extent thirty-three miles from north to south, eleven miles across in the broadest part, and comprehends several large islands. The Dutch established themselves here in 1609, when they built a square fort named Geldria; to which, after the loss of Negapatam, the chief government of their settlements on the Coromandel Coast was transferred. Their imports were arrack, sugar, Japan copper, spices, and other articles, brought

from Batavia. In 1795 the British took possession of Pullicat, and it is now comprehended in the northern Arcot collectorship.

PULMANNUS (Theodore), or Poelman, a learned corrector of the sixteenth century, born at Cranenburgh, in the duchy of Cleves, about 1510. He superintended the printing and correcting of the Latin poets from ancient MSS., for the celebrated Plantin's press. He died about 1580.

PULMO, the lungs. See **ANATOMY**.

PULMONARIA, in botany, lungwort, a genus of the monogynia order, and pentandria class of plants; natural order forty-first, asperifolia: cor. funnel-shaped, with its throat pervious: cal. prismatic and pentagonal. There are several species; of which the most remarkable is

P. officinalis, common spotted lungwort, or Jerusalem cowslip. This is a native of woods and shady places in Italy and Germany; but has been cultivated in Britain for medical use. The leaves are of a green color, spotted with white; and of a mucilaginous taste, without any smell. They are recommended in phthisis, ulcers of the lungs, &c.; but their virtues in these diseases are not warranted by experience.

PULMONARY, *adj.* } Lat. *pulmo*. Belong-
PULMON'IC. } ing to the lungs.

An ulcer of the lungs may be a cause of *pulmonick* consumption, or consumption of the lungs.

Harvey.

Often these unhappy sufferers, for want of sufficient vigour and spirit to carry on the animal regimen, drop into a true *pulmonary* consumption.

Blackmore.

Cold air, by its immediate contact with the surface of the lungs, is capable of producing defluxions upon the lungs, ulcerations, and all sorts of *pulmonick* consumptions.

Arbuthnot.

The force of the air upon the *pulmonary* artery is but small in respect to that of the heart. *Id.*

PULO BALLY, an island in the eastern seas, about two miles round, with abundance of wood and water; divided from the island of Bachian by a channel five miles wide.

PULO BANJAC ISLE, an island, about twenty-five miles in circumference, on the west coast of Sumatra, between 2° and 3° N. lat.

PULO BATU, an island about forty miles off the western coast of Sumatra, called, says Mr. Marsden, by corruption, Mintoan. It is about forty miles long, and twelve broad, in long. 97° 56' E., lat. 0° 20' N.

PULO LAUT, an island in the eastern seas, at the south entrance of the Straits of Macassar, near the south-east coast of Borneo. It is of a triangular form, and about 100 miles in circumference: the chief produce is rice. The channel between this island and Borneo is about two miles broad, less or more, and from seven to eight fathoms deep. It forms a good harbour. Long. 116° 24' E., lat. 3° 45' S.

PULO NAKO-NAKO, a cluster of isles in the eastern seas, near the western coast of Nias. Large quantities of cocoa-nut oil are prepared here. They are governed by a rajah, who monopolises the produce.

PULO SANDING, or **SANDIANG**, two islands in the Eastern seas, near the south-eastern extremity

of the Nassau or Poggy Isles. They are both uninhabited, and the only production that grow on them worth notice is the long nutmeg, and some timber.

PULO TIMOAN, an island of the eastern seas, inhabited by a short race of Malays. Byron found them, in the year 1765, a surly set of people, who came down to the beach in great numbers, having a long knife in one hand, a spear headed with iron in the other, and a dagger by their side. They went on shore however; but all they could procure was about a dozen fowls, and a goat and kid, in exchange for some pocket-handkerchiefs. The island is hilly and woody.

PULO VARELLA, an island in the Straits of Malacca, about twenty miles from the north-east coast of Sumatra. It is chiefly resorted to by the piratical inhabitants of the neighbouring islands. Long. 99° 36' E., lat. 3° 47' N.

PULO WAY, a Spice Island in the eastern seas, about nine miles west of Gorong Apee, is nearly circular, and about a mile and a half in diameter. It has a strong fort, and is esteemed healthy. Long. 130° 26' E., lat. 4° 9' S.

PULP, *n. s.* } Fr. *pulpe*; Lat. *pulpa*. Any
PUL'POUS, *adj.* } soft mass; the soft part of
PULPY. } fruit: soft, pappy.

The jaw bones have no marrow severed, but a little *pulp* marrow diffused.

Bacon's Natural History.

The savoury *pulp* they chew, and in the rind, Still as they thirsted, scoop the brimming stream.

Milton.

In the walnut and plums is a thick *pulpy* covering, then a hard shell, within which is the seed.

Ray on the Creation.

The grub

Of unobserved invades the vital core,
 Pernicious tenant, and her secret cave
 Enlarges hourly, preying on the *pulp*
 Ceaseless.

Philips.

The redstreak's *pulpous* fruit

With gold irradiate, and vermilion shines. *Id.*

Putrefaction destroys the specifick difference of one vegetable from another, converting them into a *pulpy* substance of an animal nature. *Arbuthnot.*

The **PULP** of fruits, in pharmacy, is extracted by infusion or boiling, and passed through a sieve.

PULPIT, *n. s.* Fr. *pulpitre*; Lat. *pulpitum*; Ital., Span., and Port., *pulpito*. A raised place where a speaker stands.

Produce his body to the market-place,

And in the *pulpit*, as becomes a friend,

Speak in the order of his funeral. *Shakspeare.*

Their late patron of famous memory (as their dear relique), enshrined in their La Flesche, was, after his death, in their *pulpits* proclaimed tyrant and worse.

Bp. Hall.

We see on our theatres the examples of vice rewarded, yet it ought not to be an argument against the art, any more than the impieties of the *pulpit* in the late rebellion. *Dryden.*

Sir Roger has given a handsome *pulpit* cloth, and railed in the communion-table. *Addison.*

Bishops were not wont to preach out of the *pulpit*. *Ayliffe.*

Pulpits their sacred satyr learned to spare,
 And vice admired to find a flatt'rer there. *Pope.*

PULPITUM, in the Grecian and Roman theatres, a place where the players performed their parts. It was lower than the scena, and higher than the orchestra.

PULPITUM was also a moveable desk or pulpit, from which disputants pronounced their dissertations, and authors recited their works.

PULSE, *n. s.* From pull. Leguminous plants. Plants not reaped, but pulled or plucked.

With Elijah he partook,

Or as guest with Daniel at his *pulse*.

Milton.

Mortals, from your fellows' blood abstain!
While corn and *pulse* by nature are bestowed.

Dryden.

Tares are as advantageous to land as other *pulses*.

Mortimer.

PULSE, *n. s. & v. n.*

Fr. *pouls*; Span.

PULSATION, *n. s.*

pulso; Lat. *pulsus*.

PULSION.

The vibratory motion

of the blood in an artery; oscillation; vibration; to beat as the pulse: pulsation is the vibratory stroke of the pulse; any stroke beating against something opposing: pulsion is, the act of driving forward a fluid, as opposed to suction or traction.

Think you I bear the shears of destiny?

Have I commandment on the *pulse* of life?

Shakspeare.

These commotions of the mind and body oppress the heart, whereby it is choaked and obstructed in its *pulsation*.

Harvey.

The prosperity of the neighbour kingdoms is not inferior to that of this, which, according to the *pulse* of states, is a great diminution of their health.

Clarendon.

This original of the left vein was thus contrived, to avoid the *pulsation* of the great artery.

Browne.

Admit it might use the motion of *pulsion*, yet it could never that of attraction.

More's Divine Dialogues.

My body is from all diseases free;

My temp'rate *pulse* does regularly beat.

Dryden.

The heart, when separated wholly from the body in some animals, continues still to *pulse* for a considerable time.

Ruy.

The vibrations or *pulses* of this medium, that they may cause the alternate fits of easy transmission and easy reflection, must be swifter than light, and by consequence above seven hundred thousand times swifter than sounds.

Newton.

If one drop of blood remain in the heart at every *pulse*, those, in many *pulses*, will grow to a considerable mass.

Arbuthnot.

By attraction we do not here understand what is improperly called so, in the operations of drawing, sucking, and pumping, which is really *pulsion* and trusion.

Bentley.

PULSE, in physiology. See **PHYSIOLOGY** and **MEDICINE**.

PULTENEY (William), the celebrated opposer of Sir Robert Walpole, and afterward earl of Bath, was descended from one of the most ancient families in the kingdom, and was born in 1682. He early procured a seat in the house of commons, and distinguished himself against queen Anne's ministry. When king George I. came to the throne, he was made secretary at war; but the friendship between him and Sir Robert Walpole, the premier, was interrupted in 1725, by a suspicion that Walpole wished to

promote the interests of Hanover, to the prejudice of Great Britain. His opposition to Sir Robert was indeed carried to the most indiscriminate length. At last, in 1731, the king with his own hand struck out his name from the list of privy counsellors. But he still continued to attack the minister with a severity of eloquence and sarcasm that worsted every antagonist; and Sir Robert was known to say, he dreaded his tongue more than another man's sword. At length, when Walpole resigned in 1741, Mr. Pulteney was restored to his place in the privy council, and was created earl of Bath; a title purchased at the expense of his popularity. In 1760, in the close of the war, he published A Letter to two Great Men, recommending certain articles to be insisted on in a treaty of peace; which, though the writer was then unknown, was greatly applauded, and went through several impressions. He died in 1764.

PULTENEY (Richard), M.D., was born at Loughborough in 1730. He became a surgeon and apothecary at Leicester, whence he communicated some papers on the sleep of plants, and the rare productions of Leicestershire, to the Royal Society, of which he was elected a member in 1762. Two years after he took his doctor's degree at Edinburgh, and went to settle at Blandford in Dorsetshire, where he died, October 13th, 1801. Dr. Pulteney published A General View of the Writings of Linnæus, 4to.; and Sketches of the Progress of Botany in England, 2 vols. 8vo. He left his museum to the Linnaean Society.

PULTUSK, or **PULTOVSK**, a celebrated town of Poland, on the Narew, thirty-four miles N. N. E. of Warsaw. It is the residence of the bishop of Plock, and has a Benedictine abbey and gymnasium. The Saxons were defeated here by the Swedes in 1703; and an important engagement took place here between the French and Russians, on 26th December, 1806. Population 2100.

PULVERIZE, *v. a.* } Fr. *pulveriser*; Lat. *pulverabile*, *adv.* } *pulveris*. To reduce to powder or dust: possible to be reduced to dust.

If the experiment be carefully made, the whole mixture will shoot into fine crystals, that seem to be of an uniform substance, and are consistent enough to be even brittle, and to endure to be *pulverized* and sifted.

Boyle.

In making the first ink, I could by filtration separate a pretty store of a black *pulverable* substance that remained in the fire.

Id.

'Tis thine to cherish and to feed

The pungent nose-refreshing weed:

Which, whether *pulverized* it gain

A speedy passage to the brain.

Couper.

PULVERISATION is performed on friable bodies by pounding or beating them in a mortar, &c.; but, to pulverise malleable ones, other methods must be taken. To pulverise lead, or tin, the method is this: Rub a round wooden box all over the inside with chalk; pour a little of the melted metal nimbly into the box; when, shutting the lid, and shaking the box briskly, the metal will be reduced to powder.

PULVIL, *n. s. & v. a.* Lat. *pulvillum*. Sweet scents.

Have you *pulvilled* the coachman and postilion that they may not stink of the stable? *Congreave*

The toilette, nursery of charms,
Completely furnished with bright beauty's arms,
The patch, the powder-box, *puvil*, perfumes. *Gay*.

PUMEX, the pumice-stone, a substance frequently thrown out of volcanoes, very full of pores, in consequence of which it is specifically very light, and resembles the frothy slag produced in our iron furnaces. It is of two colors, black and white; the former being that which it has when thrown out of the volcano. It is of a rough and porous consistence, being made up of slender fibres parallel to each other, and very light, so that it swims on water. Pumice-stone is used by silversmiths and other mechanics, for rubbing and smoothing the surface of metals, wood, pasteboard, and stones; for which it is well fitted by its harsh and brittle texture; thus scouring and carrying off all the inequalities.

Jameson arranges pumice under three species, viz. the *glassy*, *common*, and *porphyritic*. 1. Glassy pumice. Color smoke gray. Vesicular. Glistening pearly. Fracture promiscuous fibrous. Translucent. Between hard and semi-hard. Very brittle. Feels rough, sharp, and meagre. Specific gravity 0.378 to 1.44. It occurs in beds in the Lipari Islands.

2. Common pumice. Color nearly white. Vesicular. Glimmering pearly. Fracture fibrous. Translucent on the edges. Semi-hard. Very brittle. Meagre and rough. Specific gravity 0.752 to 0.914. It melts into a gray-colored slag. Its constituents, according to the analysis of Klapproth, silica 77.5, alumina 17.5, natron and potash 3, iron mixed with manganese 1.75. It occurs with the preceding.

3. Porphyritic pumice. Color grayish white. Massive. Minutely porous. Glimmering and pearly. Specific gravity 1.661. It contains crystals of felspar, quartz, and mica. It is associated with claystone, obsidian, pearlstone, and pitchstone porphyry. It occurs in Hungary, at Tokay, &c.

PUMICE, *n. s.* Lat. *pumex*, *pumicis*.

So long I shot, that all was spent,
Though pumice stones I hastily hent,
And threw; but nought availed. *Spenser*.
Etna and Vesuvius, which consist upon sulphur,
shoot forth smoke, ashes, and pumice, but no water. *Bacon*.

Near the Lucrine lake,
Steams of sulphur raise a stifling heat,
And through the pores of the warm pumice sweat. *Addison*.

The pumice is evidently a flag or cinder of some fossil, originally bearing another form, reduced to this state by fire: it is a lax and spongy matter full of little pores and cavities: of a pale, whitish, grey colour: the pumice is found particularly about the burning mountains. *Hill's Materia Medica*.

PUMP, *n. s.*, *v. n.*, & *v. a.* } Fr., Belg., and
PUMPER. } Teut. *pompe*;
Dan. *pompe*; Gr. *πομπα*? A hydraulic engine of extensive use and great variety of construction; a kind of shoe: to work a pump; to raise or throw any thing liquid, as by means of a pump: to examine artfully; suck: a pumper is he who uses the pump literally, or who extracts the contents of another's mind.

Get good strings to your beads, new ribbons to your pumps. *Shakspeare*.

Follow me this jest, now, till thou hast worn out thy pump. *J.*

Thalia's ivy shews her prerogative over comical poesy; her mask, mantle, and pumps, are ornaments belonging to the stage. *Peacham*.

The folly of him who pumps very laboriously in a ship, yet neglects to stop the leak. *Decay of Piety*.
In the framing that great ship built by Hiero, Athenæus mentions this instrument as being instead of a pump, by the help of which one man might easily drain out the water, though very deep. *Wilkins's Dædalus*.

The one's the learned knight, seek out,
And pump them what they come about. *Hudibras*.

Ask him what passes
Amongst his brethren, he'll hide nothing from you,
But pump not me for politics.

Otway's Venice Preserved.
A pump grown dry will yield no water, unless you pour a little water into it first. *More*.

The flame lasted about two minutes, from the time the pumper began to draw out air. *Boyle*.

Pumps may be made single with a common pump handle, for one man to work them, or double for two. *Mortimer*.

Not finding sufficient room, it breaks a vessel to force its passage, and, rushing through a larger chasm, overflows the cavities about it with a deluge, which is pumped up and emptied. *Blackmore*.

The water and sweat
Spish splash in their pumps. *Swift's Miscellanies*.

As an impartial traveller I must however tell, that in Stow-street, where I left a draw well, I have found a pump. *Johnson*.

PUMPS. For the theory and construction of a great variety of these useful machines, see **HYDROSTATICS** and **HYDRAULICS**, vol. xi. p. 511 to 523.

PUMPS, AIR. See **AIR-PUMPS** and **PNEUMATICS**, Index.

PUMPION, *n. s.* Lat. *pepo*. A plant.

We'll use this gross watery pumpion, and teach him to know turtles from jays. *Shakspeare*.

PUMPION, or **PUMKIN**. See **CUCURBITA**.

PUN, *n. s.* & *v. n.* Johnson seems rather punning when he says, 'to pun is to grind or beat with a pestle; can pun mean an empty sound, like that of a mortar beaten, as clench, the old word for pun, seems only a corruption of clink?' Qu. Lat. *punctum*? A quibble; double meaning, or equivocation; play on a word or words: to use a pun; quibble.

The hand and head were never lost of those
Who dealt in doggrel, or who punned in prose.

You would be a better man, if you could pun like Sir Tristram. *Tatler*.

It is not the word but the figure that appears on the medal: cuniculus may stand for a rabbit or a mine, but the picture of a rabbit is not the picture of a mine: a pun can be no more engraven than it can be translated. *Addison*.

But fill their purse, our poet's work is done,
Alike to them by pathos, or by pun. *Pope*.

PUNA, a rich city of Peru, in the province of Paucarolla, on the Lake Chucuito or Titicaca. It has a beautiful church for the whites, and another for the Indians; but has suffered much by an insurrection of the Indians. The silver ores in the neighbourhood are rich; but the mines filled with water. Fourteen miles north-west of Chucuito. Long. 70° 26' W., lat. 16° 20' S.

PUNA, a woody island, district, and city of South America. The island is situated at the mouth of the Guayaquil, is between six and seven leagues long, and about the same in breadth, and was once populous, containing 20,000 Indians. It was famous in the history of the conquest of Peru. The port of Puna serves for the lading place of large ships, which cannot get over the bar to Guayaquil; the island abounds in mangrove trees. The city is poor, and decayed. The port is eight leagues from the city. Long. 70° 58' W., lat. 2° 50' S.

PUNCH, *n. s.* As some have thought of Lat. *potus nauticus*. Mr. Thomson suggests Sans. and Hind. *punchiēne*, of *pun*, *punna*, a beverage, and *cheene*, 'which signifies both Chinese and sugar.' See Fryer, quoted below. A liquor made of spirits, sugar, water, lemons, &c.: the only wholesome ingredient, says Cheyne, being the water.

The West India dry gripes are occasioned by lime juice in *punch*. *Arbutnot on Aliments.*

No brute can endure the taste of strong liquor, and consequently it is against all the rules of hieroglyph to assign those animals as patrons of *punch*.

Punch is an Indian word expressing the number of ingredients. *Swift.*
Fryer's Travels.

PUN'CH, *n. s.* Ital. *puncinello*. The buffoon or harlequin of a puppet-show.

Of rare-shows he sung, and *punch's* feats. *Gay.*

PUNCH, *v. a. & n. s.* } Fr. *poinçonner*;
PUN'CHEON, *n. s.* } Span. *poizon*, *pun-*
PUN'CH'ER. } zon, of Lat. *puncto*.

To cut a hole; bore, or perforate with a sharp instrument: a puncheon and puncher are names for the instrument used: puncheon is also a liquid measure of eighty gallons.

When I was mortal my anointed body
By thee was *punched* full of deadly holes.

Shakspeare.

He granted liberty of coining to certain cities and abbeys, allowing them one staple and two *puncheons* at a rate. *Camden.*

The fly may, with the hollow and sharp tube of her womb, *punch* and perforate the skin of the cruca, and cast her eggs into her body. *Ray.*

The shank of a key the *punch* cannot strike, because the shank is not forged with substance sufficient; but the drill cuts a true round hole.

Moxon's Mechanical Exercises.

In the upper jaw are five teeth before, not incisors or cutters, but thick *punchers*. *Grew.*

By reason of its constitution it continued open, as I have seen a hole *punched* in leather. *Wiseman.*

A **PUNCH** is an instrument of iron or steel, used in several arts, for the piercing or stamping holes in plates of metals, &c., being so contrived as not only to perforate, but to cut out and take away the piece.

A **PUNCHEON**, **PUNCHIN**, or **PUNCHION**, is a little block or piece of steel, on one end of which is some figure, letter, or mark, engraven either en creux or relievō, impressions whereof are taken on metal, &c., by striking it with a hammer on the end not engraved. There are various kinds of these puncheons used in the mechanical arts. Puncheon is also a common name for all those iron instruments used by stone-cutters, sculptors, blacksmiths, &c., for the cutting, in-

cing, or piercing their several matters. Those of sculptors and statuaries serve for the repairing of statues when taken out of the moulds. The locksmiths use the greatest variety of puncheons; some for piercing hot, others for piercing cold; some flat, some square, some round, others oval, each to pierce holes of its respective figure in the several parts of locks.

PUNCTILIO, *n. s.* } Lat. *punctulum*. Nice-
PUNCTILIOUS, } ty of behaviour; a nice-
PUNCTILIOUSNESS. } ness or exact point:
punctilious, nice; exact; fastidious; superstitiously particular: the noun substantive corresponding.

If their cause is bad, they use delays to tire out their adversaries, they feign pleas to gain time for themselves, and insist on *punctilios* in his proceedings. *Kettlewell.*

Common people are much astonished when they hear of those solemn contests which are made among the great, upon the *punctilios* of a public ceremony. *Addison.*

Some depend on a *punctilious* observance of divine laws, which they hope will atone for the habitual transgression of the rest. *Rogers's Sermon.*

Punctilio is out of door the moment a daughter clandestinely quits her father's house. *Clarissa.*

PUNCTO, *n. s.* Span. *punto*. Nice point of ceremony; the point in fencing.

Vat be all you come for?

—To see thee here, to see thee there, to see thee pass thy *puncto*.

Shakspeare. Merry Wives of Windsor.

The final conquest of Granada from the Moors, king Ferdinando displayed in his letters, with all the particularities and religious *punctos* and ceremonies that were observed in the reception of that city and kingdom. *Bacon's Henry VII.*

PUNCTUAL, *adj.* } Fr. *punctuel*. Com-
PUNCTUALITY, *n. s.* } prised, or consisting
PUNCTUALLY, *adv.* } in a point; exact;
PUNCTUALNESS, *n. s.* } nice; scrupulous: the
adverb and noun substantives corresponding.

A gentleman *punctual* of his word, when he had heard that two had agreed upon a meeting, and the one neglected his hour, would say of him, he is a young man then. *Bacon.*

For the encouragement of those that hereafter should serve other princes with that *punctuality* as Sophronio had done, he commanded him to offer him a blank, wherein he might set down his own conditions. *Howel's Vocal Forest.*

This earth a spot, a grain,
An atom with the firmament compar'd,
And all her numbered stars, that seem to rowl
Spaces incomprehensible; for such
Their distance argues, and their swift return
Diurnal, merely to officiate light
Round this opacous earth, this *punctual* spot.

Milton.

This mistake to avoid, we must observe the *punctual* differences of time, and so distinguish thereof, as not to confound or lose the one in the other.

Brown's Vulgar Errors.

His memory was serviceable, but not officious; faithful to things and business, but unwillingly retaining the contexture and *punctualities* of the words. *Fell.*

Concerning the heavenly bodies, there is so much exactness in their motions, that they *punctually* come to the same periods to the hundredth part of a minute. *Ray on the Creation.*

Though some of these *punctualities* did not so much conduce to preserve the text, yet all of them shew the infinite care that was taken that there might be no mistake in a single letter. *Grew.*

I freely bring what Moses hath related to the test, comparing it with things as now they stand; and, finding his account to be *punctually* true, I fairly declare what I find. *Woodward.*

The correspondence of the death and sufferings of our Lord is so *punctual* and exact, that they seem rather like a history of events past, than a prophecy of such as were to come. *Rogers.*

He was *punctual* and just in all his dealings. *Atterbury.*

The most literal translation of the scriptures, in the most natural signification of the words, is generally the best; and the same *punctualness* which debaseth other writings, preserveth the spirit and majesty of the sacred text. *Felton.*

PUNCTUATION, *n. s.* Lat. *punctum*. The act or method of pointing a book or writing.

It ought to do it willingly, without being forced to it by any change in the words or *punctuation*. *Addison.*

PUNCTUATION, in grammar, the art of pointing, or of dividing a discourse into periods, by points expressing the pauses to be made therein. The ancients were not entirely unacquainted with punctuation. Suidas says that the period and colon were discovered and explained by Thrasymachus, about A. A. C. 380; and Cicero says that Thrasymachus was the first who studied oratorical numbers, which consisted in the artificial structure of periods and colons. It appears from a passage in Aristotle that it was known in his time. Dr. Edward Barnard says it consisted in the different positions of one single point. At the bottom of a letter, thus (A.), it was equivalent to a comma; in the middle, thus (A.), to a colon; at the top (A'), it denoted a full period. Cicero, Quintilian, Seneca, Suetonius, Elius Donatus, and St. Jerome, all mention that the Romans, as well as the Greeks, made use of points. Peculiar marks, however, were used in different ages. Of these marks of distinction, the Walcote inscription, found near Bath, may serve for a specimen:

IVLIVS VITALIS V FABRI
CESIV LEGV XXV Vv V
STIPENDIORVM &c.

After every word here, except at the end of a line, we see this mark v. There is an inscription in Montfaçon, which has a capital letter laid in an horizontal position, by way of interstitial mark. Our punctuation appears to have been introduced with the art of printing. In the fourteenth century no stops were used but arbitrary marks here and there. In the fifteenth century, we observe their first appearance. We find, from the books of this age, that they were not all produced at the same time; those we meet with in use first being only the comma, the parenthesis, the interrogation, and the full point. To these succeeded the colon, afterwards the semicolon, and, lastly, the note of admiration. The hyphen, the parenthesis, and quotation marks, are also a species of punctuation.

PUNCTULATE, *v. a.* Lat. *punctulum*. To mark with small spots.

The studs have their surface *punctulated*, as if set all over with other studs infinitely lesser. *Woodward.*

PUNCTUM STANS, a phrase by which the schoolmen vainly attempted to bring within the reach of human comprehension the positive eternity of God. Those subtle reasoners seem to have discovered that nothing which is made up of parts, whether continuous or discreet, can be absolutely infinite, and that therefore eternity cannot consist of a boundless series of successive moments. Yet, as if such a series had always existed and were commensurate in duration with the Supreme Being, they compared his eternity to one of the moments which compose the flux of time arrested in its course; and to this eternal moment they gave the name of punctum stans, because it was supposed to stand still, while the rest followed each other in succession, all vanishing as soon as they appeared.

PUNCTURE, *n. s.* Lat. *punctus*. A small prick; a hole made with a sharp point.

With the loadstone of Laurentius Guascus, what-soever needles or bodies were touched, the wounds and *punctures* made thereby were never felt. *Brown's Vulgar Errors.*

Nerves may be wounded by scission or *punctures*: the former way being cut through, they are irrecoverable; but when pricked by a sharp-pointed weapon, which kind of wound is called a *puncture*, they are much to be regarded. *Wiseman.*

PUNDA, or **PUNDY**, a town of Hindostan, province of Bejapore, formerly belonging to the Mahrattas. Long. 74° 3' E., lat. 15° 20' N.—There is another place of this name in the North-east Circars. Long. 84° 40' E., lat. 18° 14' N.

PUNDERPOOR, or **PUNDEPORA**, a town of the province of Bejapore, Hindostan, on the left bank of the Beemal. It is not large, but regular and well built, and has a handsome temple dedicated to Vishnu.

PUNDITS, or **PANDITS**, learned Brahmins devoted to the study of the Shanscrit language, and to the ancient sciences, laws, and religion of Hindostan.

PUNGENT, *adj.* } Lat. *pungens*. Prick-
PUNGENCY, *n. s.* } ing; acrid; sharp: pun-
gency is, power of pricking, or piercing; keen-
ness; acridness.

An opinion of the successfulness of the work is as necessary to found a purpose of undertaking it, as the authority of commands, the persuasiveness of promises, *pungency* of menaces, or prospect of mischiefs upon neglect can be. *Hammond.*

The latter happening not only upon the *pungent* exigencies of present or impending judgments, but in the common service of the church. *Fell.*

When he hath considered the force and *pungency* of these expressions applied to the fathers of that Nicene synod by the western bishops, he may abate his rage towards me. *Sillingfleet.*

It consists chiefly of a sharp and *pungent* manner of speech; but partly in a facetious way of jesting. *Dryden.*

Do not the sharp and *pungent* tastes of acids arise from the strong attraction, whereby the acid particles rush upon and agitate the particles of the tongue? *Newton's Optics.*

Any substance, which by its *pungency* can wound the worms will kill them, as steel and hartshorn. *Arbutnot*

Just where the breath of life his nostrils drew,
 * A charge of snuff the wily virgin threw;
 The gnomes direct to every atom just,
 The pungent grains of titillating dust. *Pope.*
 Thou canst set him on the rack,
 Inclose him in a wooden tower,
 With pungent pains on every side;
 So Regulus in torments died.
Swift's Miscellanies.

PUNIC WARS. See CARTHAGE.

PUNICA, the pomegranate tree, a genus of the monogynia order and icosandria class of plants; natural order thirty-sixth, pomaceæ: CAL. quinquefid superior; petals five; fruit a multilocular and polyspermous apple. 1. P. granata, the common pomegranate, rises with a free stem, branching numerously all the way from the bottom, growing eighteen or twenty feet high; with spear-shaped, narrow, opposite leaves; and the branches terminated by the most beautiful and large red flowers, succeeded by large roundish fruit as big as an orange, having a hard rind filled with soft pulp and numerous seeds. There is a variety with double flowers, remarkably beautiful; and one with striped flowers.

2. P. anan, the dwarf American pomegranate, rises with a shrubby stem branching four or five feet high, with narrow short leaves and small red flowers, succeeded by small fruit; begins flowering in June, and continues till October. Both these species are propagated by layers: the young branches are to be chosen for this purpose, and autumn is the proper time for laying them. Those of the common sort may be trained either as half or full standards, or as dwarfs. But those designed for walls must be managed as directed for peaches. The dried flowers of the double-flowered pomegranate are possessed of an astringent quality; for which reason they are recommended in diarrhœas, dysenteries, &c., where astringent medicines are proper. The rind of the fruit is also a strong astringent, and as such is occasionally made use of.

PUN'ISH, v. a.	} Lat. <i>punio</i> ; Fr. <i>punis</i> sable, <i>punition</i> . To chasten; afflict with penalties for a crime; avenge or revenge with death: punishable, worthy of demanding punishment: punisher, he who inflicts it: punishment and punition, the penalty of crime: punitive, awarding or inflicting that penalty.
PUN'ISHABLE, adj.	
PUN'ISHER, n. s.	
PUN'ISHMENT,	
PUN'ITION,	
PUN'ITIVE, adv.	

If you will not hearken I will *punish* you seven times more for your sins. *Leviticus. xxvi. 18.*

The house of endless pain is built thereby,
 In which ten thousand sorts of *punishments*
 The cursed creatures do eternally torment.

Spenser.

Theft is naturally *punishable*, but the kind of *punishment* is positive, and such lawful, as men shall think with discretion convenient to appoint.

Hooker.

Unless it were a bloody murderer,
 I never gave them condign *punishment*.

Shakspeare.

Neither is the cylinder charged with sin, whether God or men, nor any *punitive* law enacted by her against its rolling down the hill.

Hammond's Fundamentals.

He that doubts whether or no he should honour his parents, wants not reason, but *punishment*.

Holyday.

Their bribery is less *punishable* when bribery opened the door by which they entered,

Taylor.

Will he draw out,

For anger's sake, finite to infinite

In *punished* man?

This knows my *punisher*; therefore as far
 From granting me, as I from begging peace.

Milton.

A greater power

Now ruled him, *punished* in the shape he sinned.

Dryden.

Say, foolish one—can that unbodied fame,
 For which thou barterest health and happiness,
 Say, can it soothe the slumbers of the grave—
 Give a new zest to bliss, or chase the pangs
 Of everlasting *punishment* condign? *Kirke White.*

PUNISHMENT OF CRIMES. Dr. Paley was the last, and we believe will be the final author of any celebrity, who will be found to vindicate the general spirit of our criminal jurisprudence, in which the punishment has been any thing but the prevention of crimes. It has been constructed upon no general system of legislation. Sometimes the magistrate is clothed with a species of vindictive justice, which it seems doubtful, at least, if ever the Supreme Being delegated to any creature; at other times he is the minister of a particular order of men, a particular caste, or class; as in the administration, for instance, of the appalling enactments of the game laws: again he feebly endeavours at the legitimate, perhaps only, end of human legislation, the prevention of crimes, by punishments which, if they effected their object, are wholly disproportioned to the offence. It seems indeed to have been forgotten that the infliction of some kinds of punishment may in itself constitute a crime. Again, it has been forgotten that it is one thing to enact a law, and another to give it operation. The moral feelings will come into exercise among a people like our own, and predominate occasionally, and even steadily, beyond the force of attachment to any human institution. An ostensible and real equity will therefore be demanded in a body of laws, devolving on such a people to execute.

Dr. Paley, as Sir Samuel Romilly has remarked, himself enumerates the several aggravations which ought to guide the magistrate in the selection of objects of condign punishment; and mentions principally three—repetition, cruelty, and combination; which aggravations, Sir Samuel remarks, are as capable of being clearly and accurately described in written laws, and as proper to be submitted to the decision of a jury, as the crimes themselves. But Paley proceeds to say, that, 'by this expedient (meaning the multiplication of capital punishments), few actually suffer death, whilst the dread and danger of it hangs over the crimes of many; and then that, 'the wisdom and humanity of this design furnish a just excuse for the multiplicity of capital offences, which the laws of England are accused of creating, beyond those of other countries.' We may oppose to this extraordinary reasoning, the sagacious and sound observation of the marquis Beccaria, that, where the

consequences of crimes are problematical, additional force is rather given to the passions. With respect to the second remark of Dr. Paley, above noticed, it is impossible not to be surprised, with Sir Samuel Romilly, that, in this mode of administering the law, an apology should be found for the great number of our statutes creating capital offences; for certainly 'one would have imagined that one advantage of such a system, by which it is left to those who exercise the law to discriminate, and to find out the circumstances which are to characterize, to extenuate, or to aggravate offences, would be, that the laws, being extremely general, might be few in number, and simple and concise in their enactments. Were we to frame laws which should distinguish accurately the general character of different offences, and enumerate all the peculiar aggravations with which they might be attended, and should leave unforeseen and unnoticed no human action which was dangerous by its example, or heinous in its circumstances, we might, indeed, have a good excuse to offer for the multiplicity of our penal laws.'

One remark more from Sir Samuel Romilly.—The power of suspending the laws by granting pardons is exclusively in the king, and it is a prerogative of a very transcendental character. But in the exercise of that discretion, with which, in judicial practice, at least, the judge is invested in dispensing justice on his circuit, he is made the depository of the royal clemency; he administers the law; he suspends its execution. Still, however, it is through the king alone that lenity after sentence can reach the case of the prisoner. It must happen, therefore, that 'the convicts pardoned, so much exceeding in number those against whom the law is suffered to take its course, and the few who are executed, not the many who are pardoned, appearing to form the exceptions to a general rule, this prerogative assumes, in practice, an aspect of severity, not of mercy, and the crown seems to single out its victims for punishment, not to select the objects to whom it should extend its clemency.'

On the practical consequences of this system we have not room to dwell: they are well stated in Mr. Buxton's speech on the bill for mitigating the criminal law, 23d May, 1821. Juries will not convict; but, to save the criminal from the law they are sworn to administer, resort to the most palpable contradiction. We select an instance or two at random.

Mary Whiting was indicted for stealing seven guineas and 34s., in the house of John Sun. Verdict, guilty of stealing to the value of 39s.

Jonathan Smith was indicted for stealing £20 in money in the house of J. Marsh. Guilty of stealing to the value of 39s.

Joseph Court was indicted for stealing eight pairs of gold ear-rings, value £3 16s.; 121 other pairs of ditto, value £74 10s. 6d.; forty-eight pairs of ditto, value £12 12s.; 204 pairs of ditto, value £36 9s.; twenty-four pairs of ditto, value £6 6s.; 2488 gold beads, value £72 18s.; 864 colored beads, value £18; 144 pairs of gold ear-rings, value £20 8s.; three pairs of gold

enamelled bracelets, value £9; eighteen pairs of gold ditto, value £11 7s. 6d.; three small cases for bracelets, value 6s.; thirty-six gold seals, value £33 12s.; twelve gold locketts, value £3; and a parcel of shoes, value 14s. 8d.; the property of Messrs. Mackenzie and Grey, in a lighter belonging to them on the Thames navigating river. Guilty of stealing to the value of 39s.!

We can only add that the proposed alterations of Sir Samuel Romilly had in vain been advocated by Sir James Mackintosh and Mr. Buxton in parliament, until a distinguished member of the government, Mr. Secretary Peel, adopted in a great measure the views of that enlightening statesman: he has been obliged to leave much that is desirable (the entire subject of forgery, for instance) untouched, but he has done much, and excited the just confidence of the nation that he will not fail shortly to follow up this important subject, and do all that existing and long seated prejudices in high quarters will permit.

PUNK, *n. s.* Barb. Lat. *putanica*. A whore; common prostitute.

She may be a *punk*; for many of them are neither maid, widow, nor wife. *Shakspeare.*

And made them fight like mad or drunk,
For dame religion as for *punk*. *Hudibras.*

Near these a nursery erects its head,
Where unfledged actors learn to laugh and cry,
Where infant *punks* their tender voices try. *Dryden.*

PUNSTER, *n. s.* From pun. A quibbler; a low wit.

His mother was cousin to Mr. Swan, gamester and *punster* of London. *Arbuthnot and Pope.*

PUNT, *v. n.* Ital. *punto*. A point. To play at basset or ombre.

One is for setting up an assembly for basset, where none shall be admitted to *punt* that have not taken the oaths. *Addison.*

When a duke to Jansen *punts* at White's,
Or city heir in mortgage melts away,
Satan himself feels far less joy than they. *Pope.*

PUNY, *adj. & n. s.* Fr. *puis ne*. Young; inferior; petty; an inexperienced person.

Is not the king's name forty thousand names?
Arm, arm, my name; a *puny* subject strikes
At thy great glory. *Shakspeare's Richard III.*

Drive

The *puny* habitants; or, if not drive,
Seduce them to our party. *Milton.*
Jove at their head ascending from the sea,
A shoal of *puny* powers attend his way. *Dryden.*

PUPA, in entomology, a term now used by zoologists for that state of insects formerly called *urelia*, and *chrysalis*. See *CHRYSALIS*, and *ENTOMOLOGY*.

PUPIENAS (M. Claudius Maximus), a man of an obscure family, the son of a blacksmith, who, by his merit, raised himself to the highest offices in the Roman armies; and became successively a pretor, consul, prefect of Rome, and a governor of a province. On the death of Gordian I. and II., he was elected emperor together with Balbinus by the senate; but, his colleague and he disagreeing, the pretorian guards murdered them both, A. D. 326.

PUP'IL, *n. s.* Ital. *pupilla*; Lat. *pupula*. The apple of the eye.

Looking in a glass, when you shut one eye, the pupil of the other, that is open, dilateth.

Bacon's Natural History.

The uvea has a muscular power, and can dilate and contract that round hole in it called the pupil of the eye.

The rays, which enter the eye at several parts of the pupil, have several obliquities to the glasses.

Newton's Opticks.

PUP'IL, *n. s.* } Fr. *pupillé*; Lat. *pupillus*.
 PU'PILAGE, } A scholar; a ward: one
 PU'PILARY, *adj.* } under the care of a tutor,
 or guardian: pupilage, the state of being under such care: pupillary, pertaining to a ward or pupil.

Three sons he dying left, all under age,
 By means whereof their uncle Vortigern
 Usurp'd the crown during their pupilage;
 Which the infants' tutors gathering to fear,
 Them closely into Armorick did bear. *Spenser.*
 My master sues to her, and she hath taught her
 suitor,
 He being her pupil, to become her tutor. *Shakspeare.*

One of my father's servants,
 With store of tears, this treason 'gan unfold,
 And said my guardian would his pupil kill. *Fairfax.*

Tutors should behave reverently before their pupils. *L'Estrange.*

The severity of the father's brow, whilst they are under the discipline of pupilage, should be relaxed as fast as their age, discretion, and good behaviour allow. *Id.*

So some weak shoot, which else would poorly rise,
 Jove's tree adopts, and lifts him to the skies;
 Through the new pupil soft'ning juices flow,
 Thrust forth the gems, and give the flow'rs to blow. *Tickel.*

PUPIL, in the civil law, a boy or girl not yet arrived at the age of puberty; i. e. the boy under fourteen years, the girl under twelve.

PUPIL, in anatomy, a little aperture in the middle of the uvea and the iris of the eye, through which the rays of light pass to the crystalline humor, in order to be painted on the retina, and cause vision. See ANATOMY.

PUPPET, *n. s.* } Fr. *poupée*; Ital. *puppa*;
 PUPPETMAN, } Lat. *pupus*. A small wooden
 PUPPETSHOW. } image; a doll; a wooden
 tragedian: puppetman is the master of a puppet or puppetshow.

Once Zelmene could not stir, but that, as if they had been puppets whose motion stood only upon her pleasure, Basilius with serviceable steps, Gynecia with greedy eyes, would follow her. *Sidney.*

Oh excellent motion! oh exceeding puppet! *Shakspeare.*
 Divers of them did keep in their houses certain things made of cotton wool, in the manner of puppets. *Abbot.*

Tim, you have a taste I know,
 And often see a puppetshow. *Swift.*
 Why is a handsome wife adored
 By every coxcomb but her lord?
 From yonder puppetman enquire,
 Who wisely hides his wood and wire. *Id.*

PUPPY, *n. s.* Fr. *poupée*; Lat. *pupus*. A whelp; progeny of a bitch; a name of contempt for a fop or pert young person.

He

Talks as familiarly of roaring lions,
 As maids of thirteen do of puppy dogs.

Shakspeare.

I found my place taken up by an ill-bred awkward puppy, with a money bag under each arm.

Addison.

Nature does the puppy's eyelid close,
 Till the bright sun has nine times set and rose.

Gay.

PURBACH (George), a German astronomer, born at the village of Purbach, in 1423. He studied philosophy, divinity, and astronomy, at Vienna, and paid particular attention to the latter. He composed Astronomical Tables, and invented several mathematical instruments. He also translated Ptolemy's Almagest, and published several tracts of his own. He died in 1462.

PUR'BLIND, *adj.* From poreblind, which is still used in Scotland; pore and blind. Near-sighted; shortsighted.

'Tis known to several

Of head piece extraordinary; lower messes,
 Perchance, are to this business purblind.

Shakspeare.

Purblind man

Sees but a part o' the chain, the nearest links;
 His eyes not carrying to that equal beam,
 That poises all above. *Dryden and Lee's Oedipus.*

PURCELL (Henry), a celebrated master of music. He was made organist to Westminster Abbey in the end of the reign of Charles II. His principal works have been published under the title of Orpheus Britannicus. He died in 1695, aged thirty-seven; and was interred in Westminster Abbey, where he has a monument.

PURCHAS (Samuel), an English divine, celebrated as the compiler of a valuable collection of voyages, was born in 1577, at Thackstead in Essex. After studying at Cambridge, he obtained the vicarage of Eastwood in Essex; but, leaving that cure to his brother, he settled in London, to carry on the great work in which he was engaged. He published the first volume in folio in 1613, and the last four twelve years after, under the title of Purchas his Pilgrimage, or Relations of the World, and the Religions observed in all ages and places. Meanwhile he was made rector of St. Martin's, Ludgate, in London, and chaplain to Dr. Abbot, archbishop of Canterbury. His Pilgrimage, and Hackluyt's Voyages, led the way to other collections of that kind, and have been justly esteemed. But unhappily by his publishing he involved himself in debt. He died about 1628.

PURCHASE, *v. a. & n. s.* } Fr. *pourchasser*.

PURCHASEABLE, *adj.* } To acquire; ob-

PURCHASER, *n. s.* } tain at any ex-
 pense of labor, danger, &c.; to buy for a price: purchaseable, that may be purchased or bought: purchaser, he who makes a purchase; a buyer.

His sons buried him in the cave which Abraham purchased of the sons of Heth. *Genesis xxx.*

I will be deaf to pleading and excuses,
 Nor tears nor prayers shall purchase out abuses;
 Therefore use none. *Shakspeare.*

Upon one only alienation and change, the purchaser is to pass both licence, fine, and recovery.

Bacon

A world who would not purchase with a bruise ?

Milton.

Money being the counterbalance to all things purchasable by it, as much as you take off from the value of money, so much you add to the price of things exchanged for it.

Locke.

Most of the old statues may be well supposed to have been cheaper to their first owners, than they are to a modern purchaser.

Addison.

Our thriving dean has purchased land ;

A purchase which will bring him clear

Above his rent four pounds a year.

Swift.

PURE, *adj.*

PURELY, *adv.*

PURENESS, *n. s.*

PURIFICATION,

PURIFIER,

PURIFY, *v. a., & v. n.*

PURITY, *n. s.*

French *pur, pure ;*

Belg. *puer ;* Italian,

Span. and Port. *puro ;*

Lat. *purus.* Clean ;

clear ; unmingled ;

free ; incorrupt ;

chaste ; mere : hence

morally or ritually clean ; holy ; guiltless : the adverb and noun substantive corresponding : purification, the act of cleansing or making pure : purifier, he who performs it : to purify, to make clear, clean, guiltless, free from guilt or corruption : purity is synonymous with pureness.

All of them were pure, and killed the passover.

Ezr

Who can say, I have made my heart clean, I am pure from my sin?

Proverbs xx. 9.

I will purely purge away thy dross, and take away all thy tin.

Isaiah.

As oft as I read those comedies, so oft doth sound in mine ear the pure fine talk of Rome.

Acham.

Thou purest stone, whose pureness doth present My purest mind.

Sidney.

Could I come to her with any detection in my hand, I could drive her then from the ward of her purity, her reputation, and her marriage vow.

Shakespeare.

An essence eternal and spiritual, of absolute pureness and simplicity.

Raleigh.

If any bad blood should be left in the kingdom, an honourable foreign war will vent or purify it.

Bacon's Henry VII.

Water is the symbol of purification of the soul from sin, and bread and wine of Christ's body and blood ; therefore the symbols receive the names of what they sign.

Taylor.

The lord of the castle was a young man of spirit, but had lately, out of pure weariness of the fatigue, and having spent most of his money, left the king.

Clarendon.

Hypocrites austere talk,

Defaming as impure what God declares

Pure, and commands to some, leaves free to all.

Milton.

My love was such,

It could, though he supplied no fuel, burn ;

Rich in itself, like elemental fire,

Whose pureness does no aliment require.

Dryden.

If God gives grace, knowledge will not stay long behind ; since it is the same spirit and principle that purifies the heart, and clarifies the understanding.

South's Sermons.

Her urn

Pours streams select and purity of waters.

Prior.

Upon the particular observations on the metallick and mineral bodies, I have not founded any thing but what purely and immediately concerns the natural history of those bodies.

Woodward.

Death sets us safely on shore in our long expected

Canaan, where there are no temptations, no danger of falling, but eternal purity and immortal joys secure our innocence and happiness for ever.

Watts.

Her guiltless glory just Britannia draws

From pure religion, and impartial laws.

Titchel.

I converse in full freedom with men of both parties ; and, if not in equal number, it is purely accidental, as having made acquaintance more under one ministry than another.

Swift.

Pure and mixt, when applied to bodies, are much akin to simple and compound ; so a guinea is pure gold, if it has in it no alloy.

Watts's Logick.

From the body's purity, the mind

Receives a secret aid.

Thomson.

Hope, as an anchor firm and sure, holds fast

The Christian vessel, and defies the blast.

Hope ! nothing else can nourish and secure

His new-born virtues, and preserve him pure.

Cowper.

PURFILE, *n. s.* Fr. *pourfilee.* A sort of ancient trimming for women's gowns.

A goodly lady clad in scarlet red,

Purfiled with gold and pearl of rich assay.

Spenser.

Emroid tuffs, flowers, purfiled blue and white,

Like saphire, pearl, in rich embroidery,

Buckled below fair knighthood's bending knee.

Shakespeare.

Iris there with humid bow

Waters the odorous banks that blow,

Flowers of more mingled hue

Than her purfiled scarf can shew.

Milton.

In velvet white as snow the troop was gowned,

Their hands and sleeves the same, and purfiled o'er

With diamonds.

Dryden.

PURFLEET, a village of England, in Essex, on the north bank of the Thames, famous for its extensive lime-works. It has also a large magazine of Gunpowder. It is four miles west of Grays, and nineteen east of London.

PURGE, *v. a., v. n., & n. s.*

Fr. *purger ;*

PURGA'TION, *n. s.*

Lat. *purgo ;* To

PUR'GATIVE, *adj.*

cleanse ; clarify ;

PUR'GATORY, *n. s.*

scour ; evacuate the body ; clear from guilt or charge :

purgation is the act of purging in any way : purgative, having the power to purge or evacuate ; cathartic : purgatory, a place which the Romanists suppose to be devoted in the other world to cleansing men from impurities.

I will purge out from among you the rebels.

Ezek. xx. 38.

The blood of Christ [shall] purge our conscience from dead works to serve God.

Heb. ix. 14.

Thou thy folk through pains of purgatory,

Dest bear unto thy bliss.

Spenser's Hymn on Love.

If any man doubt, let him put me to my purgation

Shakespeare.

To the English court assemble now

From ev'ry region apes of idleness ;

Now neighbour confines purge you of your scum.

Id.

He, I accuse,

Intends t'appear before the people, hoping

To purge himself with words.

Id.

This shall make

Our purpose necessary, and not envious ;

We shall be called purgers, not murderers.

Id.

Sir Philip Calthrop purged John Drakes, the shoemaker of Norwich, of the proud humour.

Camden.

Purging medicines have their *purgative* virtue in a fine spirit, they endure not boiling without loss of virtue.

Id.
Marquis Dorset was hasting towards him, to *purge* himself of some accusation.

Id. Henry VII.
It is of good use in physick, if you can retain the *purging* virtue, and take away the unpleasant taste of the *purger*.

Bacon.
All that is filled, and all that which doth fill,
All the round world to man is but a pill;

In all it works not, but it is in all
Poisonous, or *purgative*, or cordial.

Donne.
Simplicity and integrity in the inward parts may
urge out every prejudice and passion.

Decay of Piety.

A certain monk saw some souls roasted upon spits like pigs, and some devils basting them with scalding lard; but a while after they were carried to a cool place, and so proved *purgatory*.

Bp. Taylor.
In this age there may be as great instances produced of real charity as when men thought to get souls out of *purgatory*.

Stillingfleet.
Pills, not laxatives, I like;

Of these his gain the sharp physician makes,
And often gives a *purge*, but seldom takes.

Dryden.

We do not suppose the separation finished, before
the *purgation* of the air began.

Burnet.
Sphax, we'll join our cares to *purge* away
Our country's crimes, and clear her reputation.

Addison.

Air ventilates and cools the mines, and *purges*
and frees them from mineral exhalations.

Woodward.

He was no great friend to *purging* and clysters;
he was for mixing aloes with all *purges*.
Arbutnot.
Lenient *purgatives* evacuate the humours.

Wiseman.
PURGATION, in law, signifies the clearing a person's self of a crime of which he is suspected and accused before a judge. This *purgation* is either canonical or vulgar. Canonical *purgation* is prescribed by the canon law, and the form thereof in the spiritual court is usually thus: The person thus suspected takes his oath that he is innocent of the crime charged against him; and at the same time brings some of his neighbours to make oath that they believe he swears truly. Vulgar *purgation* was anciently by fire and water, or else by combat, and was practised here till abolished by our laws.

PURGATION, in medicine, is an excretory motion arising from a quick and orderly contraction of the fleshy fibres of the stomach and intestines, whereby the chyle, corrupted humors, and excrements lodged therein, are protruded further, and at length quite excluded the body by stool.

PURGATORY is a place in which the just, after death, are supposed by the Roman Catholics to expiate certain offences which do not merit eternal damnation. Broughton has endeavoured to prove that this notion has been held by Pagans, Jews, and Mahometans, as well as by Christians; and that in the days of the Maccabees the Jews believed that sin might be expiated by sacrifice, after the death of the sinner, cannot be questioned. Much abuse has been poured upon the church of Rome for her doctrine of *purgatory*, and many false representations have been made of the doctrine. The following view of it is taken from a work which is considered as a standard by the British Catholics: 1. Every sin,

how slight soever, though no more than an idle word, as it is an offence to God, deserves punishment from him, and will be punished by him hereafter, if not cancelled by repentance here. 2. Such small sins do not deserve eternal punishment. 3. Few depart this life so pure as to be totally exempt from spots of this nature, and from every kind of debt due to God's justice. 4. Therefore few will escape without suffering something from his justice for such debts as they have carried with them out of this world; according to that rule of divine justice, by which he treats every soul hereafter according to its works, and according to the state in which he finds it in death. From these propositions, which the Papist considers as so many self-evident truths, he infers that there must be some third place of punishment; for, since the infinite goodness of God can admit nothing into heaven which is not clean and pure from all sin both great and small; and his infinite justice can permit none to receive the reward of bliss, who as yet are not out of debt, but have something in justice to suffer: there must of necessity be some place or state where souls departing this life, pardoned as to the eternal guilt or pain, yet obnoxious to some temporal penalty, or with the guilt of some venial faults, are purged and purified before their admittance into heaven. Such is the Popish doctrine of *purgatory*.

PURIFICATION is a ceremony which consists in cleansing any thing from a supposed defilement. The Pagans, before they sacrificed, usually washed themselves in water; and they were particularly careful to wash their hands, because with these they were to touch the victims consecrated to the gods. They likewise washed the vessels with which they made their libations. The Mahometans also use purifications previous to prayer; which are of two kinds, bathing, or washing the face, hands, and feet. The first is required only in extraordinary cases, as after having lain with a woman, touched a dead body, &c. But where water cannot be had, or when it may be of prejudice to a person's health, they are allowed to use fine sand, or dust, by clapping their open hands on the sand, and passing them over the parts, in the same manner as if they were dipped in water. There were also many legal purifications among the Hebrews. When a woman was brought to bed of a male child, she was esteemed impure for forty days; and when of a female, for sixty: at the end of which time she carried a lamb to the door of the temple to be offered for a burnt-offering, and a young pigeon or turtle for a sin-offering; and after this ceremony she was declared pure.

PURIM, or the Feast of Lots, a solemn festival of the Jews, instituted in memory of the deliverance they received, by means of Mordecai and Esther, from Haman's wicked attempt to destroy them.

PURITAN, *n. s.* } From pure. A name
PURITANICAL, *adj.* } originally given to the
PURITANISM, *n. s.* } Dissenters of England,
from the great professions of purity in their
creed and practice: puritanical is relating to, or
resembling, the puritans: puritanism, their religious systems or opinions.

The schism which the papists on the one hand, and the superstition which the *puritans* on the other, lay to our charge, are very justly chargeable upon themselves.

Such guides set over the several congregations will mistake them, by instilling into them *puritanical* and superstitious principles, that they may the more securely exercise their presbyterian tyranny.

A serious and impartial examination of the grounds, as well of popery as *puritanism*, according to that measure of understanding God hath afforded me.

PURITAN was a name formerly given in derision to the dissenters from the church of England, on account of their profession to follow the pure word of God, in opposition to all traditions and human constitutions. It was likewise given in the primitive church to the Novatian schismatics, because they would never admit to communion any one who from dread of death had apostatised from the faith. See NOVATIANS.

PURL, *n. s. & v. a.* Supposed by Minshew to be contracted from purple. An embroidered and puckered border: to decorate with embroidery.

Himself came in next after a triumphant chariot made of carnation velvet, enriched with *purl* and pearl.

The jaggings of pinks is like the inequality of oak leaves; but they seldom have any small *purls*.

When was old Sherwood's head more quaintly curled.

Or nature's cadle more enchased and *purled*?

PURL, *v. n.* Swed. *porla*. To murmur.—Lye. To murmur; to flow with a gentle noise.

Tones are not so apt to procure sleep, as some other sounds; as the wind, the *purling* of water, and humming of bees.

All fish from sea or shore
Freshet, or *purling* brook, or shell or fin.

My flow'ry theme,
A painted mistress, or a *purling* stream.

Around the adjoining brook, that *purls* along
The vocal grove, now fretting o'er a rock.

PUR'LIEU, *n. s.* Form PURL, a border. The grounds on the border of a forest; border; enclosure; district.

In the *purlieus* of this forest stands
A sheepcote, fenced about with olive trees.

Such civil matters fall within the *purlieus* of religion.

To understand all the *purlieus* of this place, and to illustrate this subject, I must venture myself into the haunts of beauty and gallantry.

He may be left to rot among thieves in some stinking jail, merely for mistaking the *purlieus* of the laws.

PURLIEU, in law, signifies all that ground near any forest which, being made forest by king Henry II. Richard I. and king John, was afterwards by perambulations and grants of Henry III. severed again from the same, and made *purlieu*; that is to say, pure and free from the laws of the forest. The word is derived from the French *pur*, pure, and *lieu*, place.

PURLOIN', *v. a.* Of doubtful etymology. Skinner deduces it from French *pour* and *low*. Mr. Lye from Saxon *pupllohnan*, to lie hid. To steal; to take by theft.

Not *purloining*, but shewing all good fidelity.
Titus ii. 10.

He, that brave steed there finding ready dight,
Purloined both steed and spear, and ran away full light.

They, not content like felons to *purloin*,
Add treason to it, and debase the coin.

The Arimasian by stealth
Had, from his wakeful custody, *purloined*
The guarded gold.

Some writers make all ladies *purloined*,
And knights pursuing like a whirlwind.

When did the muse from Fletcher scenes *purloin*,
As thou whole Eth'ridge dost transfuse to thine?

It may seem hard to see publick *purloiners* sit upon the lives of the little ones, that go to the gallows.

Your butler *purloins* your liquor, and the brewer sells your hogwash.

Prometheus once this chain *purloined*,
Dissolved, and into money coined.

PURNEAH, a district forming the north-west division of Bengal. It is extremely fertile and well watered, producing remarkably fine cattle. It exports a great quantity of clarified butter, and is also celebrated for its sugar and indigo. The cattle are much used in the army, and for agricultural purposes: the northern mountains also produce valuable timber, which is cut in the hot weather, and afterwards floated down the rivers. It is supposed to contain nearly 1,500,000 of inhabitants, about one-third of whom are Mahometans. In 1722 the nabob Sief Khan, a friend of Cooly Jaffier Khan, was governor of Purneah, and had permission to conquer from the bordering rajahs as much territory as he could, which was to be exempt from any increase of revenue to the state. He made therefore very considerable additions to the district; and, while other parts of Bengal were overrun by the Mahrattas, Purneah continued in a state of tranquillity and prosperity. In May 1760 Khadem Hussein, then in possession of this district, endeavoured to cut off a British detachment under the command of captain Knox, but after an engagement of six hours was repulsed. On the 25th of June he again encountered the British forces, and was defeated. At the peace this chief was compelled to retire to Oude, from which period Purneah has become a district of Bengal. Its principal towns are Purneah and Tajepore, its former capital was Deocote.

PURNEAH, the capital of the above district, is pleasantly situated on the eastern bank of the Seraw, and carries on a considerable trade. It is the residence of a judge, collector, &c. Long. 88° 23' E., lat. 25° 45' N.

PURPARTY, *n. s.* French *pour* and *parti*. Share; part in division.

Each of the coparceners had an entire county allotted for her *purparty*.

Davies on Ireland.

PURPLE, *v. a., n. s. & adj.* Fr. *pourpre*; Lat. *purpureus*. Red tinged with blue: a color among the ancients considered as the noblest, and as the regal color: to make purple: the color; a purple dress.

The poop was beaten gold,
Purple the sails, and so perfumed, that
The winds were love-sick with 'em.

Shakspeare.

Whilst your purpled hands do reek and smok,
Fulfil your pleasure. *Id. Julius Cæsar.*

Cruel and suddain, hast thou since
Purpled thy nail in blood of innocence?

Donne.

You violets, that first appear,
By your pure purple mantles known;
What are you when the rose is blown?

Wotton.

Not alone, while thou
Visit'st my slumbers nightly; or when morn
Purple the East. *Milton's Paradise Lost.*

O'er his lucid arms

A vest of military purple flowed
Livelier than Melibœan, or the grain
Of Sarra, worn by kings and heroes old.

Milton.

I could change the color, and make it purple.

Boyle.

I view a field of blood,
And Tyber liveth with a purple flood.

Dryden.

Aurora had but newly chased the night,
And purpled o'er the sky with blushing light.

Id.

May be it has been sometimes thought harsh in those who were born in purple to look into abuses with a stricter eye than their predecessors; but elected kings are presumed to come upon the foot of reformation.

Davenant.

A small oval plate, cut off a flinty pebble, and polished, is prettily variegated with a pale grey, blue, yellow, and purple.

Woodward.

Reclining soft in blissful bowers,

Purpled sweet with springing flowers. *Fenton.*

Not with more glories in the ethereal plain,

The sun first rises o'er the purpled main. *Pope.*

Their mangled limbs

Crash'd at once, death dyes the purple seas

With gore.

Thomson's Summer.

PURPLE. See COLOR-MAKING, and DYEING.

PURPORT, *n. s. & v. a.* } Fr. *pourporte*;

PURPOSE, *n. s., v. a. & v. n.* } of Lat. *pro* and

PURPOSELY, *adv.* } *porto*. Design;

tendency of a writing or discourse: to intend: purpose, the intention, design, or thing, intended; effect; consequence; instance: to purpose as a verb active is, to intend; design: as a verb neuter to have a design: purposely, by design.

I am *purposed* that my mouth shall not transgress.

Psalms xvii.

This is the *purpose* that is *purposed* upon the whole earth.

Isaiah.

What David did *purpose*, it was the pleasure of God that Solomon his son should perform. *Hooker.*

Being the instrument which God hath *purposefully* framed, thereby to work the knowledge of salvation in the hearts of men, what cause is there wherefore it should not be acknowledged a most apt mean?

Id.

He with troops of horsemen beset the passages of *purpose*, that, when the army should set forward, he might in the straits, fit for his *purpose*, set upon them.

Knolles.

He quit the house of *purpose*, that their punishment

Might have the freer course.

Shakspeare. King Lear.

Change this *purpose*,

Which being so horrible, so bloody, must

Lead on to some foul issue

Shakspeare.

It is a *purposed* thing, and grows by plot,

To curb the nobility.

Id. Coriolanus.

There was an article against the reception of the rebels, *purporting* that if any such rebel should be required of the prince confederate, that the prince confederate should command him to avoid the country.

Bacon's Henry VII.

The ground will be like a wood, which keepeth out the sun, and so continueth the wet, whereby it will never graze to *purpose* that year.

Bacon.

The first *purpose* to sin opens the gates to Satan.

Bp. Hall.

That kind of certainty which doth not admit of any doubt, may serve us as well to all intents and *purposes* as that which is infallible.

Wilkins.

And I persuade me God hath not permitted His strength again to grow, were not his *purpose* To use him farther yet.

Milton's Agonistes.

The whole included race his *purposed* prey.

Milton.

Oaths were not *purposed* more than law,

To keep the good and just in awe,

But to confine the bad and sinful,

Like moral cattle in a pinfold.

Hudibras.

Their design is a war, whenever they can open it with a *prospect* of succeeding to *purpose*.

Temple.

They, who are desirous of a name in painting, should read and make observations of such things as they find for their *purpose*.

Dryden's Dufresnoy.

'Tis common for double-dealers to be taken in their own snares, as for the *purpose* in the matter of power.

L'Estrange.

Such first principles will serve us to very little *purpose*, and we shall be as much at a loss with, as without them, if they may, by any human power, such as is the will of our teachers, or opinions of our companions, be altered or lost in us.

Locke.

That Plato intended nothing less is evident from the whole scope and *purport* of that dialogue.

Norris.

He travelled the world, on *purpose* to converse with the most learned men.

Guardian.

St. Austin hath laid down a rule to this very *purpose*.

Burnet.

They in most grave and solemn wise unfolded Matter, which little *purported*, but words Ranked in right learned phrase.

Rome.

I have *purposefully* avoided to speak any thing concerning the treatment due to such persons.

Addison.

Doubling my crime, I promise and deceive,

Purpose to slay, whilst swearing to forgive.

Prior.

He that would relish success to *purpose*, should keep his passion cool, and his expectation low.

Collier on Desire.

In composing this discourse, I *purposefully* declined all offensive and displeasing truths.

Atterbury.

The vulgar thus through imitation err,

As oft the learned by being singular;

So much they scorn the crown, that if the throng,

By chance go right, they *purposefully* go wrong.

Pope.

Where men err against this method, it is usually on *purpose*, and to shew their learning.

Swift.

I do this on *purpose* to give you a more sensible impression of the imperfection of your knowledge.

Watts.

What the Romans have done is not worth notice, having had little occasion to make use of this art, and what they have of it to *purpose* being borrowed from Aristotle.

Baker.

PURPRISE, *n. s.* Old Fr. *pourpris*; law Lat. *purpurisum, prensus*. A close or enclosure; the whole compass of a manor.

The place of justice is hallowed; and therefore not only the bench but the foot-pace and precincts, and *purprise* ought to be preserved without corruption.

Bacon's Essays.

PURPURA, in natural history. See **MUREX**.

PURPURIC ACID, in chemistry, acidum purpuricum: so called from its fine red color. The excrements of the serpent boa constrictor consist of pure lithic acid. Dr. Prout found that on digesting this substance thus obtained, or from urinary calculi, in dilute nitric acid, an effervescence takes place, and the lithic acid is dissolved, forming a beautiful purple liquid. The excess of nitric acid being neutralised with ammonia, and the whole concentrated by slow evaporation, the color of the solution becomes of a deeper purple; and dark red granular crystals, sometimes of a greenish hue externally, soon begin to separate in abundance. These crystals are a compound of ammonia with the acid principle in question. The ammonia was displaced by digesting the salt in a solution of caustic potassa, till the red color entirely disappeared. This alkaline solution was then gradually dropped into dilute sulphuric acid, which, uniting with the potassa, left the acid principle in a state of purity.

This acid principle is likewise produced from lithic acid by chlorine, and also, but with more difficulty, by iodine. Dr. Prout, the discoverer of this new acid, has, at the suggestion of Dr. Wollaston, called it purpuric acid, because its saline compounds have for the most part a red or purple color.

This acid, as obtained by the preceding process, usually exists in the form of a very fine powder, of a slightly yellowish or cream color; and when examined with a magnifier, especially under water, appears to possess a pearly lustre. It has no smell, nor taste. Its specific gravity is considerably above water. It is scarcely soluble in water. One-tenth of a grain, boiled for a considerable time in 1000 grains of water, was not entirely dissolved. The water, however, assumed a purple tint, probably, Dr. Prout thinks, from the formation of a little purpurate of ammonia. Purpuric acid is insoluble in alcohol and ether. The mineral acids dissolve it only when they are concentrated.

PURR, *v. a.* Teut. *murren*. To murmur as a cat or leopard; both words probably from the sound.

Tray fast asleep, and puss a *purring*.

All silent, not a murmur stirring. *Fire Side.*

PURRURY, a town and district of the province of Gundwanah and Hindostan, the residence of a Burdy chief, who is a tributary of Singrowla rajah. The town is large, but the country poor, and largely covered with forests.

PURSE, *n. s. & v. a.* Fr. *bourse*; Italian

PURSENET,

PURSEPROUD, *adj.*

borsa; barb. Lat *bursa*; Wel. *purs*. A small

bag in which money is contained: a net closed by a string, like a purse: to put into, or contract as, a purse; purse-proud is, puffed up with riches.

He sent certain of the chief prisoners, richly apparelled, with their *purses* full of money, into the city.

Knolles.

She bears the *purse* too; she is a region in Guiana, all gold and bounty.

Shakspeare. Merry Wives of Windsor.

Thou cried'st,

And didst contract and *purse* thy brow together,
As if thou then had'st shut up in thy brain
Some horrible conceit.

Id. Othello.

The illiberality of parents, in allowance towards their children, is a harmful error, and makes them base; acquaints them with shifts; makes them sort with mean company; and makes them surfeit more when they come to plenty: and therefore the proof is best when men keep their authority towards their children, but not their *purse*.

Lord Bacon.

I *purse*d it up, but little reck'ning made,
Till now, that this extremity compelled,
I find it true.

Milton.

I am spell-caught by Philidel,
And *purse*d within a net.

Dryden.

Conies are taken by *pursetnets* in their burrows.

Mortimer.

I will give him the thousand pieces, and, to his great surprise, present him with another *purse* of the same value.

Addison.

He was desirous of visiting Trent while the council was sitting; but the scantiness of his *purse* defeated his curiosity.

Johnson.

A **PURSER** is an officer aboard a man of war, who receives her victuals from the victualler, sees that it be well stowed, and keeps an account of what he every day delivers to the steward. He also keeps a list of the ship's company, and sets down exactly the day of each man's admission, in order to regulate the quantity of provisions to be delivered out, and that the paymaster or treasurer of the navy may issue out the disbursements, and pay off the men, according to his men.

The purser is charged with the clothes and effects of persons who die on board; and he sells the same before the mast to the rest of the crew, and is obliged to give a satisfactory account of the same to the executors or administrators of the deceased. It is his duty also to keep a regular sloop-book, wherein he is to make distinct and separate entries of the particulars and value of the sloop-clothes, bedding, dead men's clothes, &c., issued or supplied to the ship's company.

PURSLAIN, *n. s.* Lat. *portulaca*. A plant.

The medicaments, proper to diminish the milk, are lettuce, *purslain*, and endive. *Wiseman's Surgery.*

PURSUE, *v. n. & v. a.*

Fr. *poursuivre*.

PURSUEABLE,

Lat. *prosequor*. To

PURSUANT,

follow; chase; fol-

PURSUER, *n. s.*

low hostilely; imi-

PURSUIT.

tate; copy: as a

verb active, proceed: to go on: pursuable is that may be pursued: pursuant, done in consequence or prosecution of (a legal term): pursuer, he or she who follows, particularly with hostility: pursuit, the act of following; prosecution; endeavour; attempt made.

When Abraham heard that his brother was taken captive, he armed his trained servants, and *pursued*.
Genesis xiv. 14.

As righteousness tendeth to life; so he that *pursueth* evil, *pursueth* it to his own death. *Proverbs.*

Love like a shadow flies, when substance love *pursues*;

Pursuing that that flies, and flying what *pursues*.
Shakspeare.

Fled with the rest,
And falling from a hill, he was so bruised,
That the *pursuers* took him. *Id. Henry IV.*

Like a declining statesman left forlorn
To his friends' pity and *pursuers'* scorn.
Denham.

He concluded with sighs and tears, to conjure them, that they would no more press him to give his consent to a thing so contrary to his reason, the execution whereof would break his heart, and that they would give over further *pursuit* of it.
Clarendon.

Insatiate to *pursue*
Vain war with heaven. *Milton.*

His swift *pursuers* from heaven's gates discern
The advantage, and descending tread us down
Thus drooping. *Milton's Paradise Lost.*

Arm, warriors, arm for fight! the foe at hand,
Whom fled we thought, will save us long *pursuit*.
Milton.

I have, *pursues* Carneades, wondered chymists
should not consider. *Boyle.*

I will *pursue*
This ancient story, whether false or true.
Dryden.

This means they long proposed, but little gained,
Yet, after much *pursuit*, at length obtained. *Id.*

When men *pursue* their thoughts of space, they stop at the confines of body, as if space were there at an end. *Locke.*

He has annexed a secret pleasure to the idea of any thing that is new or uncommon, that he might encourage us in the *pursuit* after knowledge, and engage us to search into the wonders of his creation.
Addison.

We happiness *pursue*; we fly from pain;
Yet the *pursuit*, and yet the flight is vain.
Prior.

Its honours and vanities are continually passing before him, and inviting his *pursuit*.
Rogers.

What nature has denied fools will *pursue*,
s apes are ever walking upon two. *Young.*

PURSUIVANT, *n. s.* Fr. *poursuivant*. A state messenger; an attendant on the heralds.

How oft do they with golden pinions cleave
The fitting skies, like flying *pursuivant*! *Spenser.*

Send out a *pursuivant* at arms
To Stanley's regiment; bid him bring his power
Before sun-rising. *Shakspeare.*

For helmets, crests, mantles, and supporters, I leave the reader to Edmond Bolton, Gerard Leigh, John Ferne, and John Güillim Portsmouth, *pursuivants* of arms, who have diligently laboured in armory.
Camden.

The *pursuivants* came next,
And like the heralds each his scutcheon bore.
Dryden.

PURSUIVANT, in heraldry, is the lowest order of officers at arms. They are properly attendants on the heralds when they marshal public ceremonies. Of these in England there were formerly many; but at present there are only four, viz. blue-mantle, rouge-cross, rouge-dragon, and port-cullice. In Scotland there is only one

king at arms, who is styled Lyon; and has under him six heralds, and as many pursuivants.

PUR'SY, *adj.* Fr. *possif*; Ital. *pulsivo*; of Lat. *pulsus*. Short-breathed and fat.

Now breathless Wrong
Shall sit and pant in your great chairs for ease,
And *pursy* Insolence shall break his wind
With fear and horrid flight. *Shakspeare.*

An hostess dowager,
Grown fat and *pursy* by retail
Of pots of beer and bottled ale. *Hudibras.*

By these, the Medes
Perfume their breaths, and cure old *pursy* men.
Temple.

PUR'TENANCE, *n. s.* Fr. *appertenance*. The pluck of an animal.

Roast the lamb with fire, his head with his legs,
and with the *purtenance* thereof. *Exodus.*

The shaft against a rib did glance,
And galled him in the *purtenance*. *Hudibras.*

PURVES (James), a learned Arian preacher, born at a little village of Berwickshire, in 1734 His father was only a keeper of cattle, and intended James for the same profession. He meanwhile, having obtained the loan of some books on mathematics, made himself master of geometry and trigonometry, and afterwards taught these sciences with other branches of mathematics, and assisted some public authors in compiling mathematical works, which have been well received. He joined a party of the ancient Cameronians, and in 1769, at one of their general meetings, was called to be a pastor among them. To qualify himself for this office he studied the Greek and Hebrew languages, and compiled a Hebrew Grammar, which is still in MS. These acquisitions led him into the study of the Arian Controversy, when he finally adopted the opinions of Arius; and afterwards became preacher to a small Arian congregation in Edinburgh; where he also kept a school and a book shop, for many years before he died. His works are, 1. A Humble Attempt to investigate the Scripture doctrine of the Trinity. 2. Observations on Prophetic Times, 2 vols. 3. A Treatise on Civil Government. 4. Observations on Socinian Arguments. 5. A Scriptural Catechism. 6. Correspondence with the Buchanites. 7. Dissertation on the Seals, Trumpets, &c. 8. Enquiry into the Nature of Faith and Regeneration. 9. Review of Paine's Age of Reason. 10. A Treatise on Sacrifices. 11. Review of some Religious Opinions, established by the Powers of the World, favorable to Despotism. 12. An Historic and Prophetic Representation of Events. 13. Scheme of the Lives of the Patriarchs. All these were published at Edinburgh within the last twelve years of his life, and evidence at least uncommon industry. He was three times married, and left a daughter by each wife. He died in 1789.

PURVEY, *v. a. & v. n.* Fr. *pouvoir*; Lat. *PURVEY'ANCE*, *n. s.* } *provisus*. To provide with conveniences; a sense not now in use: procure; buy in provisions: *purveyance* is provision; or the procurement or exaction of it: *purveyor*, he who procures victuals; a procurer of any kind: *purview*, *proviso*; providing clause.

Give no odds to your foes, but do *purvey*
Yourself of sword before that bloody day.

Spenser.

Whence, mounting up, they find *purveyance* meet
Of all that princes royal court became. *Id.*

The *purveys* or victuallers are much to be con-
demned, as not a little faulty in that behalf.

Raleigh.

Some lands be more changeable than others; as
for their lying near to the borders, or because of
great and continual *purveyances* that are made upon
them. *Bacon.*

I the praise

Yield thee, so well this day thou hast *purveyed*.

Milton.

Though the petition expresses only treason and
felony, yet the act is general against all appeals in
parliament; and many times the *purview* of an act is
larger than the preamble of the petition. *Hale.*

His house with all convenience was *purveyed*.

The rest he found. *Dryden.*

These women are such cunning *purveyors*!
Mark where their appetites have once been pleased,
The same resemblance in a younger lover
Lies brooding in their fancies the same pleasures. *Id.*

The stranger, ravished at his good fortune, is in-
troduced to some imaginary title; for this *purveyor*
has her representatives of some of the finest ladies.

Addison.

What though from outmost land and sea *purveyed*,
For him each rarer tributary life
Bleeds not. *Thomson.*

And winged *purveyors* his sharp hunger fed
With frugal scraps of flesh, and maslin bread.

Harte.

PURULENT, *adj.* Fr. *purulent*; Lat. *puru-
lentus*. Consisting of pus or the running matter
of wounds.

A carcase of man is most infectious and odious to
man, and *purulent* matter of wounds to sound flesh.

Bacon.

Nothing could be more proper, for the ripening of
hard and *purulent* tumors, than dry figs.

Bp. Hall.

It is no easy thing always to discern, whether the
suspected matter expectorated by a cough be really
purulent, that is, such as comes from an ulcer.

Blackmore.

An acrimonious or *purulent* matter, stagnating in
some organ, is more easily deposited upon the liver
than any other part. *Arbuthnot.*

It spews a filthy froth
Of matter *purulent* and white,
Which happened on the skin to light,
And there corrupting on a wound,
Spreads leprosy. *Swift.*

PUS, *n. s.* Lat. *pus*. Corrupt animal matter;
matter of a sore.

Acrid substances break the vessels, and produce
an ichor instead of laudable *pus*. *Arbuthnot.*

PUS, in medicine and surgery. See **SUR-
GERY**.

PUSH, *v. a.*, *v. n.* & *n. s.* Fr. *pousser*; of Lat.
pulso, *pello*. To strike in the manner of a thrust;
drive; impel; force; urge; make a thrust,
effort, or attack: as a noun substantive, the ef-
fort; thrust; attack made; exigence; trial;
emergence.

If the ox *push* a man-servant, he shall be stoned.

Exodus.

Through thee will we *push* down our enemies.

Psalms.

The king of the south shall *push* at him, and the
king of the north shall come against him. *Daniel.*

Ne might his corse be harmed

With dint of sword or *push* of pointed spear.

Spenser.

They, like resolute men, stood in the face of the
breach, receiving them with deadly shot and *push* of
pike, in such furious manner, that the Turks began
to retire. *Knolles.*

Shew your mended faiths,

To *push* destruction and perpetual shame

Out of the weak door of our fainting land.

Shakspeare.

He gave his countenance against his name,

To laugh with gybing boys, and stand the *push*

Of every beardless vain comparative. *Id.*

We'll put the matter to the present *push*. *Id.*

He that was praised to his hurt should have a *push*
rise upon his nose; as a blister will rise upon one's
tongue, that tells a lye. *Bacon.*

Waters forcing way,

Sidelong had *pushed* a mountain from his seat,

Half sunk with all his pines. *Milton.*

He forewarns his care

With rules to *push* his fortune or to bear. *Dryden.*

Arts and sciences, in one and the same century,
have arrived at great perfection, and no wonder,
since every age has a kind of universal genius, which
inclines those that live in it to some particular stud-
ies; the work then being *pushed* on by many hands,
must go forward. *Id.*

Away he goes, makes his *push*, stands the shock
of a battle, and compounds for leaving of a leg be-
hind him. *L'Estrange.*

'Tis common to talk of dying for a friend; but,
when it comes to the *push*, 'tis no more than talk.

Id.

A calf will so manage his head as though he
would *push* with his horns even before they shoot.

Ray.

Ambition *pushes* the soul to such actions as are
apt to procure honour to the actor. *Spectator.*

Lambs, though they never saw the actions of their
species, *push* with their foreheads, before the budding
of a horn. *Addison.*

JoVE was not more pleased

With infant nature, when his spacious hand

Had rounded this huge ball of earth and seas,

To give it the first *push*, and see it roll

Along the vast abyss. *Id.*

The question we would put is not whether the
sacrament of the mass be as truly propitiatory as
those under the law? but whether it be as truly a
sacrifice? if so, then it is a true proper sacrifice, and
is not only commemorative or representative, as we
are told at a *push*. *Atterbury.*

This terrible scene which might have proved dan-
gerous, if Cornelius had not been *pushed* out of the
room. *Arbuthnot.*

We are *pushed* for an answer, and are forced at
last freely to confess, that the corruptions of the
administration were intolerable. *Swift.*

When such a resistance is made, these bold talkers
will draw in their horns, when their fierce and feeble
pushes against truth are repelled with *pushing* and
confidence. *Watts.*

PUSILLANIMITY, *n. s.* } Fr. *pusillani-*

PUSILLAN'IMOUS, *adj.* } *mité*; Lat. *pusil-*

lus and *animus*. Cowardice; meanness of spirit;
the adjective corresponding.

The property of your excellent sherris is the warm-
ing of the blood, which, before cold and settled, left
the liver white and pale, the badge of *pusillanimity*
and cowardice. *Shakspeare.*

The Chinese sail where they will, which sheweth that their law of keeping out strangers is a law of *pusillanimity* and fear. *Bacon.*

An argument fit for great princes, that neither by overmeasuring their forces they lose themselves in vain enterprizes; nor, by undervaluing them, descend to fearful and *pusillanimous* counsels. *Bacon.*

What greater instance can there be of a weak *pusillanimous* temper, than for a man to pass his whole life in opposition to his own sentiments? *Spectator.*

It is obvious, to distinguish between an act of courage and an act of rashness, an act of *pusillanimity*, and an act of great modesty or humility. *South.*

He became *pusillanimous*, and was easily ruffled with every little passion within; supine, and as openly exposed to any temptation from without. *Woodward's Natural History.*

PUSS, *n. s.* Lat. *pusio*, a dwarf, Johnson conjectures; but Belg. *poes*, is a cat. The fondling name of a cat.

A young fellow, in love with a cat, made it his humble suit to Venus to turn *puss* into a woman. *L'Estrange.*

Poor honest *puss*,

It grieves my heart to see thee thus;

But hounds eat sheep as well as hares. *Gay.*

I will permit my son to play at apodidrascind, which can be no other than our *puss* in a corner. *Arbutnot and Pope.*

Let *puss* practise what nature teaches. *Watts.*

Puss grew presently familiar, and would leap into my lap. *Copper.*

PUSTERHAL, a mountainous district of the Austrian states, in the Tyrol, on the borders of Carinthia, fifty miles long by eighteen broad. Its chief product is flax, and the manufactures linen and lace. It abounds in metallic ores, rock crystal, mineral waters, and warm baths. The population is 80,000, and the chief town Lienz.

PUSTULE, *n. s.* Fr. *pustule*; Lat. *pustula*. A small swelling; a pimple.

The blood, turning acrimonious, corrodes the vessels, producing hemorrhages, *pustules*, red, black, and gangrenous. *Arbutnot.*

PUT, *v. a., v. n. & n. s.* Dan. *putten*, 'to plant,' says Junius; but Lat. *posito*, and Ital. *postare* and *potta*, seem a more natural etymology. To place; deposit; repose; trust; apply; use actively; oblige; urge: hence cause; produce; consign, especially to writing; incite; instigate (taking *upon*); propose; state; offer; place as an ingredient: this word takes a variety of prepositions, as *by, down, forth, in, off, on, upon, &c.*; but explained in their actual use: as a verb neuter, to put, is to go, or move; steer a vessel; germinate; shoot; taking *forth, in, in for, off, over, &c.*: as a noun substantive, put, is an action or signal of distress: hence, perhaps, a rustic; low person; and an excuse; theft; as is a put-off.

And alle men that herden *puttiden* in her herte, and seiden what manner child schal this be, for the bond of the Lord was with him. *Wicliff Luk. i.*

God planted a garden, and there he *put* man. *Gen. ii. 8.*

He *put forth* his hand and pulled her in. *Ed. viii. 9.*

If God be with me, and give me bread to eat, and raiment to *put on*, then shall the Lord be my God. *Id. xxviii. 20.*

When she travailed, the one *put out* his hand. *Genesis.*

If a man *put* in his beast, and feed in another man's field; of the best of his own shall he make restitution. *Exod. xxii. 5.*

Rejoice before the Lord in all that thou *puttest* thine hands unto. *Deut. xii. 18.*

She shall be his wife, he may not *put* her away. *Id. xxii.*

Samson said, I will now *put forth* a riddle unto you. *Judges.*

The Philistines *put out* his eyes. *Id. xvii.*

How wilt thou *put* thy trust on Egypt for chariots? *2 Kings.*

Cyrus made proclamation, and *put* it also in writing. *2 Chronicles.*

The king of Egypt *put* Jehoalaz down at Jerusalem. *Id.*

None of us *put off* our cloaths, saying that every one *put* them off for a washing. *Nehem. iv. 23.*

Whosoever God doeth, nothing can be *put* to it, nor any thing taken from it. *Eccclus. iii. 14.*

The fig-tree *putteth forth* her green figs. *Canticles ii. 13.*

When he had *put* them all out he entereth in. *Mark v. 40.*

As we were *put* in trust with the gospel, even so we speak, not as pleasing men, but God. *1 Thess.*

Basilus, in his old years, marrying a young and fair lady, had of her those two daughters so famous in beauty, which *put* by their young cousin from that expectation. *Sidney.*

The greedy thirst of royal crown
Stirred Porrex up to *put* his brother down. *Spenser.*

The Turks were in every place *put* to the worst, and lay by heaps slain. *Knolles's History of the Turks.*

Taking his cap from his head, he said, this cap will not hold two heads, and therefore it must be fitted to one, and so *put* it on again. *Knolles.*

The carpenters being set to work, and every one *putting* to his helping hand, the bridge was repaired. *Id.*

Before we will lay by our just born arms,
We'll *put* thee down, 'gainst whom these arms we bear,
Or add a royal number to the dead. *Shakespeare.*

I do but keep the peace, *put up* thy sword. *Id.*

This dishonours you no more,

Than to take in a town with gentle words,

Which else would *put* you to your fortune. *Id.*

Was the crown offered him thrice?

—Ay, marry, was't, and he *put* it by thrice,

Every time gentler than other. *Id.*

Mark now how a plain tale shall *put* you down. *Id.*

Upon these taxations,

The clothiers all *put off*

The spinsters, carders, fullers, weavers. *Id.*

Strangely visited people he cures,

Hanging a golden stamp about their necks,

Put on with holy prayers. *Id. Macbeth.*

So shall inferior eyes,

That borrow their behaviour from the great,

Grow great by your example, and *put on*

The dauntless spirit of resolution. *Shakespeare.*

For the certain knowledge of that truth.

I *put* you o'er to heaven, and to my mother. *Id.*

From Ireland am I come,

To signify that rebels there are up,

And *put* the Englishmen unto the sword. *Id.*

They have a leader,

Tullus Aufidius, that will *put* you to't. *Id.*

Why so earnestly seek you to *put up* that letter. *Id.*

When in swinish sleep,
What cannot you and I perform upon
The' unguarded Duncan? what not *put upon*
His spungy officers, who shall bear the guilt
Of our great quell? *Id. Macbeth.*

Orders for sea are given;
They have *put forth* the haven. *Shakspeare.*
My good lord cardinal, they vent reproaches
Most bitterly on you, as *putter on*
Of these exactions. *Id. Henry VIII.*
They shall stand for seed! they had gone down
too, but that a wise burgher *put in* for them.

Shakspeare.
Whatsoever cannot be digested by the stomach is
by the stomach either *put up* by vomit, or *put down*
to the guts. *Bacon.*

Those that *put* their bodies to endure in health,
nay, in most sicknesses, be cured only with diet and
tendering. *Id.*

An excellent observation of Aristotle, why some
plants are of greater age than living creatures, for
that they yearly *put forth* new leaves; whereas living
creatures *put forth*, after their period of growth,
nothing but hair and nails, which are excrements. *Id.*

It is the new skin or shell that *putteth off* the old;
so we see, that it is the young horn that *putteth off*
the old. *Id.*

This came handsomely to *put on* the peace, be-
cause it was a fair example of a peace bought.

Id. Henry VII.
Wheresoever the wax floated, the flame forsook it,
till at last it spread all over, and *put* the flame quite
out. *Bacon.*

The nobility of Castile *put out* the king of Arra-
gon, in favour of king Philip. *Id. Henry VII.*

There were no barks to throw the rebels into, and
send them away by sea, they were *put all* to the
sword. *Bacon.*

Having lost two of their bravest commanders at
sea, they durst not *put it* to a battle at sea, and set
up their rest wholly upon the land enterprize. *Id.*

It is to be *put* to question in general, whether it
be lawful for Christian princes to make an invasive
war, simply for the propagation of the faith. *Id.*

The wind cannot be perceived, until there be an
eruption of a great quantity from under the water;
whereas, in the first *putting up*, it cooleth in little
portions. *Id.*

It is manifest that the duke did his best to come
down, and to *put* to sea. *Id.*

One Bell was *put* to death at Tyburn for moving
a new rebellion. *Hayward.*

No ties,
Halsers, or gables need, nor anchor cast,
Whom storms *put in* there, are with stay embraced.
Chapman.

I boarded and commanded to ascend
My friends and soldiers, to *put off* and lend
Way to our ship. *Id.*

Ambition, like a torrent, ne'er looks back;
And is a swelling, and the last affection
A high mind can *put off*. *Ben Jonson's Catiline.*
Others envy to the state draws, and *puts on*
For contumelies received. *Id.*

Sir Francis Drake came coasting along from Car-
thagena, a city of the mainland to which he *put over*,
and took it. *Abbot.*

Himself never *put up* any of the rent, but dis-
posed of it by the assistance of a reverend divine to
augment the vicar's portion. *Spelman.*

Avarice *puts on* the canonical habit.
Decay of Piety.

A nimbler fencer will *put in* a thrust so quick that
the foil will be in your bosom, when you thought it
a yard off *Digby.*

Jonathan had died for being so,
Had not just God *put by* the' unnatural blow.
Cowley.

It *puts* a man from all employment, and makes a
man's discourses tedious. *Taylor's Holy Living.*
In honouring God, *put forth* all thy strength.
Taylor.

Such as were taken on either side, were *put to* the
sword or to the halter. *Clarendon.*

The great preparation *put* the king upon the resolu-
tion of having such a body in his way. *Id.*

Four speedy cherubims
Put to their mouths the sounding alchemy.
Milton.

This question asked *puts* me in doubt. *Id.*
I *put* not forth my goodness. *Id.*

I for his sake will leave
Thy bosom, and this glory next to thee
Freely *put off*, and for him lastly die. *Id.*
I must die

Betrayed, captived, and both my eyes *put out*. *Id.*
He said, let the earth

Put forth the verdant grass, herb yielding seed,
And fruit tree yielding fruit. *Id.*

In these he *put* two weights. *Id.*

When the wisest council of men have with the
greatest prudence made laws, yet frequent emer-
gencies happen which they did not foresee, and there-
fore they are *put upon* repeals and supplements of
such their laws; but Almighty God, by one simple
fore-sight, foresaw all events, and could therefore fit
laws proportionate to the things he made. *Hale.*

Soon as they had him at their mercy,
They *put* him to the cudgel fiercely. *Hudibras.*

Nor *put up* blow, but that which laid
Right worshipful on shoulder-blade. *Id.*

One hundred pounds only *put out* at interest, at
ten per cent, doth in seventy years encrease to above
one hundred thousand pounds. *Child.*

Although astrologers may here *put in*, and plead the
secret influence of this star, yet Galen, in his com-
ment, makes no such consideration. *Browne.*

I do not intend to be thus *put off* with an old
song. *More.*

The discourse I mentioned was written to a private
friend, who *put me upon* that task. *Boyle.*

I hope for a demonstration, but Themistius hopes
to *put me off* with an harangue. *Id.*

The Canaanitish woman must *put up* a refusal, and
the reproachful name of a dog, commonly used by
the Jews of the heathen. *Id.*

We are *put* to prove things, which can hardly be
made plainer. *Tillotson.*

Those who have lived wickedly before, must
meet with a great deal more trouble, because they
are *put upon* changing the whole course of their life.
Id.

To *put* your ladyship in mind of the advantages
you have in all these points, would look like a de-
sign to flatter you. *Temple*

So nature prompts; so soon we go astray,
When old experience *puts us* in the way.
Dryden.

Put it thus—unfold to Statius straight,
What to Jove's ear thou didst impart of late:
He'll stare. *Id.*

I am as much ashamed to *put* a loose indigested
play upon the publick, as I should be to offer brass
money in a payment. *Id.*

When I drove a thrust, home as I could,
To reach his traitor heart, he *put it by*,
And cried, spare the striking. *Id.*

Now the cheerful light her fears dispelled,
She with no winding turns the truth conceal'd,
But *put* the woman off, and stood reveal'd. *Id.*

With copper collars and with brawny backs,
Quite to *put down* the fashion of our blacks. *Id.*
You tell us that you shall be forced to leave off
your modesty; you mean that little which is left;
for it was worn to rags when you *put out* this medal. *Id.*

I was not more concerned in that debate
Of empire, when our universal state
Was *put to hazard*, and the giant race
Our captive skies were ready to embrace. *Id.*
He warned him for his safety to provide;
Not *put to sea*, but safe on shore abide. *Id.*
Some hard words the goat gave, but the fox *put*
off all with a jest. *L'Estrange.*

The most wretched sort of people are dreamers
upon events and *putters* of cases. *Id.*
Mercury had a mind to learn what credit he had
in the world, and so *put on* the shape of a man. *Id.*
The stork found he was *put upon*, but set a good
face however upon his entertainment. *Id.*

It is prudence in many cases, to *put up* the injuries
of a weaker enemy, for fear of incurring the displeasure
of a stronger. *Id.*
The stag's was a forced *put*, and a chance rather
than a choice. *Id.*

The fox's *put off* is instructive towards the government
of our lives, provided his fooling be made our earnest. *Id.*

Men may *put* government into what hands they
please. *Locke.*

A sinew cracked seldom recovers its former strength,
or the memory of it leaves a lasting caution in the
man, not to *put* the part quickly again to robust employment. *Id.*

A man, not having the power of his own life,
cannot *put himself under* the absolute arbitrary power
of another to take it. *Id.*

There is great variety in men's understanding;
and their natural constitutions *put* so wide a difference
between some men, that industry would never
be able to master. *Id.*

They should seldom be *put about* doing those
things, but when they have a mind. *Id.*

He has right to *put* into his complex idea, signified
by the word gold, those qualities which upon
trial he has found united. *Id.*

Fallacies we are apt to *put upon* ourselves, by
taking words for things. *Id.*

Christ will bring all to life, and then they shall
be *put* every one upon his own trial, and receive judgment. *Id.*

Feed land with beasts and horses, and after both
put in sheep. *Mortimer's Husbandry.*

As for the time of *putting* the rams to the ewes,
you must consider at what time your grass will
maintain them. *Mortimer.*

A fright hath *put* by an ague fit, and mitigated a
fit of the gout. *Grew's Cosmologia.*

I expect an offspring, docile and tractable in whatever
we *put* them to. *Tatler.*

This last age has made a greater progress than
all ages before *put together*. *Burnet.*

Do men in good earnest think that God will be
put off so? or that the law of God will be baffled
with a lie clothed in a scoff? *South.*

I *put* the case at the worst, by supposing, what
seldom happens, that a course of virtue makes us
miserable in this life. *Spectator.*

He replied, with some vehemence, that he would
undertake to prove trade would be the ruin of the
English nation; I would fain have *put* him upon it.
Addison.

We should *put forth* all our strength, and, without
having an eye to his preparations, make the greatest
push we are able. *Id.*

My friend, fancying her to be an old woman of
quality, *put off* his hat to her, when the person pulling
off his mask appeared a smock-faced young fellow. *Id.*

An old usurer, charmed with the pleasures of a
country life, in order to make a purchase, called in
all his money; but, in a very few days after, *put* it
out again. *Id.*

When I was at Venice, they were *putting out*
curious stamps of the several edifices, most famous
for their beauty or magnificence. *Id.*

I shall be hard *put to it*, to bring myself off. *Id.*
Such national injuries are not to be *put up*, but
when the offender is below resentment. *Id.*

An ordinary fleet could not hope to succeed
against a place that has always a considerable number
of men of war ready to *put* to sea. *Id.*

This scrupulous way would make us deny our
senses; for there is scarcely any thing but *puts* our
reason to a stand. *Collier.*

If a man should *put in* to be one of the knights of
Malta, he might modestly enough prove his six descents
against a less qualified competitor. *Id.*

Queer country *puts* extol queen Bess's reign,
And of lost hospitality complain. *Brumston.*

This *put* me upon observing the thickness of the
glass, and considering whether the dimensions and
proportions of the rings may be truly derived from it
by computation. *Newton.*

It need not be any wonder why I should employ
myself upon that study, or *put* others upon it. *Walker.*

He seems generally to prevail, persuading them
to a confidence in some partial works of obedience,
or else to *put off* the care of their salvation to some
future opportunities. *Rogers.*

Wherever he *puts* a slight upon good works, 'tis as
they stand distinct from faith. *Atterbury.*

Teuta *put* to death one of the Roman ambassadors;
she was obliged, by a successful war which the Romans
made, to consent to give up all the sea coast. *Arbutnot.*

So many accidents may deprive us of our lives,
that we can never say, that he who neglects to secure
his salvation to-day, may without danger *put* it
off till to-morrow. *Wake.*

We see the miserable shifts some men are *put to*,
when that which was founded upon, and supported
by idolatry, is become the sanctuary of atheism. *Bentley.*

If without any provocation gentlemen will fall upon
one, in an affair wherein his interest and reputation
are embarked, they cannot complain of being *put* into
the number of his enemies. *Pope.*

As Homer went, the ship *put in* at Samos, where
he continued the whole winter, singing at the houses
of great men, with a train of boys after him. *Id.*

When men and women are mixed and well chosen,
and *put* their best qualities forward, there may be
any intercourse of civility and good will. *Swift.*

These wretches *put* us upon all mischief, to feed
their lusts and extravagancies. *Id.*

I only *put* the question, whether in reason it
would not have been proper the kingdom should have
received timely notice? *Id.*

It is very hard that Mr. Steele should take up the
artificial reports of his own faction, and then *put* them
off upon the world as additional fears of a popish
successor. *Id.*

There is no quality so contrary to any nature which
one cannot affect, and *put on* upon occasion, in order
to serve an interest. *Id.*

With this he *put up* to my lord,
The courtiers kept their distance due,
He twitched his sleeve. *Id.*

Homer says he *puts off* that air of grandeur which so properly belongs to his character, and debases himself into a droll. *Broomé.*

As danger did approach, her spirits rose,
And *putting* on the king dismayed her foes.

Halifax.

PUTAMINEÆ, from putamen, a shell, the name of the twenty-fifth order of Linnæus's fragments of a natural method; consisting of a few genera of plants allied in habit, whose fleshy seed-vessel or fruit is frequently covered with a hard woody shell. See **BOTANY**.

PUTATIVE, *adj.* Fr. *putatif*, from Lat. *puto*. Supposed; reputed.

If a wife commits adultery, she shall lose her dower, though she be only a *putative*, and not a true and real wife. *Ayliffe.*

PUTEANUS (*Erycius*), LL. D., or Erick Vandeput, a learned professor, born at Venlo, in Guelderland, in 1574. He was educated at Dort, and studied rhetoric and philosophy at Cologne, in the Jesuits' college. He next studied law at Louvain, and in 1597 went to Padua and Milan; at which last city he was chosen professor of eloquence in 1601. He was made historiographer to the king of Spain; and in 1603 a patrician of Rome. In 1604 he became LL. D. at Milan, and married. In 1606 he was called to Louvain, appointed successor to Justus Lipsius, and governor of the castle. He published many works, amounting to 5 vols. folio; and died in 1646.

PUTEOLI, an ancient city of Italy, in Naples, and in the province of Campania, so called either from its wells, there being many hot and cold springs thereabouts; or from its stench, putor, caused by sulphureous exhalations. (Livy, Varro, Strabo.) In a very remote age the Cumæans made it their arsenal and dockyard; and to this naval establishment gave the sublime appellation of Dicearchea, or just power. The Romans, sensible of the utility of this port, took great pains to improve its natural advantages. Nothing remains of their works but a line of piers, vulgarly called the bridge of Caligula. The ruins of its ancient edifices are widely spread along the adjacent hills and shores. An amphitheatre still exists entire in most of its parts, and a temple of Serapis. In the neighbourhood are many relics of ancient grandeur; particularly the Campanian way, paved with lava, and lined on each side with venerable towers, the repositories of the dead, which are richly adorned with stucco in the inside.

PUTI CARAJA, in botany, a genus of Indian plants: **CAL.** five cleft: **COR.** has five equal petals, the pericarp a thorny legumen and two seeds, the leaves oval and pinnated, and the stem armed: **SEEDS** very bitter, and tonic.

PUTID, *adj.* Lat. *putidus*. Mean; low; worthless.

He that follows nature is never out of his way; whereas all imitation is *putid* and servile.

L'Estrange.

PUT-IN-BAY, a bay in the south-west part of Lake Erie, formed by the island of Edward, ten miles W. N. W. of Sandusky Bay. It is open to the north, and well-sheltered. The entrance is not more than a quarter of a mile wide, having on the western side a narrow rocky

point, about forty feet high; where it joint the island the isthmus is so low as to be generally overflowed. From the point a block-house and strong battery defend the harbour, which has excellent anchorage.

PUTIVL, a town of the government of Kursk, European Russia, on the Sem. It is the chief place of a district or circle; has a number of churches, a monastery, and 9000 inhabitants, who carry on a traffic chiefly in woollens and sink. Here is also a manufactory of vitriol, and some brick-works. It is 120 miles W. S. W. of Kursk.

PUTLOG, *n. s.* From put and log. See the extract.

Putlogs are pieces of timber or short poles, about seven foot long, [put] to bear the boards they stand on to work, and to lay bricks and mortar upon.

Moxon's Mechanical Exercises.

PUTNAM, a town of Washington county, New York, twenty-eight miles north of Sandy Hill. Population 499. It lies on lake Champlain.

PUTNAM, a county of the west part of Georgia. Population upwards of 1000. Chief town Eaton Town.—Also a county of New York.

PUTREFACTION,

PUTREDINOUS, *adj.*

PUTREFACTIVE, *adj.*

PUTREFY, *v. a. & v. n.*

PUTRESCENCE, *n. s.*

PUTRESCENT, *adj.*

PUTRID, *adj.*

PUTRIDNESS.

foul; act of making rotten: putrefactive, making rotten: to putrefy, to corrupt; make rotten: as a verb neuter, to rot: putrescence, the state of rotting; the adjective corresponding: putridness, rottenness.

From the sole of the foot, even unto the head, there is no soundness in it, but wounds and bruises, and *putrefying* sores. *Isaiah i. 6.*

To keep them here,

They would but stink, and *putrefy* the air.

Shakspeare.

If the spirit protrude a little, and that motion be inordinate, there followeth *putrefaction*, which ever dissolveth the consistence of the body into much inequality. *Bacon.*

Many ill projects are undertaken, and private suits *putrefy* the public good. *Id.*

These hymns, though not revive, embalm and spice

The world, which else would *putrify* with vice.

Donne.

They make *putrefactive* generations conformable unto seminal productions. *Broomé's Vulgar Errors.*

Now if any ground this effect from gall or cholour, because being the fiery humour, it will readiest surmount the water, we may confess in the common *putrescence*, it may promote elevation. *Broomé.*

The wine to *putrid* blood converted flows.

Waller.

A wound was so *putrified* as to endanger the bone. *Temple.*

Putrid fever is that kind of fever in which the humours, or part of them, have so little circulatory motion that they fall into an intestine one, and *putrefy*, which is commonly the case after great evacuations, great or excessive heat. *Quincy.*

Putrefaction is a kind of fermentation, or intestine motion of bodies, which tends to the destruction of that form of their existence which is said to be their natural state. *Id.*

All imperfect mixture is apt to *putrefy*, and watery substances are more apt to *putrefy* than oily.

Woodward's Natural History.

One of these knots rises to supuration, and bursting excludes its *putrefaction*. *Blackmore.*

If a nurse feed only on flesh, and drink water, her milk, instead of turning sour, will turn *putrid*, and smell like urine. *Arbuthnot.*

Vegetable *putrefaction* is produced by throwing green vegetables in a heap in open warm air, and pressing them together, by which they acquire a *putrid* stercoraceous taste and odour. *Id.*

Such a constitution of the air, as would naturally *putrefy* raw flesh, must endanger by a mortification. *Id.*

Aliment is not only necessary for repairing the fluids and solids of an animal, but likewise to keep the fluids from the *putrescent* alkaline state which they would acquire by constant motion. *Id.*

If the bone be corrupted, the *putrefactive* smell will discover it. *Wiseman's Surgery.*

The pain proceeded from some acrimony in the serum, which, falling into this declining part, *putrefied*. *Id.*

Nidorous ructus depend on the foetid spirituousity of the ferment, and the *putridness* of the meat.

Floyer on the Humours.

A *putredinous* ferment coagulates all humours, as milk with rennet is turned. *Id.*

'Tis such a light as *putrefaction* breeds
In fly-blown flesh, whereon the maggot feeds,
Shines in the dark, but, ushered into day,
The stench remains, the lustre dies away. *Couper.*

His limbs,
With palsy shaken about him, blasted lie;
And all his flesh is full of *putrid* sores
And noisome wounds, his bones of racking pains:
Strange vesture this for an immortal soul. *Pollok.*

PUTREFACTION is one of the natural processes by which organized bodies are dissolved, and reduced to what may be called their original elements. Putrefaction differs from chemical solution; because, in the latter, the dissolved bodies are kept in their state of solution by being combined with a certain agent from which they cannot easily be separated; but, in putrefaction, the agent which dissolves the body appears not to combine with it in any manner or way, but merely to separate the parts from each other. It differs also from the resolution of bodies by distillation with violent fire; because in distillation new and permanent compounds are formed, but by putrefaction every thing seems to be resolved into substances much more simple and indestructible than those which are the result of any chemical process. The bodies most liable to putrefaction are those of animals and vegetables, especially when full of juices. Stones, though by the action of the weather they will moulder into dust, yet seem not to be subject to anything like real putrefaction, as they are not resolved into any other substance than sand, or small dust, which still preserves its lapideous nature. In like manner vegetables of any kind, when deprived of their juices by drying, may be preserved for many ages without being subjected to any thing like a putrefactive process. The parts of animals also, by simple drying, may be preserved in a

sound state for a much longer time than they could be without the previous exhalation of their juices.

Putrefaction is generally allowed to be a kind of fermentation, or rather to be the last stage of that process; which, beginning with the vinous fermentation, goes on through the acetous, to the stage of putridity, where it stops. In several respects, however, it differs so much from these processes, that it seems in some degree doubtful whether it can with propriety be called a fermentation or not. Both these vinous and acetous fermentations are attended with a considerable degree of heat: but in the putrefaction of animal matters especially, the heat is for the most part so small that we cannot be certain whether there is any degree of it or not produced by the process. A most remarkable difference is that the vinous fermentation produces ardent spirits, the acetous vinegar; but putrefaction produces nothing but earth, and some effluvia, which, though most disagreeable, and even poisonous to the human body, yet, being imbibed by the earth and vegetable creation, give life to a new race of beings. It is commonly supposed, indeed, that volatile alkali is a production of the putrefactive process; but this is disputed. The only thing in which the putrefactive fermentation agrees with the other kinds is, that in all the three there is an extrication of carbonic acid.

One reason why an animal body does not putrify while alive is its ventilation, as we may call it, by respiration; and another is the continual accession of new particles, less disposed to putrify than itself, by the food and drink which is constantly taken in. But, if either of these ways of preventing the commencement of this process be omitted, then putrefaction will take place as well in a living as in a dead body. Bodies will not putrify in vacuo, because there the atmosphere has not access to impart its elastic principle. If the body is very dry, putrefaction cannot take place, because the texture is too firm to be decomposed by the weak action of the elastic principle. Putrefaction may also be prevented by the addition of certain substances. Thus various kinds of salts and acids harden the texture of animal substances, and thus are successively used as antiseptics. The same thing may be said of ardent spirits; while oils and gums of various kinds prove antiseptic by a total exclusion of air, which is necessary in some degree for carrying on the process of putrefaction. Many vegetables, by the astringent qualities they possess, harden the texture of animal substances, and thus prove powerfully antiseptic; while, on the other hand, fixed alkaline salts, quicklime, and caustic volatile alkali, though they prevent putrefaction, yet they do it by dissolving the substances in such a manner that putrefaction could do no more had it exerted its utmost force. Sugar, though neither acid nor alkaline, is yet one of the most effectual antiseptics known: and this seems to be owing to its great tendency to run into the vinous fermentation, which is totally inconsistent with that of putrefaction; and this tendency is so great that it can scarcely be counteracted by the tendency of animal substances to putrefy in any circumstances whatever.

In putrefaction the animal matter generally passes off in the gaseous form; and an inconsiderable quantity of earthy matter remains when the process is finished. The precise nature of these combinations has not, from the extreme offensiveness of the process, been accurately observed; and they probably vary according to the nature of the animal matter, and the circumstances under which it is decomposed. Ammonia, formed by the union of the azote and hydrogen of the animal matter, is always disengaged in considerable quantity. Phosphureted hydrogen is likewise produced; and this gas, even when obtained pure, has the odor exclusively termed putrid. Sulphureted hydrogen forms another part of the vapors disengaged from putrefying substances. Carbureted hydrogen and carbonic acid are likewise separated. And, lastly, it is probable that not only these binary combinations, but compound gases, consisting of three or more of these elements with oxygen, are formed and discharged. As this process must necessarily be carried on at the surface of the earth, its products are diffused through the atmosphere, dissolved by water, and absorbed by the soil. They furnish the principal nutritious matter for the support of vegetables, and are again prepared for the nourishment of animals.

PUTTINGSTONE, *n. s.* Putting and stone. That is, a stone thrown or placed by the hands.

In some parts of Scotland, stones are laid at the gates of great houses, which they call *putting stones*, for trials of strength.

PUT'TOCK, *n. s.* Lat. *buteo*. A buzzard.

Who finds the partridge in the *puttock's* nest,
But may imagine how the bird was dead?

Shakspeare.

The next are those which are called birds of prey, as the eagle, hawk, *puttock*, and cormorant.

Peacham.

PUT'TY, *n. s.* Fr. *potée*; Sp. *potea*. A kind of powder on which glass is ground; a cement of glass.

An object glass of a fourteen foot telescope, made by an artificer at London, I once mended considerably, by grinding it on pitch with *putty*, and leaning on it very easily in the grinding, lest the *putty* should scratch it.

Newton.

PUTTY is compounded of whiting and lintseed oil, beaten together to the consistence of a thick dough. It is used by glaziers for fastening in the squares of glass in sash windows, and by painters for stopping up the crevices and clefts in timber, &c.

PUTUMAYO, or Ica, a river of South America, which has its rise in the district of Ibarra, Quito, about eighty miles to the south of Popayan. Its course is S. S. E. about 300 miles, when, being joined by a branch of the Caquet, it takes the name of Ica, and, after a south-east course of about 200 miles, joins the Amazons, in long. 50° 40' W., lat. 3° 30' S. It washes down considerable quantities of gold. There is a settlement of this name on the river.

PUY (Peter de), a learned French writer, born in Paris in 1583. He wrote twelve treatises, chiefly on political subjects; such as, 1. The Origin of the Salique Law: 2. The Liberties of the Gallican Church: 3. The History of the

Templars, &c. He died in 1652, aged seventy-two.

PUY, REVESSIO, a city and post town of high antiquity, and the principal place of the department of the Upper Loire, France, containing 13,000 inhabitants, and having an inferior court under the royal court of Riom; a board of manufactures, an agricultural society, and a communal college. It stands in a fine situation, in the centre of three broad and very fertile valleys, each watered by a river, and crossed by three great roads. Rising in the form of an amphitheatre on the south side of mount Anis, overtopped by the vertical rock of Corneil, and surrounded with volcanic rocks, richly cultivated fields, pretty country houses, gardens, shrubberies, fruit trees, and verdant meadows, this town presents a most picturesque appearance. It is generally well built, the houses being constructed of lava, which is very abundant in the neighbourhood; the streets, which are paved with the same material, are wide and airy, but very steep and impassable for carriages.

Near the top of the hill appears the cathedral, the front of which is a mixture of ancient and Gothic architecture, presenting four rows of columns and porticoes with large arches, the middle one, which is most magnificent, being the entrance to the church. The ascent is by an immense flight of 118 steps, covered with a lofty vaulted roof, above which rises full half of the building. The steeple is of a pyramidal form, and very lofty; built entirely of volcanic stone. In the lower part of the town is a very steep basaltic rock, which resembles a tower, and on the summit of it stands the church of St. Michael. This rock, which is 300 feet high, has the form of a cone; and the steeple of the church, pointed and extremely slender, rises like an obelisk over all. The ascent to this building is by 260 steps cut in the rock.

Here are considerable manufactures of lace, thread, black lace and blond, common stuffs, woollen counterpanes, and skin bottles for wine, nail factories, a foundry, tan-yards, fulling-mills, and dye-houses. The trade consists in corn, lace, cloth, serge, iron goods, delf-ware, mules, horses, and cattle. The public library containing 5000 volumes, the museum of pictures, statues, and antiquities, are also worth notice; as well as the tomb of Duguesclin, the promenade of Breuil, and the assembly room: an ancient building, in good preservation, once consecrated to Diana. About a mile and a half from Puy is the village of Espailly, remarkable for the ruins of its ancient castle, and some curious groups of basaltic prisms, called the organs of Espailly. This city is fifty-eight miles south of Montrbrison, ninety south-west of Lyons, sixty-three north-west of Privas, eighty-seven south-east of Clermont, and 375 south of Paris.

PUY-DE-DOME, a department of France, is formed out of the former province of Lower Auvergne, and derives its name from a high mountain which overtops the whole chain of the Dômes Mountains that extend over this country. The principal place of this prefecture is Clermont-Ferrand, and it consists of five arrondissements, Clermont-Ferrand, Ambert, Issoire,

Riom, and Thiers, having a total population of 553,410 souls, on an area of 3295 square miles, and yielding a revenue of 22,428,000 francs. These are subdivided into fifty cantons and 438 communes. This forms part of the nineteenth military division, having a royal court at Riom, and a bishopric at Clermont, and consists of four electoral arrondissements, which send seven members to the chamber of deputies. The department is bounded by that of the Allier on the north, on the east by that of the Loire, on the south by those of the Upper Loire and Cantal, and on the west by those of the Creuse and the Corrèze.

This country presents, through almost its whole extent, mountains of remarkable elevation, among which are found rich hollows, beautiful valleys, and plains of the greatest fertility. The mountains are nearly all volcanic, and the whole chain extends, from south to north, over a space of fifteen or eighteen miles, in which are at least forty Puy, with their ancient craters, ravines, torrents of lava, prisms, and columns of basalt. Above these extends the smiling Limagne, the fertile soil of which is covered with orchards and vineyards, fruitful fields richly cultivated, and fine meadows intersected by a great number of rivulets and canals. The plains are filled with chestnut trees, the green foliage of which gives an indescribable charm to this delightful country. A number of artificial lakes, serving the purpose of watering the lands, are formed by a raised causeway resting on the sides of two neighbouring hills, which interrupts the course of the streams, and thus, swelling them insensibly, causes them to overflow and fertilize the pastures; where feed vast herds of horses and cattle of every description. In the chain or rather group of the Dômes and the Dorees, which cover a great portion of the department, are every where discoverable the effects of former volcanic eruptions; and the currents of lava yield most of the petrifications dug for the building of houses: indeed whole towns are constructed of it. The volcanic cinders are very favorable to vegetation. The soil is most cultivated with horses and mules, and yields more than a supply for its population. It contains 54,250 hectares of forest (chiefly oak and fir), and 22,000 hectares of vineyards, and the mean produce of every hectare of arable land is twenty-four francs twenty-eight centimes.

The productions of this department consist in corn of all sorts, chestnuts, very good hemp, fruit, good wine, wood, and excellent pasturage. The lakes and rivers abound in fish; horses of a small kind are bred, as well as horned cattle and sheep. There are also mines of lead and antimony; quarries of marble of different colors, granite, graystone, millstone, tripoli, puzzolani, basalt, and plaster, and pits of coal. There is a royal dépôt of standard measures at Parentignac, a royal sheep walk from Puy-de-Dôme to St. Genest, and a large botanical garden at Clermont. At Mont-d'or-les-Bains, at Chateaumont, at Chatel Guyon, at St. Myon, at St. Nectaire, at St. Marguerite au Tambour, at St. Mark, and at Chateaudon, are establishments of mineral waters and warm baths. The principal manufactures are those of linen, camlets, tent cloths, Turkish

satins blond-lace, playing cards, sait-petre, chemicals, glue, candles, mercury goods, ironmongery, cutlery, kettles, and copper vessels. They have also cotton and wool-spinning manufactories, paper-mills, delf and other potteries, brass foundries, tan yards, numerous hydraulic saw-mills, &c. The trade consists in wines, corn, brandies, liqueurs, dry confectionary, walnut and hemp-seed oil, cattle, Auvergne cheeses, hemp, wool, linen, leather, paper, wood, fir-planks, coal, &c. This department is watered by the Allier, which is navigable, the Doré, the Dordogne, the Sioule, and the Morge; it is also crossed by the great roads of Lyons, Limoges, and Moulins.

PUY-DE-DÔME, a celebrated mountain in Auvergne, situated towards the centre of the chain of the Dôme, which extends from north to south over a space of twenty-four miles, but varying considerably in breadth. This mountain is in the centre of the chain, and much higher than those around, appearing like a giant in the midst of his children; one of the mountains indeed, called the Little Puy-de-Dôme, rises at its side, and, being united at the base, seems to spring out of it. The Puy-de-Dôme presents a majestic cone, exact in all its proportions, having an extensive hollow like a disk at its top. From the base to the summit, notwithstanding its steepness, it is covered with a verdure, on which numerous herds of cattle feed; and the whole surface is a grass plat, except in two or three places, where the protuberances of white lava appear, and show that the mountain has been volcanic. This magnificent extent of verdure gives an inconceivable charm to a scene abounding in grandeur and beauty.

The ascent to the mountain is by two different roads, one on the south side, called the road of Alagnat, the other on the north, called the Gravouse. From the crest one of the finest and richest prospects in the world is unfolded to the view. Elevated nearly 6000 feet above the level of the sea, and nearly 4000 above that of Clermont, there is no limit to the sight for an immense distance; below you are seen the forty neighbouring Puy, with their ancient craters, their ravines, currents of lava, and beds of black and red puzzolain. Farther distant is the whole country of Limagne, with its towns, villages, and hills without number; on all sides are fields of every color, vineyards, houses, roads, and mountains stretching into the distance, till they are lost to the view, and including an extent of nearly 400 miles.

Although the Puy is only a scorched rock, yet the rain and vapors that it incessantly imbibes give it an amazing fertility, which it communicates to all the neighbouring mountains; all of them, with only one or two exceptions, being covered with grass. This mountain has been rendered immortal by the experiments of Pascal here on the weight of the atmosphere.

PUZZLE, *v. a., v. n., & n. s.* For postle (or apposail as it has been written) from pose. Skinner. To perplex; entangle; confound; embarrass; involve; put to a stand; teaze: be bewildered, perplexed, or awkward: a puzzle is a perplexity; a perplexing occurrence; embar-

ramssent; also a child's toy designed to exercise ingenuity.

I say there is no darkness but ignorance, in which thou art more *puzzled* than the Egyptians in their fog.

Shakspeare.

Men in great fortunes are strangers to themselves, and, while they are in the *puzzle* of business, they have no time to tend their health either of body or mind.

Bacon's Essays.

I shall purposely omit the mention of arguments which relate to infinity, as being not so easily intelligible, and therefore more apt to *puzzle* and amuse, than to convince.

Wilkins.

Both armies of the enemy would have been *puzzled* what to have done.

Clarendon.

A very shrewd disputant in those points is dexterous in *puzzling* others, if they be not thorough-paced speculators in those great theories.

More.

The servant is a *puzzling* fool that heeds nothing.

L'Estrange.

These, as my guide informed me, were men of subtle tempers, and *puzzled* politicks, who would supply the place of real wisdom with cunning and avarice.

Tatler.

He is perpetually *puzzled* and perplexed amidst his own blunders, and mistakes the sense of those he would confute.

Addison.

I did not indeed at first imagine there was in it such a jargon of ideas, such an inconsistency of notions, such a confusion of particles, that rather *puzzle* than connect the sense.

Id.

Persons who labour under real evils will not *puzzle* themselves with conjectural ones.

Clarissa.

She strikes each point with native force of mind, while *puzzled* learning blunders far behind.

Young.

Few angles were there in her form, 'tis true, Thinner she might have been and yet scarce lose, Yet, after all, 'twould *puzzle* to say where

Byron.

It would not spoil some separate charm to pare.

PUZZULANA TERRA, or TERRA POZZOLANA, is a grayish kind of earth used in Italy for building under water. The best is found about Puteoli, Baiæ, and Cumæ, in Naples, from the first of which places it derives its name. It is a volcanic product, composed of heterogeneous substances, thrown out from the burning mouths of volcanoes in the form of ashes; sometimes in such large quantities, and with so great violence, that whole provinces have been covered with it at a considerable distance. This volcanic earth is of a gray, brown, or blackish color; of a loose, granular, or dusty and rough, porous or spongy texture, resembling a clay hardened by fire, and then reduced to a gross powder. Its specific gravity is from 2.57 to 2.8; and it is in some degree magnetic: it scarcely effervesces with acids, though partially soluble in them. It easily melts per se; but its most distinguishing property is, that it hardens very suddenly when mixed with one-third of its weight of lime and water; and forms a cement which is more durable in water than any other. According to Bergman's analysis, 100 parts of it contain from 55 to 60 of sileiceous earth, 20 of argillaceous, 5 or 6 of calcareous, and from 15 to 20 of iron. It is found also in France, in the late provinces of Auvergne and Limoges.

PUZZUOLO, or POZZUOLI, the ancient Puteoli, a celebrated town of Italy, delightfully situated on a peninsula, in the centre of the noble bay of this name. In ancient times this was

the chief mart of the inhabitants of Cumæ, and a rendezvous for merchants from Italy, Sicily, and Greece: the baths allured the most opulent Romans to its vicinity. But the devastations of war and earthquakes have long since greatly reduced it. Its population of about 1000 is now confined to the point which formed the ancient port. But in a square of the town stands a beautiful marble pedestal, covered with bas-reliefs, representing in allegorical figures the fourteen towns of Asia Minor that were destroyed by an earthquake, and rebuilt by Tiberius. The cathedral, which occupies the site of an ancient temple and is built chiefly of its materials, has a subterranean edifice attached, called the labyrinth, divided into a number of apartments. On the hill behind the town are the remains of an amphitheatre of considerable extent; but only the gates and portions of the vaults remain. Here are, however, massy remains of the temple of Jupiter Serapis, and of the mole that formed the ancient port. Several of its piers and arches still stand unshaken. At the end of this mole began the bridge of Caligula, which extended across part of the bay to Baiæ, no less than half a mile. Puzzuolo is still a bishop's see. In the neighbourhood is the plain of Solfotara. It is seven miles west of Naples.

PWLLHELY, a large market town of North Wales, in Carnarvonshire, seated on the coast between two rivers. It is contributory to Carnarvon in sending one member to parliament; and lies six miles south of Nevin, twenty S. S. W. of Caernarvon, and 243½ north-west of London.

PYANEPSIA, in antiquity, an Athenian festival celebrated on the seventh day of the month Pyanepsion. Plutarch ascribes the institution of this feast to Theseus, who, after the funeral of his father, on this day paid his vows to Apollo, because the youths who returned with him safe from Crete then made their entry into the city. On this occasion these young men, putting all that was left of their provisions into one kettle, feasted together on it, and made great rejoicing. The Athenians carried about an olive branch, bound about with wool, and crowned with all sorts of first fruits, to signify that scarcity and barrenness had ceased, singing in procession a song. And, when the solemnity was over, it was usual to erect the olive branch before their doors as a preservative against scarcity and want.

PYCNOSTYLE, in ancient architecture, a building where the columns stand very close to each other; only one diameter and a half of the column being allowed for the intercolumniations. The pycnostyle chiefly belonged to the composite order, and was used in the most magnificent buildings.

PYDNA, an ancient city of Macedonia, originally called Citron, seated between the mouths of the Aliacmon and Lydius. In this city Casander murdered the mother, widow, and son of Alexander the Great. A decisive battle was afterwards fought near it A. A. C. 168, between the Romans under Paulus Æmilius and the Macedonians under Philip V., in which the latter was defeated, and his kingdom was a few years after made a Roman province.

PYE (Henry James), LL. D., an English

poet, Dr. Southey's predecessor in the laureateship, was born in London in 1745. After receiving a private education, he went to Magdalen College Oxford, and took the honorary degree of master of arts in 1766, and that of doctor of laws in 1772. He was for some time in the Berkshire militia, and embarrassed himself by standing a contest for the representation of the county. In 1790 he became poet laureat; and in 1792 a police magistrate. He died August 11th, 1813. His principal works are, 1. Faringdon Hill, a poem. 2. Six odes of Pindar, translated into English verse. 3. The Progress of Refinement, a poem. 4. Poems on various subjects, 2 vols. 5. A Translation of the Poetics of Aristotle. 6. Lenore, a tale from the German of Burger. 7. The Democrat, 2 vols. 8. The Aristocrat, 2 vols. 9. Alfred, an epic poem. 10. Another collection of poems, 2 vols. 11. Comments on the Commentators on Shakspeare, 8vo. 12. A translation of the hymns and epigrams of Homer.

PYGMALION, in fabulous history, a king of Cyprus, who, being disgusted at the dissolute lives of the women of his island, resolved to live in perpetual celibacy; but, having made a statue of ivory, he so much admired it that, at the high festival of Venus, he fell down before the altar of that goddess, and besought her to give him a wife like the statue he had made. At his return home he embraced his ivory statue, when he perceived that it became sensible by degrees, and was at last a living maid, who found herself in her lover's arms the moment she saw the light. Venus blessed their union; and in nine months she was delivered of a son, named Paphos.

PYGMALION, king of Tyre, son of Belus, and brother of queen Dido, who founded Carthage. He succeeded his father, but became odious by his avarice and cruelty; and murdered Sichaus, the husband of Dido, in a temple of which he was priest, on which Dido fled with her husband's treasure. He died in his fifty-first and forty-seventh of his reign.—Virg. Æn. i. 347. Justin, 18. c. 5.

PYGMY, *n. s.* Fr. *pygmée*; Gr. *πυγμαίος*. A dwarf; one of a nation fabled to be only three spans high; any little thing or person.

They, less than smallest dwarfs in narrow room,
Throng numberless like that *pygmean* race
Beyond the Indian mount.

If they deny the present spontaneous production of larger plants, and confine the earth to as *pygmy* births in the vegetable kingdom as they do in the other; yet surely in such a supposed universal decay of nature, even mankind itself that is now nourished, though not produced, by the earth, must have degenerated in stature and strength in every generation.

Can place or lessen us or aggrandise?
Pygmies are *pygmies* still, tho' perched on Alps,
And pyramids are pyramids in vales.

PYLADES, a son of Strophius, king of Phocis, by a sister of Agamemnon. He was educated with his cousin Orestes, with whom he formed the most inviolable friendship, and whom he assisted to revenge the murder of Agamemnon, by assassinating Clytemnestra and Ægisthus. He also accompanied him into Taurica Chersonesus; and Orestes rewarded him for his services by

giving him his sister Electra in marriage. Pylades had by her two sons, Medon and Strophius. The friendship of Orestes and Pylades became proverbial.

PYLORUS. See **ANATOMY**.

PYLOS, an ancient town of Messenia, on the west coast of Peloponnesus, at the foot of Mount Ægalæus, opposite the island Sphacteria, in the Ionian Sea; seated on the promontory of Coryphasion, a name also given to the town. It was built by Pylus, at the head of a colony of Leleges from Megara, who were dispossessed of it by Neleus, the father of Nestor, who called it Nelea.

PYRAMID, *n. s.*

PYRAMIDAL, *adj.*

PYRAMID'ICALLY,

PYRAMID'ICALLY, *adv.*

PYRAMIS, *n. s.*

Fr. *pyramide*; Gr.

πυραμῖς. From *πυρ*

fire; because fire as-

cends in the figure of

a cone. A solid geo-

metrical figure, whose base is a polygon, and whose sides are plain triangles, their points meeting in one: the two adjectives and adverbs corresponding: pyramid is an obsolete form of the noun substantive.

Know, Sir, that I will not wait pinioned at your master's court; rather make my country's high *pyramids* my gibbet, and hang me up in chains.

Shakspeare. Antony and Cleopatra.

The form of a *pyramis* in flame, which we usually see, is merely by accident, and that the air about, by quenching the side of the flame, crusheth it, and extenuateth it into that form, for of itself it would be round, and therefore smoke is in the figure of a *pyramis* reversed; for the air quencheth the flame, and receiveth the smoke.

Bacon.

An hollow crystal *pyramid* he takes,

In infermental waters dipt above,

Of it a broad extinguisher he makes,

And hoods the flames.

Dryden.

The *pyramidal* idea of its flame, upon occasion of the candles, is what is in question.

Locke.

Of which sort likewise are the gems or stones, that are here shot into cubes, into *pyramidal* forms, or into angular columns.

Woodward.

Olympus is the largest, and therefore he makes it the basis upon which Ossa stands, that being the next to Olympus in magnitude, and Pelion being the least, is placed above Ossa, and thus they rise *pyramidically*.

Broome's Notes on Odyssey.

Virtue alone outbuilds the *pyramids*;

Her monuments shall last when Egypt's fall.

Young.

PYRAMID, in geometry, a solid figure, whose base is a polygon, and whose sides are plain triangles, their several points meeting in one, called the vertex of the pyramid.

Hence the superficies of a given pyramid is easily found by measuring these triangles separately; for their sum, added to the area of the base, is the surface of the pyramid required. It is no less easy to find the solid content of a given pyramid; for, the area of the base being found, let it be multiplied by the third part of the height of the pyramid, or the third part of the base by the height, and the product will give the solid content, as is demonstrated by Euclid, lib. xii. prop. 7.

PYRAMIDS OF EGYPT. These celebrated buildings, ranked by the most ancient historians among the wonders of the world, have for many ages excited the attention of the curious and the criticism of the learned. The pyramids of Gee-

za or Gizeh, so denominated from a village of that name on the banks of the Nile, are the largest, and are distant from that river about eleven miles. The three which most attract the notice of travellers stand near one another on the west side of the river, almost opposite to Cairo, and not far from the spot whereon stood the ancient Memphis. The great appearance of antiquity which they display favors the supposition that the whole of these wonderful works must have been constructed at an earlier period than any other edifices that are to be seen in Egypt. Homer is silent respecting them; but his silence is no proof that they were not in existence in his time. In the time of Herodotus as little was known concerning the second pyramid as before the late opening, with this exception, that in his time it was understood to be nearly in the state in which it was left when closed by the builders.

These three pyramids are named after three kings, whose tombs they are supposed to be, viz. Cheops, Cephrenes, and Mycerinus. Of these the largest, that of Cheops, was faced with white marble, as was also the second, and its four sides face the four cardinal points. The ascent to the top is by steps, the lowermost being nearly four feet high and three broad; the second of the same dimensions, but retiring inward from the first nearly three feet; and in the same manner the third row is placed upon the second, and the rest in the same order to the top, which terminates in a small flat or square; and they are so disposed that a line stretched from the bottom to the top would touch the angle of every step. From the time of Herodotus to the present day this pyramid has been measured by a great number of travellers and learned men, and their different calculations have only increased the uncertainty. The following table will show, at least, how difficult it is to come at the truth.

GREAT PYRAMID.

	Height.	Width of one of its sides.
	French feet.	French feet.
Herodotus	800	800
Strabo	625	600
Diodorus Siculus	600 and a fraction	700
Pliny	—	708
Le Bruyn	616	704
Prosper Alpinus	625	750
Thevenot	520	682
Niebuhr	440	710
Greaves	444	648
Belzoni	456	684

NUMBER OF LAYERS OF STONE WHICH FORM IT.

Greaves	207
Maillet	208
Albert Liewenstein	260
Pococke	212
Belon	250
Thevenot	208

According to Herodotus, the blocks of stone which served for the construction of the pyramids were obtained from quarries of oriental mountains on the frontiers of Arabia. This, however, is contrary to the observations of modern travellers, who have ascertained that the

same chalky stone of which they are composed is the produce of the district in which they stand.

The second pyramid stands at about a bow-shot from the first, towards the south. Herodotus says, after having measured both, that it falls short of the other in magnitude; that it has no subterraneous chambers: and that the Nile is not conveyed into it by a channel, as he affirms it was into the former, but that it is of an equal altitude. Diodorus informs us that it resembles the first in its architecture, but is inferior to it in magnitude; each side of the base containing a stadium, or 600 Grecian feet in length: so that by his computation each side is less than that of the former in length by 100 feet. Pliny makes the difference to be greater by forty-six feet.

On the north and west sides of this second pyramid are two very elaborate pieces of architecture, cut out of the rock in a perpendicular direction and squared by a chisel, about thirty feet in depth and about 1400 in length; supposed to be designed for the lodgings of the Egyptian priests.

The third pyramid stands at about the distance of a furlong from the second, on an advantageous rising of the rock, so that at a distance it appears equal to the former, though in fact much lower. Herodotus says that it is 300 feet on every side, and built of Ethiopic marble. Diodorus gives the same dimensions of its base, and adds that the walls were raised fifteen stories with black stone, like Thebaic marble, and the rest finished with such materials as the other pyramids are built with; that this, though exceeded by the two former in magnitude, yet far excels them in respect to the structure, art, and magnificence of the marble; and that, on the side towards the north, the name of Mycerinus, the founder, is engraved: but this inscription has been effaced by time. Pliny writes to the same effect, except that he makes this pyramid 363 feet between the angles.

Very important discoveries in the interior of these enormous masses have been made within our own time by Messrs. Davison and Caviglio, and by M. Belzoni. The most celebrated, and perhaps the most arduous of M. Belzoni's labors, was the opening of the pyramid of Cephrenes. Herodotus was informed that this pyramid had no interior chambers, and this no doubt operated in preventing that curiosity which had long before opened the pyramid of Cheops. The account of his discovery we cannot give better than in Belzoni's own words.

On my return to Cairo, I again went to visit the celebrated pyramids of Ghiza; and, on viewing that of Cephrenes, I could not help reflecting how many travellers of different nations, who had visited this spot, contented themselves with looking at the outside of this pyramid, and went away without enquiring whether any, and what chambers, exist in it; satisfied perhaps with the report of the Egyptian priests, 'that the pyramid of Cheops only contained chambers in its interior.' I then began to consider about the possibility of opening this pyramid; the attempt was perhaps presumptuous; and the risk of un-

dertaking such an immense work without success deterred me in some degree from the enterprise. I am not certain whether love for antiquity, an ardent curiosity, or ambition, spurred me on most in spite of every obstacle, but I determined at length to commence the operation. I soon discovered the same indications which had led to the development of the six tombs of the kings in Thebes, and which induced me to begin the operation on the north side. It is true, the situations of the tombs at Thebes, their form and epochs, are so very different from those of the pyramids, that many points of observation made with regard to the former, could not apply to the latter; yet I perceived enough to urge me to the enterprise. I accordingly set out from Cairo on the 6th of February, 1818, under pretence of going in quest of some antiquities, at a village not far off, in order that I might not be disturbed in my work by the people of Cairo. I then repaired to the Kaiya Bey, and asked permission to work at the pyramid of Ghiza in search of antiquities. He made no objection, but said that he wished to know if there was any ground about the pyramid fit for tillage; I informed him that it was all stones, and at a considerable distance from any tilled ground. He nevertheless persisted in enquiring of the cashief of the province, if there was any good ground near the pyramids; and, after receiving the necessary information, granted my request.

‘Having thus acquired permission, I began my labors on the 10th of February, at a point on the north side in a vertical section at right angles to that side of the base. I saw many reasons against my beginning there, but certain indications told me that there was an entrance at that spot. I employed sixty laboring men, and began to cut through the mass of stones and cement which had fallen from the upper part of the pyramid, but it was so hard joined together, that the men spoiled several of their hatchets in the operation; the stones which had fallen down along with the cement having formed themselves into one solid and almost impenetrable mass. I succeeded, however, in making an opening of fifteen feet wide, and continued working downwards in uncovering the face of the pyramid; this work took up several days, without the least prospect of meeting with any thing interesting. Meantime I began to fear that some of the Europeans residing at Cairo might pay a visit to the pyramids, which they do very often, and thus discover my retreat, and interrupt my proceedings.

‘On the 17th of the same month we had made a considerable advance downwards, when an Arab workman called out, making a great noise, and saying that he had found the entrance. He had discovered a hole in the pyramid into which he could just thrust his arm and a djerid of six feet long. Towards the evening we discovered a larger aperture, about three feet square, which had been closed in irregularly, by a hewn stone; this stone I caused to be removed, and then came to an opening larger than the preceding, but filled up with loose stones and sand. This satisfied me that it was not the real but a forced passage, which I found to lead inwards and towards the

south;—the next day we succeeded in entering fifteen feet from the outside, when we reached a place where the sand and stones began to fall from above. I caused the rubbish to be taken out, but it still continued to fall in great quantities; at last, after some days labor, I discovered an upper forced entrance, communicating with the outside from above, and which had evidently been cut by some one who was in search of the true passage. Having cleared this passage, I perceived another opening below, which apparently ran towards the centre of the pyramid. In a few hours I was able to enter this passage, and found it to be a continuation of the lower forced passage, which runs horizontally towards the centre of the pyramid, nearly all choked up with stones and sand. These obstructions I caused to be taken out; and at halfway from the entrance I found a descent which also had been forced; and which ended at the distance of forty feet. I afterwards continued the work in the horizontal passage above, in hopes that it might lead to the centre; but I was disappointed, and at last was convinced that it ended there; and that, to attempt to advance in that way would only incur the risk of sacrificing some of my workmen; as it was really astonishing to see how the stones hung suspended over their heads, resting, perhaps, by a single point. Indeed one of these stones did fall, and had nearly killed one of the men. I therefore retired from the forced passage, with great regret and disappointment.

‘Notwithstanding the discouragements I met with, I recommenced my researches on the following day, depending upon my indications. I directed the ground to be cleared away to the eastward of the false entrance; the stones, encrusted and bound together with cement, were equally hard as the former, and we had as many large stones to remove as before. By this time my retreat had been discovered, which occasioned me many interruptions from visitors: among others was the abbé de Forbin.

‘On February 28th we discovered a block of granite in an inclined direction towards the centre of the pyramid, and I perceived that the inclination was the same as that of the passage of the first pyramid, or that of Cheops; consequently I began to hope that I was near the true entrance. On the 1st of March we observed three large blocks of stone one upon another, all inclined towards the centre: these large stones we had to remove as well as others much larger as we advanced, which considerably retarded our approach to the desired spot. I perceived, however, that I was near the true entrance, and, in fact, the next day about noon, on the 2nd of March, was the epoch at which the grand pyramid of Cephrenes was at last opened, after being closed up for so many centuries that it remained an uncertainty whether any interior chambers did or did not exist. The passage I discovered was a square opening of four feet high and three and a half wide, formed by four blocks of granite; and continued slanting downward at the same inclination as that of the pyramid of Cheops, which is an angle of 26°. It runs to the length or 104 feet five inches, lined the whole way with

granite. I had much to do to remove and draw up the stones which filled the passage down to the portcullis or door of granite, which is fitted into a niche also made of granite. I found this door supported by small stones within eight inches of the floor, and in consequence of the narrowness of the place it took up the whole of that day and part of the next to raise it sufficiently to afford an entrance; this door is one foot three inches thick, and, together with the work of the niche, occupies six feet eleven inches, where the granite work ends: then commences a short passage, gradually ascending towards the centre, twenty-two feet seven inches, at the end of which is a perpendicular of fifteen feet: on the left is a small forced passage cut in the rock, and also above, on the right, is another forced passage which runs upwards and turns to the north thirty feet, just over the port-cullis. There is no doubt that this passage was made by the same persons who forced the other, in order to ascertain if there were any others which might ascend above, in conformity to that of the pyramid of Cheops. I descended the perpendicular by means of a rope, and found a large quantity of stones and earth accumulated beneath, which very nearly filled up the entrance into the passage below which inclines towards the north. I next proceeded towards the channel that leads to the centre, and soon reached the horizontal passage. This passage is five feet eleven inches high, three feet six inches wide, and the whole length, from the above-mentioned perpendicular to the great chamber, is 158 feet, 8 inches. These passages are partly cut out of the living rock, and at half-way there is some mason's work, probably to fill up some vacancy in the rock; the walls of this passage are in several parts covered with incrustations of salts.

'On entering the great chamber, I found it to be forty-six feet three inches long, sixteen feet three inches wide, and twenty-three feet six inches high; for the most part cut out of the rock, except that part of the roof towards the western end. In the midst we observed a sarcophagus of granite, partly buried in the ground, to the level of the floor, eight feet long, three feet six inches wide, and two feet three inches deep inside, surrounded by large blocks of granite, being placed apparently to guard it from being taken away, which could not be effected without great labor; the lid of it had been opened; I found in it only a few bones of a human skeleton, which merit preservation as curious reliques, they being in all probability those of Cephrenes, the reported builder of this pyramid. On the wall of the western side of the chamber is an Arabic inscription, a translation of which has been sent to the British Museum. It testifies that, 'this pyramid was opened by the Masters Mahomet El Aghar and Otman, and that it was inspected in presence of the Sultan Ali Mahomet the 1st, Ugloch.' There are also several other inscriptions on the walls, supposed to be Coptic; part of the floor of this chamber had been removed in different places, evidently in search of treasure, by some of those who had found their way into it. Under one of these stones I found a piece of metal something like the thick part of

an axe, but it is so rusty and decayed that it is almost impossible to form a just idea of its form. High up and near the centre there are two small square holes, one on the north and the other on the south, each one foot square; they enter into the wall like those in the great chamber of the first pyramid. I returned to the before-mentioned perpendicular, and found a passage to the north in the same inclination of 26° as that above: this descends forty-eight feet six inches, where the horizontal passage commences, which keeps the same direction north fifty-five feet, and half-way along it there is on the east a recess of eleven feet deep. On the west side there is a passage, twenty feet long, which descends into a chamber thirty-two feet long and nine feet nine inches wide, eight and six feet high; this chamber contains a quantity of small square blocks of stone, and some unknown inscriptions written on the walls. Returning to the original passage, and advancing north, near the end of it is a niche to receive a port-cullis like that above. Fragments of granite, of which it was made, are lying near the spot; advancing still to the north I entered a passage which runs in the same inclination as that before-mentioned, and at forty-seven feet six inches from the niche it is filled up with some large blocks of stone, put there to close the entrance which issues out precisely at the base of the pyramid. According to the measurements, it is to be observed that all the works below the base are cut into the living rock, as well as part of the passages and chambers before-mentioned. Before I conclude I have to mention that I caused a range of steps to be built, from the upper part of the perpendicular to the passage below, for the accommodation of visitors.

'It may be mentioned that, at the time I excavated on the north side of the pyramid, I caused the ground to be removed to the eastward between the pyramid and the remaining portico which lies nearly on a line with the pyramid and the sphinx. I opened the ground in several places, and in particular at the base of the pyramid; and in a few days I came to the foundation and walls of an extensive temple, which stood before the pyramid at the distance of only forty feet. The whole of this space is covered with a fine platform, which no doubt runs all round the pyramid. The pavement of this temple, where I uncovered it, consists of fine blocks of calcareous stone, some of which are beautifully cut and in fine preservation; the blocks of stone that form the foundation are of an immense size. I measured one of twenty-one feet long, ten feet high, and eight in breadth (120 tons weight each); there are some others above ground in the porticoes which measured twenty-four feet in length, but not so broad nor so thick.'

The great pyramid of Gizeh was explored with extraordinary labor and peril by Mr. Davison, British Consul at Algiers, who accompanied Wortley Montague to Egypt, in the year 1763; and, in order to apprehend the importance of the recent discoveries, it is necessary to understand the extent to which that gentleman had carried his researches.

One of his principal objects was to ascertain the depth of what had hitherto been denominated the Well. After descending, by means of a rope tied about his body, to the bottom of the first shaft, he found, on the south side, at the distance of eight feet from the lower extremity of that shaft, a second opening which reached in a perpendicular direction to the depth of only five feet; and, at the distance of four feet and a half from the bottom of this shaft, he found a third opening, which was so much closed up by a large stone at the mouth as barely to admit the body of a man. Having with the utmost difficulty prevailed upon the Arabs who accompanied him to come down and hold the rope by which he was suspended, he proceeded in his descent, and about half way down he came to a grotto nearly fifteen feet long, four or five feet wide, and as high as a man of ordinary stature. From this place the shaft took a sloping direction for a little way, and then becoming more perpendicular, he at length reached the bottom which was completely closed with sand and rubbish. Here he found a rope ladder, which had been used by Mr. Wood (author of the Ruins of Palmyra and Balbec), who had proceeded no farther than the grotto; and, though it had been left there sixteen years before, was as fresh and strong as if perfectly new. The depth of the first of these shafts was twenty-two feet, of the second twenty-nine, and of the third ninety-nine, making, with the addition of the five feet between the first and second shafts, a total descent of 155 feet.

Upon a subsequent visit, Mr. Davison next proposed to explore an opening which he had discovered at the top of the gallery: and for this purpose provided himself with several short ladders, capable of being fastened to one another by wooden pins, so as to extend, when thus united, to the length of twenty-six feet. Having mounted by the assistance of this ladder to the opening which he had observed, he found a passage two feet four inches square, which turned immediately to the right; but, on account of the dust and bats-dung with which it was covered to the depth often of a foot, it was with the greatest difficulty, and the constant hazard of suffocation, that he crawled along with his face to the ground. Upon reaching the end of this passage, he found on the right a straight entrance into a long, broad, and low room; and, both by the length and direction of the passage through which he had entered, he knew it to be situated immediately above the large room, usually called the king's chamber. This chamber is four feet longer than the one below, but exactly of the same breadth, and its covering is composed of eight stones of beautiful granite. This place could not be found by Niebuhr, though informed of its situation by Mr. Meynard who had accompanied Mr. Davison, and has never been visited since the time of the last-mentioned traveller, till the date of those recent discoveries which we now proceed to describe.

Captain or Mr. Caviglia, the master of a mercantile vessel in the Mediterranean trade, set out from Cairo on the 8th of January 1817, with a resolution to employ his utmost exertions in exploring the numerous passages and interior re-

cesses of the pyramids of Ghizeh. Conceiving that the descent of the Well in the great pyramid had never been thoroughly prosecuted, he entered the shaft, as Mr. Davison had done, with a lamp in his hand and a rope about his middle. He describes the different shafts nearly in the same manner as that gentleman does, but discovered the additional fact, that the interior was lined with masonry above and below the grotto, for the purpose, as was supposed, of supporting one of those insulated beds of gravel, which are frequently found in rock. He found nothing at the bottom but loose stones and rubbish; and was compelled, by the excessive heat and foul air, to reascend the shaft with all possible expedition; but, before he reached the grotto, all his lights were extinguished in rapid succession. Neither this experience of the enervating heat and impure air of these subterranean channels (which have often been known to cause the stoutest man to faint, even in getting up as far as the gallery), or the various histories current in Cairo of persons who were supposed to have perished in these attempts, could deter this enterprising traveller from renewing his researches, with a degree of perseverance as unexampled as his success was unexpected. Having remarked that the ground at the bottom of the Well gave a hollow sound under his feet, he was convinced that there must be some concealed outlet below; and, having pitched his tent in front of the pyramid, he hired a number of Arabs to draw up the rubbish from the spot with baskets and cords. With the aid of an order from the Kiaya-Bey, and the payment of enormous wages, 'it is still,' says Mr. Salt, 'almost inconceivable how he could so far surmount the prejudices of these people as to induce them to work in so confined a space, where a light after the first half hour would not burn, and where, consequently, every thing was to be done by feeling and not by sight; the heat at the same time being so intense, and the air so suffocating, that, in spite of all precautions, it was not possible to stay below an hour at a time, without suffering from its pernicious effects. At length, indeed, it became so intolerable that one Arab was brought up nearly dead, and several others on their ascending fainted away; so that, at last, in spite of the command laid upon them, they almost entirely abandoned their labor, declaring that they were willing to work but not to die for him.'

Disappointed in this pursuit, Mr. Caviglia applied his endeavours to clear the principal entrance of the pyramid, which had from time immemorial been so much obstructed as to render it necessary for those who entered the passage to creep on their hands and knees: by this means he hoped to admit a freer passage for the air into the interior. In the course of these labors he made the unexpected discovery that the main passage leading from the entrance continued downwards, with the same degree of inclination, the same dimensions, and the same finish of work at the sides, as at the beginning of the channel. Having cleared out this inclined passage to the length of 150 feet, the air became so impure, and the heat so suffocating, that he experienced the same difficulties in pre-

vailing with the Arabs to continue the work, and was himself attacked with spitting of blood, and other symptoms of impaired health. Still, however, persevering in his researches till he had excavated the passage to a distance of 200 feet, his labors were rewarded with the discovery of a door-way on the right side, from which a smell of sulphur was soon perceived to issue. Recollecting, that in his first visit to the pyramid, he had burned some sulphur at the bottom of the well, for the purpose of purifying the air, he conceived the probability of there being a communication by this door-way with the well. This conjecture was soon realised by the discovery that the channel opened directly upon the well, where he found the baskets, cords, and other implements, which had been left by the workmen. The opening of this communication afforded a complete circulation of air along the new passage, and up the shaft, so as greatly to facilitate his future operations. This new passage, however, did not terminate at this door-way; but, continued twenty-three feet farther, in the same line of inclination, till at length it took a horizontal direction for the space of above twenty-eight feet, and then opened into a spacious chamber immediately under the centre of the pyramid, and 100 feet below the base. This chamber, with the greatest part of the passage leading to it, is all cut out of the solid rock upon which the pyramid is built, and which projects into the body of the pyramid about eighty feet above the level of its external base. The chamber itself is sixty feet long, twenty-seven broad, with a high but flat roof; and, when first discovered, was nearly filled with loose stones and rubbish. The platform of the floor is irregular, nearly one-half of its length from the entrance being quite level, and about fifteen feet from the ceiling; while, in the middle space, it descends five feet lower, where there is an opening or hollow, resembling the commencement of another shaft or well; and thence, to the western end, it rises so much that there is scarcely room, at the extremity, to stand upright between the floor and the ceiling. Some Roman characters, rudely formed, and marked by the flame of a candle, were observed on the walls; but the mouldering of the rock had rendered them illegible. There was no vestige of any sarcophagus; and it is supposed that this receptacle of the dead had been spoiled of its contents by the early Arabs, under Al Mamoun, the son of Haroun al Raschid. On the south side of this chamber is an excavated passage, just sufficient to admit a person creeping along on his hands and knees, and continuing horizontally for the space of fifty-five feet, when it seems to terminate abruptly. Another passage, at the east end of the chamber, commencing with a kind of arch, runs about forty feet into the solid body of the pyramid.

Dr. Clarke says of the above well, 'We threw down some stones, and observed that they rested at about the depth which Greaves has mentioned (twenty feet); but being at length provided with a stone nearly as large as the mouth of the well, and about fifty pounds in weight, we let this fall, listening attentively to the result from the spot where the other stones rested. We were agree-

ably surprised by hearing, after a length of time which must have equalled some seconds, a loud and distinct report, seeming to come from a spacious subterraneous apartment, accompanied by a splashing noise as if the stone had been broken into pieces, and had fallen into a reservoir of water at an amazing depth.' 'Thus,' continues the doctor, 'does experience always tend to confirm the accounts left us by the ancients! for this exactly answers to the description given by Pliny of this well.' Now it is quite obvious, from Messrs. Davison and Caviglia's better 'experience,' that Dr. Clarke's 'large stone' could not, by any possibility, travel an inch beyond the bottom of the first shaft, or about twenty feet; unless we are to suppose that, on reaching the first bottom, it took a horizontal roll due south eight feet, dropped down the second shaft of five feet; then took a second roll of about five feet, and finally tumbled down the third shaft: but even thus there would be no 'splashing,' though 'the inundation of the Nile was nearly at its height;' as the new chamber discovered by Caviglia, which is even lower than the bottom of the well, is thirty feet above the level of the Nile at its greatest elevation.

Mr. Caviglia next proceeded to examine the chamber discovered by Mr. Davison, immediately above the king's chamber, and found the dust and bats' dung with which the floor was covered, increased to the depth of eighteen inches. He describes the sides and the roof of this upper apartment as coated with red granite of the finest polish, but its floor is very uneven, in consequence of its being formed by the individual blocks of granite which compose the roof of the chamber below. It is only four feet high; and it is not easy to conjecture for what purpose it could have been intended. Nothing was discovered by Mr. Caviglia that could lead to a solution of the long contested question respecting the original design of these recesses; but it is still considered as the most probable opinion that they were principally intended to secure the remains of the founder, or of the priests; and it is also conjectured that, among the contents of the sarcophagus, discovered in the pyramid of Cephrenes, some human bones may have been mixed with those of the cow.

Few subjects have occasioned more speculation than the intent and use of the Egyptian pyramids. About forty years since, a German professor published a volume to prove that these majestic remains of the most remote antiquity are nothing more than basaltic eruptions, magnificent sports of nature, and so many incontrovertible proofs of the general derangement which has taken place on the globe! It is, indeed, a remarkable example of human vanity that these buildings, reckoned among the wonders of the world, should not have preserved more certain data of their origin. Pliny mentions a number of authors who in his time had written concerning them; and all, he informs us, disagree in their accounts of those who built them. Some modern writers maintain that they were erected by the Israelites, under the tyranny of the Pharaohs, and allege to this purpose the testimony of Josephus, Antiq. lib. i. cap. 5.

According to Herodotus, and to Diodorus, the first pyramid was erected by Cheops, or Chemmis, a king of Egypt, who is said to have employed 360,000 men for twenty years in the structure. Cephrenes, brother and successor to the former king, is said to be the founder of the second pyramid; and the third is said to have been built by Mycerinus, the son of Chemmis, according to Diodorus; or, according to Herodotus, of Cheops. However, Herodotus says, that some ascribed the last to Rhodope, a courtesan, and the other two to the shepherd Philition. The learned Greaves places the three kings who erected these pyramids in the twentieth dynasty; Cheops having begun his reign in the year 3448 of the Julian period, 490 years before the first Olympiad, and 266 years before the Christian era. He reigned fifty years, says Herodotus, and built this pyramid, as Diodorus observes, in the 180th Olympiad; whereas he might have said 1207. Cephrenes, the builder of the second, reigned fifty-six years; and Mycerinus, the builder of the third, seven years. Bryant ascribes the structure of the pyramids to the Cuthites, or Arabian shepherds, who built Heliopolis, and who were the giants and Titans of the first ages.

The general opinion with regard to their intention and use is, that they were sepulchres and monuments of the Egyptian monarchs. This is expressly affirmed by Diodorus and Strabo, and the opinion is confirmed by the Arabian writers. The reason, says Greaves, of their erecting these magnificent structures is founded in the theology of the Egyptians, who, as Servius shows in his comment upon Virgil (*Æneid*, lib. iii.), believed that as long as the body endured so long the soul continued with it; and this was also the opinion of the Stoics. Upon this principle, that the bodies might neither be reduced to dust by putrefaction, nor converted into ashes by fire, they embalmed them, and laid them up in these stately repositories, where they might continue free from injury. Many, however, have objected to this account of the pyramids, and are of opinion that they were originally intended for some nobler purpose. If Cheops, says Dr. Shaw, or any other person who was the founder of the great pyramid, intended it only for his sepulchre, what occasion was there for such a narrow crooked entrance into it; for the well, as it is called, at the end of the entrance; for the lower chamber; for the long narrow cavities in the walls of the upper room; or, for the two anti-chambers and the lofty gallery, with benches on each side that introduce us into it. As the whole of the Egyptian theology was clothed in mysterious emblems and figures, it seems reasonable to suppose, he adds, that all these turnings, apartments, and secrets in architecture were designed for some purpose of religion, and that the deity, which was typified in the outward form of this pile, was to be worshipped within.

Major Fitzclarence, in his journey over land from India, reached Cairo shortly after the opening of the pyramid of Cephrenes had been accomplished by Belzoni; and, with the zeal and enterprize of his profession, he determined to enter into the pyramid and examine for himself,

the wonders of the central chamber, so recently laid open. With less reverence, perhaps, for the august repository of the mighty dead than might have been felt by a contemporary of the Pharaohs, he brought away a few fragments from the domus exilis Plutonia, and among the rest some small pieces of bone, one of which proved to be the lower extremity of the thigh bone, where it comes in contact with the knee joint. This singular curiosity was presented by major Fitzclarence to his royal highness the prince Regent, who submitted it to the inspection of Sir Everard Home. Sir Everard, entertaining no doubt of its being part of a human skeleton, took it to the Museum of the College of Surgeons, that, by adjusting it to the same part of different sized skeletons, he might be enabled to form some estimate of the comparative stature of the ancient Egyptians and modern Europeans. On a closer and more laborious examination, however, the fragment was found to agree with none of them; and it finally appeared that, instead of forming any part of the thigh bone of a human subject, it actually made part of that of a cow.

The large sarcophagi, instead of being the depositories of the remains of the kings of Egypt, would hence appear to have been hollowed out and sculptured with such extraordinary skill and pains to receive the mortal exuvæ of the tutelary deities; and those immense masses in which they were entombed to have owed their boundless cost and magnificence to a reverential regard for 'the brutish forms' of Apis or Osiris. Probably also the kings of Egypt would order their bones to be placed with those of their gods, and thus give rise to the tradition delivered to us by Herodotus.

Some have supposed that these stupendous monuments were erected by the Egyptians as temples or altars to their god Osiris or the sun. It was natural, say they, to build them in that shape which the rays of the sun display when discovered to the eye, and which they observed to be the same in terrestrial flame, because the circumstance was combined in their imaginations with the attribute which they adored. If they were temples dedicated to the sun, it seems a natural consequence that they should likewise be places of sepulture for kings and illustrious men, as the space which they covered would be considered consecrated ground. This hypothesis is common, and is not contradicted by the present reasoning. But considering them as altars, and, as most travellers agree that they terminate in a square horizontal surface, they venture to assert that, in great and solemn acts of adoration, the Egyptians constructed fires, the flames of which, terminating in the vertex of the pyramid, completed that emanation of their deity which they admired and adored. The learned Bryant, having settled them to be temples consecrated to the deity, had no difficulty in transforming the sarcophagus into a water-trough to hold the sacred element drawn up from the Nile—a conception about as felicitous as that which would have converted the supposed sarcophagus of Alexander into a bathing-tub; a prof of which was in the holes in the bottom to let out the water!

Dr. Clarke rejects entirely all that the Greeks

have told us respecting the names of their founders, and the circumstances under which they were erected; and has recourse, as he tells us, to Arabic or Jewish tradition, to prove that some of these vast piles were raised by the Israelites during their abode in Egypt, and that the particular pyramid which is now open was the tomb of the patriarch Joseph. Its being now open is, of course, accounted for by the fact that his bones were removed by his countrymen on their departure for Canaan! 'On the whole,' say the Quarterly Reviewers, 'we can find no reason for depriving Cheops, Cephrenes, and Mycerinus of the wicked renown of having raised the useless and oppressive piles which bear their name; and though it is impossible to say when the first pyramids were erected, and whether some of them may be or may not be the work of the Israelites, it is utterly unlikely that any of them were raised by this people on their own account, or in honor of the patriarch Joseph.'

Before we take leave of these vast piles, we must advert to a circumstance which is too remarkable to be passed over. In all the pyramids that have been opened, which at Gizeh and Saccara amount at least to six, the entrance has been found at or near the centre on the northern face, and the passage thence to proceed invariably in a slanting direction downwards; the angle of the inclination being always the same. Greaves, in his *Pyramidographia*, makes that of Cheops 26° , and Cavaglia 27° , which, he says, is common to all the sloping passages within the pyramid of Cheops. He found the same angle on opening one of the small pyramids to the south of that of Mycerinus, at the end of the passage of which were two chambers, leading one out of the other, both empty. Belzoni estimates the sloping passages of the pyramid of Cephrenes at 26° . This coincidence cannot be referred to accident, and the able Reviewer, just quoted, suggests that these passages might have been used to correct their measurement of time. The adits, as we have observed, are invariably inclined downwards, in an angle of about 27° , more or less, with the horizon, which gives a line of direction not far removed from that point in the heavens where the north polar star now crosses the meridian below the pole. The observation of the passage of this or some other star across this part of the meridian would give them an accurate measure of sidereal time: a point of the first importance in an age when no other instruments than rude solar gnomons, or something still more imperfect, were in use. Indeed, we know not of any method that could more effectually be adopted for observing the transit of a star with the naked eye than that of watching its passage across the mouth of this lengthened tube; and some one or more of these luminaries, when on the meridian below the pole, must have been seen in the direction of the angular adits. Dr. Young, however, observes that the observation of the pole-star was at least extremely ill contrived for the determination of time, on account of the very slow apparent motion of that star.

The pyramids of Saccara, though second only in importance to those of Gizeh, so nearly resem-

ble them in every particular as to need no separate description.

At Dashouf is a large pyramid of brick, called by Herodotus the pyramid of Asychis, and on which he reports was the following remarkable inscription:—'Do not compare me with the pyramids of stone; for I excel them as much as Jupiter excels the other gods: for those who built me thrust poles into a lake, and, collecting the mud which adhered to them, they made bricks of it, and thus they constructed me.' See EGYPT, SPHINX, and THEBES.

PYRAMUS, in ancient geography, a river of Cilicia, which rises on the north side of Mount Taurus, and runs into that part of the Mediterranean anciently called the Pamphylian Sea, between Issus and Magarassus.

PYRAMUS, in fabulous history, an unfortunate youth of Babylon, who fell in love with Thisbe, whom, as their parents disapproved of their union, he appointed to meet with in a wood; but, finding her veil all bloody, concluded she had been torn to pieces by a wild beast, on which he killed himself; and Thisbe soon after coming to the spot, and finding him dying, fell upon his sword also. Ovid celebrates their unfortunate love.

PYRE, *n. s.* Lat. *pyra*; Gr. *πυρ*. A pile to be burnt.

When his brave son upon the fun'ral pyre
He saw extended, and his beard on fire. *Dryden.*

Divination was invented by the Persians, and is seldom or never taken in a good sense; there are four kinds of divination, hydromancy, *pyromancy*, aeromancy, geomancy. *Ayliffe.*

Pyrites contain sulphur, sometimes arsenic, always iron, and sometimes copper. *Woodward.*

With tender billet-doux he lights the pyre,
And breathes three am'rous sighs to raise the fire. *Pope.*

Let earth dissolve, yon ponderous orbs descend,
And grind us into dust. The soul is safe;
The man emerges: mounts above the wreck,
As tow'ring flame from nature's funeral pyre. *Young.*

PYREIA, or PYRATERIA, in antiquity, temples consecrated to the sun, wherein a perpetual fire was kept. They were large enclosures built upon high eminences, without any covering. The Guebres, or worshippers of fire in Persia and the East Indies, have still these pyreia.

PYRENEUS, in fabulous history, a king of Thrace, who during a storm gave shelter to the nine Muses in his palace; but afterwards attempted to offer them violence, upon which the goddesses took to their wings and flew away; and Pyreneus, attempting to fly after them from the top of a tower, fell and was killed.

PYRENE, an ancient town of Gallia Celtica, near the source of the Istor: also a fountain near Corinth.

PYRENEES, DEPARTMENT OF THE LOWER, is formed out of the former provinces of Navarre and the Bearn, France, and derives its name from its being situated at the western extremity of the Pyrenees. The principal place of this prefecture is Pau; it is divided into five arrondissements or subprefectures, containing a total population of 399,454 souls, on an area of 3492

square miles, and yielding a territorial revenue of 15,392,000 francs. These are subdivided into forty cantons and 655 communes, and form three electoral arrondissements, which send three members to the chamber of deputies. It is in the eleventh military division, having a royal court at Pau and a bishopric at Bayonne. This department is bounded on the north by the Landes and the Gers; on the east by that of the Upper Pyrenees; on the south by the Pyrenean Mountains, which separate it from Spain, and on the west by the ocean.

The surface of this country, generally mountainous and unequal, presents a great variety of productions, and agreeable and diversified scenery. It abounds with rising grounds, covered with vines yielding excellent wine, beautiful valleys affording good pasturage, and uncultivated and wild plains. On the southern side runs a range of high mountains covered with wood, terminating westward in the Pyrenees; these diminish gradually in elevation till they are lost in the sea. The soil is naturally dry and barren, and yields its produce only by dint of labor. The small plains and valleys produce rye, wheat, barley, oats, millet, and maize, on which the people chiefly subsist; hay, and very soft and fine flax, which serves for the manufacture of the Bearn linens. Great quantities of chestnuts are gathered here. Game of all kinds abounds, and the forests furnish wood for masts, timber, and building. The climate is very temperate in the plains, but cold in the mountains; yet every where very healthy. Horses and mules are used in agriculture, but the produce is insufficient for its inhabitants. There are 112,225 hectares of forests (chestnuts, oaks, pines, and firs), and 16,700 of vineyards, yielding on an average sixteen francs seven centimes per hectare of arable land. The productions are corn of all sorts, chestnuts, excellent fruit and wines, fine linen, gall nuts, salt and fresh water fish, particularly salmon, tunnies, turbot, lampreys, pilchards, and excellent trout, horses for cavalry, mules, sheep, and small horned cattle, and pigs. There are mines of silver, iron, and copper, and quarries of marble of every color, granite, slate, marl, sulphur, and cobalt; mineral waters at Laurens, at Aas, and at Cambo, and a royal stud at Pau. The manufactures chiefly consist in Bearn linens, cotton, handkerchiefs, table linen, woollen counterpanes, twine, coarse serge, stuffs for hoods, Tunisian caps, carpets, quilts, chocolate, Andaye brandy, and cream of tartar; besides cotton spinning factories, tan-yards, manufactories of white and chamois leather, dye-houses, paper-mills, and dock yards for ship building. A considerable trade is carried on in these articles, as well as drugs, liquorice juice, resinous matters, timber, salt, fine wool, Bayonne hams, &c.

The chief rivers are the Adour, the Bidassoa, the Bidouze, the Nivelle, the Nive, and the gave d'Aleron, navigable; the Rixe, the Laran, the Luy de Bearn, the Luy de France, the Gabas, the Gaves de Pau, d'Aspe, d'Ossau, and de Mauleon. It is crossed by the great roads of Mont de Marsan, Auch, Tarbes, and Bayonne.

PYRENEES, DEPARTMENT OF THE UPPER, is formed out of the Bigarre, a dependency of the

former province of Gascony, and takes its name from its natural situation in the Pyrenean Mountains. The principal town is Tarbes. It is divided into three arrondissements or subprefectures; containing a total population of 211,979 souls, on an area of 2115 square miles, and yielding a revenue of 7,769,000 francs. It is subdivided into twenty-six cantons and 501 communes; it is in the tenth military division; forms part of the diocese of Bayonne, having its royal court at Pau, and consists of three electoral arrondissements, which send five members to the chamber of deputies. This department is bounded on the north by that of the Gers, on the east by that of the Upper Garonne, on the south by the Pyrenean Mountains, which divide it from Spain, and on the west by the department of the Lower Pyrenees.

This country is covered with lofty mountains, the tops of which are covered with perpetual snows; some presenting bare peaks, towering into the clouds and receiving at their feet the waters of numerous torrents. The mountains next in size to these have their tops covered with ancient forests, which furnish excellent wood for building and other purposes: here are found a number of rare and useful plants, and excellent pasturage, feeding numerous flocks of goats and sheep. Among the mountains are scattered fertile plains, rich pastures, and vine covered hills, producing good red and white wine. The region of hills which succeeds to the large valleys is particularly well cultivated; the plains produce a little wheat, some hay, rye, barley, and especially millet. The climate is temperate in the plains, and very cold in the mountains. The inhabitants of the Upper Pyrenees are in general simple, brave, and generous; the soil is partly cultivated with mules, and yields an insufficient supply for its inhabitants. There are 67,530 hectares of forests (chestnuts, oaks, beech, and fir), and 11,000 hectares of vineyards; the produce of each hectare of arable land being thirteen francs eighty-five centimes.

Beside the above-mentioned productions, buckwheat and maize are grown here; mulberry trees, potatoes, figs, and herbs of different kinds; honey and wax are made; there are good fresh-water fish, particularly trout; horses suited for light cavalry, many mules and asses, a fine species of horned cattle, numerous flocks of sheep, shepherds' dogs remarkable for their size and extraordinary strength, pigs, goats, poultry, especially geese, bees, &c. Iron mines are found; and quarries of asbestos, granite, ochre, marble, granite, marle, fullers' earth, potters' clay, &c. There are establishments of mineral waters at Bagnères de Bigorre, Barèges, Cauterets, Luz, Cadeac, Capoerne, Siradan, and St. Marie. Manufactures are carried on here, of bolting-cloths, twine, serge, linen cloths, light stuffs, crapes, shawls, cudgels, agricultural instruments, cutlery, nails, leather, coarse paper, and brandy; and there is a considerable trade in excellent butter, cheese, honey, provisions of all kinds, sheep and lambs, pigs, hams, poultry, wood, timber for camps, hoops, wooden shoes, &c.

The principal rivers that water this department are the Adour, the Garonne, the Neste, the Gers,

the Gave de Pau, the Arros, and the Estreux; and it is crossed by the great roads of Pau, Auch, and Mont-de-Marsan.

PYRENEES, DEPARTMENT OF THE EASTERN, is formed out of the ancient province of Roussillon, and takes its name from the eastern part of the Pyrenean Mountains, among which it is situated. The principal place of this prefecture is Perpignan, and it is divided into three arrondissements or sub-prefecturés; containing a population of 133,446 souls, on a superficial extent of 1908 square miles; and yielding a territorial revenue of 7,351,000 francs. These are subdivided into seventeen cantons and 248 communes, and consist of two electoral arrondissements, that send two members to the chamber of deputies. It forms part of the tenth military division, in the diocese of Carcassonne, and has a royal court at Montpellier. This department is bounded on the north by that of the Aude; on the east by the Mediterranean; on the south by the Pyrenean Mountains, which divide France from Spain; and on the west by the department of the Arriège.

This country is intersected with lofty mountains, which join on the Pyrenean chain, and are the highest of all the range between the Mediterranean and the Ocean. They are covered with snow and ice, and give rise to a great number of rivers, which, on account of their great declivity, are destitute of water for one part of the year; but in the rainy season, or when the snows are melted, they become impetuous torrents, the overflowing of which often causes dreadful ravages. The surface is divided into three great basins by the Tet, the Tech, the Agly, and the Aude, and generally affords a fertile soil, suitable for every purpose of agriculture. There are commonly two harvests in those lands which are watered. The hedges are formed in a great measure of pomegranate trees; orange and citron trees flourish every where in the open field; and the hills and uncultivated parts are covered with thyme, rosemary, creeping thyme, lavender, juniper, and mulberry trees. The climate is rather warm; the winter here is a kind of spring; the heat is sometimes very great in summer, and in some cantons the air would be rather unhealthy, were it not often purified by a wind from the north-west called tramontane. The soil is cultivated with mules, and yields a full supply for its inhabitants: there are 47,229 hectares of forests, chiefly firs, pines, and beech; and 35,500 hectares of vineyards, yielding an average produce of sixteen francs thirty centimes on each hectare of arable land.

The productions are wheat, barley, millet, maize, vegetables, melons, excellent fruits, flax, hemp, oak, kermes, wood, salt-marshes, wine, fine honey, mulberries, olives, lavender, &c., small game, sea fish in abundance, mules, some cows, numerous flocks of merino sheep (famed for the flavor of their flesh and the fineness of their wool), poultry, bees, silk-worms, cachemire goats, &c. There are also mines of iron, antimony, and coal, and quarries of white and colored marble, limestone, &c. They have hot baths at Arles, Molitg, Lapreste, Escaldes, and Vernet. The manufactures consist of common cloth, wool-

len stuffs and caps, corks, forged iron, and leather; and a trade is carried on in all the above articles.

The principal rivers that water the department are the Tet, the Tech, the Gly, the Cantarana, the Reart, and the Segre; and it is crossed by the great roads of Narbonne, Figuières, and Payarda.

PYRENEES, a great chain of mountains separating France from Spain, and extending from the port of Vendres on the coast of the Mediterranean to the Atlantic Ocean near Fontarabia. It is about 210 miles long; its direction is nearly from S. S. E. to N. N. W.; and both on the side of Spain and that of France it consists of several parallel ridges, varying in breadth from sixty to 120 miles. On the side of France these mountains project several branches, which run through those departments that are on the Spanish frontier. The two most considerable of these are that which crosses the departments of the Arriège and the Aude, and unites with the Alps near Castelnaudary, and that which, crossing the departments of the Upper Pyrenees and the Gers, terminates on the borders of the departments of the Landes and the Gironde. Next to the Alps these are the highest mountains in Europe; they rise gradually to the top, which serves as a point of demarcation, and at the two extremities sink in elevation down to the level of the Ocean and the Mediterranean. The highest summits of the chain are, according to M. Humboldt, the top of Nethon about 10,722 feet above the level of the sea, Posets 10,584 feet, Mount Perdu 10,576, Le Cylindre 10,374, the pic-du-Midi 8958, and Canigou 8946 feet.

The Pyrenees are less steep on the French side than on that of Spain; the most elevated summits are covered with snow during a great part of the year, and at the height of 7200 the snows never melt, but occupy a zone of from 3000 to 3600 feet, that resists all the rays of the sun; on the north and west, however, they almost always melt. From Marbore to Maladetta there is a great number of glaciers, which the eye can distinguish afar off by their bluish tint, by their even appearance, and by the clefts which cross them. The air of the higher mountains is as unwholesome as that of the lower ones is healthy. In the month of May impetuous cataracts precipitate themselves on all sides from the tops of the Pyrenees, and inundations caused by the sudden melting of the snows and the abundant rains soon fill up all the close valleys. Trees broken by the violence of the winds often choke the course of the torrents, or, carried away themselves, drag with them the crops and the houses hanging on the declivity of the mountains. Enormous masses of rocks, which appeared immovable, are now dashed from steep to steep, carrying every thing before them. To these avalanches we may add those which are occasioned in the winter by the abundant snows, which the storms loosen from the summits and precipitate into the ravines, and which increasing in size as they advance, and dragging with them masses of stone and earth, sometimes form bridges over the torrents and fill up the valleys. Often they are accompanied with a tremendous hissing; nothing

can resist their force; and the agitation of the air which they produce is so violent that every obstacle to their progress is overturned. In the neighbourhood of Baréges whole villages have sometimes been thus overwhelmed.

No country is richer in natural productions than that of the Pyrenees; the geologist may find here numberless beauties, and ever fresh sources of instruction; the mineralogist a multitude of the most curious minerals; the botanist, passing in the same day from the greatest heat to the most intense cold, meets in his way every species of plants, from those which grow in the Alps and in Sweden to those which flourish in Spain. In the middle part mineral springs abound; but, though some are of great efficacy, they are little used. The most celebrated, and which have establishments greatly frequented, are the baths of Mollit, Baréges, Bagnères, Arles, Vernet, La Preste, Ax, Cambo, Cauterets, Nossa, Olette, Nyer, and the warm springs of the Cerdagne, generally known by the name of Lascaldas.

Since the above has been prepared for press our attention has been directed to the Geological Conjectures of Mr. Charpentier, director of the Canton de Vaud mines, respecting the original form and construction of the Pyrenees. The following is an abstract of them as given in his *Essai sur la Constitution Geostroique des Pyrenees*, a very sensible and distinguished performance.

‘We have seen,’ says this writer, ‘that the different formations are disposed in bands parallel to each other and parallel to the general direction of the Pyrenees; that the granite forms only a single band, or, speaking more correctly, a chain or series of protuberances; that each of the other formations constitutes in general two bands, one of which is situated to the north, the other to the south of the granitic chain, resting upon it in the order of their relative antiquity; that many of these granitic protuberances are separated from one another by valleys, while others, on the contrary, are, as it were, agglutinated by rocks of later origin, which have filled up the spaces or vacancies by which they were formerly separated; and, lastly, that it is commonly in the spaces which exist between two great protuberances that we observe the bands that occur to the south of the granitic chain, touching and mingling with those which occur to the north. These facts entitle us to presume that the granitic formation, comprising that of mica-slate and primitive limestone, formed originally an uninterrupted chain, or rather an elongated line, having a direction from south-east to north-west, and being of a height, whether absolute or relative, much greater than at the present day; that at a period anterior to the formation of the other rocks which recline upon it, this granitic chain has undergone degradations caused by a power (perhaps currents of water) which, acting horizontally from south to north, or from north to south, has broken its ridge in many parts, scooped it out to a great depth, and changed it into a series of more or less isolated eminences; that the rocks formed after this revolution have been applied on each side against this central granitic chain, have filled up its deepest hollows, and have even cover-

ed its lowest protuberances; and that, lastly, immediately after this revolution, the ridge of the primitive formation was, without doubt, at the same time that of the whole chain of the Pyrenees.

‘Now, as we observe at the present day that the ridge of the Pyrenees, with the exception of a small number of places, is no longer the ridge of the granitic chain, which is found removed at some distance to the north; but that this geographic ridge is composed of more modern rocks, which generally surpass the primitive formation in height, we are naturally led to presume that the Pyrenees have undergone a second very considerable degradation. The disposition of the rocks, and the external form of the mountains, appear to determine the period of this revolution. It is probable that it has taken place after the formation of the transition deposite, and before the excavation of the presently existing valleys, and consequently before the deposition of the trap formation, which, as we shall see in the sequel, appears to be of a very late origin.

‘Observation tends to induce a presumption that this degradation has principally attacked the ridge then existing, and all the northern aspect of the chain. We shall represent by a diagram the results which have given rise to this supposition.

‘The figure shows the vertical and transverse

section A B C of the Pyrenees in the direction of their breadth, such as we presume it to have been before these mountains underwent the degradation of which we have been speaking. We see in this section the two declivities A B and A D of equal size; the granite occupying the centre, and forming the ridge of the chain; the transition formation, and the secondary formation, distributed in nearly equal quantities upon the south and north sides, resting upon the granite. Let us now suppose that all the portion of these mountains situated between A, B, and C, has been destroyed by the effect of some power acting from north to south, in such a manner that there remains only the part situated between C, B, and D.

‘The necessary consequence of this degradation would be a considerable change in the external form of the whole chain of mountains, and especially in the disposition and distribution of the rocks with relation to the external form of the chain; in short, this revolution would produce a multitude of results and accidents which are observed in the Pyrenees, and of which we shall recapitulate the chief.

‘There would result from the destruction of all the parts situated between A, B, and C, 1st, That the ridge would be lowered; and, further,

that its position would be removed more to the south, and that consequently the northern aspect B, C, would become longer and more sloping than the southern one B D. 2dly, That the granite, including the other primitive rocks, would no longer form the ridge of the central chain, to the north of which it would occur at a short distance. 3dly, That the southern bands of the secondary and transition formations would obtain a height which would in general surpass that of the granite and that of all the other rocks situated to the north of the primitive formation. 4thly, That these two southern bands would, in general, form the ridge of the whole system. 5thly, That the transition formation would be much more diffused, or, at least, would appear to a much greater extent, upon the north side than upon the southern declivity. 6thly, That the secondary formation would occupy all the southern declivity, while, on the northern side, it would only form the low mountains at the foot of the chain.

We here see how well the necessary results of the supposition which we have admitted accord with the actual phenomena. Several other observations would further lead us to presume, that, independently of the great revolution of which we have been speaking, the northern part of the Pyrenees must have undergone, previously to the formation of the present valleys, a new degradation of considerable extent; such, for example, are the generally softer and more rounded forms of the northern, compared with the southern mountains; the more considerable number of basins in the French valleys than in those of the Spanish side; and the immense deposits of transported rocks, of which the soil of the plains which extend from the north side of the Pyrenees is formed.

PYRIFORMIS, *banksia*, in botany, a species of *BANKSIA*, which see. It was unknown to Linné; and Gaertner, who has mentioned it, gives no specific character of it. It has solitary flowers, ovate downy capsules, and lance-shaped entire smooth leaves: CAPS. larger than in any other known species.

PYRMONT, a district in the north-west of Germany, between Hanover in the north, and the Prussian government of Minden, in Westphalia, in the south. It belongs to prince Waldec, with the title of a county, but has an area of only thirty-six square miles, with 4300 inhabitants; of the prince's income (about £10,000), the larger half arises from the mineral springs of

PYRMONT, the chief town of the above principality. It contains 2000 inhabitants, and is situated in a pleasant valley, with public walks, and houses adapted to the accommodation of visitors. Thirty-three miles S. S. W. of Hanover, and sixteen south-east of Rinteln.

PYROCITRIC ACID, in chemistry. When citric acid is put to distil in a retort, it begins at first by melting; the water of crystallisation separates almost entirely from it by a continuance of the fusion; then it assumes a yellowish tint, which gradually deepens. At the same time there is disengaged a white vapor which goes over, to be condensed in the receiver. Towards

the end of the calcination a brownish vapor is seen to form, and there remains in the bottom of the retort a light very brilliant charcoal.

The product contained in the receiver consists of two different liquids. One of an amber-yellow color, and an oily aspect, occupies the lower part; another, colorless, and liquid like water, of a very decided acid taste, floats above. After separating them from one another, we perceive that the first has a very strong bituminous odor, and an acid and acrid taste; that it reddens powerfully the tincture of litmus, but that it may be deprived almost entirely of that acidity by agitation with water, in which it divides itself into globules, which soon fall to the bottom of the vessel, and are not long in uniting into one mass, in the manner of oils heavier than water.

In this state it possesses some of the properties of these substances; it is soluble in alcohol, ether, and the caustic alkalis. However, it does not long continue thus; it becomes acid, and sometimes even it is observed to deposit, at the end of some days, white crystals, which have a very strong acidity; if we then agitate it anew with water, it dissolves in a great measure, and abandons a yellow or brownish pitchy matter, of a very obvious empyreumatic smell, and which has much analogy with the oil obtained in the distillation of other vegetable matters. The same effect takes place when we keep it under water; it diminishes gradually in volume, the water acquires a sour taste, and a thick oil remains at the bottom of the vessel.

This liquid may be regarded as a combination (of little permanence indeed) of the peculiar acid with the oil formed in similar circumstances.

This acid is white, inodorous, of a strongly acid taste. It is difficult to make it crystallise in a regular manner, but it is usually presented in a white mass, formed by the interlacement of very fine small needles. Projected on a hot body it melts, is converted into white very pungent vapors, and leaves some traces of carbon. When heated in a retort, it affords an oily-looking acid, and yellowish liquid, and is partially decomposed. It is very soluble in water and in alcohol; water at the temperature of 10° C. (50° F.) dissolves one-third of its weight. The watery solution has a strongly acid taste, it does not precipitate lime or barytes water, nor the greater part of metallic solutions, with the exception of acetate of lead and protonitrate of mercury. With the oxides it forms salts possessing properties different from the citrates.

The pyrocitrate of potash crystallises in small needles, which are white, and unalterable in the air. It dissolves in about four parts of water. Its solution gives no precipitate with the nitrate of silver, or of barytes; whilst that of the citrate of barytes forms precipitates with these salts.

The pyrocitrate of lime directly formed exhibits a white crystalline mass, composed of needles, opposed to each other in a ramification form. This salt has a sharp taste.

PYROLA, in botany, winter green, a genus of the monogynia order, and decandria class of plants; natural order eighteenth, bicornes: CAL.

quinquepartite; petals five: caps. is quinquelocular, opening at the angles.

PYROLIGNEOUS ACID, in chemistry, is the destructive distillation of any kind of wood an acid is obtained, which was formerly called acid spirit of wood, and since pyroligneous acid. Fourcroy and Vauquelin showed that this acid was merely the acetic, contaminated with empyreumatic oil and bitumen. See **ACETIC ACID**, **CHEMISTRY**, and **VINEGAR**.

PYROLITHIC ACID, in chemistry. 'When uric acid concretions are distilled in a retort, silvery white plates sublime. These are pyrolithate of ammonia. When their solution is poured into that of subacetate of lead, a pyrolithate of lead falls, which, after proper washing, is to be shaken with water, and decomposed by sulphureted hydrogen gas. The supernatant liquid is now a solution of pyrolithic acid, which yields small acicular crystals by evaporation. By heat, these melt and sublime in white needles. They are soluble in four parts of cold water, and the solution reddens vegetable blues. Boiling alcohol dissolves the acid, but on cooling it deposits it, in small white grains. Nitric acid dissolves without changing it. Hence, pyrolithic is a different acid from the lithic, which, by nitric acid, is convertible into purpurate of ammonia. The pyrolithate of lime crystallises in stalactites, which have a bitter and slightly acid taste. It consists of 91.4 acid + 8.6 lime. Pyrolithate of barytes is a nearly insoluble powder. The salts of potassa, soda, and ammonia, are soluble, and the former two crystallisable. At a red heat, and by passing it over ignited oxide of copper, it is decomposed, into oxygen 44.32, carbon 28.29, azote 16.84, hydrogen 10.'

PYROMALIC ACID, in chemistry, when malic or sorbic acid, for they are the same, is distilled in a retort, an acid sublimate, in white needles, appears in the neck of the retort, and an acid liquid distils into the receiver. This liquid, by evaporation, affords crystals, constituting a peculiar acid, to which the above name has been given.

They are permanent in the air, melt at 118° Fahrenheit, and on cooling form a pearl-colored mass of diverging needles. When thrown on red-hot coals, they completely evaporate in an acid, cough-exciting smoke. Exposed to a strong heat, in a retort, they are partly sublimed in needles, and are partly decomposed. They are very soluble in strong alcohol, and in double their weight of water, at the ordinary temperature. The solution reddens vegetable blues, and yields white flocculent precipitates with acetate of lead and nitrate of mercury; but produces no precipitate with lime water. By mixing it with barytes water, a white powder falls, which is redissolved by dilution with water, after which, by gentle evaporation, the pyromalate of barytes may be obtained in silvery plates. These consist of 100 acid, and 185.142 barytes, or, in prime equivalents, of 5.25 + 9.75.

Pyromalate of potash may be obtained in feather formed crystals, which deliquesce. Pyromalate of lead forms first a white flocculent precipitate, soon passing into a semi-transparent jelly, which, by dilution and filtration from the

water, yields brilliant pearly looking needles. The white crystals that sublime in the original distillation are considered by M. Lassaigue as a peculiar acid.

PYROMETER, from *πυρ*, fire, and *μετρον*, measure. To measure those higher degrees of heat to which the thermometer cannot be applied there have been other instruments invented by different philosophers: these are called pyrometers. The most celebrated instrument of this kind, and which has been adopted into general use, is that invented by the late ingenious Mr. Wedgwood.

This instrument is also sufficiently simple. It consists of two pieces, of brass fixed on a plate, so as to be six-tenths of an inch asunder at one end, and three-tenths at the other; a scale is marked upon them, which is divided into 240 equal parts, each one-tenth of an inch; and with this his gauge, are furnished a sufficient number of pieces of baked clay, which must have been prepared in a red heat, and must be of given dimensions. These pieces of clay, thus prepared, are first to be applied cold to the rule of the gauge, that there may no mistake take place in regard to their dimensions. Then any one of them is to be exposed to the heat which is to be measured, till it shall have been completely penetrated by it. It is then removed and applied to the gauge. The difference between its former and its present dimensions will show how much it has shrunk; and will consequently indicate to what degree the intensity of the heat to which it was exposed amounted.

High temperatures can thus be ascertained with accuracy. Each degree of Wedgwood's pyrometer is equal to 130° of Fahrenheit's.

Mr. Wedgwood sought to establish a correspondence between the indications of his pyrometer and those of the mercurial thermometer, by employing a heated rod of silver, whose expansions he measured, as their connecting link. The clay-piece and silver rod were heated in a muffle.

When the muffle appeared of a low red heat, such as was judged to come fully within the province of the thermometer, it was drawn forward toward the door of the oven; and, its own door being then nimbly opened by an assistant, Mr. Wedgwood pushed the silver piece as far as it would go. But, as the division which it went to could not be distinguished in that ignited state, the muffle was lifted out, by means of an iron rod passing through two rings made for that purpose with care to keep it steady, and avoid any shake that might endanger the displacing of the silver piece.

When the muffle was grown sufficiently cold to be examined, he noted the degree of expansion which the silver piece stood at, and the degree of heat shown by the thermometer pieces measured in their own gauge; then returned the whole into the oven as before, and repeated the operation with a stronger heat, to obtain another point of correspondence on the two scales.

The first was at 24° of his thermometer, which coincided with 66° of the intermediate one; and, as each of these last had been before found to contain 20° of Fahrenheit's, the 66° will contain

1320; to which add 50, the degree of his scale to which the (0) of the intermediate thermometer was adjusted, and the sum 1370 will be the degree of Fahrenheit's corresponding to his 24°.

The second point of coincidence was at 64° of his, and 92° of the intermediate; which 92° being, according to the above proportion, equivalent to 1840 of Fahrenheit, add 50 as before to this number, and his 64° is found to fall upon the 1890° of Fahrenheit.

It appears hence that an interval of 4° upon Mr. Wedgwood's thermometer is equivalent to an interval of 520° upon that of Fahrenheit; and, consequently, one of the former to 130° of the latter; and that the (0) of Mr. Wedgwood corresponds to 1077½° of Fahrenheit.

From these data it is easy to reduce either scale to the other through their whole range; and from such reduction it will appear, that an interval of nearly 480° remains between them, which the intermediate thermometer serves as a measure for; that Mr. Wedgwood's includes an extent of about 32,000 of Fahrenheit's degrees, or about fifty-four times as much as that between the freezing and boiling points of mercury, by which mercurial ones are naturally limited; that if the scale of Mr. Wedgwood's thermometer be produced downward in the same manner as Fahrenheit's has been supposed to be produced upward, for an ideal standard, the freezing point of water would fall nearly on 8° below (0) of Mr. Wedgwood's, and the freezing point of mercury a little below 8½°; and, that, therefore, of the extent of now measurable heat, there are about five-tenths of a degree of his from the freezing of mercury to the freezing of water; 8° from the freezing of water to full ignition; and 160° above this to the highest degree he has hitherto attained.

Mr. Wedgwood concludes his account with the following table of the effects of heat on different substances, according to Fahrenheit's thermometer and his own:—

	Fahr.	Wedg.
Extremity of the scale of his thermometer . . .	32277°	240
Greatest heat of his small air furnace	21877	160
Cast-iron melts	17977	130
Greatest heat of a common smith's forge	17327	125
Welding heat of iron greatest	13427	95
Welding heat of iron least .	12777	90
Fine gold melts	5237	32
Fine silver melts	4717	28
Swedish copper melts . . .	4587	27
Brass melts	3807	21
Heat by which his enamel colors are burnt on . . .	1857	6
Red heat fully visible in day-light	1077	0
Red heat fully visible in the dark	947	— 1
Mercury boils	600	3 ⁵⁷³ / ₁₀₀₀
Water boils	212	6 ¹⁸⁸ / ₁₀₀₀
Vital heat	97	7 ⁵⁴² / ₁₀₀₀
Water freezes	32	8 ¹² / ₁₀₀₀
Proof spirit freezes	0	8 ²⁸⁰ / ₁₀₀₀

The point at which mercury congeals, consequently the limit of mercurial thermometers, about 40 8 ¹⁰⁰⁰/₁₀₀₀

PYROMUCIC ACID. This acid, discovered in 1818 by M. Houton Labillardière, is one of the products of the distillation of mucic acid. When we wish to procure it, the operation must be performed in a glass retort furnished with a receiver. The acid is formed in the brown liquid, which is produced along with it, and which contains water, acetic acid, and empyreumatic oil; a very small quantity of the pyromucic acid remaining attached to the vault of the retort under the form of crystals. These crystals, being colored, are added to the brown liquor, which is then diluted with three or four times its quantity of water, in order to throw down a certain portion of oil. The whole is next filtered, and evaporated to a suitable degree. A great deal of acetic acid is volatilised, and then the new acid crystallises. On decanting the mother waters, and concentrating them farther, they yield crystals anew; but, as these are small and yellowish, it is necessary to make them undergo a second distillation to render them susceptible of being perfectly purified by crystallisation; 150 parts of mucic acid furnish about sixty of brown liquor, from which we can obtain eight to ten of pure pyromucic acid.

This acid is white, inodorous, of a strongly acid taste, and a decided action on litmus. Exposed to heat in a retort it melts at the temperature of 266° Fahrenheit; then volatilises, and condenses into a liquid, which passes on cooling into a crystalline mass, covered with very fine needles. It leaves very slight traces of residue in the bottom of the retort.

On burning coals, it instantly diffuses white pungent vapors. Air has no action on it. Water at 60° dissolves one-twenty-eighth of its weight. Boiling water dissolves it much more abundantly, and on cooling abandons a portion of it, in small elongated plates, which cross in every direction.

PYROPHORUS. By this name is denoted an artificial product, which takes fire or becomes ignited on exposure to the air. Hence, in the German language, it has obtained the name of luft-zunder, or air-tinder. It is prepared from alum by calcination, with the addition of various inflammable substances. Homberg was the first that obtained it, which he did accidentally in the year 1680, from a mixture of human excrement and alum, upon which he was operating by fire.

The preparation is managed in the following manner:—Three parts of alum are mixed with from two to three parts of honey, flour, or sugar; and this mixture is dried over the fire in a glazed bowl, or an iron pan, diligently stirring it all the while with an iron spatula. At first this mixture melts, but by degrees it becomes thicker, swells up, and at last runs into small dry lumps. These are triturated to powder, and once more roasted over the fire, till there is not the least moisture remaining in them, and the operator is well assured that it can liquefy no more: the mass now looks like a blackish powder of charcoal. For the sake of avoiding the previous above men-

tioned operation, from four to five parts of burned alum may be mixed directly with two of charcoal powder. This powder is poured into a phial or matrass, with a neck about six inches long. The phial, which however must be filled three-quarters full only, is then put into a crucible, the bottom of which is covered with sand, and so much sand is put round the former that the upper part of its body also is covered with it to the height of an inch: upon this the crucible, with the phial, is put into the furnace, and surrounded with red-hot coals. The fire, being now gradually increased till the phial becomes red-hot, is kept up for the space of about a quarter of an hour, or till a black smoke ceases to issue from the mouth of the phial, and instead of this a sulphureous vapor exhales, which commonly takes fire. The fire is kept up till the blue sulphureous flame is no longer to be seen;

upon this the calcination must be put an end to, and the phial closed for a short time with a stopper of clay or loam. But, as soon as the vessel is become so cool as to be capable of being held in the hand, the phial is taken out of the sand, and the powder contained in it transferred as fast as possible from the phial into a dry and stout glass made warm, which must be secured with a glass stopper.

We have made a very good pyrophorus by simply mixing three parts of alum with one of wheat-flour, calcining them in a common phial till the blue flame disappeared; and have kept it in the same phial, well stopped with a good cork when cold.

If this powder be exposed to the atmosphere, the sulphuret attracts moisture from the air, and generates sufficient heat to kindle the carbonaceous matter mingled with it.

PYROTECHNY.

PYROTECHNY, *n. s.* Fr. *pyrotechnie*. The art of managing fire, or making fire-works.

Great discoveries have been made by the means of *pyrotechny* and chymistry, which in late ages have attained to a greater height than formerly.

Hale's Origin of Mankind.

PYROTECHNY, of Greek. *πυρ*, fire, and *τεχνη*, art, is a term that has been applied to all kinds of artificial fire-works, including those of a military description; but of late it has been more commonly restricted to those fire-works which are constructed for amusement, or are used in public demonstrations of joy: and it is in this sense we shall consider it in this article.

These are inventions which, though they seem to have been for ages familiar to the Chinese and other nations of the eastern world, were brought at a recent period only into Europe by way of Italy; and the Italian and French artists long bore away the palm in their construction. The late Sir William Congreve, however, at the period of the peace of 1815, seemed suddenly to rise like one of his own rockets, above our foreign competitors; and with the aid of his majesty's parks, the public purse, the sheet of water in St. James's park, and the never-to-be-forgotten Chinese bridge over the said water, to have attained the most brilliant honors in this art. We believe all his principal devices will be found included in the descriptive account of modern fire-works here following:—

PART I.

SMALLER AND MISCELLANEOUS FIRE-WORKS.

1. *Of the Chinese fire.*—In honor of the Chinese we begin with the brilliant fire sometimes called *Chinese fire*. Iron filings, when thrown into the fire, inflame and emit a strong light. This property, discovered perhaps by chance, gave rise to the idea of rendering the fire of rockets, and

other pyrotechnical inventions, much more brilliant than when gunpowder, or the substances of which it is composed, are alone employed. Nothing is necessary but to take iron filings, very clean and free from dust, and to mix them with the ordinary composition. It must, however, be observed, that works of this kind will not keep longer than a week; because the moisture contracted by the saltpetre rusts the iron filings.

The Chinese have long been in possession of a method of rendering this fire much more brilliant and variegated in its colors; and we are indebted to father d'Incarville, a jesuit, for having made it known. It consists in the use of a simple ingredient, namely, cast iron reduced to a powder more or less fine: the Chinese gave it a name which is equivalent to that of *iron sand*. To prepare this sand take an old iron pot, and, having broken it to pieces on an anvil, pulverise the fragments till the grains are not larger than radish seed; then sift them through six graduated sieves, to separate the different sizes; and preserve these six different kinds in a very dry place, to secure them from rust, which would render this sand absolutely unfit for the proposed end. We must here remark that the grains which pass through the closest sieve are called sand of the first order; those which pass through the next in size, sand of the second order; and so on.

This sand, when it inflames, emits a light exceedingly vivid. It is very surprising to see fragments of this matter no bigger than a poppy seed form all on a sudden luminous flowers or stars, twelve and fifteen lines in diameter. These flowers are also of different forms, according to that of the inflamed grain, and even of different colors, according to the matters with which the grains are mixed. Rockets which contain the finest sand will not keep longer than eight days, and those which contain the coarsest, fifteen. The following tables exhibit the proportions of the different ingredients for rockets of from twelve to thirty-six pounds.

For red Chinese fire

Calibres.	Salt petre.	Sulphur.	Charcoal.	Sand of the 1st order.	
lbs.	lbs.	oz.	oz.	oz.	dr.
12 to 15	1	3	4	7	
18 to 21	1	3	5	7	8
24 to 36	1	4	6	8	

For white Chinese fire.

Calibres.	Salt- petre.	Bruised Gun- powder.	Charcoal.		Sand of the 3d order.	
lbs.	lbs.	oz.	oz.	dr.	oz.	dr.
12 to 15	1	12	7	8	11	
18 to 21	1	11	8		11	8
24 to 36	1	11	8	8	12	

When these materials have been weighed, the saltpetre and charcoal must be three times sifted through a hair sieve, in order that they may be well mixed: the iron sand is then to be moistened with good brandy, to make the sulphur adhere, and they must be thoroughly incorporated. The sand thus sulphured must be spread over the mixture of saltpetre and charcoal, and the whole must be mixed together by spreading it over a table with a spatula.

2. *A shower of fire.*—To form a shower of fire, mould small paper cartridges on an iron rod two lines and a half in diameter, and make them two inches and a half in length. They must not be choked, it being sufficient to twist the end of the cartridge, and having put the iron rod into it to beat it, in order to make it assume its proper form. When the cartridges are filled, which is done by immersing them in the composition, fold down the other end, and then apply a match. This will fill the surrounding air with an undulating fire. The following compositions are given as proper for meteors of this kind. 1. *Chinese fire.*—Mealed gunpowder one pound, sulphur two ounces, iron-sand of the first order five ounces. 2. *Ancient fire.*—Mealed gunpowder one pound, charcoal two ounces. 3. *A brilliant fire.*—Mealed gunpowder one pound, iron-filings four ounces. The first of these compositions is thought to be the most beautiful.

3. *Sparks*, differing only from stars in their size and duration, are thus prepared:—Put into an earthen vessel an ounce of mealed gunpowder, two ounces of pulverised saltpetre, one ounce of liquid saltpetre, and four ounces of camphor reduced to powder; pour over this mixture some gum-water, or brandy in which gum has been dissolved, till the composition becomes of the consistence of thick soup. Then take some lint which has been soaked in brandy, or in vinegar, or even in a solution of saltpetre, and, being dried and unravelled, throw into the mixture such a quantity of it as is sufficient to absorb it entirely, taking care to stir it well. This composition may be formed into small balls about the size of a pea, and being dried in the shade, and sprinkled with mealed powder, they will readily catch fire.

Sparks may also be made thus:—Take saw-dust of fir, poplar, &c., and boil it in water in which saltpetre has been dissolved. When the water has boiled some time, it is to be poured off, that the saw-dust may remain in the vessel. When nearly dry, it is to be spread out on a table, and sprinkled with sulphur sifted through a very fine sieve, to which may be added a little mealed powder.

4. *Golden rain.*—Some rockets, which, as they fall, make small undulations in the air, called by French writers fusées chevelues, and by us bearded rockets, finish with a kind of shower of fire, which is called golden rain, thus constructed:—Fill the barrels of some goose quills with the composition of flying rockets (for which see onward), and place upon the mouth of each a little moist gunpowder, both to keep in the composition, and to serve as a match. If flying rockets be then loaded with these quills, the explosion of them will terminate in a beautiful shower of fire, to which the name of golden rain has been given.

5. *Globes which burn on the water.*—To make a spherical fire ball, construct a hollow wooden globe of any size, and let its thickness be about one-ninth of its diameter. Into the upper hemisphere insert a right concave cylinder, the breadth of which may be equal to one-fifth of the diameter. A petard, loaded with good grained gunpowder, is to be introduced at the bottom of it, and to be placed horizontally; then the aperture is closed with a wooden tompion dipped in pitch, and over the whole of this part a quantity of lead is melted sufficient to make the globe sink: if the globe be now placed in the water, the lead by its gravity will make the aperture tend directly downwards, and keep in a perpendicular direction the cylinder, to which fire must have been previously applied. To ascertain whether the lead, which has been added to the globe, renders its weight equal to that of an equal volume of water, rub the globe over with pitch or grease, and make a trial, by placing it in the water.

The composition with which the globe must be loaded is as follows: to a pound of grained powder add thirty-two pounds of saltpetre reduced to fine flour, eight pounds of sulphur, one ounce of scrapings of ivory, and eight pounds of saw-dust previously boiled in a solution of saltpetre, and dried in the shade, or in the sun. Or to two pounds of bruised gunpowder add twelve pounds of saltpetre, six pounds of sulphur, four pounds of iron filings, and one pound of Greek pitch.

It is not necessary that this composition should be beaten so fine as that intended for rockets: it requires neither to be pulverised nor sifted; it is sufficient to be well mixed and incorporated. But, to prevent it from becoming too dry, it will be proper to besprinkle it with a little oil, or any other liquid susceptible of inflammation.

6. *Of globes which leap or roll on the ground.*—Having constructed a wooden globe with a cylinder similar to the above described, and having loaded it with the same composition, introduce into it four petards, or even more, loaded with good grained gunpowder to their orifices, which must be well stopped with paper or tow.

If a globe, prepared in this manner, be fired by means of a match, it will leap about, as it burns, on a smooth horizontal plane, according as the petards are set on fire. Instead of placing these petards in the inside, they may be affixed to the exterior surface of the globe; which they will make to roll and leap as they catch fire. They may be applied in any manner to the surface of the globe.

7. A similar globe may be made to roll about on a horizontal plane, with a very rapid motion. Construct two equal hemispheres of pasteboard, and adjust in one of them three common rockets filled and pierced like flying rockets that have no petard: these rockets must not exceed the interior breadth of the hemisphere, and ought to be arranged in such a manner that the head of the one shall correspond to the tail of the other. The rockets being arranged, join the two hemispheres, by cementing them together with strong paper, in such a manner that they shall not separate, while the globe is moving and turning, at the same time that the rockets produce their effect. To set fire to the first, make a hole in the globe opposite to the tail of it, and introduce into it a match. This match will communicate fire to the first rocket; which, when consumed, will set fire to the second by means of another match, and so on to the rest; so that the globe, if placed on a smooth horizontal plane, will be kept in continual motion. It is here to be observed that a few more holes must be made in the globe, otherwise it will burst.

The two hemispheres of pasteboard may be prepared in the following manner:—Construct a very round globe of solid wood, and cover it with melted wax; then cement over it several bands of coarse paper, about two inches in breadth, giving it several coats of this kind, to the thickness of about two lines. Or, which will be still easier and better, having dissolved, in glue water, some of the pulp employed by the paper-makers, cover with it the surface of the globe; then dry it gradually at a slow fire, and cut it through in the middle; by which means you will have two strong hemispheres. The wooden globe may be easily separated from the pasteboard by means of heat; for if the whole be applied to a strong fire the wax will dissolve, so that the globe may be drawn out: instead of melted wax, soap may be employed.

8. *Of aerial globes, called bombs.*—These globes are called aerial because they are thrown into the air from a mortar, which is a short thick piece of artillery of a large calibre. And though these globes are of wood, and have a suitable thickness, namely, equal to the twelfth part of their diameters, if too much powder be put into the mortar they will not be able to resist its force; the charge of powder therefore must be proportioned to the globe to be ejected. The usual quantity is an ounce of powder for a globe of four pounds weight; two ounces for one of eight, and so on.

As the chamber of the mortar may be too large to contain the exact quantity of powder sufficient for the fire-ball, which ought to be placed immediately above the powder, in order that it may be expelled and set on fire at the same time, another mortar may be constructed of wood, or of

pasteboard with a wooden bottom: it ought to be put into a large iron mortar, and to be loaded with a quantity of powder proportioned to the weight of the globe. This small mortar must be of light wood, or of paper pasted together, and rolled up in the form of a cylinder, or truncated cone, the bottom excepted; which, as already said, must be of wood. The chamber for the powder must be pierced obliquely, with a small gimlet; so that, the aperture corresponding to the aperture of the metal mortar, the fire applied to the latter may be communicated to the powder which is at the bottom of the chamber, immediately below the globe. By this means the globe will catch fire, and make an agreeable noise as it rises into the air; but it would not succeed so well if any vacuity were left between the powder and the globe.

A profile or perpendicular section of such a globe is represented by the right-angled parallelogram, the breadth of which is nearly equal to the height. The thickness of the wood, towards the two sides, is equal, as above said, to the twelfth part of the diameter of the globe; and the thickness of the cover is double the preceding, or equal to a sixth part of the diameter. The height of the chamber where the match is applied, and which is terminated by a semicircle, is equal to the fourth part of the breadth; and its breadth is equal to the sixth part. We must here observe that it is dangerous to put wooden covers on aerial balloons or globes; for these covers may be so heavy as to wound those on whom they happen to fall. It will be sufficient to place turf or hay above the globe, in order that the powder may experience some resistance.

The globe must be filled with several pieces of cane or common reed, equal in length to the interior height of the globe, and charged with a slow composition, made of three ounces of pounded gunpowder, an ounce of sulphur moistened with a small quantity of petroleum oil, and two ounces of charcoal; and in order that these reeds or canes may catch fire sooner, and with more facility, they must be charged at the lower ends, which rest on the bottom of the globe, with pulverised gunpowder moistened in the same manner with petroleum oil, or well besprinkled with brandy, and then dried. The bottom of the globe ought to be covered with a little gunpowder half pulverised and half grained; which, when set on fire, by means of a match applied to the end of the chamber, will set fire to the lower part of the reed. But care must have been taken to fill the chamber with a composition similar to that in the reeds, or with another slow composition made of eight ounces of gunpowder, four ounces of saltpetre, two ounces of sulphur, and one ounce of charcoal: the whole must be well pounded and mixed. Instead of reeds, the globe may be charged with running rockets, or paper petards, and a quantity of fiery stars or sparks mixed with pulverised gunpowder, placed without any order above these petards, which must be choked at unequal heights, that they may perform their effect at different times.

These globes may be constructed in various other ways, which it would be tedious here to enumerate. We shall only observe that, when

loaded, they must be well covered at the top; they must be wrapped up in a piece of cloth dipped in glue, and a piece of woollen cloth must be tied round them, so as to cover the hole which contains the match.

9. *Jets of fire.*—Jets of fire are a kind of fixed rockets, the effect of which is to throw up into the air jets of fire, similar to jets of water. They serve also to represent cascades: for if a series of such rockets be placed horizontally on the same line, it may be easily seen that the fire they emit will resemble a sheet of water. When arranged in a circular form, like the radii of a circle, they form what is called a fixed sun. To form jets of this kind, the cartridge for brilliant fires must, in thickness, be equal to a fourth part of the diameter, and, for Chinese fire, only to a sixth part.

The cartridge is loaded on a nipple, having a point equal in length to the same diameter, and in thickness equal to a fourth part of it; but, as it generally happens that the mouth of the jet becomes larger than is necessary for the effect of the fire, you must begin to charge the cartridge, as the Chinese do, by filling it to a height equal to a fourth part of the diameter with clay, which must be rammed down as if it were gunpowder. By these means the jet will ascend much higher. When the charge is completed with the composition you have made choice of, the cartridge must be close with a stopper of wood, above which it must be choked. The train or match must be of the same composition as that employed for loading; otherwise the dilatation of the air contained in the hole made by the piercer would cause the jet to burst. Clayed rockets may be pierced with two holes near the neck, in order to have three jets in the same plane.

If a kind of top, pierced with a number of holes, be added to them, they will imitate a bubbling fountain. Jets intended for representing sheets of fire ought not to be choked. They must be placed in a horizontal position, or inclined a little downwards. It appears to us that they might be choked so as to form a kind of slit, and be pierced in the same manner; which would contribute to extend the sheet of fire still farther. A kind of long narrow mouth might even be provided for this particular purpose.

Principal compositions for jets of fire.

1st. Jets of five lines, or less, of interior diameter.

Chinese fire.—Saltpetre one pound, pulverised gunpowder one pound, sulphur eight ounces, charcoal two ounces.

White fire.—Saltpetre one pound, pulverised gunpowder eight ounces, sulphur three ounces, charcoal two ounces, iron sand of the first order eight ounces.

2d. Jets of from ten to twelve lines in diameter.

Brilliant fire.—Pulverised gunpowder one pound, iron filings of a mean size five ounces.

White fire.—Saltpetre one pound, pulverised gunpowder one pound, sulphur eight ounces, charcoal two ounces.

Chinese fire.—Saltpetre one pound four ounces, sulphur five ounces, sand of the third order twelve ounces.

3d. Jets of fifteen or eighteen lines in diameter

Chinese fire.—Saltpetre one pound four ounces, sulphur seven ounces, charcoal five ounces, of the six different kinds of sand mixed twelve ounces. Père d'Incarville, in his memoirs on this subject, gives various other proportions for the composition of these jets; but we must confine ourselves to what has been here said, and refer the reader to the author's memoirs, which will be found in the *Manuel de l'Artificier*.

The saltpetre, pulverised gunpowder, and charcoal, are three times sifted through a hair sieve. The iron sand is besprinkled with sulphur, after being moistened with a little brandy, that the sulphur may adhere to it; and they are then mixed together: the sulphured sand is then spread over the first mixture, and the whole is mixed with a ladle only; for if a sieve were employed, it would separate the sand from the other materials. When sand larger than that of the second order is used, the composition is moistened with brandy, so that it forms itself into balls, and the jets are then loaded: if there were too much moisture, the sand would not perform its effect.

10. *Of fires of different colors.*—It is much to be wished that, for the sake of variety, different colors could be given to these fire-works at pleasure; but, though we are acquainted with several materials which communicate to flame various colors, it has hitherto been possible to introduce only a very few colors into that of inflamed gunpowder.

To make white fire, the gunpowder must be mixed with iron or rather steel filings.

To make red fire, iron sand of the first order must be employed in the same manner.

As copper filings, when thrown into a flame, render it green, it might be concluded that, if mixed with gunpowder, it would produce a green flame; but this experiment does not succeed. It is supposed that the flame is too ardent, and consumes the inflammable part of the copper too soon. But it is probable that a sufficient number of trials have not yet been made; for is it not possible to lessen the force of gunpowder in a considerable degree, by increasing the dose of the charcoal?

However the following are a few of those materials which, in books on pyrotechny, are said to possess the property of communicating various colors to fire-works.

Camphor mixed with the composition makes the flame to appear of a pale white color.

Raspings of ivory give a clear flame of a silver color, inclining a little to that of lead; or rather a white dazzling flame.

Greek pitch produces a reddish flame, of a bronze color.

Black pitch, a dusky flame, like a thick smoke, which obscures the atmosphere.

Sulphur, mixed in a moderate quantity, makes the flame appear bluish.

Sal ammoniac and verdigris give a greenish flame.

Raspings of yellow amber communicate to the flame a lemon color.

Crude antimony gives a russet color.

Borax ought to produce a blue flame; for spirit of wine, in which sedative salt, one of the component parts of borax, is dissolved by the means of heat, burns with a beautiful green flame.

Much, however, still remains to be done in regard to this subject; but it would add to the beauty of artificial fire-works, if they could be varied by giving them different colors: this would be creating for the eyes a new pleasure.

11. *Composition of a paste proper for representing animals, and other devices in fire.*—It is to the Chinese also that we are indebted for this method of representing figures with fire. For this purpose, take sulphur reduced to an impalpable powder, and, having formed it into a paste with starch, cover with it the figure you are desirous of representing on fire: it is here to be observed that the figure must first be coated over with clay, to prevent it from being burnt. When the figure has been covered with this paste, besprinkle it while still moist with pulverised gunpowder; and, when the whole is perfectly dry, arrange some small matches on the principal parts of it, that the fire may be speedily communicated to it on all sides.

The same paste may be employed on figures of clay, to form devices and various designs. Thus, for example, festoons, garlands, and other ornaments, the flowers of which might be imitated by fire of different colors, could be formed on the frieze of a piece of architecture, covered with plaster. The Chinese imitate grapes exceedingly well, by mixing pounded sulphur with the pulp of the jubebe instead of flour paste.

12. *Of suns both fixed and moveable.*—None of the pyrotechnic inventions can be employed with so much success, in artificial fire-works, as suns; of which there are two kinds, fixed and revolving: the method of constructing both is very simple.

For fixed suns, cause to be constructed a round piece of wood, into the circumference of which can be screwed twelve or fifteen pieces in the form of radii; and to these radii attach jets of fire, the composition of which has been already described, so that they may appear as radii tending to the same centre, the mouth of the jet being towards the circumference. Apply a match in such a manner that the fire communicated at the centre may be conveyed, at the same time, to the mouth of each of the jets; by which means, each throwing out its fire, there will be produced the appearance of a radiating sun. We here suppose that the wheel is placed in a position perpendicular to the horizon. These rockets or jets may be so arranged as to cross each other in an angular manner; in which case, instead of a sun, you will have a star, or a sort of cross resembling that of Malta. Some of these suns are made also with several rows of jets: these are called glories.

Revolving suns may be constructed in this manner:—Provide a wooden wheel, of any size at pleasure, and brought into perfect equilibrium around its centre, in order that the least effort may make it turn round. Attach to the circumference of it fire-jets placed in the direction of the circumference; they must not be choked at the bottom, and ought to be arranged in such a

manner that the mouth of the one shall be near the bottom of the other, so that when the fire or the one is ended it may immediately proceed to another. It may easily be perceived that, when fire is applied to one of these jets, the recoil of the rocket will make the wheel turn round, unless it be too large and ponderous: for this reason, when these suns are of a considerable size, that is, when they consist for example of twenty rockets, fire must be communicated at the same time to the first, the sixth, the eleventh, and the sixteenth; from which it will proceed to the second, the seventh, the twelfth, the seventeenth, and so on. These four rockets will make the wheel turn round with rapidity.

If two similar suns be placed one behind the other, and made to turn in a contrary direction, they will produce a very pretty effect of cross-fire. Three or four suns, with horizontal axes passed through them, might be implanted in a vertical axis, moveable in the middle of a table. These suns, revolving around the table, will seem to pursue each other. It may be easily perceived that, to make them turn around the table, they must be fixed on their axes, and these axes, at the place where they rest on the table, ought to be furnished with a very moveable roller.

13. *To make crackers.*—Cut some stout cartridge paper into pieces three inches and a half broad, and one foot long; one edge of each of these pieces fold down lengthwise about three-quarters of an inch broad; then fold the double edge down a quarter of an inch, and turn the single edge back half over the double fold; open it, and lay all along the channel, which is formed by the foldings of the paper, some meal powder; then fold it over and over till all the paper is doubled up, rubbing it down every turn; this being done, bend it backwards and forwards, two inches and a half, or thereabouts, at a time, as often as the paper will allow; hold all these folds flat and close, and, with a small pinching cord, give one turn round the middle of the cracker, and pinch it close; bind it with pack-thread, as tight as you can; then, in the place where it was pinched, prime one end and cap it with touch-paper. When these crackers are fired they will give a report at every turn of the paper; if you would have a great number of bounces, you must cut the paper longer, or join them after they are made; but, if they are made very long before they are pinched, you must have a piece of wood with a groove in it, deep enough to let in half the cracker; this will hold it straight while it is pinching.

14. *To make squibs.*—First make the cases, of about six inches in length, by rolling slips of stout cartridge paper three times round a roller, and pasting the last fold; tying it near the bottom as tight as possible, and making it air-tight at the end by sealing-wax. Then take of gunpowder half a pound, charcoal one ounce, brimstone one ounce, and steel filings half an ounce (or in like proportion); grind them with a muller, or pound them in a mortar. Your cases being dry and ready, first put a thimble full of your powder, and ram it hard down with a ruler; then fill the case to the top with the aforesaid mixture, ramming it hard down in the course of filling two or

three times; when this is done point it with touch-paper, which should be pasted on that part which touches the case, otherwise it is liable to drop off.

** The apparatus chiefly used in making fireworks consists of solid wooden cylinders, called formers, for rolling the cases on; similar cylinders, either of wood or metal, for ramming down the composition; moulds for holding the cases while filling; a machine for contracting the cavity of the cases; another for grating the materials; and a particular apparatus for boring some cases after they are filled.

IMITATIVE FIREWORKS.

Take a paper that is blacked on both sides, or, instead of black, the paper may be colored on each side with a deep blue, which will be still better for such as are to be seen through transparent papers. It must be of a proper size for the figure you intend to exhibit. In this paper cut out with a penknife several spaces, and with a piercer make a great number of holes, rather long than round, and at no regular distance from each other.

To represent revolving pyramids and globes, the paper must be cut through with a penknife, and the space cut out between each spiral should be three or four times as wide as the spirals themselves. You must observe to cut them so that the pyramid or globe may appear to turn on its axis. The columns that are represented in pieces of architecture, or in jets of fire, must be cut in the same manner, if they are to be represented as turning on their axes. In like manner may be exhibited a great variety of ornaments, cyphers, and medallions, which, when properly colored, cannot fail of producing a most pleasing effect. There should not be a very great diversity of colors, as that would not produce the most agreeable appearance.

When these pieces are drawn on a large scale, the architecture or ornaments may be shaded: and, to represent different shades, pieces of colored paper must be pasted over each other, which will produce an effect that would not be expected from transparent paintings. Five or six pieces of paper pasted over each other will be sufficient to represent the strongest shades.

To give these pieces the different motions they require, you must first consider the nature of each piece; if, for example, you have cut out the figure of the sun, or of a star, you must construct a wire wheel of the same diameter with those pieces; over this wheel you paste a very thin paper, on which is drawn, with black ink, the spiral figure. The wheel thus prepared is to be placed behind the sun or star, in such a manner that its axis may be exactly opposite the centre of either of those figures. This wheel may be turned by any method you think proper.

Now, the wheel being placed directly behind the sun, for example, and very near to it, is to be turned regularly round, and strongly illuminated by candles placed behind it. The lines that form the spiral will then appear, through the spaces cut out from the sun, to proceed from its centre to its circumference, and will resemble

sparks of fire that incessantly succeed each other. The same effect will be produced by the star, or by any other figure where the fire is not to appear as proceeding from the circumference of the centre.

These two pieces, as well as those that follow, may be of any size, provided you observe the proportion between the parts of the figure and the spiral, which must be wider in larger figures than in small. If the sun, for example, have from six to twelve inches diameter, the width of the strokes that form the spiral need not be more than one-twentieth part of an inch, and the spaces between them, that form the transparent parts, about two-tenths of an inch. If the sun be two feet diameter, the strokes should be one-eighth of an inch, and the space between one-quarter of an inch; and, if the figure be six feet diameter, the strokes should be one-quarter of an inch and the spaces five twelfths of an inch. These pieces have a pleasing effect when represented of a small size, but the deception is more striking when they are of large dimensions.

It will be proper to place those pieces, when of a small size, in a box quite closed on every side, that none of the light may be diffused in the chamber: for which purpose it will be convenient to have a tin door behind the box, to which the candlesticks may be soldered, and the candles more easily lighted.

The several figures cut out should be placed in frames, that they may be put alternately in a groove in the fore-part of the box; or there may be two grooves, that the second piece may be put in before the first is taken out.

The wheel must be carefully concealed from the eye of the spectator.

Where there is an opportunity of representing these artificial fires by a hole in the partition, they will doubtless have a much more striking effect, as the spectator cannot then conjecture by what means they are produced.

It is easy to conceive that, by extending this method, wheels may be constructed with three or four spirals, to which may be given different directions. It is manifest, also, that on the same principle a great variety of transparent figures may be contrived, and which may be all placed before the same spiral lines.

To represent cascades of fire.—In cutting out cascades, you must take care to preserve a natural inequality in the parts cut out; for if to save time you should make all the holes with the same pointed tool, the uniformity of the parts will not fail to produce a disagreeable effect. As these cascades are very pleasing when well executed, so they are highly disgusting when imperfect. These are the most difficult pieces to cut out.

To produce the apparent motion of these cascades, instead of drawing a spiral you must have a slip of strong paper, of such length as you judge convenient. In this paper there must be a great number of holes near each other, and made with pointed tools of different dimensions.

At each end of the paper, a part, of the same size with the cascade, must be left uncut; and towards those parts the holes must be made a greater distance from each other.

When the cascade that is cut out is placed be-

fore the scroll of paper just mentioned, and it is entirely wound upon the roller, the part of the paper that is then between being quite opaque, no part of the cascade will be visible; but, as the winch is turned gently and regularly round, the transparent part of the paper will give to the cascade the appearance of fire that descends in the same direction; and the illusion will be so strong that the spectators will think they see a cascade of fire, especially if the figure be judiciously cut out.

PART II. OF ROCKETS.

SECT. I.—CONSTRUCTION OF THE CASES.

Rockets may be regarded as the grand basis of all fire-works, which are little more than modifications of their form, and of the materials of which they usually consist. A rocket is a cartridge or case made of stiff paper, which being filled in part with gunpowder, saltpetre, and charcoal, rises of itself into the air, when fire is applied to it.

There are three sorts of rockets: small ones the calibre of which does not exceed a pound bullet; that is to say, the orifice of them is equal to the diameter of a leaden bullet which weighs only a pound; for the calibres or orifices of the moulds or the models used in making rockets are measured by the diameters of leaden bullets. Middle sized rockets, equal to the size of a ball of from one to three pounds. And large rockets, equal to a ball of from three to 100 pounds.

To give the cartridges the same length and thickness, in order that any number of rockets may be prepared of the same size and force, they are put into a hollow cylinder of strong wood, called a mould. This mould is sometimes of metal; but at any rate it ought to be made of some very hard wood. This mould must not be confounded with another piece of wood, called the former or roller, around which is rolled the thick paper employed to make the cartridge. If the calibre of the mould be divided into eight equal parts, the diameter of the roller must be equal to five of these parts. The vacancy between the roller and the interior surface of the mould, that is to say three-eighths of the calibre of the mould, will be exactly filled by the cartridge.

As rockets are made of different sizes, moulds of different lengths and diameters must be provided. The calibre of a cannon is nothing else than the diameter of its mouth; and we here apply the same term to the diameter of the aperture of the mould. The size of the mould is measured by its calibre; but the length of the moulds for different rockets does not always bear the same proportion to the calibre, the length being diminished as the calibre is increased. The length of the mould for small rockets ought to be six times the calibre, but for rockets of the mean and larger size it will be sufficient if the length of the mould be five times or four times the calibre of the moulds. We shall give two tables, one of which contains the calibres of moulds below a pound bullet; and the other

the calibres from a pound to 100 pounds bullet.

For making the cartridges, large stiff paper is employed. This paper is wrapped round the roller, and then cemented by means of common paste. The thickness of the paper, when rolled up in this manner, ought to be about one-eighth and a half of the calibre of the mould, according to the proportion given to the diameter of the roller. But, if the diameter of the roller be made equal to three-fourths the calibre of the mould, the thickness of the cartridge must be a twelfth and a half of that calibre. When the cartridge is formed, the roller is drawn out, by turning it round, until it is distant from the edge of the cartridge the length of its diameter. A piece of cord is then made to pass twice round the cartridge at the extremity of the roller. And into the vacancy left in the cartridge another roller is introduced, so as to leave some space between the two. One end of the pack-thread must be fastened to something fixed, and the other to a stick conveyed between the legs, and placed in such a manner as to be behind the person who chokes the cartridge. The cord is then to be stretched by retiring backwards, and the cartridge must be pinched until there remains only an aperture capable of admitting the piercer. The cord employed for pinching it is then removed, and its place is supplied by a piece of pack-thread, which must be drawn very tight, passing it several times round the cartridge, after which it is secured by means of running knots made one above the other.

Besides the roller, a rod is used, which being employed to load the cartridge, must be somewhat smaller than the roller, in order that it may be easily introduced into the cartridge. The rod is pierced lengthwise, to a sufficient depth to receive the piercer, which must enter into the mould, and unite with it exactly at its lower part. The piercer, which decreases in size, is introduced into the cartridge through the part where it has been choked, and serves to preserve a cavity within it. Its length, besides the nipple or button, must be equal to about two-thirds that of the mould. Lastly, if the thickness of the base be a fourth part of the calibre of the mould, the point must be made equal to a sixth of the calibre. It is evident there must be at least three rods, pierced in proportion to the diminution of the piercer, in order that the powder which is rammed in by means of a mallet, may be uniformly packed throughout the whole length of the rocket. It may be easily perceived, also, that these rods ought to be made of some very hard wood, to resist the strokes of the mallet.

In loading rockets it is more convenient not to employ a piercer. When loaded on a nipple, without a piercer, by means of one massy rod, they are pierced with a bit and a piercer fitted into the end of a bit-brace. Care however must be taken to make this hole suited to the proportion assigned for the diminution of the piercer. That is to say, the extremity of the hole, at the choked part of the cartridge, ought to be about a fourth of the calibre of the mould; and the extremity of the hole which is in the inside for

about two-thirds of the length of the rocket ought to be a sixth of the calibre. This hole must pass directly through the middle of the rocket. In short, experience and ingenuity will suggest what is most convenient, and in what manner the method of loading rockets, which we shall here explain, may be varied.

After the cartridge is placed in the mould, pour gradually into it the prepared composition; taking care to pour only two spoonfuls at a time, and to ram it immediately down with the rod, striking it in a perpendicular direction with a mallet of a proper size, and giving an equal number of strokes, for example, three or four each time that a new quantity of the composition is poured in. When the cartridge is about half filled, separate with a bodkin the half of the folds of the paper which remains, and, having turned them back on the composition, press them down with the rod and a few strokes of the mallet, in order to compress the paper on the composition. Then pierce three or four holes in the folded paper, by means of a piercer, which must be made to penetrate to the composition of the rocket. These holes serve to form a communication between the body of the rocket and the vacuity at the extremity of the cartridge, or that part which has been left empty.

In small rockets this vacuity is filled with granulated powder, which serves to let them off: they are then covered with paper, and pinched in the same manner as at the other extremity. But in other rockets, the pot containing stars, serpents, and running rockets, is adapted to it, as will be shown hereafter. It may be sufficient however to make, with a bit or piercer, only one hole, which must be neither too large nor too small, such as a fourth part of the diameter of the rocket, to set fire to the powder, taking care that this hole be as straight as possible, and exactly in the middle of the composition. A little of the composition of the rocket must be put into these holes, that the fire may not fail to be communicated to it.

It now remains to fix the rocket to its rod, which is done in the following manner:—When the rocket has been constructed as above described, make fast to it a rod of light wood, such as fir or willow, broad and flat at the end next the rocket, and decreasing towards the other. It must be as straight and free from knots as possible, and ought to be dressed, if necessary, with a plane. Its length and weight must be proportioned to the rocket; that is to say, it ought to be six, seven, or eight feet long, so as to remain in equilibrium with it, when suspended on the finger, within an inch, or an inch and a half of the neck. Before it is fired, place it with the neck downwards, and let it rest on two nails, in a direction perpendicular to the horizon. To make it ascend straighter and to a greater height, adapt to its summit a pointed cap or top, made of common paper, which will serve to facilitate its passage through the air.

These rockets, in general, are made in a more complex manner, several other things being added to them to render them more agreeable, such for example as a petard, which is a box of

tin-plate, filled with fine gunpowder, placed on the summit. The petard is deposited on the composition, at the end where it has been filled; and the remaining paper of the cartridge is folded down over it to keep it firm. The petard produces its effect when the rocket is in the air and the composition is consumed.

Stars, golden rain, serpents, saucissons, and several other amusing things, may also, as we have seen, be added to them. This is done by adjusting to the head of the rocket, an empty pot or cartridge, much larger than the rocket, in order that it may contain serpents, stars, and various other appendages, to render it more beautiful.

Rockets may be made to rise into the air without rods. For this purpose four wings must be attached to them in the form of a cross, and similar to those seen on arrows or darts. In length, these wings must be equal to two-thirds that of the rocket; their breadth towards the bottom should be half their length, and their thickness ought to be equal to that of a card. But this method of making rockets ascend is less certain, and more inconvenient, than that where a rod is used; and for this reason it is rarely employed.

We shall now show the method of finding the diameters or calibre of rockets, according to their weight; but we must first observe that a pound rocket is that just capable of admitting a leaden bullet of a pound weight, and so of the rest. The calibre for the different sizes may be found by the two following tables, one of which is calculated for rockets of a pound weight and below; and the other for those from a pound weight to fifty pounds.

I. TABLE of the calibre of moulds of a pound weight and below

Ounces.	Lines.	Drachms.	Lines.
16	19½	14	7¼
12	17	12	7
8	15	10	6½
7	14¾	8	6¼
6	14¼	6	5¾
5	13	4	4½
4	12½	2	3¾
3	11½		
2	9½		
1	6½		

The use of this table will be understood merely by inspection; for it is evident that a rocket of twelve ounces ought to be seventeen lines in diameter; one of eight ounces, fifteen lines; one of ten drachms, six lines and one-third; and so of the rest. On the other hand, if the diameter of the rocket be given, it will be easy to find the weight of the ball corresponding to that calibre. For example, if the diameter be thirteen lines, it will be immediately seen, by looking for that number in the column of lines, that it corresponds to a ball of five ounces.

II. TABLE of the calibre of moulds from one to fifty pounds ball.

Pounds.	Calibre.	Pounds.	Calibre.	Pounds.	Calibre.	Pounds.	Calibre.
1	100	14	241	27	300	40	341
2	126	15	247	28	304	41	344
3	144	16	252	29	307	42	347
4	158	17	257	30	310	43	350
5	171	18	262	31	314	44	353
6	181	19	267	32	317	45	355
7	191	20	271	33	320	46	358
8	200	21	275	34	323	47	361
9	208	22	280	35	326	48	363
10	215	23	284	36	330	49	366
11	222	24	288	37	333	50	368
12	228	25	292	38	336		
13	235	26	296	39	339		

The use of the second table is as follows :—If the weight of the ball be given, which we shall suppose to be twenty-four pounds, seek for that number in the column of pounds, and opposite to it, in the column of calibres, will be found the number 288. Then say, as 100 is to nineteen and a half so is 288 to a fourth term, which will be the number of lines of the calibre required; or multiply the number found, that is 288, by nineteen and a half, and from the product, 56·16, cut off the last two figures: the required calibre therefore will be 56·16 lines, or four inches eight lines.

On the other hand, the calibre being given in lines, the weight of the ball may be found with equal ease: if the calibre, for example, be twenty-eight lines, say as nineteen and a half is to twenty-eight so is 100 to a fourth term, which will be 143·5 or nearly 144. But in the above table, opposite to 144 in the second column, will be found the number three in the first; which shows that a rocket, the diameter or calibre of which is twenty-eight lines, is a rocket of a three pounds ball.

SECT. II.—COMPOSITION OF THE POWDER FOR ROCKETS, AND THE MODE OF FILLING THEM.

The composition of the powder for rockets must be different, according to the different sizes; as that proper for small rockets would be too strong for large ones. This is a fact respecting which almost all the makers of fire-works are agreed. The quantities of the ingredients which experience has shown to be the best are as follow :—

For rockets capable of containing one or two ounces of composition.—To one pound of gunpowder add two ounces of soft charcoal; or to one pound of gunpowder a pound of the coarse powder used for cannon; or to nine ounces of gunpowder two ounces of charcoal; or to a pound of gunpowder an ounce and a half of saltpetre, and as much charcoal.

For rockets of two or three ounces.—To four ounces of gunpowder add an ounce of charcoal; or to nine ounces of gunpowder add two ounces of saltpetre.

For a rocket of four ounces.—To four pounds of gunpowder add a pound of saltpetre and four ounces of charcoal: you may add also, if you

choose, half an ounce of sulphur; or to one pound two ounces and a half of gunpowder add four ounces of saltpetre and two ounces of charcoal; or to a pound of powder add four ounces of saltpetre and one ounce of charcoal; or to seventeen ounces of gunpowder add four ounces of saltpetre and the same quantity of charcoal; or to three ounces and a half of gunpowder add ten ounces of saltpetre and three ounces and a half of charcoal. But the composition will be strongest if to ten ounces of gunpowder you add three ounces and a half of saltpetre and three ounces of charcoal.

For a rocket of five or six ounces.—To two pounds five ounces of gunpowder add half a pound of saltpetre, two ounces of sulphur, six ounces of charcoal, and two ounces of iron filings.

For rockets of seven or eight ounces.—To seventeen ounces of gunpowder add four ounces of saltpetre and three ounces of sulphur.

For rockets of from eight to ten ounces.—To two pounds and five ounces of gunpowder add half a pound of saltpetre, two ounces of sulphur, seven ounces of charcoal, and three ounces of iron filings.

For rockets of from ten to twelve ounces.—To seventeen ounces of gunpowder add four ounces of saltpetre, three ounces and a half of sulphur, and one ounce of charcoal.

For rockets of from fourteen to fifteen ounces.—To two pounds four ounces of gunpowder add nine ounces of saltpetre, three ounces of sulphur, five ounces of charcoal, and three ounces of iron filings.

For rockets of one pound.—To one pound of gunpowder add one ounce of sulphur and three ounces of charcoal.

For a rocket of two pounds.—To one pound four ounces of gunpowder add two ounces of saltpetre, one ounce of sulphur, three ounces of charcoal, and two ounces of iron filings.

For a rocket of three pounds.—To thirty ounces of saltpetre add seven ounces and a half of sulphur and eleven ounces of charcoal.

For rockets of four, five, six, or seven pounds.—To thirty-one pounds of saltpetre add four pounds and a half of sulphur and ten pounds of charcoal.

For rockets of eight, nine, or ten pounds.—

To eight pounds of saltpetre add one pound four ounces of sulphur and two pounds twelve ounces of charcoal.

We shall here observe, that these ingredients must be each pounded separately and sifted; they are then to be weighed and mixed together, for the purpose of loading the cartridges, which ought to be kept ready in the moulds. The cartridges must be made of strong paper, doubled, and cemented by means of strong paste, made of fine flour and very pure water.

Of Matches.—Before we proceed farther it will be proper to describe the composition of the matches necessary for letting the rockets off. Take linen, hemp, or cotton thread, and double it eight or ten times, if intended for large rockets; or only four or five times, if to be employed for stars. When the match has been thus made as large as necessary, dip it in pure water, and press it between your hands, to free it from the moisture. Mix some gunpowder with a little water, to reduce it to a sort of paste, and immerse the match in it, turning and twisting it till it has imbibed a sufficient quantity of the powder; then sprinkle over it a little dry powder, or strew some pulverised dry powder upon a smooth board, and roll the match over it. By these means you will have an excellent match; which if dried in the sun, or on a rope in the shade, will be fit for use.

SECT. III.—FORMATION OF ROCKETS.

The upper part of rockets is generally furnished with some composition, which takes fire when it has reached to its greatest height, emits a considerable blaze, or produces a loud report and whizzing noise. Of this kind are saucissons, maroons, stars, showers of fire, &c. To make room for an artifice of this kind, the rocket is crowned with a part of greater diameter called a pot. The following is the method of making this pot, and connecting it with the rocket:—

The mould for forming the pot, though of one piece, must consist of two cylindric parts of different diameters. That on which the pot is rolled up must be three diameters of the rocket in length, and its diameter must be three-fourths that of the rocket; the length of the other ought to be equal to two of these diameters, and its diameter to seven-fifths that of the rocket. Having rolled the thick paper, intended for making the pot, twice round the cylinder, a portion of it must be pinched in that part of the cylinder which has the least diameter: this part must be pared in such a manner as to leave only what is necessary for making the pot fast to the top of the rocket, and the ligature must be covered with paper.

To charge such a pot, attached to a rocket. Having pierced three or four holes in the double paper which covers the vacuity of the rocket, pour over it a small quantity of the composition with which the rocket is filled, and by shaking it make a part enter these holes; then arrange, in the pot, the composition with which it is to be charged, taking care not to introduce into it a quantity heavier than the body of the rocket. The whole must be secured by means of a few

small balls of paper, and the pot covered with paper cemented to its edges: let a pointed summit be added to it, and the rocket is fit for use.

We shall now give an account of the different artifices with which such rockets are loaded.

1. *Of serpents.*—Serpents are small flying rockets without rods, which, instead of rising in a perpendicular direction, mount obliquely, and fall back in a zig-zag form without ascending to a great height. The composition of them is nearly the same as that of rockets; and therefore nothing more is necessary than to determine the proportion and construction of the cartridge, which is as follows:—The length of the cartridge may be about four inches; it must be rolled round a stick somewhat larger than the barrel of a goose-quill, and, after being choked at one of its ends, fill it with the composition a little beyond its middle, and then pinch it so as to leave a small aperture. The remainder must be filled with grained powder, which will make a report when it bursts. Lastly, choke the cartridge entirely towards the extremity; and at the other extremity place a train of moist powder, to which, if fire be applied, it will be communicated to the composition, and cause the whole to rise in the air. The serpent, as it falls, will make several turns in a zig-zag direction, till the fire is communicated to the grained powder; on which it will burst with a loud report before it falls to the ground.

If the serpent be not choked towards the middle, instead of moving in a zig-zag direction, it will ascend and descend with an undulating motion, and then burst as before. The cartridges of serpents are generally made with playing cards. These cards are rolled round a rod of iron or hard wood, a little larger, as already said, than the barrel of a goose-quill. To confine the card, a piece of strong paper is cemented over it. The length of the mould must be proportioned to that of the cards employed, and the piercer of the nipple must be three or four lines in length. These serpents are loaded with bruised powder, mixed only with a very small quantity of charcoal. To introduce the composition into the cartridge, a quill, cut into the form of a spoon, may be employed; it must be rammed down by means of a small rod, to which a few strokes are given with a small mallet.

When the serpent is half loaded, instead of pinching it in that part, you may introduce into it a vetch seed, and place granulated powder above it to fill up the remainder. Above this powder place a small pellet of chewed paper, and then choke the other end of the cartridge. If you are desirous of making larger serpents, cement two playing cards together; and, that they may be managed with more ease, moisten them a little with water. The match consists of a paste made of bruised powder, and a small quantity of water.

2. *Maroons.*—Maroons are small cubical boxes, filled with a composition proper for making them burst, and may be constructed with great ease.

Cut a piece of pasteboard, according to the method taught in geometry to form the cube; join these squares at the edges, leaving only one

to be cemented, and fill the cavity of the cube with grained powder; then cement strong paper in various directions over this body; and wrap round it two rows of pack-thread, dipped in strong glue; then make a hole in one of the corners, and introduce into it a match. If you are desirous to have luminous marroons, that is to say, marroons which, before they burst in the air, emit a brilliant light, cover them with a paste the composition of which will be given hereafter for stars; and roll them in pulverised gunpowder to serve as a match or communication.

3. *Saucissons*.—Marroons and saucissons differ from each other only in their form. The cartridges of the latter are round, and must be only four times their exterior diameter in length. They are choked at one end in the same manner as a rocket; and a pellet of paper is driven into the aperture which has been left, in order to fill it up. They are then charged with grained powder, above which is placed a ball of paper gently pressed down, to prevent the powder from being bruised; the second end of the saucisson being afterwards choked, the edges are pared on both sides, and the whole is covered with several turns of pack-thread, dipped in strong glue, and then left to dry. When you are desirous of charging them, pierce a hole in one of the ends, and apply a match, in the same manner as marroons.

4. *Stars*.—Stars are small globes of a composition which emits a brilliant light, which may be compared to the light of the stars in the heavens. These balls are not larger than a nutmeg or musket bullet, and when put into the rockets must be wrapped up in tow, prepared for that purpose. The composition of these stars is as follows:—To a pound of fine gunpowder well pulverised add four pounds of saltpetre, and two pounds of sulphur. When these ingredients are thoroughly incorporated, take about the size of a nutmeg of this mixture, and having wrapt it up in a piece of linen rag, or of paper, form it into a ball; then tie it closely round with a packthread, and pierce a hole through the middle of it, sufficiently large to receive a piece of prepared tow, which will serve as a match. This star, when lighted, will exhibit a most beautiful appearance; besides the fire, as it issues from the two ends of the hole in the middle, will extend to a greater distance, and make it appear much larger.

If you are desirous to employ a moist composition in the form of a paste, instead of a dry one, it will not be necessary to wrap up the star in any thing but prepared tow; because, when made of such paste, it can retain its spherical figure. There will be no need also of piercing a hole in it, to receive the match; because, when newly made, and consequently moist, it may be rolled in pulverised gunpowder, which will adhere to it. This powder, when kindled, will serve as a match, and inflame the composition of the star, which in falling will form itself into tears.

Another method of making rockets with stars.—Mix three ounces of saltpetre, with one ounce of sulphur, and two drachms of pulverised gunpowder; or mix four ounces of sulphur with the same quantity of saltpetre and eight ounces

of pulverised gunpowder. When these materials have been well sifted, besprinkle them with braudy, in which a little gum has been dissolved, and then make up the star in the following manner:—Take a rocket mould, eight or nine lines in diameter, and introduce into it a nipple, the piercer of which is of a uniform size throughout, and equal in length to the height of the mould. Put into this mould a cartridge, and by means of a pierced rod load it with one of the preceding compositions; when loaded, take it from the mould, without removing the nipple, the piercer of which passes through the composition, and then cut the cartridge quite round into pieces of the thickness of three or four lines. The cartridge being thus cut, draw out the piercer gently, and the pieces, which resemble the men employed for playing at drafts, pierced through the middle, will be stars, which must be filed on a match thread, which, if you choose, may be covered with tow.

To give more brilliancy to stars of this kind, a cartridge thicker than the above dimensions, and thinner than that of a flying rocket of the same size, may be employed; but, before it is cut into pieces, five or six holes must be pierced in the circumference of each piece to be cut. When the cartridge is cut, and the pieces have been filled, cement over the composition small bits of card, each having a hole in the middle, so that these holes may correspond to the place where the composition is pierced.

Remarks.—1. There are several other methods of making stars, which it would be too tedious to describe. We shall therefore only show how to make étoiles à pet, or stars which give a report as loud as that of a pistol or musket. Make small saucissons, as taught in the third section; only it will not be necessary to cover them with pack-thread: it will be sufficient if they are pierced at one end, in order that you may tie to it a star constructed according to the first method, the composition of which is dry; for, if the composition be in the form of a paste, there will be no need to tie it. Nothing will be necessary in that case but to leave a little more of the paper hollow at the end of the saucisson which has been pierced, for the purpose of introducing the composition; and to place in the vacuity, towards the neck of the saucisson, some grained powder, which will communicate fire to the saucisson when the composition is consumed.

2. As there are some stars which in the end become petards, others may be made which shall conclude with becoming serpents. But this may be so easily conceived and carried into execution that it would be losing time to enlarge further on the subject. We shall only observe that these stars are not in use, because it is difficult for a rocket to carry them to a considerable height in the air: they diminish the effect of the rocket or saucisson, and much time is required to make them.

SECT. IV.—OF COURANTINS OR ROCKETS WHICH FLY ALONG A ROPE.

A common rocket, which however ought not to be very large, may be made to run along an extended rope. For this purpose affix to the

rocket an empty cartridge, and introduce into it the rope which is to carry it; placing the head of the rocket towards that side on which you intend it to move: if you then set fire to the rocket, adjusted in this manner, it will run along the rope without stopping, till the matter it contains is entirely exhausted. If you are desirous that the rocket should move in a retrograde direction; first fill one-half of it with the composition, and cover it with a small round piece of wood, to serve as a partition between it and that put into the other half; then make a hole below this partition, so as to correspond with a small canal filled with bruised powder, and terminating at the other end of the rocket: by these means the fire, when it ceases in the first half of the rocket, will be communicated through the hole into the small canal, which will convey it to the other end; and, this end being then kindled, the rocket will move backwards, and return to the place from which it set out.

Two rockets of equal size, bound together by means of a piece of strong pack-thread, and disposed in such a manner that the head of the one shall be opposite to the neck of the other, that when the fire has consumed the composition in the one it may be communicated to that in the other, and oblige both of them to move in a retrograde direction, may also be adjusted to the rope by means of a piece of hollow reed. But, to prevent the fire of the former from being communicated to the second too soon, they ought to be covered with oil-cloth, or to be wrapped up in paper.

Remark.—Rockets of this kind are generally employed for setting fire to various other pieces when large fire-works are exhibited; and to render them more agreeable, they are made in the form of different animals, such as serpents, dragons, &c.; on which account they are called flying dragons. These dragons are very amusing, especially when filled with various compositions, such as golden rain, long hair, &c. They might be made to discharge serpents from their mouths, which would produce a very pleasing effect, and give them a greater resemblance to a dragon.

Rockets which fly along a rope, and turn round at the same time.—Nothing is easier than to give to a rocket of this kind a rotatory motion around the rope along which it advances; it will be sufficient for this purpose to tie it to another rocket, placed in a transversal direction. But the aperture of the latter, instead of being at the bottom, ought to be in the side, near one of the ends. If both rockets be fired at the same time, the latter will make the other revolve around the rope, while it advances along it.

Of rockets which burn in the water.—Though fire and water are two things of a very opposite nature, the rockets above described, when set on fire, will burn and produce their effect even in the water; but as they are then below the water the pleasure of seeing them is lost: for this reason, when it is required to cause rockets to burn as they float on the water, it will be necessary to make some change in the proportions of the moulds, and materials of which they are composed. In regard to the mould, it may be eight

or nine inches in length, and an inch in diameter: the former, on which the cartridge is rolled up, may be nine lines in thickness, and the rod for loading the cartridge must as usual be somewhat less. For loading the cartridge there is no need for a piercer with a nipple.

The composition may be made in two ways; for if it be required that the rocket, while burning on the water, should appear as bright as a candle, it must be composed of three materials mixed together, viz. three ounces of pulverised and sifted gunpowder, one pound of saltpetre, and eight ounces of sulphur. But, if you are desirous that it should appear on the water with a beautiful tail, the composition must consist of eight ounces of gunpowder pulverised and sifted, one pound of saltpetre, eight ounces of pounded and sifted sulphur, and two ounces of charcoal. When the composition has been prepared according to these proportions, and the rocket has been filled in the manner above described, apply a saucisson to the end of it; and having covered the rocket with wax, black pitch, resin, or any other substance capable of preventing the paper from being spoiled in the water, attach to it a small rod of white willow, about two feet in length, that the rocket may conveniently float.

If it be required that these rockets should plunge down, and again rise up, a certain quantity of pulverised gunpowder, without any mixture, must be introduced into them, at certain distances, such, for example, as two, three, or four lines, according to the size of the cartridge.

Remarks.—1. Small rockets of this kind may be made without changing the mould or composition, in several different ways, which, for the sake of brevity, we are obliged to omit. Such of our readers as are desirous of further information on this subject may consult those authors who have written expressly on pyrotechny.

2. It is possible also to make a rocket which, after it has burnt some time on the water, shall throw out sparks and stars; and these after they catch fire shall ascend into the air. This may be done by dividing the rocket into two parts, by means of a round piece of wood, having a hole in the middle. The upper part must be filled with the usual composition of rockets, and the lower with stars, which must be mixed with grained and pulverised gunpowder, &c.

3. A rocket which takes fire in the water, and, after burning there half the time of its duration, mounts into the air with great velocity, may be constructed in the following manner:—Take a flying rocket, furnished with its rod, and by means of a little glue attach it to a water-rocket, but only at the middle, in such a manner, that the latter shall have its neck uppermost, and the other its neck downward. Adjust to their extremity a small tube, to communicate the fire from one end to the other, and cover both with a coating of pitch, wax, &c., that they may not be damaged by the water. Then attach to the flying rocket, after it has been thus cemented to the aquatic one, a rod of the kind described in the second article; and suspend a piece of pack-thread to support a musket bullet in fast to the rod by means of a needle or bit of iron wire.

When these arrangements have been made, set fire to the part after the rocket is in the water; and, when the composition is consumed, the fire will communicate through the small tube to the other rocket: the latter will then rise and leave the other, which will not be able to follow it, on account of the weight adhering to it.

SECT. V.—BY MEANS OF ROCKETS TO REPRESENT SEVERAL FIGURES IN THE AIR.

If several small rockets be placed upon a large one, their rods being fixed around the large cartridge which is usually attached to the head of the rocket, to contain what it is destined to carry up into the air; and these small rockets be set on fire while the large one is ascending, they will represent in a very agreeable manner a tree, the trunk of which will be the large rocket, and the branches the small ones. If these small rockets take fire when the large one is half burned in the air, they will represent a comet; and when the large one is entirely inverted, so that its head begins to point downwards, in order to fall, they will represent a kind of fiery fountain. If several serpents be attached to the rocket with a

piece of pack-thread, by the ends that do not catch fire; and if the pack-thread be sufficed to hang down two or three inches, between every two, this arrangement will produce a variety of agreeable and amusing figures.

A rocket which ascends in the form of a screw.—A straight rod, as experience shows, makes a rocket ascend perpendicularly, and in a straight line: it may be compared to the rudder of a ship, or the tail of a bird, the effect of which is to make the vessel or bird turn towards that side to which it is inclined; if a bent rod therefore be attached to a rocket, its first effect will be to make the rocket incline towards that side to which it is bent; but, its centre of gravity bringing it afterwards into a vertical situation, the result of these two opposite efforts will be that the rocket will ascend in a zig-zag or spiral form. In this case indeed, as it displaces a greater volume of air and describes a longer line, it will not ascend so high as if it had been impelled in a straight direction; but, on account of the singularity of this motion, it will produce an agreeable effect. For the military Congreve rocket, see **ROCKET**.

PYRRHA, the daughter of Epimetheus and Pandora, and wife of Deucalion, king of Thesaly, in whose reign the flood happened. See **DEUCALION**. She was the mother of Amphycion, Helen, and Protogenes, by Deucalion. Ovid, *Met.* i.

PYRRHICHA, in antiquity, a kind of exercise on a horseback, or a feigned combat, for the exercise of the cavalry. It was thus called from its inventor Pyrrhus of Cydonia, who first taught the Cretans to march in measure and cadence to battle, and to observe the time of the Pyrrhic foot. Others derive the name from Pyrrhus the son of Achilles, who instituted this exercise at the obsequies of his father. Aristotle says that it was Achilles himself who invented it. The Romans also called it *ludus Trojanus*, the Trojan game; and *Aulus Gellius*, *decursus*. It is represented on medals by two cavaliers in front running with lances, and the word *decursio* in the exergue.

PYRRHIC, in the Greek and Latin poetry, a foot consisting of two syllables, both short; as *deus*. Among the ancients this foot is also called *perambius*; by others *hegemonia*.

PYRRHO, a Greek philosopher, born at Elis in Peloponnesus, who flourished about 300 B. C. He was the disciple of Anaxarchus, whom he accompanied as far as India, where he conversed with the Brahmins and Gymnosophists. He had made painting his profession before he studied philosophy. He established a sect whose fundamental principle was, that there is nothing true or false, right or wrong, honest or dishonest, just or unjust; or that there is no standard of any thing beyond law or custom, and that uncertainty and doubt belong to every thing. From this continual seeking after truth and never finding it, the sect obtained the name of *Sceptics* or *Pyrrhonians* from the founder. Pyrrho died about the ninetieth year of his age; his memory was honored with a statue at Athens, and a monument in his own country.

PYRRHUS I., or Neoptolemus, the first king of Epirus, the son of Achilles and Deidamia. See **EPHRUS**. He was killed by Orestes in the temple of Delphi.

PYRRHUS II., king of Epirus, the son of Æacides and Phthia, and a lineal descendant of Pyrrhus I.; celebrated for his war with the Romans. He conquered Antigonus, and reigned some time in Macedonia, but was at last killed at Argos, A. C. 272. See **ROME**.

PYRRHONISM, *n. s.* [From Pyrrho, the founder of the sceptics.] Scepticism; universal doubt.

As some ignorantly affect to be more knowing, so others vainly affect to be more ignorant than they are; who, to show they have greater insight and penetration than other men, insist upon the absolute uncertainty of science; will dispute even first principles; grant nothing as certain, and so run it into downright *pyrrhonism*; the too common effect of abstracted debates excessively refined. *Mason*.

PYRUS, the pear-tree, a genus of the pentagynia order and icosandria class of plants; natural order thirty-sixth, pomaceæ: *CAL.* quinquefid; petals five; fruit an apple, inferior, quinquelocular, and polyspermous. To this genus Linné has joined the apple and quince.

1. *P. communis*, the common pear-tree, rises with an upright large trunk, branching thirty or forty feet high, in some widely around, in others more erectly, and forming a conical head, oval, lanceolated, serrated leaves, and corymbose clusters of white flowers from the sides of the branches, succeeded by large fruit extended at the base. Under this species are comprehended almost endless varieties, all bearing the above description. They bear their flowers and fruit upon spurs, arising from the sides of the branches from two or three years old and upwards; the same branches and spurs continuing fruitful for a great number of years. The summer pears ripen in different sorts from the beginning of July until the middle or end of

September, and are generally fit to eat from the tree, or at least do not keep a week or two before they rot. The autumn pears come to perfection in October, November, and December; some ripening nearly on the tree in October and November, others requiring to lie some time in the fruitery, while some will keep two months; but all the winter pears, though they attain their full growth on the tree by the end of October and in November, yet they do not acquire perfection for eating till from the end of November to April and May. Those of each class have different properties; some being melting, others breaking, some mealy, and some hard and austere, fit only for kitchen uses. As many of the finest sorts were first obtained from France, they are still continued in most catalogues by French names. All the varieties of the pear-tree are hardy, and will succeed in any common soil of a garden or orchard. They are propagated by grafting and budding upon any kind of pear stocks; also occasionally upon quince stocks, and sometimes upon white thorn stocks; but pear stocks are greatly preferable to all others for general use.

2. *P. coronaria*, the sweet scented crab of Virginia, grows twelve or fifteen feet high, having angular serrated leaves, pedunculated umbels of whitish red, sweet-scented flowers, succeeded by small round crabs, remarkably sour and austere. There is one variety, called the evergreen Virginian crab-tree.

3. *P. cydonia*, the quince, formerly ranked by botanists as a distinct genus, but classed by Linné and his followers as a species of *pyrus*. It was formerly divided into three species, which must now rank as varieties; viz.

i. *P. cydonia lusitana*, the Portugal quince, with obverse oval leaves, woolly on their under side:

ii. *P. cydonia maliforma*, with oval leaves, wholly on their under side, and lengthened at their base: and

iii. *P. cydonia oblonga*, with an oblong fruit lengthened at the base. There are some other varieties of this fruit, propagated in fruit gardens, and in the nurseries for sale; one of which is a soft eatable fruit, another very astringent, and a third with a very small fruit, cottony all over, which is scarcely worth keeping. These Mr. Miller supposed to be the seminal variations, but the three others to be distinct species. The Portugal quince is the most valuable; its pulp turns to a fine purple when stewed or baked, and becomes much softer and less austere than the others; it is therefore much fitter for making marmalade. These trees are all easily propagated, either by layers, suckers, or cuttings, which must be planted in a moist soil. Those raised from suckers are seldom so well rooted as those which are obtained from cuttings or layers, and are subject to produce suckers again in greater plenty; which is not so proper for fruit bearing trees. These trees require very little pruning; the chief thing to be observed is, to keep their stems clear from suckers, and cut off such branches as cross each other; likewise all upright luxuriant shoots from the middle of the tree should be taken off, that the head may not

be too much crowded with wood, which is of ill consequence to all fruit trees. These sorts may also be propagated by budding or grafting upon stocks raised by cuttings; so that the best sorts may be cultivated in this way in greater plenty than by any other method.

4. *P. malus*, the common apple-tree, grows twenty or thirty feet high, having oval serrated leaves and sessile umbels of whitish red flowers succeeded by large, roundish, and oblong fruit, concave at the base. The varieties of this species are amazingly great with respect to the differences of the fruit. Botanists say, that the wilding, or crab-apple of the woods and hedges is the original kind, and from the seeds of which the cultivated apple was first obtained. The varieties of this last no doubt are multiplied to some hundreds in different places, having been all first accidentally obtained from the seed or kernels of the fruit, and the approved sorts continued and increased by grafting upon crabs or any kind of apple stocks; but, although the number of varieties is very considerable, there are not above forty or fifty sorts retained in the nurseryman's catalogue. These varieties arrive at full growth in successive order from July to the end of October, improve in perfection after being gathered, and several of the winter kinds in particular, keep good for many months, even till the arrival of apples next summer. Among these various kinds of apples some are used for the dessert, some for the kitchen, and some for cyder making. All kinds of apples are propagated in the same manner as the pears, using apple stocks instead of pear stocks. They will succeed in any common soil of a garden or orchard, and in any free situation, except in a low and very moist soil, in which they are apt to canker, and very soon go off. In a friable loam they are generally very successful.

PYTHAGORAS, a celebrated philosopher of antiquity, respecting the time and place of whose birth critics are much divided. Dr. Bentley determines the date of his birth to be the fourth year of the forty-third Olympiad; Lloyd places it about the third year of the forty-eighth; and Dodwell fixes it in the fourth year of the fifty-second. It is generally believed that he was born in the island of Samos, and that he flourished about A. A. C. 500. His father Mnesarchus, who is said by some to have been a lapidary, and by others a merchant of Tyre, appears to have been a man of some distinction, and to have bestowed upon his son the best education. Of his childhood and early education we know nothing, except that he was first instructed in his own country by Creophilus, and afterwards in Scyros by Pherecydes. Poetry and music, eloquence and astronomy, became his studies; and in gymnastic exercises he often bore the palm for strength and dexterity. He first distinguished himself in Greece at the Olympic games, and soon after he commenced his travels. He visited Egypt, where, through the interest of Polycrates, tyrant of Samos, he obtained the patronage of king Amasis, by whose influence, with his own assiduity and perseverance, he gained the confidence of the priests; from whom he learned their sacred mysteries,

theology, and system of symbolical learning. In Egypt, too, he became acquainted with geometry, and the solar system; and made himself master of all the learning for which it was so famed among the nations of antiquity. It is said that he afterwards visited Persia and Chædeæ, where from the Magi he learnt divination, the interpreting of dreams, and astronomy. He likewise travelled into India, conversed with the Gymnosophists, and acquired from them a knowledge of the philosophy and literature of the east; and such was his ardor in the pursuit of science, that in quest of it, says Cicero, he crossed many seas, and travelled on foot through many barbarous nations. After he had spent many years in acquiring information on every subject, he returned to Samos, and attempted to institute a school for the instruction of his countrymen. Failing of success, he repaired to Delos, where he pretended to receive moral dogmas from the priestess of Apollo. He also visited Crete, where he was initiated into the most sacred mysteries of Greece. He went likewise to Sparta and Elis, and again assisted at the Olympic games; where, in the public assembly, he was saluted with the title of sophist, or wise man, which he declined. He returned to Samos, enriched with mythological learning and mysterious rites, and again instituted a school. His mysterious symbols and oracular precepts made this attempt more successful than the former; but, meeting with some opposition, he retired to Magna Græcia, and settled at Crotona. Here he founded the Italic sect; and his mental accomplishments, the fame of his travels, and his Olympic crown, soon procured him numerous pupils. His manly eloquence, and graceful delivery, attracted the most dissolute, and produced a remarkable change in the morals of the Crotonians. His influence was increased by the regularity of his own example, and its conformity to his precepts. He punctually attended the temples of the gods at an early hour; he lived upon the most simple food; clothed himself like the priests of Egypt; and, by his frequent purifications and regular offerings, appeared superior in sanctity to the rest of mankind. He endeavoured to delight his scholars with verse and music, by playing on his harp, and singing the pæans of Thales. Bodily exercises also made a considerable part of his discipline. At Crotona he had a public school for the general benefit of the people, in which he taught them virtue, condemning vice, and instructing them in the duties of social life. He also had a college in his own house, which he denominated *κοινυβιον*, in which there were two classes of students, viz. *εξωτερικοι*, or auscultantes, and *εσωτερικοι*. The former were probationers, and were kept under a long examen. A silence of five years was imposed upon them; which, according to Clemens Alexandrinus was to inure them to the pure contemplation of the Deity. The latter were called genuini, perfecti, mathematici; and, by way of eminence, Pythagoreans. They alone were admitted to the knowledge of the arcana of Pythagoric discipline, and the use of ciphers and hieroglyphics. The authority of Pythagoras among his pupils was so great that

it was even deemed a crime to dispute his word; and their arguments were considered as infallibly convincing, if they could enforce them by adding that the master said so. To give more weight to his exhortations, Pythagoras retired into a subterranean cave, where his mother sent him intelligence of every thing which happened during his absence. After several months, he re-appeared on the earth with a grim and ghastly countenance, and declared in the assembly of the people that he was returned from Hades; which gave rise to many other fabulous reports. At length his singular doctrines, and perhaps his strenuously asserting the rights of the people against their tyrannical governors, raised a powerful party against him; which soon obliged him to fly for his life. His friends fled to Rhegium; and he himself, after being refused protection by the Locrians, fled to Metapontum, where he took refuge in the temple of the Muses, and where it is said he died of hunger about A. A. C. 497. The time, place, and manner of his death, however, are all very uncertain. After his death his followers paid the same respect to him as was paid to the gods; they erected statues in honor of him, converted his house at Crotona into a temple of Ceres, appealed to him as a deity, and swore by his name. Pythagoras married Theano of Crotona, or of Crete, by whom he had two sons, Telagues and Mnesarchus, who, after his death, took the management of his school. He also had a daughter called Damo. Whether he left any writings behind him is disputed. The golden verses, which Hierocles illustrated with a commentary, have been ascribed to Epicharmus or Empedocles, and contain a brief summary of his popular doctrines. From his mysterious secrecy, our information concerning his doctrine and philosophy is very uncertain. The purpose of philosophy, according to his system, is to raise the mind to the contemplation of immutable truth, and the knowledge of divine and spiritual objects. Mathematical science was with him the first step to wisdom, because it inures the mind to contemplation, and takes a middle course between corporeal and incorporeal beings. The whole science he divided into two parts, numbers and magnitude; and each of these he subdivided into two others, the former into arithmetic and music, and the latter into magnitude at rest and in motion; the former comprehending geometry, and the latter astronomy. Arithmetic he considered as the noblest science; and an acquaintance with numbers as the highest good. He considered numbers as the principles of every thing; and divided them into scientific and intelligible. Of the Monad, Duad, Triad, Tetrad, and Decad, various explanations have been given by various authors; but nothing certain is known of them. Music followed numbers, and was useful in raising the mind above the dominion of the passions. He invented the harmonical canon, or monochord; and the music of the spheres was a fanciful doctrine of Pythagoras. He reduced geometry to a regular science. A geometrical point, which he defines to be a monad, or unity with position, he says, corresponds to unity in arithmetic, a line to two, a

superficies to three, and a solid to four. God he considered as the universal mind, diffused through all things, and the self-moving principle of all things (*αυτοματισμος των παντων*), and of whom every human soul is a portion. Subordinate to the Deity there were, in the Pythagorean creed, three orders of intelligences, gods, demons, and heroes, of different degrees of excellence and dignity. These, together with the human soul, were considered as emanations from the Deity, the particles of subtle ether assuming a grosser clothing the farther they receded from the fountain. God himself was represented under the notion of monad, and the subordinate intelligences as numbers derived from, and included in, unity. Man was considered as consisting of an elementary nature, and a divine or rational soul. His soul, a self-moving principle, is composed of two parts; the rational, seated in the brain; and the irrational, including the passions, in the heart. In both these respects he participates with the brutes. The sensitive soul perishes; the other assumes an ethereal vehicle, and passes to the regions of the dead, till sent back to the earth to inhabit some other body brutal or human. See *ΜΕΤΕΜΨΥΧΩΣΙΣ*. It was this notion which led Pythagoras and his followers to abstain from flesh, and to be so peculiarly merciful to animals of every description. This doctrine is thus beautifully represented by Ovid, who introduces Pythagoras as saying,

‘Morte carent animæ: semperque priore relicta
Sede, novis domibus habitant, vivuntque receptæ:
Omnia mutantur; nihil interit; errat et illinc,
Huc venit, hinc illuc, et quoslibet occupet artus
Spiritus, æque feris humana in corpora transit,
Inque feras noster: nec tempore deperit illo,
Utque novis fragilis signatur cera figuris,
Nec manet ut fuerat, nec formas servat eandem,
Sed tamen ipsa eadem est, animam sic semper eandem,
Esse, sed in varias doceo migrare figuras.’

‘What then is death, but ancient matter drest
In some new figure, and a varied vest?
Thus all things are but altered, nothing dies;
And here and there the unbodied spirit flies,
By time, or force, or sickness dispossessed,
And lodges where it lights, in man or beast;
Or hunts without, till ready limbs it find,
And actuates those according to their kind;
From tenement to tenement is tost,
The soul is still the same, the figure only lost:
And, as the softened wax new seals receives,
This face assumes, and that impression leaves;
Now called by one, now by another name,
The form is only changed, the wax is still the same;
So death, thus called, can but the form deface,
The immortal soul flies out in empty space,
To seek her fortune in some other place.’

PYTHEAS, an eminent philosopher, astronomer, and geographer, born in Massilia in the age of Aristotle. He distinguished himself by his travels, as well as by his writings, all of which are now lost, though some of them were extant so late as the fifth century. He entered the sea, then unknown, now called the Baltic, and sailed as far as Thule. He was the first who established a distinction of climate by the length of days and nights.

PYTHEUS, a Lydian, famous for his riches, who is said to have entertained Xerxes, and all his numerous army, when going to invade Greece.

PYTHIA, or **PYTHONISSA**, the priestess of Apollo at Delphi, by whom he delivered oracles. She was so called from Pythius, a name of that god. The Pythia was at first required to be a young girl; but in latter times she was a woman of fifty years of age. The first and most famous Pythia was Phemonœ. Oracles were at first delivered by her in hexameter verse. All the Pythias were to be pure virgins, and all of them delivered their oracles with great enthusiasm and violent agitations. See *ORACLE* and *DELPHI*.

PYTHIAN GAMES, in Grecian antiquity, sports instituted near Delphos in honor of Apollo, on account of his slaying the serpent Python. See *APOLLO*. These games, at their first institution, were celebrated only once in nine years; but afterwards every fifth year, from the number of the Parnassian nymphs who came to congratulate Apollo, and to make him presents on his victory. The victor was crowned with garlands.

PYTHON, in fabulous history, a monstrous serpent, produced by the earth after Deucalion's deluge. Juno, being exasperated at Latona, who was beloved by Jupiter, commanded this serpent to destroy her; but, flying from the pursuit of the monster, she escaped to Delos, where she was delivered of Diana and Apollo; the latter of whom destroyed Python with his arrows, in memory of which victory the Pythian games were instituted. See *APOLLO*.

PYX, *n. s.* Lat. *pyxis*; Gr. *πυξίς*, a box. The box in which the Romanists keep the host.

Pyxis is a small metal case for containing the consecrated species in the Catholic church. Anciently it was made in the form of a dove, and suspended over the altar. *Dr. A. Rees.*

PYX. Lat. *pyxis*, from Gr. *πύξις*. In archæology, a name given to the little casket in which the ancients often deposited their jewels and other ornaments. It was frequently of rich materials, and highly embellished; its shape was a long square, and it is often found represented on Greek vases.

Q.

Q, the sixteenth letter of the alphabet, borrowed from the Latin or French, and for which the Saxons generally used *cp*, *cw*. The name of this letter is derived from Fr. *queue*, tail; its form being that of an U with a tail. The Q has this peculiar to it, that it is always followed by a U, and is therefore reckoned among the mutes. It is formed from the Hebrew *q*, *koph*; which most other languages have borrowed; though some of them have rejected it again, particularly the Greeks.

In effect, there is that resemblance between the Q and the C in some languages, and the K in others, that many grammarians, in imitation of the Greeks, banish the Q as a superfluous letter. Papias even affirms that all the Latin words now written with a Q were written among the ancient Romans with a C; but we want better authority for this. For though, in many cases, some write indifferently *quor*, or *cur*; *cum*, or *quum*; *quotidie*, or *cotidie*, &c., yet it does not thence follow that they ever wrote *cis*, *cæ*, *cid*, for *quis*, *quæ*, *quid*. Far from this, the ancients sometimes substituted Q for C; and wrote *quojus*, *quoi*, for *cujus*, *cui*, &c.

Varro, however, and some other grammarians, as we are told by Censorinus, &c., would never use the Q. The truth is, its use or disuse seems to have been so little settled and agreed on that the poets used the Q or C indifferently, as best suited their measures; it being a rule that the Q joined the two following vowels into one syllable; and that the C imported them to be divided. Hence it is that Lucretius uses *cuiet* for three syllables, in lieu of *quieit*; *acua* for *aqua*; and that Plautus uses *relicuum* for *reliquum*; as in

Quod dedi, datum non vellem relicuum non;
where the *cum* must be two syllables, otherwise the trochiac verse will be lame of a foot. In the French the sound of the Q and K are so near akin, that some of their nicest authors think the former might be spared. Ramus adds that till the establishment of royal professors in the university of Paris, under Francis I., they always used Q in the Latin the same as in the French; pronouncing *kis*, *kalis*, *kantus*, &c., for *quis*, *qualis*, *quantus*.

Some very learned men make Q a double letter as well as K and X. According to them, Q is evidently a C and U joined together, and they see the traces of the C U in the figure of the Q; the V being only laid obliquely, so as to come within the cavity of the C; as C <!

Q, among the ancients, was a numeral letter, signifying 500; as in the verse,

Q velut A cum D quingentus vult numerare.

A dash over it, as *Q̄*, denoted it to signify 500,000.

Q is also used as an abbreviation in several arts. Q. pl. in physicians' bills, stands for quantum placet, as much as you please; q. s. for quantum sufficit, or as much as is necessary. See ABBREVIATION.

QUACK, *v. n. & n. s.* Belg. *quacken*; Teut. *kuacken*; or from the sound. To cry as a goose or duck; be boisterously or chatteringly vain. Hence, as a noun-substantive, a vain and boastful pretender to medicinal, or other arts.

Many poor country vicars, for want of other means, are driven to their shifts; to turn mountebanks, *quacksalvers*, and empyricks. *Burton.*

Believe mechanick virtuosi

Can raise them mountains in Potosi,

Seek out for plants with signatures,

To quack of universal cures. *Hudibras.*

Saltimbancoes, quacksalvers, and charlatans deceive the vulgar in lower degrees; were Æsop alive, the Piazza and the Pont Neuf could speak their fallacies. *Brown.*

The change, schools, and pulpits are full of *quacks*, jugglers, and plagiarists. *L'Estrange.*

Ordinary *quacks* and charlatans are thoroughly sensible how necessary it is to support themselves by collateral assistances, and therefore always lay claim to some supernumerary accomplishments foreign to their profession. *Tatler.*

Wild ducks *quack* where grasshoppers did sing. *King.*

At the first appearance that a French *quack* made in Paris, a boy walked before him, publishing with a shrill voice, 'My father cures all sorts of distempers;' to which the doctor added in a grave manner, 'The child says true.' *Addison.*

Some *quacks* in the art of teaching pretend to make young gentlemen masters of the languages, before they can be masters of common sense. *Felton on the Classicists.*

Despairing *quacks* with curses fled the place,
And vile attorneys, now an useless race. *Pope.*

QUADI, an ancient people of Germany, situated on the south-east of the mountains of Bohemia, on the banks of the Danube, and extending as far as the river Marus, or March, running by Moravia, which country they occupied.

QUADRA AND VANCOUVER'S ISLAND, an island on the north-west coast of North America, between Queen Charlotte's Sound and De Fuca's Straits. Nootka Sound lies not far from its south-west side. It was so named by Vancouver in honor of his meeting with signior Quadra, the officer who was commissioned by the court of Spain to cede, in the name of his court, the disputed territory of Nootka.

QUADRAGESIMAL, *adj.* Fr. *quadragesimal*; Lat. *quadragesima*. Lenten; belonging to or used in Lent.

I have composed prayers out of the church collects, adventual, *quadragesimal*, paschal, or pentecostal. *Sanderson.*

QUADRANGLE, *n. s.* Lat. *quadratus* and *angulus*. A square; a surface with four right angles.

My choler being overblown

With walking once about the *quadrangle*,

I come to talk. *Shakspeare. Henry VI.*

The escorial hath a *quadrangle* for every month in the year. *Howel.*

I was placed at a *quadrangular* table, opposite to the mace-bearer. *Spectator.*

Common salt, shooteth into little crystals, coming near to a cube, sometimes into square plates, sometimes into short *quadrangular* prisms. *Grew.*

Each environed with a crust, conforming itself to the planes, is of a figure *quadrangular*. *Woodward.*

QUADRANS, a farthing, the fourth part of a penny. Before the reign of Edward I. the smallest coin was a sterling, or penny, marked with a cross; by the guidance of which a penny might be cut into halves for a halfpenny, or into quarters or four parts for farthings; till, to avoid the fraud of unequal cuttings, that king coined halfpence and farthings in distinct round pieces.

QUADRANT, *n. s.*

QUADRANTAL, *adj.*

QUADRATE, *adj.*, *n. s.*, &

QUADRATIC, *adj.* [*v. n.*]

QUADRATURE, *n. s.*

Lat. quadrans.

The fourth part;

the quarter; the

quarter of a circle;

an instrument for

measuring altitudes: *quadrate* is square; four-fold; divisible into four parts; suited; fitted: a square; in astrology, an aspect of the heavenly bodies, wherein they are distant from each other ninety degrees, and the same with quartile: as a verb neuter, to suit; fit; be accommodated: *quadratic*, an algebraic term applied to such equations as retain, on the unknown side, the square of the root or the number sought: *quadrature* is the act of squaring; state of being square; a quadration square; the first and last quarter of the moon.

And 'twixt them both a *quadrate* was the base, Proportioned equally by seven and nine; Nine was the circle set in heaven's place, All which compacted, made a goodly diapase. *Spenser.*

Whether the exact *quadrate* or the long square be the better is not well determined; I prefer the latter, provided the length do not exceed the latitude above one-third part. *Wotton.*

Some tell us that the years Moses speaks of were somewhat above the monthly year, containing in them thirty-six days, which is a number *quadrate*. *Hakewill on Providence.*

The word consumption, being applicable to a proper or improper consumption, requires a general description, *quadrate* to both. *Harvey.*

The powers militant

That stood for heaven, in mighty *quadrate* joined

Of union irresistible, moved on

In silence their bright legions. *Milton.*

All things parted by the' empyreal bounds,

His *quadrature* from thy orbicular world. *Id.*

In sixty-three years may be lost eighteen days, omitting the intercalation of one day every fourth year, allowed for this *quadrant* or six hours supernumerary. *Bronne.*

The number of ten hath been extolled, as containing even, odd, long and plain, *quadrate* and cubical numbers. *Id.*

To our understanding a *quadrate*, whose diagonal is commensurate to one of the sides, is a plain contradiction. *More.*

The obliquity of the ecliptick to the equator, and from thence the diurnal differences of the sun's right ascensions, which finish their variations in each *quadrant* of the circle of the ecliptick, being joined to the former inequality, arising from the excentricity, makes these quarterly and seeming irregular inequalities of natural days. *Holder on Time.*

It is full moon when, the earth being between the sun and moon, we see all the enlightened part of the moon; new moon when, the moon being between us and the sun, its enlightened part is turned from us: and half moon, when the moon being in the *quadratures*, we see but half the enlightened part. *Locke.*

Some had compasses, others *quadrants*. *Tatler.*

Aristotle's rules for epic poetry, which he had drawn from his reflections upon Homer, cannot be supposed to *quadrate* exactly with the heroic poems which have been made since his time; as it is plain his rules would have been still more perfect, could he have perused the *Æneid*. *Addison.*

Thin taper sticks must from one centre part;

Let these into the *quadrant's* form divide. *Gay.*

Sir Isaac Newton discovered a way of attaining the quantity of all *quadrable* curves analytically, by his method of fluxions, some time before the year 1688. *Derham.*

To fill that space of dilating, proceed in straight lines, and dispose of those lines in a variety of parallels: and, to do that in a *quadrantal* space, there appears but one way possible; to form all the intersections, which the branches make, with angles of forty-five degrees only. *Id.*

The speculations of algebra, the doctrine of infinites, and the *quadrature* of curves, should not in-trench upon our studies of morality. *Watts.*

QUADRANT, in geometry, is the arch of a circle, containing 90°, or the fourth part of the entire periphery. Sometimes also the space or area included between this arch and two radii drawn from the centre to each extremity thereof, is called a quadrant, or more properly a *quadrantal* space, as being a quarter of an entire circle.

QUADRANT is also a mathematical instrument of great use in astronomy and navigation, for taking the altitudes of the sun and stars, and for taking angles in surveying, &c. It is variously contrived, and furnished with different apparatus, according to the various uses it is intended for. See **ASTRONOMY** and **NAVIGATION**. The common surveying quadrant is made of brass, wood, or any other solid substance; the limb of which is divided into 90°, and each of these farther divided into as many equal parts as the space will allow, either diagonally or otherwise. On one of these semidiameters are fitted two moveable sights; and to the centre is sometimes fixed a label, or moveable index, bearing two other sights; but in lieu of these last sights there is sometimes fitted a telescope; also from the centre there is hung a thread with a plummet; and on the under side or face of the instrument is fitted a ball and a socket, by which it may be put into any position. The general use of it is for taking angles in a vertical plane, comprehended under right lines going from the centre of the instrument, one of which is horizontal, and the other is directed to some visible point. But, besides the parts already described, there is frequently added on the face, near the centre, a kind of compartment, called the *quadrat*, or geometrical square. This quadrant may be used in different situations; for observing heights or depths, its plane must be disposed perpendicularly to the horizon; but, to take horizontal distances, its plane is disposed parallel thereto. Again, heights and distances

may be taken two ways, viz. by means of the fixed sights and plummet, or by the label.

QUADRANT, GUNNER'S, called also *gunners' square*, is that used for elevating and pointing cannon, mortars, &c., and consists of two branches, either of brass or wood, between which is a quadrantal arch divided into 90° , beginning from the shorter branch, and furnished with a thread and plummet. The use of the gunners' quadrant is extremely easy; for if the longest branch be placed in the mouth of the piece, and it be elevated till the plummet cut the degree necessary to hit a proposed object, the thing is done. Sometimes on one of the surfaces of the long branch are noted the divisions of diameters and weights of iron bullets, as also the bores of pieces.

QUADRANT, GUNTER'S, so called from its inventor Edmund Gunter, besides the usual apparatus of other quadrants, has a stereographical projection of the sphere on the plane of the equinoctial. It has also a kalendar of the months, next to the divisions of the limb.

QUADRANT, HADLEY'S, is an instrument of great utility both in navigation and practical astronomy. It is named from Mr. Hadley, who first published an account of it, though the invention originated with the celebrated Dr. Hooke, and was completed by Sir Isaac Newton. Its utility arises from the accuracy and precision with which it enables us to determine the latitude and longitude, and to it navigation is much indebted for the very great and rapid advances it has made of late years. It is easy to manage, and of extensive use, requiring no peculiar steadiness of hand, nor any such fixed basis as is necessary to other astronomical instruments. It is used for taking angles in maritime surveying, and with equal facility at the mast head as upon the deck, by which its sphere of observation is much extended; for supposing many islands to be visible from the mast head, and only one from deck, no useful observation can be made by any other instrument. By this angles may be taken at the mast head from the one visible object with great exactness; and further, taking angles from heights, as hills, or a ship mast's head, is almost the only way of exactly describing the figure and extent of shoals. It has been objected to the use of this instrument for surveying, that it does not measure the horizontal angles, by which alone a plan can be laid down. This objection, though true in theory, may be reduced in practice by a little caution; and Mr. Adams has given very good directions for doing so. No instrument has undergone, since the original invention, more changes than this quadrant. An essential and invaluable property, whereby it is rendered peculiarly advantageous in marine observations, is, that it is not liable to be disturbed by the ship's motion; for, provided the mariner can see distinctly the two objects in the field of his instrument, no motion nor vacillation of the ship will injure his observation.

QUADRANT, MURAL. See *ASTRONOMY*.

QUADRANT OF ALTITUDE is an appendage of the artificial globe, consisting of a lamina, or slip of brass, the length of a quadrant of one of the

great circles of the globe, and graduated. At the end, where the division terminates, is a nut rivetted on, and furnished with a screw, by means whereof the instrument is fitted on the meridian, and moveable round upon the rivet to all points of the horizon. Its use is to serve as a scale in measuring of altitudes, amplitudes, azimuths, &c.

QUADRANTAL, in antiquity, the name of a vessel in use among the Romans for the measuring of liquids. It was at first called amphora; and afterwards quadrantal, from its form, which was square every way like a die. Its capacity was eighty libræ, or pounds of water, which made forty-eight sextaries, two urnæ, or eight congii.

QUADRATE, a mathematical instrument, called also a geometrical square, and line of shadows: it is frequently an additional member on the face of the common quadrant, as also on those of Gunter's and Sutton's quadrants.

QUADRATE, in printing, a piece of metal used to fill up the void spaces between words, &c.

QUADRATURE, in astronomy, that aspect of the moon when she is 90° distant from the sun; or when she is in a middle point of her orbit, between the points of conjunction and opposition, namely, in the first and third quarters. See *ASTRONOMY*.

QUADRATURE, in geometry, denotes the reducing a figure to a square, or the finding of a square which shall contain just as much surface or area as a circle, an ellipsis, a triangle, &c., is the quadrature of a circle, ellipsis, &c. This question, especially among the ancient mathematicians, was a great postulatam. The quadrature of rectilinear figures is easily found, for it is merely the finding their areas or surfaces, i. e. their squares; for the squares of equal areas are easily found by only extracting the roots of the areas thus found. The quadrature of the curvilinear spaces is of more difficult investigation; and in this respect extremely little was done by the ancients, except the finding the quadrature of the parabola by Archimedes. This he obtained in a very ingenious manner, by inscribing an isosceles triangle in the parabola, then two isosceles triangles on the equal sides of the former, four others on these, and so on, which he found to have a certain relation, decreasing in the proportion $1, \frac{1}{4}, \frac{1}{16}$, &c., the infinite sum of which series would therefore express the area of the parabola, or the area of all the triangles of which he thus conceived it to be composed; and which sum he found to be one and one-third, or two-thirds of the circumscribing rectangle. After this time, a period of near 2000 years elapsed without producing the quadrature of a single curvilinear figure, although the subject seems to have engaged the attention of the most eminent mathematicians during that long interval, particularly the quadrature of the circle. This figure, being the most simple in appearance and construction of any contained under a curve line, was well calculated to excite the curiosity of mathematicians. Archimedes doubtless attempted the solution of this problem; but, failing in producing the exact quadrature, he contented himself with giving an

approximation, showing by the inscription and circumscription of a polygon of ninety-six sides, that the diameter being 1, the circumference was greater than $3\frac{1}{7}$, but less than $3\frac{1}{8}$.

It would be useless to attempt in this place to enumerate the various absurd quadratures which have been, from time to time, published by minor geometers, with all that conceit and confidence which seldom fail to accompany inferiority. Some attributed their success to divine inspiration; others to their own superior talents: some offered large sums of money to those who should discover any error in their investigation, while others expected great rewards from their government as a recompence for their discovery, foolishly attaching great importance to a problem, which, if it could be accurately solved, would serve no other purpose but to gratify the curiosity of mathematicians. Towards the year 1585, Metius, combatting the false quadrature of Simon Duchêne, gave the ratio of 113 to 355, which is very exact. Vieta found a still nearer approximation, carrying it to ten places of decimals, whereas the former is true only to six places.

Adrianus Romanus carried the approximation to seventeen figures, and Ludolph Van Ceulen to thirty-six; which he published in his work, *De Circulo et Adscriptis*; and of which Snellius published a Latin translation in 1619. He afterwards verified Van Ceulen's approximation by some theorems of his own invention, which greatly facilitated the computation, and which he published in 1621, under the title of *Willebrordi Snellii Cyclometricus de Circuli Dimensione*, &c.

Descartes gave a geometrical construction from which it was easy to draw an expression in the form of a series; and Huygens afterwards discovered some curious theorems connected with this subject, and formed some useful rules for approximating towards the length of the circular arc.

A curious discovery connected with this subject was given by Wallis in his *Arithmetica Infinitorum*, in 1655: where he shows that the ratio of a circle to the square of its diameter is truly expressed by the infinite fraction.

$$\frac{3^2 \cdot 5^2 \cdot 7^2 \cdot 9^2 \cdot 11^2 \cdot \&c.}{2 \cdot 4^2 \cdot 6^2 \cdot 8^2 \cdot 10^2 \cdot 12^2 \cdot \&c.}$$

Such was the progress which mathematicians had made towards the solution of this interesting problem prior to the invention of fluxions, which, by reducing the quadrature of all curves to one general principle, again revived the hopes of success with regard to the circle, notwithstanding some pretended demonstrations of its impossibility; and its quadrature was accordingly again attempted with the greatest eagerness. The quadrature of a space, and the rectification of a curve, were now reduced to that of finding the fluent of a given fluxion but still the problem was found to be incapable of a general solution in infinite terms. The fluxion of a given fluent was found to be always assignable, but the converse proposition, viz. of finding the fluent of a given fluxion, could only be effected in particular cases; and amongst the

exceptions, to the great regret and disappointment of geometers, was included the case of the circle with regard to every form of fluxion under which it could be obtained. Mr. Glenie in 1812 read a paper before the Royal Society to prove that the true geometrical quadrature of the circle was impossible; which is now indeed generally allowed.

QUADRATUS, a native of Athens, where he was educated, and became a disciple of the apostles. About A. D. 125, when the emperor Adrian visited Athens, and was initiated into the Eleusinian mysteries, a persecution of the Christians arose, wherein Publius bishop of Athens suffered martyrdom. Quadratus succeeded him, and wrote an Apology for the Christians, which he presented to the emperor, who thereupon stopt the prosecution. This work is lost, but was extant in the time of Eusebius, who says it showed the genius of the author, and the true doctrine of the apostles. Quadratus was banished from Athens, but nothing certain is recorded of his death.

QUADRATUS, a surname of Mercury, because some of his statues were square.

QUADREL, in building, a kind of artificial stone, so called from its being square. The quadrels are made of a chalky earth, &c., and dried in the shade for two years. These were formerly in great request among the Italian architects.

QUADRIFRONS, AND QUADRICEPS, surnames of Janus, because he was represented with four heads and four faces.

QUADRIGA, in antiquity, a car or chariot drawn by four horses. On the reverses of medals, we frequently see the emperor or Victory in a quadriga, holding the reins of the horses; whence these coins are, among the curious, called nummi quadrigati and victoriatii.

QUADRILATERAL, *adj.* Fr. *quadrilatere*; Lat. *quatuor* and *latus*. Having four sides.

Tin, incorporated with crystal, disposes it to shoot into a *quadrilateral* pyramid, sometimes placed on a *quadrilateral* base or column. Woodward.

QUADRILLE, a game played by four persons, with forty cards; which are the remains of a pack, after the four tens, nines, and eights are discarded; these are dealt three and three, and one round four, to the right hand player; and the trump is made by him that plays with or without calling, by naming spades, clubs, diamonds, or hearts, and the suit named is trumps.

QUADRIO (Francis Xavier), a learned Jesuit, born in the Valteline in 1695. He afterwards became secular priest, and died at Milan in 1756. He published, 1. A Treatise on the Italian Poetry. 2. A History of Italian Poetry, in 7 vols. 3. Dissertations upon the Valteline, in 3 vols.

QUAD'RUPED, *n. s.* Fr. *quadrupede*; Lat. *quadrupes*. An animal that goes on four legs.

The different flexure and order of the joints is not disposed in the elephant as in other *quadrupeds*.

The fang teeth, eye teeth, or dentes canini of some *quadruped*. Browne. Woodward on Fossils.

Most *quadrupedes*, that live upon herbs have incisive teeth to pluck and divide them. *Arbuthnot.*

The king of brutes,
Of *quadrupeds* I only mean. *Swift.*

The cockney, travelling into the country, is surprized at many actions of the *quadruped* and winged animals. *Watts's Logic.*

QUADRUPEDS, in zoology, those animals which have four limbs or legs proceeding from the trunk of their body. See ZOOLOGY.

QUAD'RUPLE, *adj.* Fr. *quadruple*; Lat. *quadruplus*. Fourfold; four times told.

A law, that to bridle theft doth punish thieves with a *quadruple* restitution, hath an end which will continue as long as the world itself continueth.

Hooker.

The lives of men on earth might have continued double, treble, or *quadruple*, to any of the longest times of the first age. *Raleigh.*

Fat refreshes the blood in the penury of aliment during the winter, and some animals have a *quadruple* caul. *Arbuthnot on Aliments.*

If the person accused maketh his innocence appear, the accuser is put to death, and out of his goods the innocent person is *quadruply* recompensed. *Swift.*

QU'ERE. Lat. *quære*. Enquire; seek; a word put when any thing is recommended to enquire.

Quære, if it is steeped in the same liquor, it may not prevent the fly and grub.

Mortimer's Husbandry.

To QUAFF, *v. a.* Junius derives this word from the Greek *κναφίζειν* in the Æolic dialect used for *κναθίζειν*. Skinner from *go off*, as *go off*, *guoff*, *quoff*, *quaff*. It comes from Fr. *coqfer*, to be drunk, says Johnson: Swed. *quäsa*, from Goth. *kaf*, deep. Thomson. To drink; swallow in large draughts.

QUAGGA (*equus quagga*). This animal, which is an inhabitant of the southern parts of Africa, is not unlike the zebra; its ears, however, are shorter, and it is not marked with stripes on its fore legs or hinder parts; its rump is of a grayish color, and its belly, legs, and tail whitish. The quagga is a social animal, living in large troops, is far more tractable than the zebra, and is said to be occasionally used in the Cape of Good Hope for domestic purposes. Notwithstanding this mildness of character when domesticated, it is exceedingly fearless in its native plains, and is even said to be more than a match for the hyæna, fighting desperately both with its hoofs and teeth. It will breed with the common horse; a mixed race of this kind, possessing great beauty of form, and retaining, in a great degree, the characteristic markings of the quagga, existed in England some years since. The quagga has received a variety of names from authors; thus Pennant terms it the quacha, Massou the opeagha, and Sparrman calls it by the name here adopted. It should be remarked that Edwards has mistaken it for the female zebra.

QUAG'MIRE, *n. s.* Quake and mire. A shaking marsh; a bog that trembles under the feet.

The fen and *quagmire*, so marsh by kind,
Are to be drained. *Tusser.*

VOL. XVIII.

The brain is of such a clammy consistence that it can no more retain motion than a *quagmire*.

Glanville's Scep sis.

The wet particles might have easily ever mingled with the dry, and so all had either been sea or *quagmire*. *More.*

QUAID, *part.* 'Of this participle I know not the verb,' says Johnson, 'and believe it only put by Spenser, who often took great liberties, for quailed.' But it is nearer *cowed* both in sound and signification. Dejected; depressed; crushed.

Therewith his sturdy courage soon was *quaid*,
And all his senses were with a sudden dread dismay'd. *Spenser.*

QUAIGH, or QUAFF, a kind of drinking vessel, peculiar to the Highlands, made of different pieces of wood, of various colors joined together by small hoops. They are made of various sizes, to hold from a gill, (or quarter) to a pint or even a quart of Scottish measure. The small ones have two handles (or lugs as they are called) projecting from the brim; the large have four.

QUAIL, *v. n. & v. a.* Belg. *quelen*; Teut. *qual*, is sickness. To languish; lose spirits; sink into dejection; decline: crush; quell.

After Solymn had with all his power in vain besieged Rhodes, his haughty courage began to *quail*, so that he was upon point to have raised his siege. *Knolles.*

To drive him to despair, and quite to *quail*,
He shewed him painted in a table plain
The damned ghosts. *Spenser.*

This may plant courage in their *quailing* breasts,
For yet is hope of life and victory. *Shakspeare.*

While rocks stand,
And rivers stir, thou can'st not shrink or *quail*;
Yea, when both rocks and all things shall disband,
Then shalt thou be my rock and tower. *Herbert.*

To pass the *quailing* and withering of all things by the recess, and their reviving by the reaccess of the sun, the sap in trees precisely follows the motion of the sun. *Hakevill.*

Three, with fiery courage, he assails;
Three, as kings adorned in royal woe;
And each successive after other *quails*,
Still wond'ring whence so many kings should rise. *Daniel.*

QUAIL, *n. s.* Fr. *caille*; Ital. *quaglia*; Belg. *quackel*; barb. Lat. *quaquila*. A bird of game and passage.

His *quails* ever
Beat mine. *Shakspeare. Antony and Cleopatra.*
Hen birds have a peculiar sort of voice, when they would call the male, which is so eminent in *quails*, that men, by counterfeiting this voice with a *quail*-pipe, easily draw the cocks into their snares. *Ray on the Creation.*

A dish of wild fowl furnished conversation, concluded with a late invention for improving the *quail*-pipe. *Addison.*

A fresher gale
Sweeping with shadowy gust the field of corn,
While the *quail* clamours for his running mate. *Thomson.*

QUAIL, in ornithology. See PERDIX.
QUAIL-PIPES, or quail-calls, are made of a small leather purse, about two fingers wide, and four fingers long, in the shape of a pear; this is stuffed half full of horse-hair, and a' the end of

it is placed a small whistle, made of the bone of a rabbit's leg, about two inches long, and the end formed like a flageolet, with a little soft wax. This is the end fastened into the purse; the other is closed up with the same wax, only a hole is opened with a pin, to make it give a distinct and clear sound. To make this sound, it must be held full in the palm of the hand, with one of the fingers placed over the top of the wax; then the purse is to be pressed, and the finger is to shake over the middle of it, to modulate the sound it gives into a sort of shake. This is the most useful call; for it imitates the note of the hen-quail, and seldom fails to bring a cock to the net if there be one near the place. The call that imitates the note of the cock, and is used to bring the hen to him, is to be about four inches long, and above an inch thick; it is to be made of a piece of wire turned round and curled, and covered with leather; and one end of it must be closed up with a piece of flat wood, about the middle of which there must be a small thread or strap of leather, and at the other end is to be placed the same sort of pipe, made of bone, as in the other call. The noise is made by opening and closing the spiral.

QUAINT, *adj.* } Fr. *coint*; of Lat. *comp-*
QUAINTLY, *adv.* } *tus*. Nice; minutely ex-
QUAINTNESS, *n. s.* } act; having petty ele-
gance; subtle; sly; fine-spun; affected: Spenser uses it for quailed.

As clerkes been full subtle and *quaint*. *Chaucer*.
Each ear sucks up the words a true love scattereth
And plain speech oft, than *quaint* phrase framed is.

Sidney.

With such fair slight him Guyon failed:

Till at the last, all breathless, weary and faint,

Him spying, with fresh onset he assailed,

And kindling new his courage, seeming *quaint*,

Struck him so hugely, that through great constraint

He made him stoop. *Spenser*.

You were glad to be employed,

To shew how *quaint* an orator you are.

Shakspeare.

I never saw a better fashioned gown,
More *quaint*, more pleasing, or more commendable.

Shakspeare.

Breathe his faults so *quaintly*,

That they seem the taints of liberty,

The flash and outbreak of a fiery mind. *Id.*

When was old Sherwood's hair more *quaintly*
curled,

Or nature's cradle more enchased and purld?

Ben Jonson.

What's the efficient cause of a king? surely a
quaint question; yet a question that has been moved.

Holyday.

He his fabrick of the heav'ns

Hath left to their disputes, perhaps to move

His laughter at their *quaint* opinions wide

Hereafter. *Milton's Paradise Lost*.

He spends some passages about two similitudes;
one of mine, and another *quainter* of his own.

Stillingfleet.

As my Buxoma

With gentle finger, stroaked her milky care,

I *quaintly* stole a kiss. *Gay*.

There is a certain majesty in simplicity, which is
far above all the *quaintness* of wit. *Pope*.

To this we owe those monstrous productions,
which under the name of trips, spies, amusements,
and other conceited appellations, have overrun us;

and I wish I could say, those *quaint* fopperies were
wholly absent from graver subjects. *Swift*.

QUAKE, *v. n. & n. s.* Sax. *þacan*; Lat. *quatit*
To shake; to tremble with cold or fear; to be
yielding; not solid or firm: a shudder.

The mountains *quake* at him, and the hills melt,
and the earth is burnt at his presence. *Nahum*. i. 5.

Dorus threw Pamela behind a tree, where she
stood *quaking* like the partridge on which the hawk
is ready to seize. *Sidney*.

Do such business as the better day

Would *quake* to look on: *Shakspeare*. *Hamlet*.

As the earth may sometimes shake,

For winds shut up will cause a *quake*;

So often jealousy and fear

Stol'n to mine heart, cause tremblings there.

Suckling.

The *quaking* powers of height stood in amaze.

Cowley.

In fields they dare not fight, where honour calls,

The very noise of wars their souls does wound,

They *quake* but hearing their own trumpets sound.

Dryden.

Next Smedley dived; slow circles d'amp'd o'er

The *quaking* mud, that clos'd and op'd no more.

Pope.

QUAKERS. See FRIENDS.

QUALIFY, *v. a. & v. n.* } Fr. *qualifier*;

QUALIFICATION, *n. s.* } of Lat. *qualis* and

facere. To fit or furnish; make capable of;

hence reduce; assuage; modify; abate: as a

verb neuter, fit one's self: qualification is, ac-

complishment; fitness; that which fits or quali-

fies; abatement; modification.

He balms and herbs thereto applied,

And evermore with mighty spells them charmed,

That in short space he has them *qualified*,

And him restored to health that would have dy'd.

Spenser.

That which ordinary men are fit for, I am *qualified*

in; and the best of me is diligence. *Shakspeare*.

I do not seek to quench your love's hot fire,

But *qualify* the fire's extreme rage,

Lest it should burn above the bounds of reason.

Id.

I have drunk but one cup to-night, and that was
craftily *qualified* too; and behold what innovation it

makes here. *Id.*

It hath so pleased God to provide for all living

creatures, wherewith he hath filled the world, that

such inconveniences as we contemplate afar off are

found by trial, and the witness of men's travels, to

be so *qualified*, as there is no portion of the earth

made in vain. *Raleigh's History of the World*.

Place over them such governors, as may be *quali-*

fied in such manner as may govern the place.

Bacon.

They would report that they had records for twenty

thousand years, which must needs be a very great

untruth, unless we will *qualify* it, expounding their

years not of the revolution of the sun, but of the

moon. *Abbot*.

It hath no larinx or throttle to *qualify* the sound.

Brownie.

So happy 'tis you move in such a sphere,

As your high majesty with awful fear

In human breasts might *qualify* that fire,

Which kindled by those eyes had flamed higher.

Waller.

Children should be early instructed in the true

estimate of things, by opposing the good to the

evil, and compensating or *qualifying* one thing with

another. *L'Estrange*.

Good *qualifications* of mind enable a magistrate to perform his duty, and tend to create a public esteem of him. *Atterbury.*

My proposition I have *qualified* with the word often; thereby making allowances for those cases, whereby men of excellent minds may, by a long practice of virtue, have rendered the heights and rigours of it delightful. *Id.*

It is in the power of the prince to make piety and virtue become the fashion, if he would make them necessary *qualifications* for preferment. *Swift.*

After mentioning the corporation and test acts, and some others which do not relate to the point under consideration, it is enacted that persons who, after the passing of the act, have omitted to *qualify* in the manner prescribed by those acts, and who shall properly *qualify* before the 25th of the ensuing December, shall be indemnified against all penalties, forfeitures, incapacities, and disabilities; and their elections, and the acts done by them, are declared to be good. *Tomlin's Law Dictionary.*

QUALITY, *n. s.* Fr. *qualité*; Lat. *qualitas*. Nature considered relatively; property; adjunct; disposition of mind or temper; qualification; rank: hence persons of high rank collectively considered.

These, being of a far other nature and *quality*, are not so strictly or everlastingly commanded in scripture. *Hooker.*

It is with the clergy, if their persons be respected, even as it is with other men; their *quality* many times far beneath that which the dignity of their place requireth. *Id.*

In the division of the kingdom, it appears not which of the dukes he values most; for *qualities* are so weighed, that curiosity in neither can make choice of either's moiety. *Shakspeare.*

O, mickle is the powerful grace, that lies

In plants, herbs, stones, and their true *qualities*. *Id.*

Let him be so entertained, as suits with gentlemen of your knowing to a stranger of his *quality*. *Id. Cymbeline.*

The attorney of the duchy of Lancaster partakes of both *qualities*, partly of a judge in that court, and partly of an attorney-general. *Bacon.*

The matter is, whether he be a man of such *quality* that the state allows him to have a dove-house. *Selden.*

He had those *qualities* of horsemanship, dancing, and fencing, which accompany a good breeding. *Clarendon.*

The masters of these horses may be admitted to dine with the lord lieutenant: this is to be done, what *quality* soever the persons are of. *Temple.*

One doubt remains, said I, the dames in green, What were their *qualities*, and who their queen? *Dryden.*

The power to produce any idea in our mind, I call *quality* of the subject, wherein that power is. *Locke.*

Since the event of an action usually follows the nature or *quality* of it, and the *quality* follows the rule directing it, it concerns a man, in the framing of his actions, not to be deceived in the rule. *South.*

I shall appear at the masquerade, dressed up in my feathers, that the *quality* may see how pretty they will look in their travelling habits. *Addison.*

People of *quality* are fine things, indeed, if they had but a little more money; but for want of that they are often forced to do things they are ashamed of. *Vanburgh.*

No sensible *qualities*, as light and color, heat and

sound, can be subsistent in the bodies themselves absolutely considered, without a relation to our eyes and ears, and other organs of sense: these *qualities* are only the effects of our sensation, which arise from the different motions upon our nerves from objects without, according to their various modification and position. *Bentley.*

Of all the servile herd, the worst is he,
That in proud dullness joins with *quality*,
A constant critick at the great man's board,
To fetch and carry nonsense for my lord. *Pope.*

We, who are hearers, may be allowed some opportunities in the *quality* of standers-by. *Swift.*

To *quality* belongs the highest place,
My lord comes forward; forward let him come!
Ye vulgar! at your peril give him room. *Young.*

Nothing discovers the true *quality* and disposition of the mind more, than the particular kind of knowledge it is most fond of. *Mason.*

QUALM, *n. s.* Sax. *cpæalm*; Dan. and **QUALMISH**, *adj.* § Teut. *qualm*. A sudden fit of sickness; sudden seizure of languor: the adjective corresponding.

Some sudden *qualm* hath struck me to the heart,
And dimmed mine eyes, that I can read no further. *Shakspeare.*

I am *qualmish* at the smell of leek. *Id.*
Compared to these storms, death is but a *qualm*,
Hell somewhat lightsome, the Bermudas calm. *Donne.*

I find a cold *qualm* come over my heart, that I faint, I can speak no longer. *Howel.*

All maladies
Of ghastly spasm, or racking torture *qualms*
Of heart-sick agony. *Milton's Paradise Lost.*
For who, without a *qualm*, hath ever looked
On holy garbage, though by Homer cooked? *Roscommon.*

Thy mother well deserves that short delight,
The nauseous *qualms* of ten long months and travail
to delight. *Dryden's Virgil.*

You drop into the place,
Careless and *qualmish* with a yawning face. *Dryden.*

They have a sickly uneasiness upon them, shifting and changing from one error, and from one *qualm* to another, hankering after novelties. *L'Estrange.*

The *qualms* or ruptures of your blood
Rise in proportion to your food. *Prior.*

When he hath stretched his vessels with wine to their utmost capacity, and is grown weary and sick, and feels those *qualms* and disturbances that usually attend such excesses, he resolves that he will hereafter contain himself within the bounds of sobriety. *Calamy.*

QUANGSEE, a province of the south-western frontier of China, bordering on Tonquin. East and north it is flat, but fertile, and yields rice for export. The rest of the province consists of lofty mountains, covered with wood, and containing mines of gold, silver, copper, and tin, which have only of late been allowed to be worked on condition of their paying forty per cent. to the emperor, and five per cent. to the officers and troops employed in superintending them. The gold mines, however, were retained by the emperor in his own hands. The *quanglang* tree, of the pith of which bread is made, is indigenous here; as well as a species of *cinnamon*.

mon. Sir G. Staunton reckons the inhabitants at 10,000,000. The capital is called Kouelong or Queyling.

QUANTITY, *n. s.* } Fr. *quantité*; Ital. *quantità*; Lat. *quantitas*. Ex-
 QUANTITIVE, } tent; bulk; bigness or
 QUANTUM, *n. s.* } smallness of size or number; part; portion; a large portion; measure of time in pronunciation: quantitive is estimable by quantity: quantum, amount; sum.

If I were sawed into *quantities*, I should make four dozen of such bearded hermites staves as master Shallow.

So varying still their moods, observing yet in all their *quantities*, their rests, their censures metrical.

This explication of rarity and density, by the composition of substance with *quantity*, may give little satisfaction to such who are apt to conceive therein no other composition or resolution but such as our senses shew us, in compounding and dividing bodies according to *quantitive* parts.

The easy pronunciation of a mute before a liquid does not necessarily make the preceding vowel, by position, long in *quantity*; as *patrem*.

Unskilled in hellebore, if thou shou'dst try

To mix it, and mistake the *quantity*,

The rules of physick wou'd against thee cry.

The warm antiscorbucal plants, taken in *quantities*, will occasion stinking breath, and corrupt the blood.

Quantity is what may be increased or diminished.

The *quantum* of presbyterian merit, during the reign of that ill-advised prince, will easily be computed.

QUANTITY.—To define what the ancient quantity was, in the age when its nature was not determinable merely from the mouldering manuscripts, or hieroglyphic symbols of our modern copyists; but when the criteria for the ear, which Quinctilian declares cannot be imitated except orally, were obtained from the only effectual source, the *viva vox*, is an arduous and almost hopeless task. From the ashes, however, we have gleaned together with other antiquarians our quota; and from the scattered fragments, imperfect records, and broken monuments of the general ruin, have collected what we call our rules.

It is clear that in the ancient elocution there were not only fifteen vowel sounds, represented by six letters, but each of these was again susceptible of one of the three accents, the acute, the grave, or the circumflex. And though the Greeks remedied this in part, by two additional characters, yet to express the mere duration of their syllables, there is still an obvious deficiency. Every intelligent observer will admit that elocution is nothing but a species of music, since every thing implied by the duration of a syllable, the mood or general time of delivery, accent, emphasis, pause, tone, and cadence, are properties which may be very adequately expressed on paper, in musical composition, or, more completely, by a good organ. Hence the duration of a syllable is perfectly analogous to the relative difference between a minim and a crotchet; to the mood, to the general time, whether quick or slow, observed in the whole compo-

sition; and accent and emphasis, being an elevation or depression of the voice, are actually the variation from one note to another; pause is, by musicians, under the term a rest, only changed in name; while tone, implying all that modulation of the voice effected by the tranquil, plaintive or empassioned mind, is what the complete organ very nearly effects by its diapason, sesquialter, principal, and occasionally by the 'swell'; and the cadence is but the return of the air and notes to the same key to which the whole composition is set. We now easily perceive that of all that once gave eloquence to the orations of Cicero, and harmony to the strains of Virgil, we now retain but a concatenation of vowels and consonants, in fact, but a lifeless syllabication. Notwithstanding, however, this latitude for doubt, and the difficulties to which the question is liable, several with little hesitation define the quantity of a syllable to be the duration of the voice in pronouncing it. But whilst this, on the one hand, renders the whole poetic fabric consistent, it is, on the other, not a little at variance with the customary and established pronunciation of many who are amongst the principal advocates of prosodial orthoepy, as well as with the manner in which the Latin language is frequently pronounced among the moderns, and by the British nation. To youth we prescribe the laws of quantity, and we oblige them to pronounce the first syllable of *prōfugus* short, and that of *cōpia* long, because the former is a tribrac, and the latter a dactyl; but we not only allow them, but accustom ourselves to pronounce *nēpos*, *fides*, *glōbus*, and *conjūgium*, as though these several syllables were respectively long, and are accused by foreigners not only of departing from the genuine sound of the Greek and Latin vowels, but of violating the quantity of these languages more than any other European nation. The author of the *Essay on the Harmony of Languages* gives us a detail of the particulars by which this accusation is proved, so accurate as to give it claim to citation here. 'The falsification of the harmony by English scholars in their pronunciation of Latin, with regard to essential points, arises from two causes only: first, from a total inattention to the length of vowel sounds, making them long or short merely as chance directs; and, secondly, from sounding doubled consonants as only one letter. The remedy of the last fault is obvious. With regard to the first, we have already observed that each of our vowels has its general long sound, and its general short sound totally different. Thus, the short sound of *e* lengthened is expressed by the letter *a*, and the short sound of *i* lengthened is expressed by the letter *e*. And with all these anomalies, usual in the application of vowel characters to the vowel sounds of our own language, we proceed to the application of vowel sounds to the vowel characters of the Latin. Thus, in the first syllable of *sidus* and *nōmen*, which ought to be long, and of *miser* and *onus*, which ought to be short, we equally use the common long sound of the vowels; but, in the oblique cases, *sideris*, *nominis*, *miseri*, *oneris*, &c., we use quite another sound, and that a short one. These strange anomalies are not in common to us with our

southern neighbours the French, Spaniards, and Italians. They pronounce *sidus*, according to our orthography, *seedus*, and in the oblique cases preserve the same long sound of the *i*. Nomen they pronounce as we do, and preserve, in the oblique cases, the same long sound of the *o*. The Italians also, in their own language, pronounce doubled consonants as distinctly as the two most discordant mutes of their alphabet. It is a matter of curiosity to observe with what regularity we use these solecisms in the pronunciation of Latin. When the penultimate is accented, its vowel, if followed but by a single consonant, is always long, as in Dr. Foster's examples. When the antepenultimate is accented, its vowel is, without any regard to the requisite quantity pronounced short, as in *mirabile*, *frigidus*; except the vowel of the penultimate be followed by a vowel, and then the vowel of the antepenultimate is, with as little regard to true quantity, pronounced long, as in *maneo*, *redeat*, *odium*, *imperium*. Quantity is, however, vitiated, to make *i* short, even in this case, as in *oblivio*, *vinea*, *virium*. The only difference we make in pronunciation between *vinea* and *venia*, is, that to the vowel of the first syllable of the former, which ought to be long, we give a short sound; to that of the latter, which ought to be short, we give the same sound, but lengthened. *U*, accented, is always, before a single consonant, pronounced long, as in *humerus*, *fugiens*. Before two consonants no vowel sound is ever made long, except that of the diphthong *au*, so that, whenever a doubled consonant occurs, the preceding syllable is short.

Mr. Pickbourn, the author of a Dissertation on the English Verb, justly observes (Monthly Magazine, No. 135), 'That scholars err in their pronunciation of, 1st, words of two syllables having the first short, as *eques*; 2dly, words of three syllables having the first long and the second short, as *sidera*; 3dly, polysyllables accented on the antepenultimate; as *juvenilibus*, *interea*, &c.; and, lastly, words ending in a long vowel, as *domini*, or in a long vowel and a single consonant, as *dominis*. These errors arise in part from the want of distinguishing between the long and short powers of the vowels, and, in part from the indistinct and confused notion which we have of accent. For, when it falls on a short syllable, we often make that syllable long; and, when it falls on a long one, we sometimes make it short. Accent does certainly affect quantity; that is, it makes the accented syllable a little longer than it would be without it. But its operation is never so great as to make a short syllable become long, nor does the privation of accent make a long syllable become short; for there are degrees of time both in long and short syllables. All short syllables are not equally short; nor are all long ones equally long.'

In justice to this part of the subject we may now offer a remark which we find in Dr. Valpy's excellent Greek Grammar. He differs in some degree from Mr. Pickbourn, when he observes, 'that the elevation of the voice does not lengthen the time of that syllable, so that accent and quantity

by the best critics are considered as perfectly distinct, and by no means inconsistent with each other. In our language the accent falls on the antepenultimate equally in the words *liberty* and *library*, yet, in the former, the tone only is elevated, in the latter the syllable is also lengthened. The same difference exists in *báron*, and *bácon*, in *lével* and *léver*. In words of two and of three short syllables the difference between the French and English pronunciation is striking. The former make iambics and anapests, the latter chorees and dactyls. The French say, *fugis*, *fugimús*; the English, *fugis*, *fúgimus*. In many instances both are equally faulty; thus we shorten the long *is* in *fávus*, the plural of *fávus*; they lengthen the short *is* in *óris*, the genitive of *os*. Indeed both may be said to observe neither accent nor quantity.' We have thus stated at length the manner in which ancient quantity is violated by the moderns, and more particularly by the English.

Three methods present themselves to enable us to preserve the prosodial quantity. 1st. To allow every vowel its prescribed duration, without altering the customary division of syllables; as *nó-ta*, *lò-cus*, &c.; but this will oblige us to throw the accent on the second syllable, as *glò-bus*, contrary to the laconic canon of Sanctius:

'Accentum in se ipsa monosyllaba dictio ponit.
Exacuit sedem dissyllabon omne priorem.
Ex tribus extollit primam penultima curta.
Extollit se ipsam quando est penultima longa.'

This will very frequently occasion the following vowel to be long; as, *té-né-o*, contrary to, 'Vocalis ante alteram in eadem dictione ubique brevis est.'

2dly. If, then, we must abandon the preceding method, we have the alternative left of uniting to the preceding vowel the succeeding consonant; as, *nót-a*, *lóc-us*. But still some difficulty occurs, for, first, this method would in many instances occasion pronunciations very harsh to our customary prepossessions; as, *grád-us*, *cád-o*, *plíc-o*, *stüp-e-o*, *bñ-us*, *jüb-e-o*, *tén-e-o*, *mán-e-o*, *núm-e-rus*, *tríb-us*, *hón-os*, *fáv-or*, *fút-u-rus*, *jüg-um*, *fid-es*, *pét-o*, *tím-or*, *tím-e-o*, *víd-e-o*, 'Homines tuentur illum glób-um.' 'Per-tasum est con-jüg-i, &c. But is this really an objection? Have not custom and long-established usage the power of warping the mind, and giving it prejudices against that which in its unbiassed state it would have adjudged to be agreeable and elegant? This from innumerable instances we are assured to be a fact. And we may very reasonably enquire, is all this harshness of pronunciation of which we appear to be so sensible actually chargeable on the ancients? Does it not arise rather from the mistaken ideas we have formed of the power of their vowels and consonants, which, if rectified, would render the harmony of pronunciation and prosodial quantity again consistent?

'E, in Latin, as well as Greek,' according to Ainsworth, 'was pronounced *ε*.' From the circumstance of their anciently writing *ΤΕΙ ΑΡΑΘΕΙ ΤΥΧΕΙ* for *τη αγαθη τυχη*, it is to *η* that he attributes the power of *ε*. But since it is ambiguous, and the attempt inconclusive, to

explain the sound of one ancient vowel by another, the most satisfactory and decisive method, as far as it can be done, is to have recourse to the more immutable sounds of nature.

The learned authors of the Port Royal Greek Grammar, in order to convey the sound of the long Greek vowel η, tell us 'it is a sound between the *e* and *a*; and that Eustathius, who lived towards the close of the twelfth century, says that βῆ, βῆ, is a sound made in imitation of the bleating of a sheep; to this purpose they quote the following verse of an ancient writer, Cratinus:—

‘Οδ’ ἡλίθιος ὡσπερ τρῶβατον, βῆ, βῆ, λεγων βαδίζει.

‘Is fatuus perinde, ac ovis, bē, bē, dicens incedit.

‘He, like a silly sheep, goes crying baa.’

In a similar manner the sound of the long *i* is preserved to us by the word πῖπι, which signifies to pip like a chicken; and, since their note is nearly what we may express by pee-ep, the long power of that letter seems to have been equivocal to our *ee*. Eustathius likewise remarks on the 499th verse of Iliad I. that the word Βλόψ ἐστίν ὁ τῆς κλεψύδρας ἥχος μιμητικῶς κατὰ τὰς παλαιὰς βῆ ἔχει μίμησιν προβάτων φωνῆς. Κροτινος, i. e. Βλοψ, is, according to the ancients, an imitation of the sound of the clepsydra; et βῆ imitates the bleating of sheep. The clepsydra was an instrument to measure time by water; and, it should be particularly observed, was occasionally employed to measure time for the regulations of orators, and in other recitations. Abstracting the *o* in Βλοψ from the effect of position before ψ, it will, as we shall determine hereafter, have the power of our *o*; and blops adequately imitates the noise of water running with intermissions out of a narrow-mouthed vessel; and, with the French pronunciation, with equal propriety, is signified by the word glouglou; but not quite so happily by us, by the word guggle. Ainsworth seems to consider that the long sound of *o* was equal to *u*. To determine this, it may be useful to quote the word glōcio, to cluck as a hen (from κλωζω), particularly since this word, amongst many others will prove an irrefragable proof that *c*, amongst the ancients, was equivocal to *κ*, or hard, since glouk, glouk, is the sound produced by the hen after the period of incubation. The sound of the long *u* is no less sincerely preserved by Plautus in Menach. page 622, edit. Lambin, in making use of it to imitate the cry of an owl:—

‘Men. Egon’ dedi? Pen. Tu, Tu, istic, inquam vin’ afferri noctuam,

Que tu, tu, usque dicat tibi? nam nos jam nos defessi sumus.’

‘It appears here,’ says Mr. Forster, in his Defence of the Greek accents, page 129, that an owl’s cry was tu, tu, to a Roman ear; tou, tou, to a French; and too, too, to an English one.’ Lambin, who was a Frenchman, observes on the passage, ‘Alludit ad nocturnam vocem tu, tu, seu tou, tou.’ On this Mr. Walker remarks, that the English have totally departed from this sound of the *u* in their own language, as well as their pronunciation of Latin. Ausonius confirms this power of *u*: ‘Cecropiis ignota sonis, feralis o-

nans U. Feralis idēo, quia refert feralē illam avē.’ This also explains the reason of the Latin word būbulo expressing the cry of an owl. Aristophanes has handed down to us the pronunciation of the Greek diphthong αυ, αυ, by making it expressive of the barking of a dog. This is what is exactly preserved by nurses and children to this day in bow, wow. This is the sound of the same letters in the Latin tongue, not only in proper names derived from Greek, but in every other word where this diphthong occurs. Most nations in Europe, perhaps all but the English, pronounce audio and laudo, as if written owdio and lowdo; the diphthong sound like ou in loud.’

Since the long *u* has been so fully proved to have been equivocal to *oo*, which Dr. Carey confirms, by considering it equivalent to the Greek ο, and to the sounds in the Italian pur, the French pour, and the English poor, we may suppose that the ancients pronounced lumen, according to our orthography, loomen, and allowed the power of the middle *u*, as in cube, to their short accented *u*, and that of *ū*, as in cub, to their short unaccented *u*, i. e. when the accent rested on the following consonant. Hence, instead of being compelled to divide nūm’-er-us, fūt’-u-rus, stūp’-e-o, jūb’-e-o, so as to throw the accent on the latter consonant of the first syllable, we may adopt a distribution more reconcilable, at least with our habits, and by placing the accent on the first vowel instead of the following consonant, may give the short Roman accented *u* the sound of *u* in tube, and pronounce nearly as usual, nū’-me-rus, fū’-tu-rus, jū’-be-o, &c. Relative to jugum and conjugium, we here avail ourselves of a remark from Dr. Carey. ‘The word, which in England we pronounce jugum, is in reality yugum, as the Germans, in fact, at this day, pronounce it. Of this, indeed, there is little doubt, since Ιακωβ was properly yakōb, and the Hebrew י, before a vowel, had the power of *y*. Now by these remarks being warranted, first, to place the accent on the first vowel of the root jū’-gun: secondly, to give the power of the middle *u* to the short Roman accented *u*; and thirdly, that of *y* to *j* before a vowel, we may avoid nearly all the harshness for which these words would otherwise have been notorious; as yū’-gum, con-yū’-gium. The same unpleasantness may be removed from glōb’-us, since the long Roman *o* is considered to have been equal to *u*, which is more exactly represented by our *au*; for hōra was probably pronounced haura, since it is borrowed from the Hebrew אור, aur, and aurōra from εβ, אור (propitious light), or owraura. Therefore the middle *o*, as in note, may be added to the short Roman accented *o*, and for glōb’-us, we may, more agreeably, say glō’-bus.

Many writers have undertaken to assign the syllables which constitute the seat of the accent, but few distinguish the accented vowel from the accented consonant. And here, perhaps, the solution of the whole may be found. It is evident, that mī’-les has the accent on the first syllable, and on the vowel of that syllable: hence it is easily preserved long. And, it is equally obvious, that honorif’icus has the accent on the an

penultimate, and on the consonant *f* of that syllable; and, therefore, it more rapidly inclines to an increased brevity.

Another difficulty to which we are liable in our apprehension of the nature of ancient quantity arises from that which is said to be long by position. From this some have deduced an objection against the attempt to conform the present pronunciation to quantity; observing that, 'if we would be consistent and unexceptionable in our adherence to prosodial metre, we have to recollect that the same word is often both long and short; as *nĕc*, when single, or not followed by a consonant; which by position we find long, as *Fulgura nĕc diri toties arsere comete*. Then, if we invariably echo the quantity, we must, *pro re natā*, say *nĕc*, and *nĕc diri*, i. e. *neek*, and *neck diri*. And the improbability that the ancients were so ready on every occasion to pronounce the same word both long and short would incline us, to infer that we have no idea of what they meant by quantity.'

This has given rise to the remarks in Mr. Walker's Treatise on Classical Pronunciation, which, if they are not in every instance the most decisive, are at least the most ingenious that we have seen on the question.

'The long quantity,' says he, 'of the ancients, must arise either from a prolongation of the sound of the vowel, or from the delay of the voice, which the pronunciation of two or more consonants in succession are supposed naturally to require. Now vowels were said to be either long by nature, or long by position. Those vowels which were long by position were such as were succeeded by two or more consonants; as the first *o* in *ponsor*. If the long quantity of the ancients was the same distinction of the sound of the vowel as we make in the words *cadence* and *magic*, then the *a* in *māter* and *pāter* must have been pronounced like our *a* in *paper* and *matter*; and those vowels which were long by position, as the *a* in *Bāchus* and *cāmpus*, must have been sounded by the ancients as we hear them in the words *bake* and *came*. But if the long quantity of the ancients was no more than a retardation of the voice on the consonants, or that duration of sound which an assemblage of consonants is supposed naturally to produce, without making any alteration in the sound of the vowel, of such long quantity as this an English ear has not the least idea. Unless the sound of the vowel be altered, we have not any conception of a long or short syllable; and the first syllables of *banish*, *banner*, and *banter*, have, to our ears, exactly the same quantity. The same may be observed of *senate*, *seminary*, *sentence*, and *sentiment*;' and if, as an ingenious enquirer into this subject has asserted, the ancients pronounce both the consonants in *callidus*, *fallo*, &c., this seems to shorten, rather than lengthen, the vowel of the first syllable. 'If, however, the quantity of the ancients lay only in the vowel, which was lengthened and shortened in our manner by altering the sound, how strange must have been their poetical language, and how different from the words taken singly! And, when these observations on the quantity of the ancients are collect-

ively considered, shall we wonder that the learned and ingenious author of the *Elements of Criticism* should go so far as to assert that the dactyls and spondees of hexameter verse, with respect to pronunciation, are merely ideal, not only with us, but that they were so with the ancients themselves? Few, however, will adopt an opinion which will necessarily imply that the Greek and Latin critics were utterly ignorant of the nature of their own language; and every admirer of those excellent writers will rather embrace any explanation of accent and quantity, than give up *Dionysius of Halicarnassus*, *Cicero*, *Quinctilian*, and *Longinus*. Suppose then, as a last refuge, we were to try to read a Greek or Latin verse, both by accent and quantity, and see what such a trial will produce.

'By quantity, let us suppose the vowel lengthened to express the long quantity; and by the acute accent the rising inflexion; thus:—

Títýre, tú pátulā récubans súb tégmine fági,
Sylvéstrem ténui músam meditáris avéna.

Títýrĕ, tū pátulā récúbāns súb tégmĭnĕ fági,
Sylvĕstrĕm tĕnūi músām meditáris avĕnā.

Teétýre toó pátulēe récubanes soób tégmine fági,
Seélveestrem ténui moósame meditáris avena.

Μήνιν ἄϊδε Θεά, Πηληϊάδεω Ἀχιλλῆος
Ὀβλομένην, ἣ μυρῖ Ἀχαιοῖς ἀλγέ ἔθηκεν.

Μήνιν ἄϊδέ Θεᾶ, Πηληϊάδεω Ἀχιλλῆος
Ὀυλόμένην, ἣ μυρῖ Ἀχαιοῖς ἀλγέ ἔθηκεν.

Meín-en á-eye-de The-ây, Pei-lei-e-â-dyo A-kil-lel-ose.

Ow-lom-én-ein, heì moo-ré a-kay-oēs al-ge éth-ei-kei.

'Now there are but four possible ways of pronouncing these verses, without going into a perfect song. One is, to pronounce the accented syllable with the falling inflexion, and the unaccented with the same inflexion in a lower tone; which is the manner in which we pronounce our own words, when we give them the accent with the falling inflexion. The second is to pronounce the accented syllable with the rising inflexion, and the unaccented syllables with the same inflexion in a lower tone; which we never hear in our own language. The third is to pronounce the accented syllable with the falling inflexion, and the unaccented syllables with the rising, in a lower tone. And the fourth to pronounce the accented syllable with the rising inflexion, and the unaccented with the falling, in a lower tone. None of these modes, but the first and last, do we ever hear in our own language; the second and third seem too difficult to permit us to suppose that they could be the natural current of the human voice in any language. The first leaves us no possible means of explaining the circumflex; but the last, by doing this, gives us the strongest reason to suppose that the Greek and Latin acute accent was the rising inflexion, and the grave the falling inflexion in a lower tone.'

Concerning the question whether the ancient poetry should be read chiefly according to accent or quantity, which has lately been much agitated, may we not then infer, that since the precise nature of accent does not seem to be determined,

and therefore if, in reading, either must give way to the other (for which, however, there is no absolute necessity), it is certainly better that what is in some degree uncertain should yield to that which is more accurately ascertained. By reading according to quantity is not, however, meant the breaking down, splitting, or destroying the words by attending to the feet only; but pronouncing the words of a verse so as to give, as much as possible, its due quantity, in real time, to every syllable. And as much as to this mode of reading, we can add an attention to accent, emphasis, tone, pause, and cadence, whether metrical or sentential, insomuch, doubtless, will the pronunciation be the more correct and harmonious.

The nature of quantity as observed in the English language is at once so simple, unique, and, in general, so well known, that any enlargement on this part of the subject is unnecessary. It is sufficient to observe that a vowel or syllable is, in the English language, long, and requires double the time of a short one, when the accent is on the vowel; which occasions it to be slowly joined in pronunciation with the following letters; as fall, bale, hōise, feature. And that a syllable is short, and only of half the length of a long one, when the accent is on the consonant; which occasions the vowel to be quickly joined to the succeeding letters; as ärt, bönnët, hüngër.

QUANTONG, an extensive, fertile, and populous province of Southern China, on the sea coast, which bounds it E. S. S. Northward it is bounded by a high ridge of mountains, which separate it from Kyangsi. It contains the important port of Canton, and is the most commercial of all the Chinese provinces. The mountains of the north frontier yield gold, copper, iron, and the timber called iron-wood: also a fine species of rose-wood and of osier. Southward, the country produces every kind of grain and fruits in profusion, and two crops in the year. A great number of ducks are bred in the waters. The governor resides at Chao-king, and has a considerable military and naval force on foot to suppress the piracy of the neighbouring seas, and keep in awe the rude mountain tribes. Sir George Staunton estimates the inhabitants at 21,000,000.

QUANTONG, a town of the province of Ava, in the Birman empire, on the south-east side of the Irrawaddy, and only twenty-five miles distant from the China frontier. The meaning of Quantong, or Canton, is, in Chinese, a port or mart; a number of such names, therefore, occur on the boundaries of the empire, to which foreign merchants are allowed to repair. It is probable this town was either built or named by the Chinese: it is still frequented by these merchants, who bring porcelain, tea, silks, fruit, &c., hither, and exchange them for emeralds, rubies, iron, and brown cotton.

QUARANTAIN, *n. s.* } French *quarantain*.
 QUARANTINE. } The space of time which a ship, suspected of infection, is obliged to forbear intercourse or commerce.

Pass your *quarantine* among some of the churches round this town, where you may learn to speak, be-

fore you venture to expose your parts in a city congregation. *Swift.*

QUARANTINE may be ordered by the king, with advice of the privy council, at such times, and under such regulations, as he judges proper. Ships ordered on quarantine must repair to the place appointed, and must continue there during the time prescribed, generally six weeks; and must have no intercourse with the shore, except for necessary provisions, which are conveyed with every possible precaution. When the time is expired, and the goods opened and exposed to the air as directed, if there be no appearance of infection they are admitted to port. Persons giving false information to avoid performing quarantine, or refusing to go to the place appointed, or escaping, also officers appointed to see quarantine performed deserting their office, neglecting their duty, or giving a false certificate, suffer death as felons. Goods from Turkey, or the Levant, may not be landed without a licence from the king, or certificate that they have been landed and aired at some foreign port. See SANITARY LAWS.

QUARLES (Francis), the son of James Quarles, clerk to the board of green cloth, and purveyor to queen Elizabeth, was born in 1592. He was educated at Cambridge; became a member of Lincoln's Inn; and was for some time cup-bearer to the queen of Bohemia, and chronicler to the city of London. He went to Ireland as secretary to archbishop Usher; but the troubles in that kingdom forced him to return, and he died in 1644. His works both in prose and verse are numerous, and were formerly in great esteem, particularly his *Divine Emblems*.

QUARRE, *n. s.* Fr. *quarré*. A quarry. Not in use.

Behold our diamonds here, as in the *quarre* they stand. *Drayton.*

QUARREL, *n. s. & v. n.* } Fr. *querelle*;
 QUARRELOUS, *adi* } Lat. *querela*. A
 QUARRELSOME. } breach of concord; dispute; contest; cause of contest; ground of opposition or objection: Shakspeare uses it for a quarrelsome person: to quarrel is, to dispute; debate, squabble; scuffle; combat; disagree; object, urge frivolous objections: the adjectives correspond.

Herodias had a *quarrel* against him, and would have killed him, but she could not. *Mark vi. 19.*

Wine drunken with excess, maketh bitterness of the mind, with brawling and *quarrelling*. *Ecclesi.*

He thought he had a good *quarrel* to attack him. *Holingshed.*

The *quarrel* which, in this present part, striveth against the current and stream of laws, was a long while nothing feared. *Hooker.*

I love the sport well, but I shall as soon *quarrel* at it as any man. *Shakspeare.*

If I can fasten but one cup upon him, With that which he hath drank to night already, He'll be as full of *quarrel* and offence As my young mistress' dog. *Id. Othello.*

Better She ne'er had known pomp, though't be temporal; Yet if that *quarrel*, fortune, do divorce It from the bearer, 'tis a suff'rance panging As soul and body's sev'ring. *Id. Henry VIII.*

Ready in gybes, quick answered, saucy, and
As quarrelous as the weazel. *Id. Cymbeline.*

Wives are young men's mistresses, companions
for middle age, and old men's nurses; so a man
may have a quarrel to marry when he will. *Bacon.*

Cholerick and quarrelsome persons will engage one
into their quarrels. *Id. Essays.*

If not in service of our God we fought,
In meaner quarrel if this sword were shaken,

Well might thou gather in the gentle thought,
So fair a princess should not be forsaken. *Fairfax.*

You and I may engage in this question, as far as
either of us shall think profitable, without any the
least beginning of a quarrel, and then that will com-
petently be removed from such, as of which you
cannot hope to see an end. *Hammond.*

It were a matter of more trouble than necessity to
repeat in this quarrel what has been alledged by the
worthies of our church. *Holyday.*

To admit the thing, and quarrel about the name,
is to make ourselves ridiculous.

Bramhall against Hobbes.
Some things arise of strange and quarreling kind,
The forepart lion and a snake behind. *Cowley.*

In a poem elegantly writ
I will not quarrel with a slight mistake.

Beasts called sociable quarrel in hunger and lust;
and the bull and ram appear then as much in fury
and war, as the lion and the bear. *Temple.*

I quarrel not with the word, because used by Ovid.
Dryden.

The same zeal and faithfulness continues in your
blood, which animated one of your noble ancestors
to sacrifice his life in the quarrel of his sovereign. *Id.*

We are apt to pick quarrels with the world for
every little foolery. *L'Estrange.*

There needs no more to the setting of the whole
world in a flame than a quarrelsome plaintiff and
defendant. *Id.*

I have no quarrel to the practice; it may be a di-
verting way. *Felton on the Classics.*

I consider your very testy and quarrelsome people
in the same light as I do a loaded gun, which may
by accident go off and kill one. *Shenstone.*

QUARREL. *Fr. quadreau; Ital. quadrella,*
of *Lat. quadrangula.* An arrow with a square
head.

It is reported by William Brito that the arcuba-
lista or arbalist was first shewed to the French by
our king Richard I. who was shortly after slain by
a quarrel thereof. *Camden.*

Twanged the string, out flew the quarrel long.
Fairfax.

QUARRY, *n. s.* } *Fr. quarre,* of *Lat. qua-*
QUARRYMAN. } *dratus.* A square; an ar-
row with a square head; a place where stones
are roughly squared: a quarryman is one who
works in a quarry.

The same is said of stone out of the quarry, to
make it more durable. *Bacon's Natural History.*

The shafts and quarries from their engines fly,
As thick as falling drops in April showers. *Fairfax.*

As hard and unrelenting she,
As the new-crusted Niobe;
Or, what doth more of statue carry,
A nun of the Platonic quarry. *Cleveland.*

Pyramids and towers
From diamond quarries hewn, and rocks of gold.
Milton.

He like Amphion makes those quarries leap
Into fair figures from a confused heap. *Waller.*

Could necessity infallibly produce quarries of stone,
which are the materials of all magnificent structures? *More.*

For them alone the heavens had kindly heat
In eastern quarries, ripening precious dew. *Dryden.*

To take down a quarry of glass to scowre, sodder,
band, and to set it up again, is three halfpence a
foot. *Mortimer.*

As long as the next coal-pit, quarry, or chalk-pit
will give abundant attestation to what I write, to
these I may safely appeal. *Woodward.*

One rhomboidal bony scale of the needle-fish, out
of Stunfield quarry, the quarryman assured me was
flat, covered over with scales, and three foot long. *Id.*

QUARRY, *n. s. & v. a.* *Fr. querir,* to seek.
Skinner. *Fr. curée,* from *Lat. curo.* Thomson.
A prey; particularly the prey of the hawk: to
prey upon.

She dwells among the rocks, on every side
With broken mountains strongly fortified;
From thence whatever can be seen surveys,
And stooping, on the slaughtered quarry preys. *Sandys.*

Your wife and babes
Savagely slaughtered; to relate the manner,
Were on the quarry of these murdered deer
To add the death of you. *Shakespeare. Macbeth.*

So scented the grim feature, and up turned
His nostrils wide into the murky air,
Sagacious of his quarry. *Milton.*

They their guns discharge;
This heard some ships of ours, though out of view,
And swift as eagles to the quarry flew. *Waller.*

An hollow crystal pyramid he takes,
In firmamental waters dipt above,
Of it a broad extinguisher he makes,
And hoods the flames that to their quarry strove. *Dryden.*

Let reason then at her own quarry fly,
But how can finite grasp infinity? *Id.*

With cares and horrors at his heart, like the vul-
ture that is day and night quarrying upon Prome-
theus's liver. *L'Estrange.*

QUARRY, among hunters, is sometimes used
for a part of the entrails of the beast taken, given
by way of reward to the hounds.

QUARRY, or QUARREL, among glaziers, a pane
of glass cut in a diamond form. Quarries are of
two kinds, square and long; the acute angle in
the square quarrels being 77° 19', and 67° 21' in
the long ones.

QUARRYING, is the business of directing
and conducting the sinking and management of
the different kinds of quarries, pits, and shafts,
as well as of the different sorts of work which
are necessary to be undertaken, carried on, and
performed in the several different descriptions of
them; such as those of separating; getting up,
and preparing the various sorts of materials for
use in the arts, or in other ways. It is a practice
which requires considerable knowledge and ex-
perience, to be fully master of it in all its bear-
ings and intentions.

Limestone, chalk, and building stone, are gene-
rally found in strata either on or near the surface.
When at a great depth it is not found worth while
to work them. When stones of any kind are pro-
cured by uncovering the earth, and then working
them out, they are said to be quarried; but when

a pit or shaft is sunk, and the materials procured are worked under ground, they are said to be mined.

Quarrying slates, particularly those of the blue, green, and purple or blackish kinds, undergo several different sorts of preparation in the quarrying, according to the purposes to which they are to be afterwards applied. They are separated and divided into very thin pieces or slates, where light neat coverings are required, or in much demand; but for more strong and heavy coverings, in exposed situations, or other places, they are split into much thicker sheets, layers, or slates, and are, of course, more clumsy in their appearance. Each sort in the business of quarrying is wrought in a separate manner, and packed up by itself; the different sorts having appropriate names.

White or brown slates are never divided and prepared in so fine a way as the other kinds, but separated into much thicker flakes or laminæ, in this intention. The blue, green, and purple, or darkish sorts, are, for the most part, found capable of being split into very thin laminæ or sheets; but those of the white, or brownish free-stone kinds, can seldom be separated or divided in any very thin manner, as the layers of the large masses of the stones are of a much thicker nature, they consequently form heavy, strong, thick coverings, proper for buildings in exposed climates and situations, and of the more rough kinds, such as barns, stables, and other sorts of out-houses. In the different operations and processes of this sort of quarrying, slate knives, axes, bars, and wedges, are chiefly made use of in the different intentions of splitting and cleaning the slates, they being separated into proper thicknesses by the axe, bar, and wedge, and afterwards chipped into their proper forms and shapes by the knife. All the different inequalities which may appear upon any part of them are likewise removed by this last sort of implement.

In *quarrying stone* the work is usually performed in such a manner as to suit the different uses for which they are intended. Where flags are to be formed, they are split or riven into suitable thicknesses, and squared to different sizes, so as to be adapted to different applications. These operations are executed in rather a rough way, as they are afterwards to be finished by the stone-mason. When for steps they have the proper breadths and depths given to them in a sort of squaring manner, being left to be completed as they may be wanted for particular uses and applications. Gate-posts are, for the most part, quarried so as have from about a foot to a foot and a half or more in the square. Trough-stones have the quarrying performed so as to be formed into various proper-sized squares or other forms, in a rough manner, being left in these states to be afterwards hewn and hollowed out, in the intended parts, by the stone-masons. Stones for building purposes are usually raised and quarried out roughly into something of the square shape, being left in that state for the builders, who afterwards fit them so as to suit their own purposes and intentions.

The quarrymen commonly make use of large

hammers, with cutting ends on one side, the other being formed in a plain manner; strong sharp crowbars, and broad sharp iron wedges; by which means these matters are, from the constant practice of the men, split and torn into such forms as are wanted with great ease and facility.

Quarry Cart is a name given to that sort of cart which is principally employed in the work of quarries, and which is generally of a low, compact, strong kind, in its nature, form, and manner of construction, in order to sustain heavy weights, and receive them without difficulty, or the danger of being destroyed. Carts for this purpose should always be made of well-seasoned wood, be well put together, and have sufficient strength of timber in those parts where the main stress of the load is placed. Some quarry counties have well-formed carts of this nature, as many of those towards the northern boundaries of this kingdom.

Quarry Wagon, or truck, a small carriage of the low truck kind, which is much employed in the business of quarries, especially those of the slate kinds, for the purpose of holding and conveying the rough materials, which have been blown from the large massy rocks, or separated in other ways, out of or from the quarries and pits in which they are situated and contained, to the places where they are to receive their different preparations and shapes.

It is formed and constructed on a frame somewhat similar to that of the common barrow, and mounted on two low light iron wheels on the fore part, having two feet behind, projecting from the frame, bent something in the manner of the letter S, and of sufficient length to let it stand or rest in a horizontal position while it is in the act of being loaded. These feet are usually made of iron, but they may be formed of other materials. A sort of inclined plane is formed from the bottoms of the quarries or pits, up which it is forced with great ease and facility by the workmen, or small animals of the horse kind, after being filled with these sorts of heavy materials. It is a very useful and convenient machine in this application, being met with in most of the slate quarries in the northern part of Lancashire, as well as in those of many other districts of the kingdom.

Quarryings are the small pieces which are broken or chipped off from the different sorts of materials which are found and wrought in quarries, while they are undergoing their different preparations for various uses. These substances, where they are of the hard kind, such as those of the blue and lime-stone, as well as some other sorts, are extremely well calculated for the purpose of forming and repairing roads, as they are nearly, if not quite, in a state fit for immediate application in this way. Materials of these kinds ought, therefore, where they can be conveniently had, never to be neglected by those who have the care and management of roads, as they will save much expense and trouble, in a great number of instances.

Draining of quarries.—In order to accomplish this it will be necessary, in ascending from the quarry or pit, carefully to examine and ascertain

if, at any place higher on the declivity, any porous stratum, bed of rock, sand, or gravel, tails out, which may conduct and convey the water contained in it to the sand bed, which is below in the works; and, where any such bed is found, to cut or bore into it in such a manner as to form a drain that is capable of carrying away the whole or the greatest part of the water, and of course to clear or diminish the quantity contained in the quarry or pit, which would otherwise have continued to descend through such porous substrata or beds, and have continued to fill the sands, or quarries and pits.

But a sufficient quantity to injure, hinder, and inconvenience the working of the quarries or pits, may yet continue to drain and ooze from the sides of the sand-beds, notwithstanding they should happen to dip towards the lower ground, in which case, however, the water may readily and with great ease be drawn off at some particular point in it. In order to effect this, and thereby remove the inconvenience of this filtrating water, in descending from the quarries or pits along the declivity, it should be endeavoured to discover and ascertain at what particular point or place, in the low ground, the sand terminates or tails out, which is mostly best accomplished by means of proper levelling; and if there should be there any appearance of the water's having a natural outlet, it may, by means of making in it a deep drain, be far more readily and effectually drawn off and removed; as springs, for the most part, naturally pass and flow through narrow, winding, convoluted openings, or perforations; of course, whenever the orifices or passages are opened, enlarged, or made lower than before, the discharge of water becomes greater and more expeditious. Where, however, there happens to be a deep impervious layer or covering of clay, or other matter of a similar nature, placed above or upon the termination or tail of the sand, the drain need only be cut down to it or a little way into it, as by means of boring through it, or the remaining portion of it, a ready and easy outlet or passage may be given to the whole of the water that may be contained in the sand-bed or other porous stratum.

In regard to the removal of the water found and contained in the bottoms of such quarries, pits, or deep works, it must be drained off and got rid of in quite a different manner, as the level of the ground may probably be, or decline, nowhere lower than the mouths or openings of such quarries, pits, &c.; as it is solely and particularly on the supposition, and in such cases as where the direction of the different strata and sand-beds have a dipping position with the natural inclination of the surface of the land, or lie nearly horizontally, that the method of proceeding which is stated above is practicable. But should they, for instance, lie in a reverse or contrary direction, there is but little possibility or chance of accomplishing the object, the removal of the water, unless by discovering or hitting on their terminations, somewhere on the opposite sides of the hills or elevations, which in some cases may very nearly or exactly be found out, by ascertaining the precise inclination or direction of the materials of the quarries, pits, &c.,

and by a careful and exact use of the level. But this will be much better comprehended, and a more full and perfect notion of its nature be afforded, by the section figure in the plate on draining quarries, pits, &c., in agriculture, given by Mr. Elkington, in his work on this subject.

The water which is found in the bottoms of these different kinds of undertakings, or which proceeds from the rocks or their sides, or in other ways in the course of working them, is commonly got quit of by means of some sort of engine or pump, in order to assist in working of which the water gained by cutting the drains already noticed may be particularly useful, especially where the usual stream for that purpose is insufficient for that purpose, in saving the great expense of working such machinery by the power of steam. But without the aid of a natural stream, which is capable of being converted to this purpose, it is rarely possible to find, by means of drains, or in any other way, a quantity of water sufficient to drive weighty machinery, in a situation of proper height to have the full and necessary command of it.

It has been remarked in Mr. Elkington's work on draining, in these cases, that the duke of Buccleugh's coal-works, near Langholm, in the county of Dumfries, afford a striking example of the superior powers of water and machinery, when properly combined, where a command of the former can be had, and when the latter is constructed on proper principles, and conducted with that care and ingenuity which are requisite in such difficult undertakings.

Boring has been practised of late, with complete success, in the case of a colliery in the county of York, which had been wrought many years, and in which the water was raised about sixty yards by a steam-engine.

The actual working of quarries is an operation depending more on strength than skill. In quarrying sandstone, consisting of regular layers, the work is performed chiefly by means of the pick, wedge, hammer, and pinch or lever; recourse being seldom had to the more violent and irregular effects of gunpowder. But for some kinds of limestone, and for greenstone and basalt, blasting with gunpowder is resorted to; and some of the rocks called primitive, such as granite, gneiss, and sienite, could scarcely be torn asunder without it.

The burning of lime may be considered as belonging to the subject of quarrying. See our article LIME. The operation is performed in what are called draw-kilns, or perpetual kilns. These should always be close to or near the quarry, and either situated at a bank, or furnished with a ramp or inclined plane of earth for carting up the coal and lime to the top of the kiln. Lime-kilns may be built either of stone or brick; but the latter, as being better adapted to stand excessive degrees of heat, is considered as preferable. The outside form of such kilns is sometimes cylindrical, but more generally square. The inside should be formed in the shape of a hog'shead, or an egg, opened a little at both ends, and set on the smallest; being small in circumference at the bottom, gradually wider towards the middle, and then contracting again towards

the top. In kilns constructed in this way, it is observed, fewer coals are necessary, in consequence of the great degree of reverberation created, above that which takes place in kilns formed in the shape of a sugar loaf reversed. Near the bottom, in large kilns, two or more apertures are made: these are small at the inside of the kiln, but are sloped wider, both at the sides and the top, as they extend towards the outside of the building. The uses of these apertures are for admitting the air necessary for supplying the fire, and also permitting the laborers to approach with a drag and shovel to draw out the calcined lime. From the bottom of the kiln within, in some cases, a small building called a horse is raised in the form of a wedge, and so constructed as to accelerate the operation of drawing out the burned limestone, by forcing it to fall into the apertures which have been mentioned above. In other kilns of this kind, in place of this building there is an iron grate near the bottom, which comes close to the inside wall, except at the apertures where the lime is drawn out. When the kiln is to be filled, a parcel of furze or faggots is laid at the bottom, over this a layer of coals, then a layer of limestone (which is previously broken into pieces, about the size of a man's fist), and so on alternately, ending with a layer of coals, which is sometimes, though seldom, covered with sods or turf, in order to keep the heat as intense as possible. The fire is then lighted in the apertures; and when the limestone towards the bottom is completely calcined, the fuel being considerably exhausted, the limestone at the top subsides. The laborers then put in an addition of limestone and coal at the top, and draw out at bottom as much as they find thoroughly burned; and thus go on, till any quantity required be calcined. When limestone is burned with coals, from two bushels and a half to three and a half, on a medium three bushels of calcined limestone, are produced for every bushel of coal used.

A lime-kiln, on an improved plan, has been erected at Closeburn in Dumfrieshire, by Monteith. Instead of the wide and shallow circular kiln, these kilns are elliptical and deep. Some parts are added to it which are found of most important use. The first is a kind of roof or cover. The disadvantage of the want of some contrivance to protect kilns in stormy weather, has been long felt, and many attempts have been made to apply some kind of cover, but, we believe, none with such success as that used at Closeburn. The next addition is having cast-iron doors below, at the opening where the kiln is drawn. There is a grating through which the ashes fall while drawing the kiln, which makes that operation a much less disagreeable employment than formerly; and the ashes and small lime thus separated are excellent for agricultural purposes. There is often a great loss of fuel, from allowing lime-kilns to cool when there is no demand; all that is necessary to be done is, to shut the cast-iron doors, above as well as below, and the dampers in the chimneys. The heat is thus preserved, and fuel saved, by keeping the kiln hot, to be ready for use as soon as wanted. Farmer's Magazine, vol. xvi. p. 134.

Booker's lime kiln (Dumfriesshire, p. 594), is of an oval form, twenty-two feet high, two feet wide at the bottom, nine feet in the middle, and gradually contracted to three feet at top. It is lined with brick, and, instead of being covered with a dome, Booker adopts a cover of cast-iron with a vent in it, which cover is placed on a ring of three feet diameter, built into, and fixed on the top of the kiln. The cover, by moving on a pivot, is easily thrown off when the kiln is to be charged, and, being put on during the process of calcination, it both increases the draught of air through the kiln, and, by acting as a reverberatory furnace, is attended with a considerable saving of fuel.

QUART, *n. s.* Fr. *quart*, of Lat. *quartus*. The fourth part; a quarter; the fourth part of a gallon; a quart measure.

Albanac had all the northern part,
Which of himself Albania he did call,

And Camber did possess the western *quart*.

Spenser.

When I have been dry, and bravely marching, it
hath served me instead of a *quart* pot to drink in.

Shakspeare.

You'd rail upon the hostess of the house,
And say you would present her at the leet,
Because she bought stone jugs and no sealed *quarts*.

Id.

You have made an order that ale should be sold
at three halfpence a *quart*. *Swift's Miscellanies.*

QUART, in English measure, the fourth part of the gallon, or two pints.

QUARTAN, *n. s.* Fr. *quartaine*; Lat. *quartana*. The fourth day ague.

Call her the metaphysics of her sex,

And say she tortures wits, as *quartans* vex
Physicians. *Cleveland.*

It were an uncomfortable receipt for a *quartan*
ague, to lay the fourth book of Homer's *Iliads* under
one's head. *Brown.*

A look so pale no *quartan* ever gave,
Thy dwindled legs seem crawling to the grave.

Dryden.

QUARTATION, *n. s.* Lat. *quartus*. A chymical operation, defined below.

In *quartation*, which refiners employ to purify gold, although three parts of silver be so exquisitely mingled by fusion with a fourth part of gold, whence the operation is denominated, that the resulting mass acquires several new qualities; yet, if you cast this mixture into aqua fortis, the silver will be dissolved in the menstruum, and the gold, like a dark powder, will fall to the bottom. *Boyle.*

QUARTATION is an operation by which the quantity of one thing is made equal to a fourth part of the quantity of another thing. Thus, when gold alloyed with silver is to be parted, we are obliged to facilitate the action of the aquafortis by reducing the quantity of the former of these metals to one-fourth part of the whole mass; which is done by sufficiently increasing the quantity of the silver, if it be necessary. This operation is called *quartation*, and is preparatory to the parting; and even many authors extend this name to the operation of parting. See ASSAY.

QUARTER, <i>n. s. & v. a.</i>	} Fr. <i>quartier</i> , of Lat. <i>quartus</i> . A fourth part; a part of the heavens con- sidered as divided into the cardinal
QUARTERAGE,	
QUARTER-DAY,	
QUARTER-DECK,	
QUARTERLY, <i>adj. & adv.</i>	
QUARTER-MASTER, <i>n. s.</i>	

points: hence, region; district; division; station; abode: particularly military station, cantonment, or abode; hence a military cry for mercy, i. e. to be sent to the captors' quarters; mercy; friendship; kind treatment; a measure of eight bushels: to divide into four parts; divide in any way; station; lodge; diet; bear as an appendage to herald in arms, see below: quarterage is a quarterly allowance: quarter-day, one of the four days in the year on which rent is usually paid: quarter-deck, the short upper deck of a ship: quarterly, containing a fourth part; or once in a quarter: quarter-master, he who regulates soldiers' quarters.

No leaven shall be seen in thy quarters. *Exodus.*

It is an accustomed action with her to seem thus washing her hands; I have known her continue in this a quarter of an hour. *Shakspeare. Macbeth.*

I'll give thee a wind.

—I myself have all the other,
And the very points they blow,
And all the quarters that they know,
I' the shipman's card. *Id.*

Where is lord Stanley quartered?

—Unless I have mista'en his quarters much,
His regiment lies half a mile
South from the mighty power of the king.

Shakspeare.

Friends, all but now,

In quarter, and in terms like bride and groom
Divesting them for bed, and then, but now
Swords out, and tilting one at other's breasts. *Id.*

Mothers shall but smile when they behold
Their infants quartered by the hands of war. *Id.*

They do best, who, if they can but admit love,
yet make it keep quarter, and sever it wholly from
their serious affairs. *Bacon.*

The first, being compounded of argent and azure,
is the coat of Beauchamp of Hack in the county of
Somerset, now quartered by the earl of Hertford.

Peacham.

The like is to be said of the populousness of their
coasts and quarters there. *Abbot.*

They had settled here many ages since, and over-
spread all the parts and quarters of this spacious con-
tinent. *Heylin.*

The soil so fruitful that an acre of land well or-
dered will return 200 bushels or 25 quarters of corn.
Id.

Thou canst defend as well as get,
And never hadst one quarter beat up yet. *Cowley.*

He magnified his own clemency, now they were at
his mercy, to offer them quarter for their lives if they
gave up the castle. *Clarendon.*

His praise, ye winds! that from four quarters blow,
Breathe soft or loud. *Milton's Paradise Lost.*

He fed on vermin;

And, when these failed, he'd suck his claws,
And quarter himself upon his paws. *Hudibras.*

He used two equal ways of gaining,

By hindring justice or maintaining;

To many a whore gave privilege,

And whipped for want of quarterage. *Id.*

However rarely his own rent-days occurred, the
indigent had two and fifty quarter-daies returning in
his year. *Fell.*

The moon makes four quarterly seasons within her
little year or month of consecution. *Holder.*

Observe what stars arise or disappear,
And the four quarters of the rolling year.

Dryden.

The quarters of the several chiefs they showed,
Here Phenix, here Achilles, made abode. *Id.*

Discover the opinion of your enemies, which is
commonly the truest; for they will give you no
quarter, and allow nothing to complaisance. *Id.*

A bungling cobbler, that was ready to starve at his
own trade, changes his quarter, and sets up for a
doctor. *L'Étrange.*

When the cocks and lambs lie at the mercy of
cats and wolves, they must never expect better quar-
ter. *Id.*

Supposing only three millions to be paid, 'tis evi-
dent that to do this out of commodities, they must,
to the consumer, be raised a quarter in their price;
so that every thing, to him that uses it, must be a
quarter dearer. *Locke.*

The quartermaster general was marking the ground
for the encampment of the covering army. *Tatler.*

The sons of the church being so much dispersed,
though without being driven, into all quarters of the
land, there was some extraordinary design of divine
wisdom in it. *Sprat.*

You have quartered all the foul language upon me
that could be raked out of Billingsgate. *Spectator.*

When the winds in southern quarters rise,
Ships, from their anchors torn, become their sport,
And sudden tempests rage within the port.

Addison.

The usurer would be very well satisfied to have
all the time annihilated that lies between the present
moment and next quarter-day. *Id.*

Suppose the common depth of the sea, taking one
place with another, to be about a quarter of a mile.

Burnet.

To the young, if you give any tolerable quarter,
you indulge them in their idleness, and ruin them.

Collier.

From the obliquity of the ecliptick to the equator
arise the diurnal differences of the sun's right ascen-
sion, which finish their variations in each quadrant
of the ecliptick, and this, being added to the former
inequality from eccentricity, makes these quarterly
and seemingly irregular inequalities of natural days.

Bentley.

Mr. Wharton, who detected some hundreds of the
bishop's mistakes, meets with very ill quarter from
his lordship. *Swift.*

The quarter-deck is that above the upper-deck,
reaching forward from the stern to the gangway,
and supports the carronades, &c. *Falconer.*

QUARTER, in dry measure, is, eight bushels.

QUARTER, in heraldry, is applied to the parts
or members of the first division of a coat that is
quartered, or divided into four quarters.

QUARTER, FRANC, in heraldry, is a quarter
single or alone; which is to possess one fourth
part of the field. It makes one of the honorable
ordinaries of a coat. See HERALDRY.

QUARTERS, WINTER, sometimes mean the
space of time included between leaving the camp
and taking the field; but more properly the
places where the troops are quartered during the
winter. The first business, after the army is in
winter quarters, is to form the chain of troops to
cover the quarters well; which is done either
behind a river, under cover of a range of strong
posts, or under the protection of fortified towns.
Hussars are very useful on this service. It
should be observed, as an invariable maxim, in
winter quarters, that the regiments be disposed
in brigades, to be always under the eye of a ge-
neral officer; and, if possible, let the regiments

be so distributed as to be each under the command of its own chief.

QUARTER BILL, a roll or list, containing the different stations to which all the officers and crew of the ship are quartered in the time of battle, and the names of all the persons appointed to those stations.

QUARTER OF A SHIP, that part of the ship's side which lies towards the stern: or which is comprehended between the aftmost end of the main chains and the sides of the stern, where it is terminated by the quarter pieces. On the quarter may be defined an arch of the horizon, contained between the line prolonged from the ship's stern and any distant object, as land, ships, &c. Thus, if the ship's keel lies on an east and west line, the stern being westward, any distant object perceived on the north-west or south-west is said to be on the larboard starboard quarter.

QUARTERS, a name given at sea to the several stations where the officers and crew of a ship of war are posted in action. The number of men appointed to manage the artillery is always in proportion to the nature of the guns, and the number and condition of the ship's crew. The lieutenants are usually stationed to command the different batteries, and direct their efforts against the enemy. The master superintends the movements of the ship, and whatever relates to the sails. The boatswain, and a sufficient number of men, are stationed to repair the damaged rigging; and the gunner and carpenter wherever necessary, according to their respective offices. The marines are generally quartered on the poop and forecastle, or gangway, under the direction of their officers; although, on some occasions, they assist at the great guns, particularly in distant cannonading.

QUARTERS, HEAD, OF AN ARMY, the place where the commander-in-chief has his quarters. The quarters of generals of horse are, if possible, in villages behind the right and left wings, and the generals of foot are often in the same place; but the commander-in-chief should be near the centre of the army.

QUARTER GUNNER, a petty officer under the direction of the gunner of a ship of war, whom he is to assist in every branch of his duty; as keeping the guns and their carriages in proper order, and duly furnished with whatever is necessary; filling the powder into cartridges; scaling the guns, and keeping them always in a condition for service. The number of quarter-gunners in any ship is always in proportion to the number of her artillery, one quarter-gunner being allowed to every four guns.

A QUARTER MASTER, in the army, is an officer, whose business is not only to look after the quarters of the soldiers, but their clothing, bread, ammunition, firing, &c. Every regiment of foot and artillery has a quarter-master, and every troop of horse one.

QUARTER MASTERS, in a ship of war, are petty officers appointed by the captain to assist in the several duties of the ship, as stowing the ballast and provisions in the hold, coiling the cables on their platforms, overlooking the steering of the ship, keeping the time by the watch-

glasses, and, in turn, overlooking the purser's steward in his delivery of provisions, &c.

QUARTER MASTER GENERAL is a considerable officer in the army; and should be a man of great judgment and experience, and well skilled in geography. His duty is to make the marches and encampments of an army; he should know the country perfectly, with its rivers, plains, marshes, woods, mountains, defiles, passages, &c. even to the smallest brook. Prior to a march, he receives the order and route from the commanding general, and appoints a place for the quarter-masters of the army to meet him next morning, with whom he marches to the next camp; where, having viewed the ground, he marks out to the regimental quarter-masters the ground allowed each regiment for their camp: he chooses the head quarters, and appoints the villages for the generals of the army's quarters: he appoints a proper place for the encampment of the train of artillery: he conducts foraging parties, as likewise the troops to cover them against assaults, and has a share in regulating the winter-quarters and cantonments.

QUARTER NETTING, a sort of net-work, extended along the rails on the upper part of a ship's quarter. In a ship of war these are always double. The interval is sometimes filled with cork, or old sails; but chiefly with the hammocks of the sailors, so as to form a parapet against the enemy's small arms in battle.

QUARTER SESSIONS, a general court held quarterly by the justices of peace of each county. This court is appointed by statute 2 Hen. V. c. 4, to be in the first week after Michaelmas day; the first week after the Epiphany; the first week after the close of Easter; and in the week after the translation of St. Thomas a Becket, or the 7th of July. This court is held before two or more justices of the peace, one of whom must be of the quorum. The jurisdiction of this court, by 34 Edw. III. c. 1, extends to the trying and determining of all felonies and trespasses whatsoever, though they seldom, if ever, try any greater offence than small felonies within the benefit of clergy, their commission providing, that if any case of difficulty arises, they shall not proceed to judgment, but in the presence of one of the justices of the courts of king's bench or common pleas, or one of the judges of assize. But there are many offences, and particular matters, which by particular statutes belong properly to this jurisdiction, as the smaller misdemeanors not amounting to felony, relating to the game, highways, alehouses, bastard children, the settlement and provision for the poor, vagrants, servants' wages, apprentices, &c. The records or rolls of the sessions are committed to the custody of a special officer, denominated the *custos rotulorum*. In most corporation towns there are quarter-sessions kept before justices of their own, within their respective limits, which have exactly the same authority as the general quarter-sessions of the county, except in a very few instances.

QUARTER-STAFF, *n. s.* Quarter and staff. A staff of defence: so called, perhaps, from the manner of using it; one hand being placed at the middle, and the other equally between the

middle and the end. So says Dr. Johnson: Mr. Thomson, more probably, from quarter, a district, and staff; the quarterstaff being once a badge of authority amongst foresters.

His *quarterstaff*, which he could ne'er forsake, Hung half before, and half behind his back.

Dryden.

Immense riches he squandered away at *quarterstaff* and cudgel play, in which he challenged all the country.

Arbutnot.

QUARTILE, *n. s.* Lat. *quartus*. An aspect of the planets, when they are three signs or ninety degrees distant from each other, and is marked thus □.

Mars and Venus in a *quartile* move

My pangs of jealousy for Ariet's love. *Dryden.*

QUARTO, *n. s.* Lat. *quartus*. A book in which every sheet, being twice doubled, makes four leaves.

Our fathers had a just value for regularity and systems; then folios and *quartos* were the fashionable sizes, as volumes in octavo are now. *Watts.*

QUARTO-DECIMANI, an ancient sect in the Christian church, who taught that Easter should always be celebrated according to the custom of the Jews, on the fourteen day of the moon in the month of March, whensoever that day fell out. And hence they derived their name *quarto-decimani*.

QUARTZ, in mineralogy, a genus of siliceous earths, chiefly composed of silica. According to Kirwan, the quartz are in general the purest of the siliceous kind. Cronstedt gives the following characteristics of it:—1. It is generally cracked throughout, even in the rock itself, whereby, as well as by its own nature, it breaks into irregular and sharp fragments. 2. It cannot be easily made red hot, without cracking still more. 3. It never decays in the air. 4. Melted with potass, in a due proportion, it gives a more solid glass than any of the other siliceous stones. It is met with in clefts, fissures, and small veins in rocks; it seldom forms large veins, and still more rarely whole mountains, without a mixture of heterogeneous substances. M. Magellan remarks that quartz is one of the principal kinds of stone which contain metals. In some of the Hungarian veins the gold is so minutely dispersed that it cannot be discerned by the best microscopes before it is separated by pounding and washing. The width of the veins, some of which are half a fathom, and some still more, repay the trouble and expenses, which the small quantity of gold would not otherwise counterbalance. Near Lauterberg, upon the Hartz, are veins of this stone from one to three fathoms wide, consisting of a loose sand, in which they find the copper ore in nests.

Rock crystals are generally found upon or among quartz, and are to be met with in all parts of the world. The greatest numbers are furnished to the European countries from Mount St. Gothard, in Switzerland.

Professor Jameson divides this mineral genus into two species: rhomboidal quartz, and indivisible quartz.

1. Rhomboidal quartz contains fourteen subspecies. 1. Amethyst. 2. Rock crystal. 3. Milk quartz. 4. Common quartz. 5. Prase.

6. Cat's eye. 7. Fibrous quartz. 8. Iron flint. 9. Hornstone. 10. Flinty slate. 11. Flint. 12. Calcedony. 13. Heliotrope. 14. Jasper.

2. Indivisible quartz contains nine subspecies. 1. Float-stone. 2. Quartz sinter. 3. Hyalite. 4. Opal. 5. Menillite. 6. Obsidian. 7. Pitchstone. 8. Pearlstone. 9. Pumice-stone. See MINERALOGY.

QUASH, *v. a. & v. n.* French *casser*; Belg. *quassen*; Ital. *squacciare*, *quassare*; Lat. *quasso*. To crush; squeeze; subdue; annul; make void.

'Twas not the spawn of such as these

That dyed with Punick blood the conquered seas
And quashed the stern *Eacides*. *Roscommon.*

The whales

Against sharp rocks, like reeling vessels quashed,
Though huge as mountains, are in pieces dashed.

Waller.

A thin and fine membrane strait and closely adhering to keep it from *quashing* and shaking. *Ray.*

Our she confederates keep pace with us in *quashing* the rebellion, which had begun to spread itself among part of the fair sex. *Addison's Freeholder.*

The water in this dropsy, by a sudden jerk, may be heard to *quash*. *Sharp's Surgery.*

QUASI CONTRACT, in the civil law, an act without the strict form of a contract, but yet having the force thereof. In a contract there must be the mutual consent of both parties, but in a quasi-contract one party may be bound or obligated to the other, without having given his consent to the act whereby he is obliged. For example: I have done your business, in your absence, without your procurement, and it has succeeded to your advantage. I have then an action against you for the recovery of what I have disbursed, and you an action against me to make me give an account of my administration, which amounts to a quasi contract.

QUASSIA, in botany, a genus of the monogynia order, and decandria class of plants; natural order fourteenth, grinales. It was so named from Quassi, a negro slave, who discovered its virtues: *cal.* pentaphyllous; petals five; nectarium, pentaphyllous; there are from two to five seed cases, standing asunder, and monospermous. There are three species, the *amara*, *simaruba*, and *excelsa* or *polygama*.

1. *Q. amara* grows to the height of several feet, and sends off many strong branches. The wood is of a white color and light; the bark is thin and gray: the leaves are placed alternately on the branches, and consist of two pairs of opposite pinnae, with an odd one at the end: all the leaflets are of an elliptical shape, entire, veined, smooth, pointed, sessile, on the upper pagina of a deep green color, on the under paler: the common foot-stalk is articulated, and winged, or edged, on each side with a leafy membrane, which gradually expands towards the base of the pinnae: the flowers are all hermaphrodite, of a bright red color, and terminate the branches in long spikes: the bractæ or floral leaves are lance-shaped or linear, colored and placed alternately upon the peduncles; the calyx is small, persistent, and five toothed; the corolla consists of five lance-shaped equal petals, at the base of which is placed the nectary, or five roundish, colored, scales; the filaments are ten, slender, somewhat longer than the corolla, and crowned

with simple antheræ, placed transversely; the receptacle is fleshy and orbicular; the germen is ovate, divided into five parts, and supports a slender style, longer than the filaments, and terminating by a tapering stigma; the capsules are five, two celled, and contain globular seeds. It is a native of South America, particularly of Surinam, and also of some of the West Indian Islands. The root, bark, and wood, of this tree have all places in the materia medica. The wood is most generally used, and is said to be a tonic, stomachic, antiseptic, and febrifuge.

It has been found very effectual in restoring digestion, expelling flatulencies, and removing habitual costiveness, produced from debility of the intestines, and common to a sedentary life. Dr. Letson, whose extensive practice gave him an opportunity of trying the effects of quassia in a great number of cases, says, 'In debility, succeeding febrile diseases, the Peruvian bark is most generally more tonic and salutary than any other vegetable hitherto known; but in hysterical atony, to which the female sex is so prone, the quassia affords more vigor and relief to the system than the other, especially when united with the vitriolum album, and still more with the aid of some absorbent.' In dyspepsia, arising from hard drinking, and also in diarrhoeas, the doctor exhibited the quassia with great success. But, with respect to the tonic and febrifuge qualities of quassia, he says, 'I by no means subscribe to the Linnæan opinion where the author declares, 'me quidem judice chinchinam longe superat.' It is very well known that there are certain peculiarities of the air, and idiosyncrasies of constitution, unfavorable to the exhibition of Peruvian bark, even in the most clear intermissions of fever. In these cases quassia may often be substituted with success.'

2. *Q. excelsa*, or *Q. polygama*, was named by Sir Joseph Banks, Dr. Solander, and Dr. Wright, *pricrania amara*. It is now, however, always ranked under quassia. It is very common in the woodlands of Jamaica, is beautiful, tall, and stately, sometimes being 100 feet long, and ten feet in circumference, eight feet above the ground. The trunk is straight, smooth, and tapering, sending off its branches towards the top. The outside bark is pretty smooth, of a light gray or ash color, from various lichens. The bark of the roots is of a yellow cast, somewhat like the cortex *simaruba*. The inner bark is tough, and composed of fine flaxy fibres. The wood is of a yellow color, tough but not very hard. It takes a good polish, and is used as flooring. The leaves are sub-alternate; the small leaves are in pairs, from five to eight, standing opposite to each other on short foot-stalks, and ending with an odd one. They are of an oblong oval shape, and pointed; the ribs reddish, and the young leaves are covered with a fine brownish down. The flowers come out in bunches or clusters from the lower part of the last shoot before the leaves, and stand on round foot-stalks. The flowers are small, of a yellowish green color, with a very small calyx. The male or barren tree has flowers nearly similar to the hermaphrodite, but in it there are only the rudiments of a style. The fruit is a smooth black drupa,

round shaped, and of the size of a pea. There is but little pulp, and the nut covers a round kernel. These drupæ are generally three, sometimes two, and often only one, attached sidewise to a roundish fleshy receptacle. It flowers in October and November, and its fruit is ripe in December and January. Except the pulp of the fruit, every other part of this tree has an intensely bitter taste. In taste and virtues it is nearly equal to the quassia of Surinam, and is sold in London for the quassia amara; and it may be safely used in all cases where that drug has been thought proper, whether as an antiseptic, or in cases of weakness in the stomach and bowels. It may either be given alone, or joined with the Jesuit's bark.

3. *Q. simaruba* is common in all the woodlands in Jamaica. It grows to a great height and considerable thickness. The trunks of the old trees are black and a little furrowed. Those of the young trees are smooth and gray, with here and there a broad yellow spot. The inside bark of the trunk and branches is white, fibrous, and tough. It tastes slightly bitter. On cutting or stripping off this bark, no milky juice issues, as has been mentioned by various authors. The wood is hard and useful for buildings. It splits freely, and makes excellent staves for sugar hogsheads. It has no sensible bitter taste. The branches are alternate and spreading. The leaves are numerous and alternate. On the upper side they are smooth, shining, and of a deep green color; on the under side they are white. The flowers appear about the beginning of April. They are of a yellow color, and placed on spikes beautifully branched. The fruit is of that kind called a drupa, and is ripe towards the end of May. It is of an oval shape, is black, smooth, and shining. The pulp is fleshy and soft; the taste a nauseous sweet. The nut is flattened, and on one side winged. The kernel is small, flat, and tastes sweet. The natural number of these drupæ is five on each common receptacle; but, for the most part, there are only two or three; the rest by various accidents prove abortive. The roots are thick, and run superficially under ground to a considerable distance. The bark is rough, scaly, and warted. The inside when fresh is a full yellow, but when dry paler. It has but little smell. The taste is bitter, but not very disagreeable. This is the true cortex *simarubæ* of the shops. This tree in Jamaica is called mountain damson, bitter damson, and stave wood. On examining the fructification, Dr. Wright found this tree to be a species of quassia. Under that name he sent it to Europe, and Linnæus adopted it into his system. There are male flowers on one tree and female flowers on another; and this is invariably the case in Jamaica. Most authors who have written on the *simaruba* agree that in fluxes it restores the lost tone of the intestines, allays their spasmodic motions, promotes the secretion by urine and perspiration, removes that lowness of spirits attending dysenteries, and disposes the patient to sleep; the gripes and tenesmus are taken off, and the stools are changed to their natural color and consistence. In a moderate dose it occasions no disturbance or uneasiness;

but in a large dose it produces sickness at stomach and vomiting. Negroes are less affected by it than white people. Dr. Cullen, however, says, 'We can perceive nothing in this bark but that of a simple bitter; the virtues ascribed to it in dysentery have not been confirmed by my experience, or that of the practitioners in this country; and, leaving what others are said to have experienced to be further examined and considered by practitioners, I can only at present say that my account of the effect of bitters will perhaps explain the virtues ascribed to the simaruba. In dysentery I have found an infusion of chamomile flowers a more useful remedy.'

QUATERNARY, } Lat. *quaternarius*, qua-
QUATERNION, OR }
QUATERNITY. } *tertio*. The number four.

Air and ye elements, the eldest birth
Of nature's womb, that in *quaternion* run
Perpetual circle, multiform, and mix
And nourish all things; let your ceaseless change
Vary to our great Maker still new praise. *Milton*.

The number of four stands much admired, not only in the *quaternity* of the elements, which are the principles of bodies, but in the letters of the name of God. *Browne*.

The objections against the *quaternity* of elements and ternary of principles, needed not to be opposed so much against the doctrines themselves. *Boyle*.

I have not in this scheme of these nine *quaternions* of consonants, distinct known characters, whereby to express them, but must repeat the same. *Holder's Elements of Speech*.

QUATRAIN, *n. s.* Fr. *quatrain*. A stanza of four lines rhyming alternately: as,

I have writ my poem in *quatrains* or stanzas of four in alternate rhyme, because I have ever judged them of greater dignity for the sound and number, than any other verse in use. *Dryden*.

QUATRE-BRAS, a hamlet of the Netherlands, in the province of Namur, about seven miles west of Ligny, remarkable for the memorable conflict occurring here between the British and French, on the 16th of June, 1815. It derives its name from the meeting of four roads. See WATERLOO.

QUATUORVIRI, in antiquity, formerly written IIII Viri, Roman magistrates, who had the care of conducting and settling the colonies sent into the provinces. There were also quatuorviri appointed to inspect the high-ways, to take care of repairs, &c.

QUAVER, *v. n.* Sax. *cpavan*. To shake the voice; speak or sing with a tremulous voice; tremble.

Miso, sitting on the ground with her knees up, and her hands upon her knees, tuning her voice with many a *quavering* cough, thus discoursed. *Sidney*.

The division and *quavering*, which please so much in music, have an agreement with the glittering of light playing upon a wave. *Racon*.

A membrane, stretched like the head of a drum, is to receive the impulse of the sound, and to vibrate or *quaver* according to its reciprocal motions. *Ray*.

Now sportive youth
Carol incoherent rhythms with suiting notes,
And *quaver* inharmonious. *Philips*.

We shall hear her *quavering* them half a minute after us, to some sprightly airs of the opera. *Addison*.

If the eye and the finger remain quiet, these colors vanish in a second minute of time, but if the finger be moved with a *quavering* motion, they appear again. *Newton's Opticks*.

QUAVER, in music, a measure of time equal to half a crochet, a fourth part of a minim, or an eighth part of a semibreve.

QUAY, *n. s.* Fr. *quai*. See below. A key; an artificial bank to the sea or river, on which goods are conveniently unladen.

Kay, key, or *quay*, is a wharf or place by the water side, in a sea-port, for the loading and unloading of merchandise. The verb *cajore*, in old writers, according to Scaliger, signifies to keep in or restrain; and hence came our term *kay*: the ground where keys are made being bound in with planks and posts. *Dr. A. Rees*.

QUAY, or KEY, a long wharf, usually built of stone, by the side of a harbour or river, and having several storehouses for the convenience of loading and discharging merchant ships; with posts and rings whereby they are secured; together with cranes, capsterns, and other engines, to lift the goods in or out of the vessels which tie along side.

QUEA'CHY, *adj.* Originally perhaps *quacky*, *quaggy*, or *quashy*. Unsound; boggy. Not in use.

The boggy mears and *queachy* fens below.

Drayton.

Godwin's *queachy* sand.

Id.

QUEAN, *n. s.* Sax. *crean, þorcpen*. A low or worthless woman; a strumpet.

As fit as the nail to his hole, or as a scolding *quean* to a wrangling knave. *Shakspeare*.

This well they understand like cunning *queans*,
And hide their nastiness behind the scenes.

Dryden.

Such is that sprinkling which some careless *quean*
Flirts on you from her mop. *Swift*.

Now Tam, O Tam; had they been *queans*
A' plump and strapping in their teens;
Their sarks, instead o' creeshie flannen,
Been snaw-white seventeen hunder linen!

Burns.

QUEA'SY, *adj.* Of uncertain etymology. Goth. *kuesa*, is to sicken; sicken with nausea; fastidious; squeamish.

I, with your two helps, will so practise on Benedict, that, in despite of his quick wit and his *queasy* stomach, he shall fall in love with Beatrice.

Shakspeare.

He, *queasy* with his insolence, already
Will their good thoughts call from him. *Id*

Whether a rotten slate and hope of gain,
Or to disuse me from the *queasy* pain
Of being beloved and loving,
Out push me first. *Donne*.

The humility of Gregory the Great would not admit the style of bishop, but the ambition of Boniface made no scruple thereof, nor have *queasy* resolutions been harboured in their successors ever since.

Broune's Vulgar Errors.

Without question,
Their conscience was too *queasy* of digestion.

Dryden

Men's stomachs are generally so *queasy* in these cases, that it is not safe to overload them.

Government of the Tongue.

Y

QUEBEC, the capital of Canada and of British America, is situated at the junction of Charles River with the St. Lawrence, and is divided into the Old and New, or Upper and Lower towns. The former is on a rocky promontory, named Cape Diamond, the summit of which is 350 feet above the level of the river. On the highest part of the promontory is the citadel, composed of a whole bastion, a curtain, and half bastion, with a ditch, counterguard, covered way, and glacis to the south-west, with many other works, so that the fortifications may be considered as impregnable, both by nature and art, and require 5000 men to defend them properly.

The castle of St. Louis was burned down in 1834; the public buildings chiefly remarkable for their solidity and beauty are, a Catholic church; the ancient Jesuits' College, now occupied as a barrack for the troops; a seminary for the education of the Catholic clergy; a Protestant church court-house; the hôtel-dieu, or civil hospital; a poor-house; a new jail; a convent of Ursulines, which has thirty-six sisters; a general hospital, &c. There are two market-places; a place d'armes, a parade, and an esplanade. The castle of St. Louis, situated on the summit of the rock, is a handsome stone building, seated near the edge of a precipice, something more than 200 feet high, and supported towards the steep by a solid work of masonry, rising nearly half the height of the edifice, and surmounted by a spacious gallery, whence there is a most commanding prospect over the basin, the island of Orleans, Point Levi, and the surrounding country. The whole pile is 162 feet long, by forty-five broad, and three stories high. This building has been repaired and improved on a grand scale. The new jail was completed in 1814, at an expense of £15,000.

The Lower Town is the principal place of commerce, and occupies the ground at the foot of the promontory, which has been gradually gained, either by mining, or running out wharfs: it is considered unhealthy. The streets of both towns are in general irregular, uneven, and narrow, and few of them paved: but some considerable improvements in the style of building have of late been made, as well as in the plan of the streets. The houses are of unequal heights, and often covered with boards, though the frequent fires have caused some to use tin or painted sheet iron. Next the river are very extensive warehouses, and vessels come close to the wharfs to discharge their cargoes; at some of them the vessels remain afloat at low water, at others, which are not carried so far out, or where the river does not deepen so suddenly, the vessels lie dry at low water. The communication from the Lower to the Upper Town is by a winding street, at the top of which is a fortified gate.

Mountain Street, where formerly the ascent was so steep as to make it difficult for a carriage, is now passable for all sorts of vehicles. John Street, Buade Street, Fabrique Street, and the greater part of Palace Street, may be considered as the mercantile part of the Upper Town, being inhabited chiefly by merchants, retail traders, artizans, and tavern-keepers. St.

Louis Street, running nearly parallel to St. John Street, is much more elevated, airy, and agreeable, and by far the pleasantest part of the town; as such, most of the superior officers of the provincial government, and people of the first rank reside here.

On the south shore of the river, opposite Cape Diamond, is Point Levi, which with the former cape narrows the river to three-quarters of a mile; but between these points and Orleans Island is a basin, five or six miles wide, capable of holding 100 sail of the line. The rise of tide at the equinoxes is twenty-five feet. Charles's River, which empties itself at the town, issues from a lake of the same name, twelve miles from Quebec, and is only navigable for boats.

At Quebec the river begins to freeze in December, and some years the ice becomes solid and stationary, and carriages and horses cross side to side. The ice usually begins to break up in April, when a sudden thaw comes on, and generally clears the river in a few days. The first breaking up is accompanied by a noise like that of a heavy cannonade; for the current being then increased, by the melting of the ice and snow, the masses of the former are driven against each other with great fury and noise. Between Quebec and Point Levi, on the opposite shore of the St. Lawrence, a great number of ferry-boats are continually passing. In the winter, when masses of ice are floating up and down with the tide, and often when there is a strong breeze, impelled at the rate of three or four knots an hour, this passage is singularly laborious; yet it is very rare that accidents happen. It is not an uncommon thing to see several large canoes, laden with provisions for the market, crossing the river as nearly in a line as they are able to keep. They are provided with strong poles, having iron hooks at the end for grappling hold of the ice, and drag ropes; the cargoes are generally secured by a strong lashing. When large sheets of ice oppose their progress, the men, by means of the poles and ropes, which they employ with uncommon ability, get the canoe upon it, and by main force drag it perhaps fifty or sixty yards, or until they find a convenient opening to launch it again among the smaller fragments. Quebec exports grain, flour, timber, lumber, ashes, &c. In return, all the manufactures of Europe are imported. The annual value of the exports and imports amount to about £1,000,000 sterling. Mr. Bouchette estimated the population of this city at 30 000 souls.

The French first chose the ground on which Quebec now stands for a settlement, in the year 1608. Its progress was slow, owing to the hostility of the natives. In 1629 it was taken by the English, but restored. In 1690 it was fortified, and from this period gradually improved. In 1711 an attempt was made by the English and Americans, under brigadier Hill, to surprise Quebec, but it proved abortive; and it remained in possession of the French till the memorable year 1759, when it was taken by the English, under the command of the brave Wolfe, who fell in the engagement: by the peace in 1763 it was ceded; with the rest of Canada, to this country. In 1775 the Americans made an

unsuccessful attempt against this city, with the loss of about 700 men, and their commander Montgomery.

Nothing can be more beautiful than the summer views between Quebec and Montreal, both banks of the river being thickly dotted with villages and farm-houses, the latter extremely neat; and in each of the former, however small, is a church.

QUECK, *v. n.* Sex. *зѣпican*, to wince. To shrink; show pain; complain. Not in use.

The lads of Sparta were accustomed to be whipped at altars, without so much as *quecking*. *Bacon*.

QUEDAH, or KIDDEH, a Malay principality in the peninsula of Malacca, on the west coast, along which it extends about 150 miles, between 5° and 8° N. lat., and immediately opposite Prince of Wales's Island. It presents a considerable plain, covered with close wood, through which winds a river navigable for small craft up to the foot of the mountains. From Trang to Purlis this coast is sheltered by many islands, the distance being twenty-four leagues, low, and covered with woods. The water is also remarkably shallow, ships being obliged to anchor a great distance from the shore. Along this tract eleven small rivers empty themselves into the sea. Inland this country is from twenty to thirty-five miles in breadth, but the cultivated land no where exceeds twenty miles from the shore.

The smaller rivers of Quedah are navigable for prows, and some of them for larger vessels. Qualla Mooda is a shallow rapid stream, convenient on account of its communication with the tin mines; the annual produce of which is about 1000 peculs, and might be much more. The country to the south, being supplied with abundant moisture, is extremely productive of rice, and abounds with buffaloes, bullocks, and poultry. The other articles of commerce are tin, elephants' teeth, wax, &c.; and it imports the same as at the other Malay ports, chiefly opium and Spanish dollars. It was a place of considerable trade before the establishment of Prince of Wales's Island.

The principal sea-port, called Quedah by strangers, and Quallah Batany by the natives, is in lat. 6° N. Its river is navigable for vessels of 300 tons; but the entrance is choked up by a mud bank; and the road, where ships of burden anchor, is above two leagues from the shore. At the mouth there was a small brick fort, now in ruins. Both shores are muddy, swampy, and covered with jungle. Seven miles up the river is Allistar, where the king resides, to which place all vessels can ascend whose draught of water permits to pass the bar.

In 1786 an agreement was entered into with the king of Quedah for the cession of Pulo Penang, now Prince of Wales's Island, to the British; and, in May 1792, a regular treaty of peace and amity, to continue as long as the sun and moon give light, was concluded; by this the East India Company engaged to pay the king 6000 dollars annually, while they remained in possession of the island. In 1802 a new arrangement was entered into, by the conditions of which Yeng de per Tuan, king of Quedah, agreed to

make over to the East India Company all that part of his sea-coast between Qualla Karrican and the river side of Qualla Moodah, and measuring inland from the sea sixty orlongs; which tract of country the company engaged to protect from all enemies and pirates. The king agreed to permit the free exportation of provisions, and other articles, to Prince of Wales's Island, and engaged not to permit any European to settle in his dominions. The treaty stipulated for the apprehension and delivery of insurgents, felons, debtors, and slaves; and, in consideration of the benefits accruing to the company, they agreed to pay his majesty of Queda 10,000 dollars annually.

QUEDLINBURG, a large town of Prussian Saxony, on the Bude, thirty miles S.S.W. of Magdeburg. It is surrounded by an earthen mound, and divided into the Old and New Town, which has three suburbs. The abbey church is handsome, but the others are only remarkable as antiquities. Until 1802 there was a Lutheran abbey for ladies in this neighbourhood, which was admitted to rank with the principalities of the empire. In that year it was secularised. Here are manufactures of woollen, a high school, and several hospitals; and the poet Klopstock was born here.

QUEEN, *n. s. & v. n.* Sax. *cpēn*, a woman, a wife, the wife of a king; the wife or widow of a king; a female sovereign; to play the queen.

He was lagt

In a most curious mantle, wrought by the hand
Of his queen mother. *Shakspeare. Cymbeline.*

A threepence bowed would hire me,
Old as I am, to queen it. *Id. Henry VIII.*

Have I a queen

Past by my fellow rulers of the world?
Have I refused their blood to mix with yours,
And raise new kings from so obscure a race?

Dryden.

That queen Elizabeth lived sixty-nine, and reigned forty-five years, means no more than that the duration of her existence was equal to sixty-nine, and the duration of her government to forty-five annual revolutions of the sun.

Locke.

The meanest hind in fair Scotland

May rove their sweets among;

But I, the queen of a' Scotland,

Maun lie in prison strang.

Burns.

Within the garden's peaceful scen

Appeared two lovely foes

Aspiring to the rank of queen,

The Lily and the Rose.

Cowper.

QUEEN, in law. The queen of England is either queen regnant queen consort, or queen dowager. The queen regent, regnant, or sovereign, is she who holds the crown in her own right; as the first, and perhaps the second, queen Mary, queen Elizabeth, and queen Anne; and such a one has the same powers, prerogatives, rights, dignities, and duties, as if she had been a king. But the queen consort is the wife of the reigning king; and she, by virtue of her marriage, is participant of divers prerogatives above other women. She is a public person, distinct from the king; and not, like other married women, so closely connected as to have lost all legal or separate existence. For the queen is of ability to purchase lands, and to convey them, to make

leases, to grant copyholds, and do other acts of ownership, without the concurrence of her lord. She is also capable of receiving a grant from the king, which no other wife is from her husband. The queen of England has separate courts and officers, distinct from the king's, not only in matters of ceremony, but even of law; and her attorney and solicitor-general are entitled to a place within the bar of his majesty's courts, together with the king's counsel. She may likewise sue and be sued alone, without joining her husband. She may also have a separate property in goods as well as lands, and has a right to dispose of them by will. In short, she is in all legal proceedings looked upon as a feme sole, and not as a feme covert; as a single, not as a married woman. For which the reason given is this: Because the wisdom of the common law would not have the king (whose continual care and study is for the public, and circa ardua regni) to be troubled and disquieted on account of his wife's domestic affairs; and therefore it vests in the queen a power of transacting her own concerns, without the intervention of the king.

The queen has also many exemptions, and minute prerogatives. For instance: she pays no toll; nor is she liable to any amercement in any court. But in general, unless where the law has expressly declared her exempted, she is upon the same footing with other subjects; being, to all intents and purposes, the king's subject, and not his equal. Nevertheless, it is equally treason to compass or imagine the death of our lady the king's companion, as of the king himself: and to violate or defile the queen consort amounts to the same high crime; as well in the person committing the fact, as in the queen herself, if consenting. If, however, the queen be accused of any species of treason, she shall, whether consort or dowager, be tried by the peers of parliament.

The husband of a queen regnant, as prince George of Denmark was to queen Anne, is her subject; and may be guilty of high treason against her: but, in the instance of conjugal infidelity, he is not subjected to the same penal restrictions.

QUEEN DOWAGER is the widow of the king, and as such enjoys most of the privileges belonging to her as queen consort: but it is not high treason to violate her chastity, or conspire her death, because the succession is not endangered thereby; but no man can marry her without special license from the king, on pain of forfeiting his lands and goods.

QUEEN ANN'S COUNTY, a county of Maryland, bounded north by Kent; east by Delaware; south-east by Caroline county; south by Talbot county; and west by Chesapeake Bay. The chief town is Antreville.

QUEEN-APPLE, *n. s.* Queen and apple. A species of apple.

Her cheeks with kindly claret spread,
Aurora-like new out of bed,

Or like the fresh *queen-apple's* side,

Blushing at sight of Phœbus' pride. *Sidney.*

The *queen-apple* is of the summer kind, and a good cyder-apple mixed with others. *Mortimer.*

The winter *queening* is good for the table. *Id.*

QUEEN CATHERINE'S FORELAND, the north-east point of Terra del Fuego, at the east entrance into the straits of Magellan, discovered by Frobisher in 1576.

QUEEN CHARLOTTE'S FORELAND, the south-east extremity of New Caledonia. Long. 167° 14' E., lat. 22° 15' N. Also the name of the south-west point of New Hanover, in the eastern seas; discovered by captain Carteret in 1767. It is a high bluff point, and the land around has a great number of little hummocks or hills. Long. 148° 27' E., lat. 2° 29' S.

QUEEN CHARLOTTE'S ISLAND, an island in all the Pacific, about six miles long and one broad, discovered in 1767 by captain Wallis. He describes it as sandy and level, full of trees, without underwood, and abounding with scurvy-grass. The canoes appeared to be about thirty feet long, four feet broad, and three and a half deep. Two of these, being brought along-side of each other, were fastened at the distance of about three feet, by cross beams, passing from the larboard gunwale of one to that of the other, in the middle, and near to each end. The inhabitants were handsome, of a middle stature, and dark complexion, with long black hair. Long. 138° 4' W., lat. 19° 18' S.

QUEEN CHARLOTTE'S ISLANDS, a group in the North Pacific Ocean, of which we know very little, except that they lie off the west coast of North America; the largest being of a triangular form, about 170 miles long, and in some places sixty broad. These islands were observed by captain Cook, who imagined them to form part of the continent. They were first discovered to be islands by Dixon, in 1787. Being visited by captain Gray, of the United States, he called them Washington's Islands, and found several convenient harbours. Vancouver coasted along the shore, and observed that near the sea the land was elevated, but rose gradually into rugged and uneven mountains towards the interior of the principal island. He understood that the inhabitants cultivated a species of tobacco. Long. from 131° to 133° 7' W., lat. 52° to 54° 22' N.

QUEEN CHARLOTTE'S ISLANDS, another group discovered by captain Carteret in 1767, consisting of Egmont's Island or New Guernsey, Lor. Howe's Island or New Jersey, and several others. Carteret sent a cutter, with the master and a party of men, on shore; when a quarrel ensued, respecting the cutting down of a cocoa-tree, in which many Indians were killed, and, on the side of the English, the master and three of the seamen were wounded, and soon after died. Captain Carteret, being desirous to get in some water, veered the ship close to the shore, but was himself induced to order several shots to be fired, by which several Indians seem to have been killed, before he could attain his purpose. These islands were discovered in 1595 by Mendana, the principal being called by him Santa Cruz. The others are very inconsiderable.

'The inhabitants of Egmont Island,' says Carteret, 'are extremely nimble, vigorous, and active, and seem to be as well qualified to live in the water as upon the land; for they were in and

out of their canoes almost every minute. The canoes that came out against us from the west end of the island might probably, upon occasion, carry about a dozen men, though three or four manage them with amazing dexterity; we saw, however, others of a large size upon the beach, with awnings or shades over them. We got two of their bows, and a bundle of their arrows, from a canoe; and with these weapons they do execution at an incredible distance. One of them went through the boat's washboard, and dangerously wounded a midshipman in the thigh. Their arrows were pointed with flint, and we saw among them no appearance of any metal. The country in general is woody and mountainous, with many valleys intermixed. Several small rivers flow from the interior part of the country into the sea, and there are many harbours upon the coast. Long. $163^{\circ} 30'$ to $165^{\circ} 10' E.$, lat. $9^{\circ} 50'$ to $11^{\circ} 20' S.$

QUEEN CHARLOTTE'S SOUND, a northern bay of the south island of New Zealand, where captain Cook erected a post with a union flag, and took possession of the country in the name and for the use of king George III. In sailing either in or out with little wind, attention must be had to the tides, which flow about nine or ten o'clock at the full and change of the moon, and rise and fall between seven and eight feet. The variation of the compass was found, from good observation, to be $13^{\circ} 5' E.$ The land about consists wholly of high hills and deep valleys, well stored with a variety of hard timber, fit for all purposes except masts. The sea abounds with fish; so that, without going out of the cove where they lay, the Endeavour's crew caught every day, with hooks and lines, a quantity sufficient to serve the ship's company: the inhabitants, amounting to about 400, had straggling houses along the shore. See ZEALAND, NEW.

QUEEN'S COUNTY, anciently called Leix, a shire in the province of Leinster and kingdom of Ireland, so named from queen Mary of England. It is about thirty miles in length by twenty-five in breadth, contains about 146,000 inhabitants, 25,000 houses, and its superficies measures 235,000 acres. Here are nine baronies, viz. Ballyadams, Cullinagh, Maryborough East, Maryborough West, Portenehinch, Slieumargue, Stradbally, Tinnehinch, and Upper Ossory. The ecclesiastical subdivision is made into twenty-nine parishes, and twenty-three parts of parishes. The chief towns are Ballynakill, Maryborough (so named also from Mary queen of England), the Assizes Town, Mountrath, part of the elegant town of Portarlington, Stradbally, and Mountmellick. There are here many noble seats, and many resident gentry. Much of the boggy districts has been reclaimed, by which both the climate and soil have benefited. Between the King's and Queen's counties is that great natural boundary, seventeen miles in length, called the Sliebh-bloom Range, or the Ard-narin Mountains. The first appellation appears to signify the 'mountain dedicated to Beal's Day;' the second means 'The height of Ireland.' In the whole length of this great chain there is but one pass, called the Gap of Glandine, and even this a difficult one. A remarkable circumstance

relating to the Sliebh-Bloom mountains is, that the north side of the whole range is singularly fertile, while the south is completely barren. Here also are the sources of the only two rivers of consequence in the county, the Barrow and the Nore; the former rendered navigable by deepening and by lateral cuts, but the latter unmanageable from its rapidity and sudden floods. The Queen's County abounds in mineral productions; the great bed of coal, called the Leinster district, lies between the rivers Nore and Barrow, and rests upon limestone: this coal is of the non-flaming species called stone, and sometimes Kilkenny coal; the vein reaching this last district. The limestone of this region exhibits many remarkable appearances; such as great dislocations, parallel disturbances in the coal strata, and an apparent change in their nature; the occurrence of irregular beds and veins of siderocalcite, or brown spar, traversing the limestone; and, lastly, the vast caves discovered at or near the junction of the calcareous and coal strata. The soil of this county in general is gravelly, favorable for the growth of corn; and the pasture is found peculiarly adapted for the cheese farmer, who sometimes deceives the factor by imposing his cheese as English-made. Queen's-County cheese is held in high estimation at home. The ancient families of this district were the O'More's, Fitzpatrick's, and Wandesford's. Many beautiful specimens of military and ecclesiastical antiquities still survive, amongst which the celebrated fortified rock called 'Dunamaze' should not be omitted: this still interesting place, formerly the citadel of the O'More's of Leix, was occupied as a post of defence and security as early as the third century. The ruins now visible were erected by the chieftain O'More. Abbey Leix and Aghaboe are the most interesting of the monastic remains. Queen's County returns three members to the imperial parliament, two for the county, and one for the borough of Portarlington.

QUEEN'S-COUNTY, a county of New-York, in the west part of Long Island; bounded north by Long Island Sound; east by Suffolk county; south by the Atlantic; and west by King's county. Chief towns, Jamaica and North Hempstead.

QUEENBOROUGH, a post and market town, situate at the western extremity of the Isle of Sheppey, Kent, at the mouth of the Medway, forty-five miles east from London. The houses are neat, uniform, and regularly built. The church is a plain, ancient structure. Here is a small copperas manufactory; and in the town is a guildhall and a prison. This place is a distinct liberty, and it is governed by a mayor, four jurats, and two bailiffs. Its magistrates hold quarterly courts, and also general sessions every half year. It returned two members to parliament, the right of election being in the corporation and burgesses, the number about 150, but is now disfranchised. Market on Monday.

QUEENSFERRY, a royal borough and parish on the south bank of the Firth, where the river is not above two miles broad; nine miles west of Edinburgh. It was so named from the celebrated queen Margaret, wife of Malcolm

Canmore, who frequented this passage much, and patronised the town. It consists of one street, chiefly inhabited by seafaring people. Its chief manufacture is soap. This borough unites with Stirling, Dunfermline, Culross, and Inverkeithing, in electing a representative in the imperial British parliament. It is governed by a provost, three bailies, dean of guild, and town council. It has two piers on the east and west, and the coast abounds with cod, haddocks, whittings, skate, flounders, herrings, lobsters, oysters, crabs, &c.

QUEENSTOWN, a neat place of Upper Canada, on the Niagara, under the ridge called Queenstown Heights. It is the dépôt for the merchandise brought from Montreal and Quebec, for the Upper province, and is remarkable for the romantic beauty and grandeur of its situation. It has a good capacious harbour, a church, court-house, stores for government and for the Indian department, wharfs, and barracks. Much commercial activity is displayed during the season of navigation. Queenstown suffered much during the late war.

QUEER, *adj.* 'Of this word the original is not known,' says Dr. Johnson: 'a correspondent supposes a queer man to be one who has a *quare* to his name in a list.' But there is a Teut. *kuerh*, of this signification. Odd; strange; particular; churlish.

He never went to bed till two in the morning because he would not be a *queer* fellow; and was every now and then knocked down by a constable, to signalise his vivacity. *Spectator.*

QUEILING, or KOUILING, a city of China, of the first rank, capital of QUANGSEE, (which see,) environed by mountains. Its name is derived from a species of odoriferous flower, abundant in the neighbourhood. A rapid river, but not navigable, flows under the walls. This city is fortified, but does not equal other Chinese capitals in wealth and population. Long. 109° 51' E., lat. 25° 12' N.

QUEIS, or QUEISS, a river of the Prussian states, which rises in Silesia, divides it from Lusatia, and falls into the Bober, above the town of Sagan. Its banks were, in September 1813, the scene of a battle between the French and Prussians.

QUELL, *v. a. & n. s.* } Sax. *cpellan*; Dan. }
 QUELLER. } *quale*. To kill; }
 crush; subdue: hence, as a noun-substantive, murder; violent death: a *queller* is a conqueror.

What cannot we put upon
 His spongy followers, who shall bear the guilt
 Of our great *quell*? *Shakspeare. Macbeth.*

What avails
 Valour or strength, though matchless, *quelled* with pain,

Which all subdues, and makes remiss the hands
 Of mightiest. *Milton's Paradise Lost.*

Hail, Son of the Most High,
Queller of Satan, on thy glorious work
 Now enter. *Id. Paradise Regained*

This *quelled* her pride, but other doubts remained,
 That, once disdaining, she might be disdained.

Dryden.
 He is the guardian of the publick quiet, appointed to restrain violence, to *quell* seditions and tumults, and to preserve that peace which preserves the world.

Aterbury.

QUELPAERT, an island in the eastern seas, south of the peninsula of Corea. It was made known to Europeans in 1635 by the wreck of a Dutch vessel here, called the Sparrow-hawk. The crew were carried to the capital of Corea, whence they with difficulty made their escape. The island was also coasted by La Perouse, in 1787. It is chiefly composed of a mountain, about 6000 feet high, whence the land slopes down to the sea. The jealous character of the nation prevents any considerable intercourse between it and Europeans. Long. 126° 35' E., lat. 33° 14' N.

QUELQUE'CHOSE, *n. s.* Fr. *quelquechose*. A trifle; a kickshaw. A word not adopted.

From country grass to comfitures of court,
 Or city's *quelquechose*, let not report
 My mind transport. *Donne.*

QUENCH, *v. a. & v. n.* } Saxon *cpencan*; }
 QUENCH'ABLE, *adj.* } Goth. *kvaugicen*. }
 QUENCH'ER, *n. s.* } To extinguish; cool; }
 QUENCH'LESS, *adj.* } allay: hence to destroy: as a neuter verb, to grow cool; the adjectives and noun substantive corresponding.

The fire had power in the water, forgetting his own virtue; and the water forgat his own *quenching* nature. *Wisdom xix. 20.*

Since stream, air, sand, mine eyes and ears conspire,
 What hope to *quench*, where each thing blows the fire? *Sidney.*

This is the way to kindle, not to *quench*. *Shakspeare.*

But if all aim but this be levelled false,
 The supposition of the lady's death
 Will *quench* the wonder of her infamy. *Id.*

Dost thou think, in time
 She will not *quench*, and let instructions ente
 Where folly now possesses? *Id. Cymbeline.*
 Come, bloody Clifford, rough Northumberland,
 I dare your *quenchless* fury to more rage. *Shakspeare.*

Milk *quencheth* wild-fire better than water, because it entereth better. *Bacon's Natural History.*

When death's form appears, she feareth not
 An utter *quenching* or extinguishment;
 She would be glad to meet with such a lot
 That so she might all future ill prevent. *Davies.*
 The judge of torments, and the king of tears,
 He fills a burnished throne of *quenchless* fire. *Crashaw.*

Subdued in fire the stubborn metal lies;
 One draws and blows reciprocating air;
 Others to *quench* the hissing mass prepare. *Dryden.*

You have already *quenched* sedition's brand,
 And zeal, which burnt it, only warms the land. *Id.*

Covered with skin and hair keeps it warm, being naturally very cold, and also to *quench* and dissipate the force of any stroke, and retund the edge of any weapon. *Ray.*

Beseech God, that he will inflame thy heart with this heavenly fire of devotion; and, when thou hast obtained it, beware that thou neither *quench* it by any wilful sin, or let it go out again for want of stirring it up and employing it. *Duty of Man.*

When your work is forged, do not *quench* it in water to cool it, but throw it down upon the floor or hearth to cool of itself; for the *quenching* of it in water will harden it. *Mozon's Mechanical Exercises.*

Every draught, to him that has *quenched* his thirst,

is but a further *quenching* of nature, a provision for rheum and diseases, a drowning of the spirits.

South.

His heart with wounds unnumbered riven,
His back to earth, his face to heaven,
Fallen Hassan lies—his unclosed eye
Yet lowering on his enemy,
As if the hour that sealed his fate,
Surviving left his *quenchless* hate.

Byron.

QUENTIN, (St.), a fine town in the north-east of France, and department of the Aisne, is situated on the Somme, and near the canals of Crozat and St. Quentin. It stands on an eminence, in a strong position, but its fortifications have been long neglected. It contains a public square, in which is situated the hotel de ville, and the ancient cathedral, both in the Gothic style. It has long been noted for its linen, thread, cambric, lawn, gauze, and latterly for its cottons. In these a surprising number of hands are employed, and a great export trade carried on with Holland, Germany, and other foreign countries. The French were defeated here in a general engagement by the Spaniards, in 1557. Population 11,000. Twenty-two miles south of Cambrai, forty south by east of Arras.

QUERCUS, the oak tree, a genus of the polyandria order and monœcia class of plants; natural order fiftieth, amentacæ: CAL. nearly quinquefid: COR. none; the stamina are from five to ten in number: FEMALE CAL. monophyllous, very entire, and scabrous: COR. none; the styles are from two to five, and there is an ovate seed. Dr. Rees describes eighty-four species of quercus; the following are some of the most important.

Q. ægilops, the large prickly-cupped Spanish oak, grows seventy or eighty feet high, or more, with a very large trunk, and widely spreading head, having a whitish bark, large oblong-oval deeply serrated smooth leaves, the serratures bowed backwards, and large acorns placed in singularly large prickly cups. This is a noble species, nearly equal in growth to our common English oak.

Q. cerris, the smaller prickly-cupped Spanish oak, grows thirty or forty feet high, and has oblong, lyre-shaped, pinnatifid, transversely jagged leaves, downy underneath, and small acorns placed in prickly cups.

Q. coccifera, the scarlet or kermes oak, grows but fourteen or fifteen feet high, branching all the way, and of bushy growth; with large oval, undivided, indented, spinous leaves; and producing small glandular excrescences, called kermes or scarlet grain, used by the dyers. See *Coccus* and *KERMES*.

Q. esculus, of Pliny, or the cut-leaved Italian oak, grows about thirty feet high, having a purplish bark, oblong deeply sinuated smooth leaves, and long slender close-sitting acorns in very large cups.

Q. granuntia, the Montpellier holly-leaved evergreen oak, grows forty or fifty feet high; and has oblong-oval, close-sitting, sinuated spinous leaves, downy underneath, bearing a resemblance to the leaves of the holly.

Q. ilex, the common evergreen oak, grows forty or fifty feet high, having a smooth bark,

oval and oblong, undivided, serrated, petiolated leaves, downy and whitish underneath. The varieties are broad-leaved, narrow-leaved, and sometimes both sorts and other different shaped leaves on the same tree; also sometimes with sawed and prickly leaves.

Q. Moluccensis, Moluccan oak, commonly called American live oak, grows about forty feet high, having oval, spear-shaped, smooth, entire leaves, and small oblong eatable acorns.

Q. phellos, the willow-leaved American oak, grows forty or fifty feet high, having long narrow, smooth, entire leaves, like those of the willow. There is a variety called the dwarf willow-leaved oak.

Q. prinus, the chestnut-leaved American oak, grows fifty or sixty feet high; having large oblong-oval smooth leaves, pointed both ways, the edges sinuated serrated, with the sinuses uniformly round.

Q. robur, the common English oak, grows from about sixty or seventy to 100 feet high, with a prodigiously large trunk, and monstrous spreading head; oblong leaves, broadest towards the top, the edges acutely sinuated, having the angles obtuse. There is a variety, having the leaves finely striped with white. This species grows in great abundance all over England, in woods, forests, and hedge-rows.

The following are the dimensions of some of the finest oaks at Welbeck, as stated in a pamphlet by Hayman Rooke, esq., F. S. A.:—The Green Dale Oak is said to be 700 years old. Girth of the trunk above the arch thirty-five feet; height of the arch ten feet three inches; width six feet three inches; and height of the tree, to the top of the live stump, fifty-four feet. The Porters are two very large trees, and are so called from the circumstance of there formerly having been a gate placed between them. The first measures in circumference at the ground thirty-eight feet; at a yard high twenty-seven feet; at two yards twenty three feet; total height ninety-eight feet six inches; and solidity 348 feet! The other in girth at the surface thirty-four feet; at one yard high twenty-three feet; at two yards twenty feet; height eighty-eight feet; and solidity 744 feet. The Duke's Walking Stick, in girth at the ground twenty-one feet; at one yard high fourteen feet; stem seventy feet six inches; total height 111 feet; and solidity 440 feet. The Oak and Ash. Girth of both at the ground thirty-six feet; of the oak at one yard high eighteen feet; at two yards fifteen feet four inches, and height ninety-two feet. The ash is comparatively very small; it leaves the oak at a small distance above the ground, and unites again at eight or nine feet high; then branches out, and towers with it for some thirty or forty feet. Dr. Walker mentions an oak, at Loch Arkeg in Lochaber, which measured twenty-four feet six inches, at the height of four feet from the ground.

The English oak is as remarkable for its slowness of growth and longevity as for its bulk; the trunk has been often observed to have reached the size of not more than twenty inches, and sometimes not more than fourteen, in the space of fourscore years. In regard to bulk we have

an account of an oak belonging to lord Powis, growing in Broomfield wood, near Ludlow in Shropshire, in 1764, the trunk of which measured sixty-eight feet in girth, twenty-three in length, and which, reckoning ninety feet for the larger branches, contained in the whole 1455 feet of timber, round measure, or twenty-nine load and five feet, at fifty feet to a load. The Cowthorp oak, near Wetherby in Yorkshire, lays a claim to being the father of the forest. Dr. Hunter, who, in his edition of Evelyn, has given an engraving of it, says that within three feet of the surface it measures sixteen yards, and close to the ground twenty-six. In 1776, though in a ruinous condition, it was eighty-five feet high, and its principal limb extended sixteen yards from the bole. The foliage was very thin. If this measurement was taken as the dimensions of the real stem, the size of this tree would be enormous; but like most very large trees, its stem is short, spreading wide at the base, the roots rising above the ground like buttresses to the trunk, which is similar, not to a cylinder, but to the frustum of a cone. Mr. Marshman says, 'I found it in 1768 at four feet, forty feet six inches; at five feet, thirty-six feet six inches; and at six feet, thirty-two feet one inch.' In the principal dimensions it is exceeded by the Bentley oak, of which the same writer gives the following account:—'In 1759 the oak in Holt forest, near Bentley, was at seven feet, thirty-four feet. There is a large excrescence at five and six feet, that would render the measure unfair. In 1778 this tree was increased half an inch in ten years. It does not appear to be hollow, but by the trifling increase I conclude it not sound.' These dimensions, however, are exceeded by those of the Boddington oak, near the turnpike road between Cheltenham and Tewkesbury, in the vale of Gloucester. The stem is remarkably collected at the root, the sides of its trunk being much more upright than those of large trees in general; and yet its circumference at the ground is about twenty paces; measuring with a two foot rule ft is more than eighteen yards. At three feet high it is forty-two feet, and where smallest, i. e. from five to six feet high, it is thirty-six feet. At six feet it swells out larger, and forms an enormous head, which has been furnished with huge, and probably extensive, arms. But time and the fury of the wind have robbed it of much of its grandeur, and the greatest extent of arm in 1783 was eight yards from the stem.

In the Gentleman's Magazine for May, 1794, we have an account of an oak tree growing in Penhurst Park in Kent, together with an engraving. It is called the bear or bear oak, from being supposed to resemble that which Camden thought gave name to the county of Berkshire. The dimensions of the tree are these:—

	Ft.	In.
Girth close to the ground	35	6
Girth one foot from the ground	27	6
Girth five feet from the ground	24	0
Height taken by shadow	73	0
Girth of lowest, but not largest, limb	6	9

With respect to longevity, Linné gives an account of an oak 260 years old; but we have

had traditions of some in England (how far to be depended upon we know not) that have attained to more than double that age.

Q. rubra, the red Virginian oak, grows about sixty feet high, having a dark grayish bark, long obtusely sinuated leaves, with the sinuses terminated by bristly points, and have sometimes red spotted veins, but generally dyeing in autumn to a reddish color, remaining on the trees late in the season.

Q. suber, the cork tree, grows thirty or forty feet high, having a thick, rough, fungous, cleft bark, and oblong-oval, undivided, serrated leaves, downy underneath. This species furnishes that useful material cork; it being the bark of the tree, which becomes of a thick fungous nature, under which, at the same time, is formed a new bark, and, the old one being detached for use, the tree still lives, and the succeeding young bark becomes also of the same thick spongy nature in six or seven years, fit for barking, having likewise another fresh bark forming under it, becoming cork like the others in the like period of time; and in this manner these trees wonderfully furnish the cork for our use, of which are made the corks for bottles, bungs for barrels, and numerous other useful articles. The tree grows in great plenty in Spain and Portugal, and from these countries we receive the cork. The Spaniards burn it, to make that kind of light black we call Spanish black, used by painters. The Spaniards line stone walls with cork, which not only renders them very warm, but corrects the moisture of the air. All the above species of quercus produce flowers annually in the spring, about April or May, of a yellowish color, but make no ornamental appearance, and are males and females separated in the same tree; the males being in loose amentums, and the females sitting close to the buds in thick leathery hemispherical calyxes, succeeded by the fruit or acorns, which are oval nuts fixed by their base into rough permanent cups, and mostly sit quite close, and some on short foot-stalks, ripening in autumn, which in the common English oak are in great abundance, and often in tolerable plenty on some of the other sorts; those of all the kinds serve for propagating their respective species; they are also excellent food for swine and deer, the common acorns in particular. All the above species will prosper in any middling soil and open situation, though in a loamy soil they are generally more prosperous; however there are but few soils in which oak will not grow; they will even thrive tolerably in gravelly, sandy, and clayey land, as may be observed in many parts of this country of the common oak. Besides the grand purposes to which the timber is applied in navigation and architecture, and the bark in tanning of leather, there are other uses to which the different parts of this tree have been referred. The Highlanders use the bark to dye their yarn of a brown color, or, mixed with coppers, of a black color. The acorns are a good food to fatten swine and turkeys. See OAK.

Q. marina, the sea oak, in botany, the name of one of the broad-leaved dichotomous sea fucuses. It is not agreed among the late botanists, what was the sea oak of Theophrastus; Clusius and Cæsalpinus suppose it to have been a species of

the shrubby coralline; but Theophrastus says the sea oak had a long, thick, and fleshy leaf; whence we may conclude it to have been of the fucus class.

QUERELE, *n. s.* Fr. *querelle*; Lat. *querela*. A complaint to a court. See **QUARREL**.

A circumduction obtains not in causes of appeal, but in causes of first instance and simple *querelle* only. *Ayliffe*.
